| Network Packet Drops | net.droppedTotal.delta.summation.number | Total number of dropped packets during the time interval. | |
| Network Receive Errors | net.errorRcv.delta.summation.number | Number of receive errors on the switch port during the time interval.<br>Receive errors occur when there is excessive output rates of traffic, or if the receive buffer is full. | |
| Network Rx Int Mac Errors | net.errorRxIntMac.delta.summation.number | The number of frames for which reception on a particular interface fails due to an internal MAC sublayer receive error. | |
| Network Rx Rate (Kbps) | net.received.rate.average.kiloBitsPerSecond | Average rate at which data is received during the time interval. This metric represents the bandwidth of the network. | Yes |
| Network Single Collision Errors | net.errorSingleCollisionFrames.delta.summation.number | Number of single collision errors detected over the network in the selected duration. | |
| Network SQE Test Errors | net.errorSQETests.delta.summation.number | Number of signal quality test errors detected over the network in the selected duration. | |

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| Network Symbol Errors | net.errorSymbol.delta.summation.number | Number of symbol errors detected over the network in the selected duration. | |
| Network Traffic Rate (Kbps) | net.usage.rate.average.kiloBitsPerSecond | Average rate of received and transmitted traffic during the time interval. | Yes |
| Network Tx Intmac Errors | net.errorTxIntMac.delta.summation.number | Number of frames for which transmission on a particular interface fails due to an internal MAC sublayer transmit error. | |
| Network Tx Rate (Kbps) | net.transmitted.rate.average.kiloBitsPerSecond | The average rate at which data was transmitted during the time interval. | Yes |
| Network Undersize Errors | net.errorUnderSize.delta.summation.number | Number of undersize errors detected over the network in the selected duration.<br>This error is an indication of a bad frame generated by the connected device. | |
| Network Xmit Errors | net.errorXmit.delta.summation.number | Number of Xmit errors detected over the network in the selected duration.<br>Xmit errors occur when there is excess input rates of traffic, or if the transmit buffer is full.<br>The transmit buffer becomes full because of excessive collisions and 10 MB ports. You must increase the speed of the interface and move the link partner to full-duplex to minimize the occurrence of Xmit errors. | |
| Out Queue Length | net.outQLen.absolute.average.number | Number of output packets waiting in the queue. | |
| Rx Broadcast Packets | net.broadcastRx.delta.summation.number | Number of broadcast packets received during the specified time interval. | |
| Rx Broadcast Ratio (%) | net.broadcastByRx.ratio.average.percent | Percentage of broadcast packets received during the time interval. | |
| Rx Frame Errors | net.rxframes.delta.summation.number | Number of frame errors received during the time interval.<br>Rx frame errors can occur due to various reasons such as noise or interference in the communication channel, incorrect packet formatting, or issues with the network hardware. | |
| Rx Jumbo Packets | net.jumboRx.delta.summation.number | Number of jumbo packets received during the time interval. | |

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| Rx Packet Drop Percent (%) | net.packetDropRx.ratio.average.percent | Average ratio of total number of dropped Rx packets to total number of Rx packets. | |
| Rx Packet Errors | net.errorRx.delta.summation.number | Number of received packet errors detected over the network in the selected duration.<br>For packet-oriented interfaces, an Rx packet error indicates the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer. | |
| Rx Packet Per Second | net.ppsRx.rate.average.number | Average rate at which packets are received per second. | |
| Rx Packets | net.packetsRx.delta.summation.number | Number of packets received during the time interval. | |
| Switch Port Uptime (%) | net.interfaceStatus.rate.average.percent | Interface uptime percentage. | |
| Total Network Traffic (Kb) | net.usage.delta.summation.kiloBytes | Sum of data transmitted and received during the time interval. | |
| Total Packet Per Second | net.ppsTotal.rate.average.number | Average rate of total packets (received packets and transmitted packets) per second. | |
| Total Rx Bytes | net.totalRx.delta.summation.bytes | Total number of bytes received by the switch port. | |
| Total Tx Bytes | net.totalTx.delta.summation.bytes | Total number of bytes transmitted by the switch port. | |
| Tx Broadcast Packets | net.broadcastTx.delta.summation.number | Number of broadcast packets transmitted during the time interval. | |
| Tx Broadcast Ratio (%) | net.broadcastByTx.ratio.average.percent | Average percent of broadcast packets transmitted during a specified time interval. | |
| Tx Jumbo Packets | net.jumboTx.delta.summation.number | Number of jumbo packets transmitted during the time interval. | |
| Tx Packet Drop Percent (%) | net.packetDropTx.ratio.average.percent | Ratio of total number of dropped Tx packets to total number of Tx packets. | |
| Tx Packet Errors | net.errorTx.delta.summation.number | Number of transmitted packet errors detected over the network in the selected duration.<br>For packet-oriented interfaces, Tx packet errors indicate the number of outbound packets that were not transmitted because of errors. | |
| Tx Packet Per Second | net.ppsTx.rate.average.number | Number of packets transmitted per second during the time interval. | |

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| Tx Packets | net.packetsTx.delta.summation.number | Total number of packets transmitted during the time interval. | |
| Unicast Rx Packets | net.unicastRx.delta.summation.number | Total number of unicast packets received during the time interval. | |
| Unicast Tx Packets | net.unicastTx.delta.summation.number | Total number of unicast packets transmitted during the time interval. | |
| Unknown Rx Packets | net.unknownRx.delta.summation.number | Total number of unknown packets received during the time interval.<br>For packet-oriented interfaces, unknown Rx packets indicate the number of packets received through the interface that were discarded because of an unknown protocol or an unsupported protocol.<br>For character-oriented or fixed-length interfaces that support protocol multiplexing, unknown Rx packets indicate the number of transmission units received through the interface that were discarded because of an unknown protocol or an unsupported protocol. | |
| uRPF Drop Packets | net.droppedRPFRx.delta.summation.number | Number of packets dropped at the switch port due to unicast reverse-path forwarding (uRPF). | |
| uRPF Packet Drop Ratio (%) | net.droppedRPFRx.rate.average.percent | Average ratio of dropped uRPF packets to total Rx packets. | |
| RX Missed Error | net.pnic.receiveMissedErrors.absolute.latest.number | The number of total RX missed errors. | |
| RX Ring Buffer Usage Percentage | net.pnicRx.ringBuffer.usage.absolute.average.percent | The average percentage of RX ring buffer capacity used. | |
| TX Ring Buffer Usage Percentage | net.pnicTx.ringBuffer.usage.absolute.average.percent | The avarage percentage of TX ring buffer capacity used. | |
| RX Ring Buffer Current Capacity | net.pnicRx.committed.absolute.latest.bytes | Currently configured Rx Ring buffer capacity in bytes. | |
| TX Ring Buffer Current Capacity | net.pnicTx.committed.absolute.latest.bytes | Currently configured Tx Ring buffer capacity in bytes. | |

### Edge Data Plane CPU Core Metrics

These metrics provide information about the usage of the Edge Data Plane CPU cores that are connected to the switch ports.

| Metric Name | Metric API Name | Description |
|---|---|---|
| Edge Dataplane.CPU Core Micro Flow Cache Hit Percent | edge.dataplane.cpu.core.microflowcache.hit.rate.average.percent | Average percentage of micro flow cache hit rate of the Edge dataplane CPU core . |
| Edge Dataplane.CPU Core Mega Flow Cache Hit Percent | edge.dataplane.cpu.core.megaflowcache.hit.rate.average.percent | Average percentage of mega flow cache hit rate of the Edge dataplane CPU core |

## Service Node Metrics

Service node metrics provide information about the performance of a particular service node.

| Metric Name | Metric API Name | Decription |
|---|---|---|
| Bytes Received | net.lbServiceNodeBytesIn.delta.summation.bytes | Total number of bytes received by the specified node address from the server. |
| Bytes Sent | net.lbServiceNodeBytesOut.delta.summation.bytes | Total number of bytes sent to the server from the specified node address. |
| Current Connections | net.lbServiceNodeCurrentConnections.delta.summation.number | Total number of ongoing connections between the server and the specified node address. |
| max connections | net.lbServiceNodeMaxConnections.delta.summation.number | Maximum number of connections between the server and the specified node address. |
| Packets Received | net.lbServiceNodePacketsIn.delta.summation.number | Total number of packets received by the specified node address from the server. |
| Packets Sent | net.lbServiceNodePacketsOut.delta.summation.number | Total number of packets sent to the server from the specified node address. |
| Total Connections | net.lbServiceNodeTotalConnections.delta.summation.number | Total number of connections between the server and the specified node address. |
| Total Requests | net.lbServiceNodeTotalRequests.delta.summation.number | Total number of requests going through the specified node address. |

## Tier Metrics

VCF Operations for networks collects network and flow related metrics for Tiers.

| Metric Name | Metric API Name | Description |
|---|---|---|
| App Tier TCP Internet Retransmitted Packet Ratio | net.tcpRetransmitedInternetPackets.ratio.average.percent | Average percentage of retransmitted internet packets to total number of internet flows associated with the tier. |
| App/Tier TCP Retransmitted Packets | net.tcpRetransmitedPackets.delta.summation.number | Total number of retransmitted packets to the total number of transmitted packets associated with the tier. |
| App/Tier TCP Retransmitted Packets Internet | net.tcpRetransmitedPacketsInternet.delta.summation.number | Total number of retransmitted internet packets to the total number of transmitted internet packets associated with the tier. |
| Avg East-West RTT | net.eastWestTcpRtt.absolute.average.microsecond | Max of Avg Round trip time tier-east west traffic |
| Avg Internet RTT | net.internetTcpRtt.absolute.average.microsecond | Max of Avg Round trip time tier-internet traffic |
| Dropped Flows | net.droppedFlows.count.absolute.latest.number | Total number of dropped flows associated with the tier to the total number of flows. |
| East-West ReTransmitted Ratio | net.tcpRetransmitedEastWestPackets.ratio.average.percent | Max of Avg Retransmission rate-east west traffic |
| Internet Dropped Flows | net.droppedInternetFlows.count.absolute.latest.number | Total number of dropped internet flows associated with the tier to the total number of internet flows. |
| Median TCP RTT | net.p50FlowAvgTcpRtt.absolute.average.microsecond | Median round trip time of all the TCP flows associated with the tier. |
| Median TCP RTT Internet Flows | net.p50InternetFlowAvgTcpRtt.absolute.average.microsecond | Median round trip time of all the internet TCP flows associated with the tier. |
| Network Packet Count | net.packetsTotal.delta.summation.number | Total packets received and transmitted from a tier in the selected duration. |
| Network Rx Rate | net.received.rate.average.kiloBitsPerSecond | Average rate at which data is received across all endpoints in the tier. |
| Network Tx Rate | net.transmitted.rate.average.kiloBitsPerSecond | Average rate at which data is transmitted across all endpoints in the tier. |
| p95 TCP RTT | net.p95FlowAvgTcpRtt.absolute.average.microsecond | p95 latency round trip time of all the TCP flows associated with the tier. |
| Rx Flow Drops | flow.droppedRx.delta.summation.number | Total number of dropped incoming flows to a tier. |
| Rx Internet Flow Drops | flow.droppedRxInternet.delta.summation.number | Total number of dropped incoming internet flows to a tier. |
| TCP Retransmitted Packet Ratio | net.tcpRetransmitedPackets.ratio.average.percent | Percentage of retransmitted packets in all the flows associated with the tier. |

| Metric Name | Metric API Name | Description |
|---|---|---|
| Total Internet Packets | net.packetsTotalInternet.delta.summation.number | Total number of internet packets received and transmitted from the tier. |
| Total Rx Bytes | net.totalRx.delta.summation.bytes | Sum of bytes received during the time interval. |
| Total Tx Bytes | net.totalTx.delta.summation.bytes | Sum of bytes transmitted during the time interval. |
| Tx Flow Drops | flow.droppedTx.delta.summation.number | Total number of dropped outgoing flows to total number of outgoing flows. |
| Tx Internet Flow Drops | flow.droppedTxInternet.delta.summation.number | Total number of dropped outgoing internet flows to total number of outgoing internet flows. |

## Virtual Connect Manager Metrics

VCF Operations for networks collects flow metrics for Virtual Connect Managers.

| Metric Name | Metric API Name | Description |
|---|---|---|
| Outbound Expire Flow Drop Count | flow.fiveTupleExpireOutbound.delta.summation.number | Number of five tuples dropped because of reaching the maximum outbound limit for source IP addresses in flows. |
| Wrong Collector Flow Drop Count | flow.rawRecordReporterWrongCollector.delta.summation.number | Number of raw flow records dropped as they were reported on a wrong type of VCF Operations for networks collector. |

## VLAN Metrics

Virtual local area network (VLAN) metrics provide information about network the performance of the VLAN.

| Metric Name | Metric API Name | Description |
|---|---|---|
| Dropped Rx Packets | net.droppedRx.delta.summation.number | Number of dropped Rx packets in the selected duration. |
| Dropped Tx Packets | net.droppedTx.delta.summation.number | Number of dropped Tx packets in the selected duration. |
| Max Network Traffic Rate | net.usage.rate.maximum.kiloBitsPerSecond | Maximum network usage rate over any five minute interval in the selected duration. |
| Max Network Tx Rate | net.transmitted.rate.maximum.kiloBitsPerSecond | Maximum data transmission rate over any five minute interval in the selected duration. |
| Max Packet Drop Ratio | net.packetDrop.ratio.maximum.percent | Maximum ratio of total packets dropped to total number of packets received over any five minute interval in the selected duration. |
| Max Packet Drops | net.droppedTotal.delta.maximum.number | Maximum number of dropped packets over any five minute interval in the selected duration. |

| Metric Name | Metric API Name | Description |
|---|---|---|
| Multicast Rx Packets | net.multicastRx.delta.summation.number | Total number of multicast packets received during the sampling interval. |
| Multicast Tx Packets | net.multicastTx.delta.summation.number | Total number of multicast packets transmitted during the sampling interval. |
| Network Max Rx Rate | net.received.rate.maximum.kiloBitsPerSecond | Maximum network data receive rate on the host over any five minute interval in the selected duration. |
| Network Packet Count | net.packetsTotal.delta.summation.number | Total number of packets transmitted and received during the time interval. |
| Network Packet Drop Percent | net.packetDrop.ratio.average.percent | Ratio of total number of dropped packets to total number of packets. |
| Network Packet Drops | net.droppedTotal.delta.summation.number | Total number of packet drops. |
| Network Rx Rate | net.received.rate.average.kiloBitsPerSecond | Average rate at which data was received during the time interval.<br>This metric represents the bandwidth of the network. |
| Network Traffic Rate | net.usage.rate.average.kiloBitsPerSecond | Average rate of received and transmitted traffic during the time interval. |
| Network Tx Rate | net.transmitted.rate.average.kiloBitsPerSecond | Average rate at which data was transmitted during the time interval.<br>This metric represents the bandwidth of the network. |
| Rx Broadcast Packets | net.broadcastRx.delta.summation.number | Number of broadcast packets received during a specified time interval. |
| Rx Broadcast Ratio | net.broadcastByRx.ratio.average.percent | Percentage of broadcast packets received during a specified time interval. |
| Rx Packet Drop Percent | net.packetDropRx.ratio.average.percent | Ratio of total number of dropped Rx packets to total number of Rx packets on all interfaces that are part of the VLAN. |
| Rx Packets | net.packetsRx.delta.summation.number | Average number of received packets during the time interval. |
| Total Network Traffic | net.usage.delta.summation.kiloBytes | Sum of data transmitted and received during the time interval. |
| Tx Broadcast Packets | net.broadcastTx.delta.summation.number | Number of broadcast packets transmitted during a specified time interval. |
| Tx Broadcast Ratio | net.broadcastByTx.ratio.average.percent | Average percent of broadcast packets transmitted during a specified time interval. |
| Tx Packet Drop Percent | net.packetDropTx.ratio.average.percent | Ratio of total number of dropped Tx packets to total number of Tx packets on all interfaces that are part of the VLAN. |

| Metric Name | Metric API Name | Description |
|---|---|---|
| Tx Packets | net.packetsTx.delta.summation.number | Average number of transmitted packets during the time interval. |
| Unicast Rx Packets | net.unicastRx.delta.summation.number | Total number of unicast packets received by the host. |
| Unicast Tx Packets | net.unicastTx.delta.summation.number | Total number of unicast packets transmitted by the host. |

### Virtual Disk Metrics

Virtual disk metrics provide information about the performance of the virtual disk.

| Metric Name | Metric API Name | Description |
|---|---|---|
| Read IOPS | virtualDisk.numberReadAveraged.rate.average.number | Average number of read commands issued per second on the virtual disk. |
| Read Latency (ms) | virtualDisk.totalReadLatency.absolute.average.millisecond | Read latency in milliseconds averaged over a period of 24 hours. |
| Read Rate (kbps) | virtualDisk.read.rate.average.kiloBytesPerSecond | Read throughput averaged over a period of 24 hours. |
| RW IOPS | virtualDisk.numberRWAveraged.rate.average.number | Average number of read and write commands issued on the virtual disk over a period of 24 hours. |
| RW Rate (kbps) | virtualDisk.usage.rate.average.kiloBytesPerSecond | Read and write throughput averaged over a period of 24 hours. |
| Used Space | virtualDisk.used.absolute.latest.bytes | Total space used by the virtual disk. |
| Write IOPS | virtualDisk.numberWriteAveraged.rate.average.number | Average number of write commands issued per second on the virtual disk. |
| Write Latency (ms) | virtualDisk.totalWriteLatency.absolute.average.millisecond | Write latency in milliseconds averaged over a period of 24 hours. |
| Write Rate (kbps) | virtualDisk.write.rate.average.kiloBytesPerSecond | Write throughput in milliseconds averaged over a period of 24 hours. |

### VM Datastore Metrics

Virtual Machine Datastore metrics provide information about the performance of the link that connects the datastore to the VM.

| Metric Name | Metric API Name | Decription |
|---|---|---|
| Committed Space | datastore.committed.absolute.latest.bytes | Storage space on the datastore that is commited for this link. |
| Read IOPS | datastore.numberReadAveraged.rate.average.number | Average number of read commands issued per second during the collection interval. |
| Read Latency (ms) | datastore.totalReadLatency.absolute.average.millisecond | Average latency of each read operation issued by the link through which the host is connected to the datastore. |

| Metric Name | Metric API Name | Decription |
|---|---|---|
| Read Rate (Kbps) | datastore.read.rate.average.kiloBytesPerSecond | Average number of kilobytes read by the link through which the host is connected to the datastore. |
| RW IOPS | datastore.numberRWAveraged.rate.average.number | Average number of read and write commands issued per second during the collection interval. |
| RW Rate (Kbps) | datastore.usage.rate.average.kiloBytesPerSecond | The aggregated input rates and output rates of the link through which the host is connected to the datastore. |
| Write IOPS | datastore.numberWriteAveraged.rate.average.number | Average number of write commands issued per second during the collection interval. |
| Write Latency (ms) | datastore.totalWriteLatency.absolute.average.millisecond | Average latency of each write operation issued by the link through which the host is connected to the datastore. |
| Write Rate (Kbps) | datastore.write.rate.average.kiloBytesPerSecond | Average number of kilobytes written by the link through which the host is connected to the datastore. |

## Virtual Machine Metrics

VCF Operations for networks collects CPU usage, datastore, memory, and network metrics for VMs.

### CPU Usage Metrics

CPU usage metrics provide information about the CPU use on the VM.

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| CPU Co-Stop Rate (%) | cpu.costop.rate.average.percent | Average percentage of time spent by the vCPUs in the `CoStop` state due to co-vCPU scheduling contention. | |
| CPU Co-Stop Rate vCPU (%) | cpu.costop_vcpu.rate.average.percent | Average percentage of time spent by a vCPU in the `CoStop` state due to co-vCPU scheduling contention. | |
| CPU Co-Stop Time | cpu.costop.delta.summation.millisecond | Time spent in the `CoStop` state by all vCPUs of a VM. | |
| CPU Ready Rate (%) | cpu.ready.rate.average.percent | Percentage of time that the VM was waiting in line to use the CPU on the host.<br>The CPU ready time depends on the number of VMs on the host and their CPU loads. | Yes |
| CPU Ready Rate vCPU (%) | cpu.ready_vcpu.rate.average.percent | Percentage of time per vCPU that the VM was waiting in line to use the CPU on the host.<br>The CPU ready time depends on the number of VMs on the host and their CPU loads. | |

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| CPU Ready Time | cpu.ready.delta.summation.millisecond | Amount of time a VM is ready to use the CPU but was unable to schedule physical CPU time. The VM cannot schedule physical CPU time when all the VMware vSphere ESX host CPU resources are busy. | |
| CPU Run Rate (%) | cpu.run.rate.average.percent | Average percentage of time spent in the `Run` state by all vCPUs of this VM. | |
| CPU Run Rate vCPU (%) | cpu.run_vcpu.rate.average.percent | Average percentage of time spent by a vCPU in the `Run` state. | |
| CPU Run Time | cpu.run.delta.summation.millisecond | Amount of time spent in the `Run` state by all vCPUs of this VM. | |
| CPU Usage (MHz) | cpu.usagemhz.rate.average.megaHertz | Amount of actively used vCPU. The CPU Usage metric is associated with the host and not the guest operating system. | |
| CPU Usage Rate (%) | cpu.usage.rate.average.percent | Average percentage of actively used vCPU to the total available CPU. The CPU Usage metric is associated with the host and not the guest operating system. CPU usage rate indicates the average CPU utilization over all available vCPUs in the VM. For example, if a VM with one vCPU is running on a host that has four physical CPUs and the CPU usage is 100%, the VM is using a 100% of one physical CPU. | Yes |
| CPU Wait Rate (%) | cpu.wait.rate.average.percent | Percentage of CPU time spent in the `Wait` state such as CPU idle, CPU swap wait, and CPU I/O wait. | |
| CPU Wait Rate vCPU (%) | cpu.wait_vcpu.rate.average.percent | Percentage of CPU time per vCPU spent in the `Wait` state such as CPU idle, CPU swap wait, and CPU I/O wait. | |
| CPU Wait Time | cpu.wait.delta.summation.millisecond | Amount of CPU time spent in the `Wait` state such as CPU idle, CPU swap wait, and CPU I/O wait. | |

## Network Metrics

Network metrics provide information about the network performance of the VM.

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| Dropped Rx Packets | net.droppedRx.delta.summation.number | Number of dropped Rx packets to the total number of Rx packets. | Yes |
| Incomplete TCP Session Count | net.incomplete.sessionCount.delta.summation.number | Total number of incomplete TCP sessions received at the VM from other VMs or IP addresses during the time interval.<br>**Note:**<br>This metric is available only for Enterprise License users having a deployment of XXL brick Size Collector.<br>If you scale up the brick size of your existing collector to XXL, you must restart the `nfcapd` service to start collecting the Incomplete TCP Session Count metric.<br>Run the following command on the Collector CLI:<br>`sudo service nfcapd restart` | Yes |
| Dropped Tx Packets | net.droppedTx.delta.summation.number | Number of dropped Tx packets to the total number of Tx packets. | Yes |
| Max Network Traffic Rate (Kbps) | net.usage.rate.maximum.kiloBitsPerSecond | Maximum data transmission rate on the VM over any five minute interval in the selected duration. Maximum network rate includes both transmitted and received data. | Yes |
| Max Network Tx Rate (Kbps) | net.transmitted.rate.maximum.kiloBitsPerSecond | Maximum data transmission rate on the VM over any five minute interval in the selected duration. | |
| Max Packet Drop Ratio (%) | net.packetDrop.ratio.maximum.percent | Maximum ratio of total packets dropped to total number of packets received over any five minute interval in the selected duration. | |
| Max Packet Drops | net.droppedTotal.delta.maximum.number | Maximum number of dropped packets over any five minute interval in the selected duration. | Yes |

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| Multicast Rx Packets | net.multicastRx.delta.summation.number | Total number of multicast packets received across all pNICs (physical network adapters) during the sampling interval. | |
| Multicast Tx Packets | net.multicastTx.delta.summation.number | Total number of multicast packets transmitted across all pNICs during the sampling interval. | Yes |
| Network Max Rx Rate (Kbps) | net.received.rate.maximum.kiloBitsPerSecond | Maximum network data receive rate on the VM over any five minute interval in the selected duration. | |
| Network Packet Count | net.packetsTotal.delta.summation.number | Total number of packets transmitted and received during the interval across all pNICs. | Yes |
| Network Packet Drop Percent (%) | net.packetDrop.ratio.average.percent | Ratio of total number of dropped packets to total number of packets. | Yes |
| Network Packet Drops | net.droppedTotal.delta.summation.number | Total number of packet drops on the VM. | Yes |
| Network Rx Rate (Kbps) | net.received.rate.average.kiloBitsPerSecond | Average rate at which data was received during the time interval. | Yes |
| Network Traffic Rate (Kbps) | net.usage.rate.average.kiloBitsPerSecond | Average rate at which data was received and transmitted during the time interval. | Yes |
| Network Tx Rate (Kbps) | net.transmitted.rate.average.kiloBitsPerSecond | Average rate at which data was transmitted during the time interval. | Yes |
| Rx Broadcast Packets | net.broadcastRx.delta.summation.number | Total number of broadcast packets received during the time interval. | |
| Rx Broadcast Ratio (%) | net.broadcastByRx.ratio.average.percent | Percentage of broadcast packets received during the time interval. | |
| Rx Packet Drop Percent (%) | net.packetDropRx.ratio.average.percent | Ratio of total number of dropped Rx packets to total number of Rx packets. | |
| Rx Packets | net.packetsRx.delta.summation.number | Average number of received packets during the time interval. | Yes |
| Total Network Traffic | net.usage.delta.summation.kiloBytes | Sum of data transmitted and received across all vNICs of the VM. | Yes |
| Total Packets Per Second | net.ppsTotal.rate.average.number | Average rate of received and transmitted packets per second. | |
| Tx Broadcast Packets | net.broadcastTx.delta.summation.number | Number of broadcast packets transmitted during a specified time interval. | |

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| Tx Broadcast Ratio (%) | net.broadcastByTx.ratio.average.percent | Average percentage of broadcast packets transmitted during the time interval. | |
| Tx Packet Drop Percent (%) | net.packetDropTx.ratio.average.percent | Ratio of total number of dropped Tx packets to total number of Tx packets. | |
| Tx Packets | net.packetsTx.delta.summation.number | Average number of transmitted packets during the time interval. | Yes |
| Unicast Rx Packets | net.unicastRx.delta.summation.number | Total number of unicast packets received by the host. | |
| Unicast Tx Packets | net.unicastTx.delta.summation.number | Total number of unicast packets transmitted by the host. | |
| Uptime | sys.uptime.absolute.latest.second | Total time elapsed since the last system startup. | |
| Uncommitted Space | storage.uncommitted.absolute.latest.bytes | Uncommitted space of VM storage. | |
| Snapshot Size | snapshot.used.absolute.latest.bytes | The size of the VM snapshot. | |

## Datastore Metrics

Datastore metrics provide information about the datastore use.

| Metric Name | Metric API Name | Decription |
|---|---|---|
| Read IOPS | datastore.numberReadAveraged.rate.average.number | Average number of read commands issued per second during the collection interval. |
| Max IO Latency | datastore.maxTotalLatency.absolute.latest.millisecond | Highest latency value across all datastores used by the VM. |
| Read Latency (ms) | datastore.totalReadLatency.absolute.average.millisecond | Average latency of each read operation issued by this VM on its datastore. |
| Read Rate (Kbps) | datastore.read.rate.average.kiloBytesPerSecond | Read throughput of datastores connected to the VM averaged over 24 hours. |
| RW IOPS | datastore.numberRWAveraged.rate.average.number | Average number of read and write commands sent from the VM to the connected datastores. |
| RW Rate (Kbps) | datastore.usage.rate.average.kiloBytesPerSecond | Read and write throughput of datastores connected to the VM averaged over 24 hours. |
| Write IOPS | datastore.numberWriteAveraged.rate.average.number | Average number of write commands sent from the VM to the connected datastores. |
| Write Latency | datastore.totalWriteLatency.absolute.average.millisecond | Average latency of each write operation issued by this VM on its datastore. |
| Write Rate (Kbps) | datastore.write.rate.average.kiloBytesPerSecond | Write throughput of datastores connected to the VM averaged over 24 hours. |

## Memory Metrics for Hosts

Memory metrics provide information about memory use and allocation on the virutal machine.

| Metric Name | Metric API Name | Decription | Supported by Databus |
|---|---|---|---|
| Memory Balloon | mem.vmmemctl.absolute.average.kiloBytes | Average memory of the guest physical memory allocated to `vmmemctl` for this VM. `vmmemctl` is a VMware exclusive memory-management driver that controls ballooning. | |
| Memory Swap-In Rate (Kbps) | mem.swapinRate.rate.average.kiloBytesPerSecond | Rate at which the memory is swapped from disk to active memory during the time interval. | |
| Memory Swap-Out Rate (Kbps) | mem.swapoutRate.rate.average.kiloBytesPerSecond | Rate at which the memory is swapped from active memory to the disk during the time interval. | |
| memory Swapped | mem.swapped.absolute.average.kiloBytes | Amount of guest physical memory swapped out to the VM's swap file by the VMkernel. The swapped memory stays on the disk until the VM needs it. This metric refers to VMkernel swapping and not to guest OS swapping. | |
| Memory Usage Rate (%) | mem.usage.absolute.average.percent | Percentage of memory used from the available machine memory. | Yes |
| Overhead Memory | mem.overhead.absolute.average.kiloBytes | Amount of memory allocated to a VM beyond its reserved amount.<br>The VM requires overhead memory to power on.<br>Overhead memory includes the space reserved for the VM frame buffer and various virtualization data structures.<br>It depends on the number of vCPUs and the configured memory for the guest operating system. | |
| Consumed Memory | mem.consumed.absolute.average.kiloBytes | Amount of host memory used by the VM for its guest operating system's physical memory.<br>Consumed memory does not include the overhead memory.<br>It only includes shared memory and memory that might be reserved, but not used. That is, `consumed memory = memory granted - memory saved from page sharing`. | |

| Metric Name | Metric API Name | Decription | Supported by Databus |
|---|---|---|---|
| Active Memory | mem.active.absolute.average.kiloBytes | Amount of guest physical memory that is in use by the VM.<br>Active memory is estimated using VMkernel statistical sampling. It represents the actual amount of memory the VM needs. Therefore, the unused memory can be swapped out or ballooned without any performance impact. | |

### Snapshot Metrics

The snapshot metric provide information about the VM snapshot.

| Metric Name | Metric API Name | Decription |
|---|---|---|
| Snapshot Size | snapshot.used.absolute.latest.bytes | The size of the VM snapshot. |

## Virtual Network Interface Card Metrics

Virtual network interface card (vNIC) metrics provide information about the performance of the virtual network interface card.

| Metric Name | Metric API Name | Description |
|---|---|---|
| Dropped Rx Packets | net.droppedRx.delta.summation.number | Number of received packets dropped during the collection interval. |
| Dropped Tx Packets | net.droppedTx.delta.summation.number | Number of transmitted packets dropped during the collection interval. |
| Interface Rx Utilization (%) | net.rx.utilization.absolute.latest.percent | Interface utilization percentage for the received traffic. |
| Interface Tx Utilization (%) | net.tx.utilization.absolute.latest.percent | Interface utilization percentage for the transmitted traffic. |
| Interface Utilization (%) | net.utilization.absolute.latest.percent | Interface utilization percentage for received and transmitted traffic. |
| Max Network Traffic Rate (Kbps) | net.usage.rate.maximum.kiloBytesPerSecond | Maximum total network usage rate over a five minute interval. |
| Max Network Tx Rate (Kbps) | net.transmitted.rate.maximum.kiloBytesPerSecond | Maximum network data transmit rate over five minute interval. |
| Max Packet Drop Ratio (%) | net.packetDrop.ratio.maximum.percent | Maximum five minute interval ratio of total dropped packets to total number packets. |
| Max Packet Drops | net.droppedTotal.delta.maximum.number | Maximum number of dropped packets over any five minute interval in the selected duration. |
| Multicast Rx Packets | net.multicastRx.delta.summation.number | Number of multicast packets received during the time interval. |

| Metric Name | Metric API Name | Description |
|---|---|---|
| Multicast Tx Packets | net.multicastTx.delta.summation.number | Number of multicast packets transmitted during the time interval. |
| Network Max Rx Rate (Kbps) | net.received.rate.maximum.kiloBytesPerSecond | Maximum network data receive rate over any five minute interval. |
| Network Packet Count | net.packetsTotal.delta.summation.number | Total number of packets transmitted and received during the time interval. |
| Network Packet Drop Percent (%) | net.packetDrop.ratio.average.percent | Average ratio of dropped packets to total number packets. |
| Network Packet Drops | net.droppedTotal.delta.summation.number | Total number of packet drops. |
| Network Rx Rate (Kbps) | net.received.rate.average.kiloBytesPerSecond | Average rate at which data was received during the time interval.<br>This metric represents the bandwidth of the network. |
| Network Rx Rate (Kbps) | net.received.rate.average.kiloBytesPerSecond | Average rate at which data was received during the time interval.<br>This metric represents the bandwidth of the network. |
| Network Traffic Rate (Kbps) | net.usage.rate.average.kiloBytesPerSecond | Average rate of received and transmitted traffic during the time interval. |
| Network Tx Rate (Kbps) | net.transmitted.rate.average.kiloBytesPerSecond | Average rate at which data was transmitted during the interval.<br>This metric represents the bandwidth of the network. |
| Rx Broadcast Packets | net.broadcastRx.delta.summation.number | Number of broadcast packets received during the time interval. |
| Rx Broadcast Ratio (%) | net.broadcastByRx.ratio.average.percent | Ratio of received broadcast packets to total number of received packets. |
| Rx Packet Drop Percent (%) | net.packetDropRx.ratio.average.percent | Average ratio of dropped received packets to total received packets. |
| Rx Packets | net.packetsRx.delta.summation.number | Number of packets received during the time interval. |
| Total Network Traffic | net.usage.delta.summation.kiloBytes | Sum of data transmitted and received during the time interval. |
| Tx Broadcast Packets | net.broadcastTx.delta.summation.number | Number of broadcast packets transmitted during the time interval. |
| Tx Broadcast Ratio (%) | net.broadcastByTx.ratio.average.percent | Ratio of transmitted broadcast packets to total transmitted packets. |

| Metric Name | Metric API Name | Description |
|---|---|---|
| Tx Packet Drop Percent (%) | net.packetDropTx.ratio.average.percent | Average ratio of dropped transmitted packets to total transmitted packets. |
| Tx Packets | net.packetsTx.delta.summation.number | Number of packets transmitted during the time interval. |
| Unicast Rx Packets | net.unicastRx.delta.summation.number | Total number of unicast packets received during the time interval. |
| Unicast Tx Packets | net.unicastTx.delta.summation.number | Total number of unicast packets transmitted during the time interval. |

## Virtual Network Interface Metrics

Virtual network interface (Vmknic) metrics provide information about the performance of the virtual network interface that is used by the VMKernel.

| Metric Name | Metric API Name | Description |
|---|---|---|
| Carrier Losses Detected | net.txcarrier.delta.summation.number | Number of carrier losses detected at the vmknic. |
| Collisions Detected | net.txcolls.delta.summation.number | Number of collisions detected at the vmknic. |
| Dropped Rx Packets | net.droppedRx.delta.summation.number | Average ratio of the number of dropped Rx packets to the total number of Rx packets. |
| Dropped Tx Packets | net.droppedTx.delta.summation.number | Average ratio of the number of dropped Tx packets to the total number of Tx packets. |
| Maximum Total Network Rate | net.total.rate.maximum.kiloBitsPerSecond | Maximum total network rate over any five minute interval in the selected duration. |
| Network Maximum Rx Rate | net.rx.rate.maximum.kiloBitsPerSecond | Maximum network data receive rate on the network interface over any five minute interval in the selected duration. |
| Network Maximum Tx Rate | net.tx.rate.maximum.kiloBitsPerSecond | Maximum network data transmission rate on the network interface over any five minute interval in the selected duration. |
| Network Packet Count | net.packetsTotal.delta.summation.number | Total number of packets transmitted and received during the time interval. |
| Network Packet Drops | net.droppedTotal.delta.summation.number | Total number of packet drops on the vmknic. |
| Rx Frame Errors | net.rxframes.delta.summation.number | Number of frame errors received over the network in the selected duration. |
| Rx Packet Drop Rate | net.packetDropReceived.ratio.average.percent | Average ratio of dropped Rx packets to the total number of Rx packets. |

| Metric Name | Metric API Name | Description |
|---|---|---|
| Rx Packet Errors | net.errorRx.delta.summation.number | Number of received packet errors detected over the network in the selected duration. |
| Rx Packet Per Second | net.ppsRx.rate.average.number | Average rate at which packets are received per second. |
| Rx Packets | net.packetsRx.delta.summation.number | Number of packets received over the time interval. |
| Total Packet Per Second | net.ppsTotal.rate.average.number | Average number of packets received and transmitted per second. |
| Total Rx Bytes | net.totalRx.delta.summation.bytes | Total number of bytes received by the vmknic. |
| Total Tx Bytes | net.totalTx.delta.summation.bytes | Total number of bytes transmitted by the vmknic. |
| Tx Packet Drop Rate | net.packetDropTransmitted.ratio.average.percent | Average ratio of dropped Tx packets to total Tx packets. |
| Tx Packet Errors | net.errorTx.delta.summation.number | Number of transmitted packet errors detected over the network in the selected duration. |
| Tx Packet Per Second | net.ppsTx.rate.average.number | Average rate at which packets are transmitted per second. |
| Tx Packets | net.packetsTx.delta.summation.number | Number of packets transmitted over the time interval. |

## Flow Metrics

VCF Operations for networks collects the flow data from various data sources in your network that has flow export capabilities, such as VMware vSphere Distributed Switch and VMware vDefend Distributed Firewall, and calculates traffic information.

To view the flow metrics on the user interface, do the following:

1. Enter `Flows` on the search bar.
2. On the search result page, click **Add More Filters** under the **Filters** option.
3. Select **Metrics**. The metrics are displayed to the right.
4. Select the metric you want to view.

**Table 1354: Flow Metrics**

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| Active Sessions Count | flow.openSessionCount.absolute.latest.number | The total number of active or open sessions that are aggregated into this flow.<br>A session consists of 5 tuples (source IP, destination IP, source port, destination port, and protocol).<br>The aggregated flow consists of 4 tuples (source IP, destination IP, destination port, and protocol).<br>For a client server session, incoming and outgoing sessions are aggregated into a single flow. | |
| Average TCP RTT (ms) | flow.nsxTcpRtt.absolute.average.microsecond | Average TCP RTT of the flow within the specified duration. If no duration is specified, the default is last 24 hours. | |
| Destination Bytes | flow.dstBytes.delta.summation.bytes | Total number of bytes sent by the destination of the flow. | Yes |
| Flow Packet Count | flow.totalPackets.delta.summation.number | Total number of packets exchanged between the source and the destination of a flow.<br>A flow consists of 4 tuples (source IP, destination IP, destination port and protocol) and is an aggregation of sessions identified by 5 tuples (source IP, destination IP, source port, destination port and protocol).<br>For a client server connection, incoming and outgoing sessions are aggregated into a single flow. | Yes |
| Maximum TCP RTT | flow.nsxTcpRtt.absolute.maximum.microsecond | Maximum TCP RTT of the flow within the specified duration. If no duration is specified, the default is last 24 hours. | |
| Packet Loss | flow.packetDrop.ratio.average.percent | Ratio of the number of packets dropped to the total number of packets transmitted. | |
| Retransmitted Packet Ratio (%) | flow.retransmittedPacketsTx.ratio.average.percent | Ratio of the number of packets retransmitted to the total number of packets transmitted. | |
| Sessions | flow.allowedSessionCount.delta.summation.number | The total number of established sessions that have been aggregated into a flow.<br>A session consists of 5 tuples (source IP, destination IP, source port, destination port and protocol). The aggregated flow consists of 4 tuples (source IP, destination IP, destination port and protocol).<br>For a client server session, incoming and outgoing sessions are aggregated into a single flow. | Yes |
| Source Bytes | flow.srcBytes.delta.summation.bytes | Total number of bytes sent by the source of the flow. | Yes |
| TCP Retransmission Ratio (%) | flow.tcpRetransmittedPackets.ratio.maximum.percent | Ratio of TCP retransmitted packets to total number of TCP transmitted packets. | Yes |

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| Total Traffic | flow.totalBytes.delta.summation.bytes | Total number of bytes exchanged between the source and destination of a flow. A flow consists of 4 tuples (source IP, destination IP, destination port and protocol) and is an aggregation of sessions identified by 5 tuples (source IP, destination IP, source port, destination port and protocol).<br>For a client server connection, incoming and outgoing sessions are aggregated into a single flow. | Yes |
| Traffic Rate | flow.totalBytesRate.rate.average.bitsPerSecond | Average of incoming and outgoing traffic. | Yes |

To learn about the retention period of flow metrics, see Metric Definitions.

## Health Metrics

VCF Operations for networks collects health metrics from the Collector, Platform, and system to diagnose and monitor health problems related to the VCF Operations for networks instance.

Health metrics are of the following types:

- Node metrics
- Service metrics
- System metrics

### Viewing Health Metrics

You can view the node and service metrics on VCF Operations for networksPlatform and Collector pages. Where as, you can view the system metrics only on the **System Dashboard** page.

To view node and service metrics:

1. Enter `Platform` or `Collector` on the search bar.
2. On the search results page, select a Platform or Collector to view the health metrics available for that entity.

To view the system metrics, Enter `System Dashboard` on the search bar.

### Node Metrics

Node metrics provide information about the memory, disk IO, and CPU utilization of a node.

| Metric Name | Metric API Name | Descrip |
|---|---|---|
| Memory Usage | CUSTOM_METRIC[level:node]vRNI.used.memory.percentage.rate.average.number | Percent configur |
| Data Disk Usage | CUSTOM_METRIC[level:node]vRNI.used.disk.percentage.rate.average.number | Percent given no |
| CPU Usage | CUSTOM_METRIC[level:node]vRNI.cpu.utilization.percentage.rate.average.number | Percent availabl |

### Service Metrics

Service metrics indicate if a service is running. In the metric API name, you must replace `<service_name>` with your service name (such as IpfixProcessor, ElasticSearch, Kafka) to view the state of the service.

| Metric Name | Metric API Name | Descrip |
|---|---|---|
| Service Uptime | CUSTOM_METRIC[service.name:<service_name>]vRNI.service.uptime.rate.average.number | Binary i for netw • 0 de heal • 1 de is no • 2 de |

### System Metrics

System metrics provide information about the performance and usage of the overall VCF Operations for networks system.

| Metric Name | Metric API Name | Descrip |
|---|---|---|
| Processing Lag | grid.messageAge.absolute.latest.millisecond | The lag grid. High pro showing |
| Grid Usage | grid.busy.absolute.latest.percent | The cap network The utili the proc in poten lag. Adding and dele count ar the proc |
| Indexer Lag | grid.indexerLag.absolute.latest.millisecond | The lag High inc showing |
| VM Count | vRNI.internal.tenants.usage.vm.count.absolute.maximum.number | Total co |
| Host Count | vRNI.internal.tenants.usage.host.count.absolute.maximum.numb | Total co |
| Application Count | vRNI.internal.tenants.usage.application.count.absolute.maximum.number | Total co system. |
| Daily Flow Count | vRNI.internal.tenants.usage.flow.daily.count.absolute.maximum.number | Total co |
| Weekly Flow Count | vRNI.internal.tenants.usage.flow.weekly.count.absolute.maximum.number | Total co days. |
| Firewall Rule Count | vRNI.internal.tenants.usage.firewallRule.count.absolute.maximum.number | Total co |

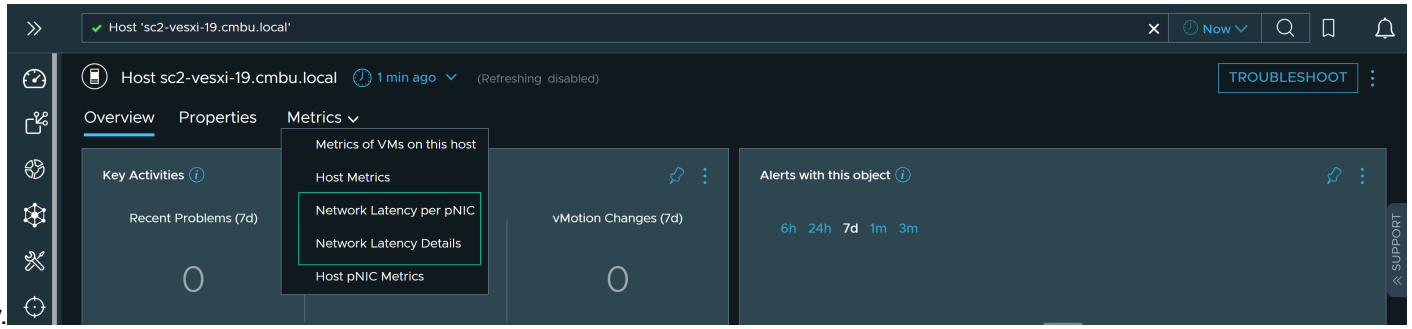
## Latency Metrics

Latency metrics provide information about the latency of a network. You can monitor the latency to diagnose and troubleshoot performance bottlenecks in your network.

### Viewing Latency Metrics

To view the latency metrics on the user interface, do the following:

1. Enter `Host`, `VMware VM`, or `NSX-T transport node` on the search bar. Latency metrics are available only for these entities.
2. On the search results page, click the entity you want to view.
3. On the entity page, select the **Metrics** tab to view the latency metrics available for that entity.



**Note:**

To view latency metrics, you must have selected the **Enable latency metric collection** check box when adding NSX managers as data sources in VCF Operations for networks.

## Interface Pair Metrics

Interface pair metrics provide information regarding the latency of the data packets traveling between the source and destination VXLAN tunnel endpoints (VTEPs) or virtual network interface cards (vNICs).

| Metric Name | Metric API Name | Description |
|---|---|---|
| Max Interface Latency | netopa.interfacePairLatency.absolute.maximum.microsecond | Maximum round-trip time taken by the data packet to travel from VTEP to VTEP or from vNIC to vNIC. |
| Min InterfaceLatency | netopa.interfacePairLatency.absolute.minimum.microsecond | Minimum round-trip time taken by the data packet to travel from VTEP to VTEP or from vNIC to vNIC. |
| Interface Latency | netopa.interfacePairLatency.absolute.average.microsecond | Average round-trip time taken by the data packet to travel from VTEP to VTEP or from vNIC to vNIC. |

## Interface pNIC Pair Info Metrics

Interface Physical Network Interface Card (pNIC) pair info metrics provide information about the following network latency statistics:

- pNIC to vNIC
- vNIC to pNIC

| Metric Name | Metric API Name | Description |
|---|---|---|
| Max pNIC vNIC Latency | netopa.pnicInterfaceLatency.absolute.maximum.microsecond | Maximum round-trip time taken by the data packet to travel from pNIC to vNIC. |
| Max vNIC pNIC Latency | netopa.interfacePnicLatency.absolute.maximum.microsecond | Maximum round-trip time taken by the data packet to travel from vNIC to pNIC. |

| Metric Name | Metric API Name | Description |
|---|---|---|
| Min pNIC vNIC Latency | netopa.pnicInterfaceLatency.absolute.minimum.microsecond | Minimum round-trip time taken by the data packet to travel from pNIC to vNIC. |
| Min vNIC pNIC Latency | netopa.interfacePnicLatency.absolute.minimum.microsecond | Minimum round-trip time taken by the data packet to travel from vNIC to pNIC. |
| pNIC vNIC Latency | netopa.pnicInterfaceLatency.absolute.average.microsecond | Average round-trip time taken by the data packet to travel from pNIC to vNIC. |
| vNIC pNIC Latency | netopa.interfacePnicLatency.absolute.average.microsecond | Average round-trip time taken by the data packet to travel from vNIC to pNIC. |

### VM Network Utilization Metrics

VCF Operations for networks collects VM network utilization metrics to display the performance of VMs based on network utilization.

VM network utilization metrics track network activity and throughput of VMs. To view these metrics on the user interface, do the following:

1. Enter `VMware VM` on the search bar.
2. On the search result page, select a VM of your choice.
3. On the respective VM page, select **Network Utilization** under the **Metrics** tab.

| Metric Name | Metric API Name | Description | Supported by Databus |
|---|---|---|---|
| Rx Packet Per Second | net.ppsRx.rate.average.number | Average rate at which packets are received per second. | |
| Tx Packet Per Second | net.ppsTx.rate.average.number | Average rate at which packets are transmitted per second. | |
| Total Packet Per Second | net.ppsTotal.rate.average.number | Average number of packets received and transmitted per second. | |
| Network Traffic Rate (Kbps) | net.usage.rate.average.kiloBitsPerSecond | Average rate at which the network is utilized for transmitting and receiving packets across all vNICs (virtual network interface controller) during the interval. | Yes |
| Network Rx Rate (Kbps) | net.received.rate.average.kiloBitsPerSecond | Average rate at which data is received across the virtual machine's vNIC (virtual network interface controller) during the interval.<br>This metric represents the bandwidth of the network. | Yes |
| Network Tx Rate (Kbps) | net.transmitted.rate.average.kiloBitsPerSecond | Maximum network data rate (transmitted and received rates) during the selected duration. | Yes |

To learn about the retention period of VM network utilization metrics, see Metric Definitions.

## Troubleshooting and Known Limitations

## Common Data Source Errors

When you add a data source, you can come across several errors. This table contains the list of common errors with the cause and resolution for each.

**Table 1355:**

| Error Text | Cause | Resolution |
|---|---|---|
| Invalid Response from Data Source | VCF Operations for networks collector was unable to process the information received from the Data Source as the information was not in the expected format. | In some data providers this problem is observed intermittently and might go away in the next polling cycle. If it occurs consistently, contact support. |
| Data Source is not reachable from collector VM | Data source IP address on SSH/REST (port 22 or 443) is either not reachable from the VCF Operations for networks collector VM or the data source is not responding. This error occurs while adding the data source. | Verify connectivity to the data source from VCF Operations for networks collector VM on port 22 or 443. Make sure data source is up and running and the firewall is not blocking connection from VCF Operations for networks collector VM to the data source. |
| No NSX Controller found | An NSX Controller has been selected in the NSX Manager data source page but there is no NSX Controller installed. | Install an NSX Controller on NSX Manager and then select NSX Controller check box on the NSX Manager data source page. |
| Data source type or version mismatch | Provided data source IP Address/FQDN is not of selected data source type. | Verify that provided data source IP Address/FQDN is of selected data source type and version is supported by VCF Operations for networkst |
| Error connecting to data source | VCF Operations for networks collector VM is unable to connect to the data source. This error occurs after adding the data source. | Verify connectivity to the data source from VCF Operations for networks collector VM on port 22 or 443. Make sure that the data source is up and running and firewall is not blocking connection from VCF Operations for networks collector VM to the data source. |
| Not found | VCF Operations for networks collector VM is not found. | Check if pairing is done between VCF Operations for networks collector VM and VCF Operations for networks Platform VM. |
| Insufficient privileges to enable IPFix | The user who is trying to enable IPFIX in vCenter does not have the required privileges. | Provide adequate privileges to the user. For more information, see Add VMware vCenter. |
| IP/FQDN is invalid | The IP/FQDN provided on the data source page is not valid or does not exist. | Provide valid IP/FQDN address. |
| No data being received | VCF Operations for networks Platform VM is not receiving data from VCF Operations for networks collector VM for that data source. | Contact Support. |
| Invalid credentials | Provided credentials are invalid. | Provide the correct credentials. |
| Connection string is invalid | The IP/FQDN provided on data source page is not in proper format | Provide valid IP/FQDN address. |
| Recent data may not be available, due to processing lag | VCF Operations for networks Platform VM is overloaded and lagging behind in processing data. | Contact support. |

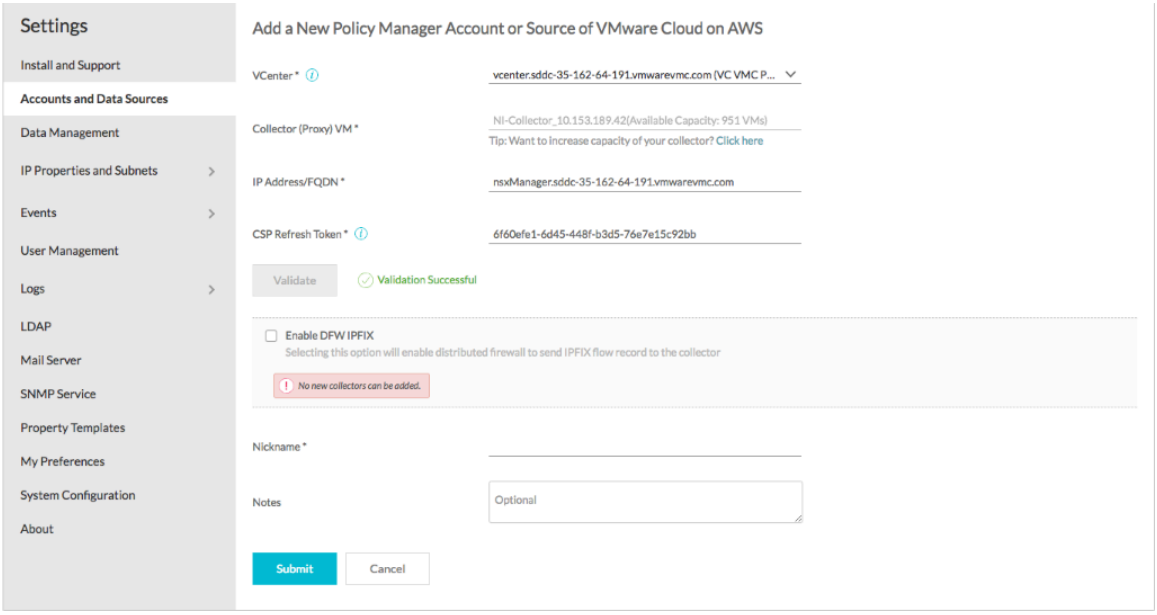
| Error Text | Cause | Resolution |
|---|---|---|
| Request timed out, please try again | VCF Operations for networks could not complete request in specified time. | Try again. If the issue is not fixed, then contact support. |
| Failed for unknown reason, please retry or contact support | Request failed for some unknown reason. | Try again. If the issue is not fixed, then contact support. |
| Password authentication for SSH needs to be enabled on device | SSH login using password is deactivated on the device added | Enable password authentication for SSH on the device being added for monitoring. |
| SNMP connection error | Error connecting to the SNMP port | Verify if SNMP is configured correctly on the target device. |

## Unable to Enable DFW IPFIX

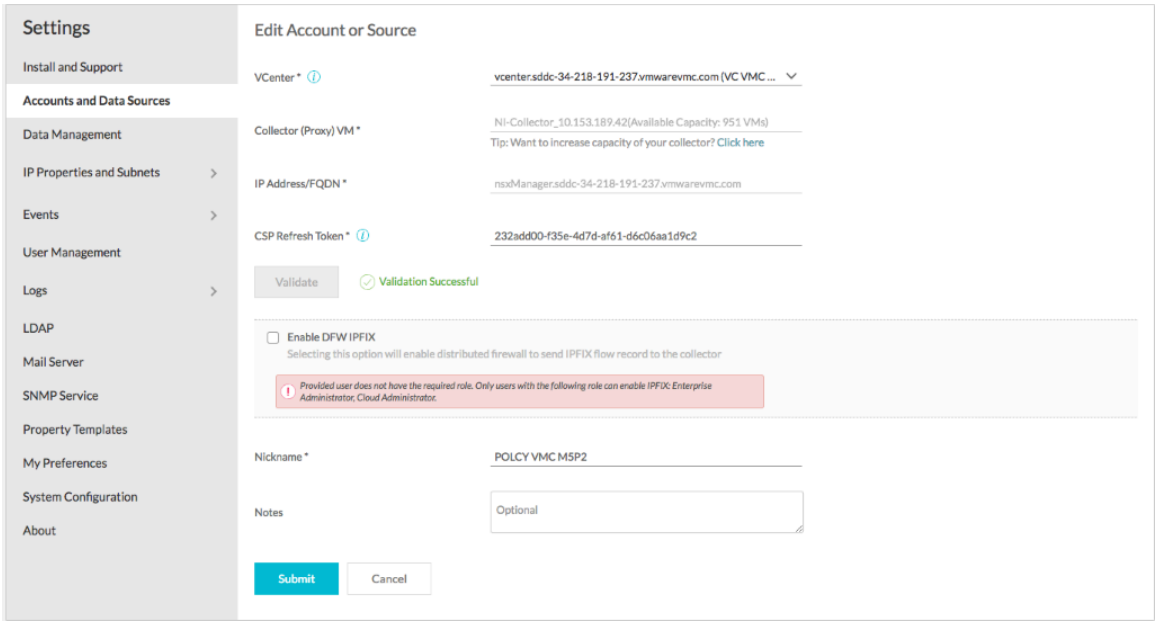
VCF Operations for networks does not allow you to enable DFW IPFIX.

While adding a policy manager or source of VMware Cloud on AWS, when you attempt to enable DFW IPFIX, you might see the following error messages:

- `No New collectors can be added.`
- `Provided user does not have the required role. Only users with the following role can enable IPFIX: Cloud Administrator.`
- VMware Cloud on AWS supports only four collectors to its DFW IPFIX collector profile. So, when the existing profile already has four collectors, you see the `No New collectors can be added` message.



- The user does not have the write permission. Only users with **Cloud Administrator** role can perform the write operation on the VMware Cloud on AWS policy manager.



- To add a new collector, you must:
  - Delete an existing collector, or
  - Create a new profile, or
- To avoid or fix the user role issue, perform one of the following steps:
  - Assign the **Cloud Administrator** role to the user, or
  - Log in as user with **Cloud Administrator** role.

## User Account Locked After Failed Login Attempts

You are not able to log in to VCF Operations for networks.

After several failed login attempts your account is locked, and you are not able to log in VCF Operations for networks user interface (UI).

After five consecutive failed login attempts, the system temporarily locks the account for 15 minutes. Each subsequent failed login attempt adds an additional 15 minutes to the lockout duration. If you keep trying to log in after the initial lockout, your account can get locked for a maximum of one day.

You can use the new password that you have received from the admin to log in to the VCF Operations for networks UI.

## Known Limitations

View the unsupported list of features or actions.

The following list contains features or actions that are currently not supported:

- If the collector is in shutdown state during a scheduled discovery operation, you see a double dash `(--)` in the last discovery status and discovery time.
- For virtual entities like VMs, VMware vCenter, NSX, and so on, the following intents don't work:
  - Duplicate IP Address
  - Duplicate MAC Address
  - HSRP/VRRP Active STP Root Colocation
  - HSRP/VRRP Configuration Error
  - Port Channel Member Mismatch
  - STP Path Cost Method Inconsistency
  - All STIG intents

- For Cisco Bridge Virtual Interface (BVI), the Duplicate IP Address intent might trigger false positive alerts for all the BVI member interfaces which share the same IP address.
- VCF Operations for networks supports only Per VLAN Spanning Tree (PVST) protocol for HSRP/VRRP Active STP Root Colocation intent.
- For Cisco ASA devices, the Default Password Existence intent doesn't raise an alert even though the default password is in use. This is because passwords in Cisco ASA configuration is unavailable in plain text and a same password carries different encrypted values for different users.
- In the Application Summary widget, the Intents count shows as two even when no intent is set for applications.
- In the VeloCloud Edge Summary widget, the Intents count shows as two even when no intent is set for VMware SD-WAN.
- End-to-end path search involving Cisco ACI and VMware NSX-T data sources does not work in the network map.
- The autocomplete feature is not supported for IPv6 addresses.
- Cisco ASA redundant interfaces are not included in Port Channel Member Mismatch intent check as the redundant interface to member interface mapping is not supported in VCF Operations for networks.
- If you sort firewall rules using Comment filter and if that rule comment contains double quote (""), then you see `Invalid query format in "Firewall Rule Comment is set"` as double quote ("") in a firewall rule comment is not supported in VCF Operations for networks.
- In the Network Map, when you search for Path that involves Cisco ASA BVI interfaces, you see an incomplete path as Cisco ASA BVI interfaces are not supported in Network Map.
- VCF Operations for networks currently shows only first 25 alerts per intent.
- For Cisco ASR1000, the following intents are not supported:
  - STP Path Cost Method Inconsistency
  - HSRP/VRRP Active And STP Root Co-location
- Data collection does not collect the inventory from Kubernetes clusters managed by Tanzu Kubernetes Grid Integrated Edition when the last action is in failed state.
- Deactivate the Tanzu Kubernetes Grid Integrated Edition data source in VCF Operations for networks while upgrading the Tanzu Kubernetes Grid Integrated Edition and re-enable it after the upgrade is successful.
- NSX-T Federation behavior with Advanced license:

  NSX-T Federation is not supported with advanced license. Hence, VCF Operations for networks continues to treat NSX-T federated objects as local objects and due to this, you may see the following behavior:
  - As stretched networking is not supported, duplicate flows can be displayed.
  - VM-VM path does not consider stretched entities and an *unknown path* message is displayed when VMs are across sites.
    - If the networking for the VMs within the site is managed by the VMware NSX-T Federation Local manager (LMs), it works as expected.
    - If the networking for a site is managed by the VMware NSX-T Federation Global Managers (GMs) (like the Layer 2 network created by GM for a specific site), then even within site VM-VM path does not work.
  - Global entities cannot be searched.
  - You can see a reference to a global entity in some other Policy entities. If you click this entity, a *Feature Not Supported* message is displayed.
  - GMs can not be added as a data source in VCF Operations for networks. All the VMware NSX-T Federation related data is fetched from the LMs.
- NSX-T Federation behavior for an advance license user upgrading from an earlier version of VCF Operations for networks to advance license version 6.4 and above:
  - The global entities that were searchable before the upgrade, will not be searchable after the upgrade.
  - After the upgrade, site tagged flows are deleted after a certain duration of time and duplicate flows can appear.
  - Some entities can have stale references to the Global Entities, for example, policy groups can have references to global groups, or local firewall rules can have references to the global firewall rules. Clicking these references displays a *standard not supported by license* message.
- In the Network Map, path search does not work if VMware NSX Edge VM is connected to NVDS.
- For devices that do not support CDP and LLDP protocols, Port Channel Member Mismatch intent does not generate alerts if:
  - Neighbor devices with inconsistent port-channel configuration make one or more member ports inactive

  - There is no ARP table entry pointing to an interface that is not a member of any port-channel, but its neighbor is member of a port-channel
- The Port Mode Mismatch intent might generate false positive alerts for Cisco ASA devices if VLAN sub-interfaces are configured at port channels.
- If Panorama fails to commit configuration changes to a Palo Alto gateway, VCF Operations for networks continues to use the latest configuration present in Panorama, which may not be in sync with the policies enforced by the Palo Alto gateway.
- The paths via tunnels if the ECMP (Equal Cost Multi Path routing) is enabled, may overlap with each other.
- In case of Federation, vCenter must be added as a compute manager in VMware NSX-T for the global entity enrichment to work properly.

  VMware NSX-T Federation Global Managers (GMs) can not be added as a data source in VCF Operations for networks. All the VMware NSX-T Federation related data is fetched from the VMware NSX-T Federation Local manager (LMs).
- Some complex VM-VM paths in a VMware NSX-T Federation setup may exhibit cross-lines. Use the path labels to understand the path topologies for such paths.
- Firewall masking event does not work for the Global firewall rule and the Applied To field is missing for Global Gateway Firewall Rules.
- ServiceNow changed the data-modelling and storing of data for the applications discovered by the Service Mapping plugin with the Discoverable by Service Mapping configuration option. This change is not supported in VCF Operations for networks for ServiceNow based application discovery. VCF Operations for networks still supports applications discovered by Service Mapping with the Manual Endpoint configuration option.
- Global Rules spanning across site do not show up in VM-VM path.
- Invalid credentials error can occur on the VMware NSX-T data source if the VMware NSX-T added to VCF Operations for networks is upgraded.

  **Workaround**: Re-enter the credentials.
- When HSRP/VRRP interfaces at two devices are configured with the same matching Virtual IP address but have the protocol Group ID misconfigured, the HSRP/VRRP Configuration Error intent misclassifies that as "2 Active Master interfaces", instead of classifying it as 'Master interface doesn't know Standby'.
- When the content of an open alert changes, VCF Operations for networks does not show the new value in the alert details.
- In the Network Map, the entity details window of the distributed switches does not show alerts that are originated from intents.
- You cannot see the unprotected flows for the Kubernetes service in the Micro-Segmentation Planning page.
- With the release of vSphere 7.x, some VCF Operations for networks features stop to work in 6.x versions due to vSphere Tanzu. For more information, see the KB article 78492.
- Spanning Tree Protocol (STP) support in VCF Operations for networks is only limited to Cisco Per-VLAN Spanning Tree Protocol (PVSTP).
- VCF Operations for networks recommends configuring unique FQDN hostnames on host entities (like UCS Blades or servers) for proper interpretation of underlying host entities. Absence of unique FQDN hostnames may lead to incorrect association of VMs to underlying similar hostnames.
- Unable to change the IP address of a Federation instance after it is configured in Federation.

  **Workaround**Unpair the instance and reconfigure it with the required IP address.
- If a Federation instance is in the disconnected state, the Unpair option is deactivated.
- For some time the values of the Federation page Key Performance Indicators (KPI) are inconsistent when compared to the values in the entity details page or the actual instance. This is because the polling frequencies of Federation page KPIs are different.
- VCF Operations for networks does not support Federation as a search query and the time range selection for this query. Federation page always shows the present data.
- In the Federation page, the deployment widget shows new changes after one minute as the response time for the Deployments widget is cached for one minute.
- Any Federation instance that is unreachable for more than 24 hours, is not shown in the Environment widget of the Federation page.
- Path search in Network Map does not return any results if Check Point VRRP virtual IP is used as the source address.

- In the Federation page, the Platform Capacity section includes unknown flows with internet flows and east-west flows for the deployed instances.
- Flow based link inference algorithm of VCF Operations for networks used by Network Assurance and Verification (NAV) can show incorrect links between a pair of devices when unsupported devices are present between the pair. These incorrect links can cause Loop Detection intent to generate false alerts.
- Known limitations for IPv6 addresses:
  - Online upgrade and support tunnel for pure IPv6 and dual-stack setup is not certified.
  - VCF Operations for networks does not support the change of IP family from IPv4 to IPv6 and conversely.
  - VCF Operations for networks does not support webhooks for IPv6 and dual-stack.
- When you add VMware NSX-T Manager using the Certificate (Principal Identity) authentication method, Security Intelligence integration does not work with the principal identity user.
- VCF Operations for networks fails to collect data for some `show` commands using SSH from devices (such as Arista switches). The fail happens if `enable` password is configured for the device and the password prompt shows up when the user account attempts to enter the `enable` mode.

## Create a Migration Plan and Export Migration Waves

You can use VCF Operations for networks to create a migration plan for your workloads. After creating your migration plan, you export it as part of migration waves and perform the migration in VCF Operation HCX.

To enhance your search and filtering capabilities, you can include more VM attributes in a CSV file you upload in VCF Operations for networks. In addition to the VM attributes you want to use, this file must contain the mandatory `vc_ip` and `vm_moref` attributes. The `vc_ip` attribute value is the IP address of the vCenter instance where the VM is hosted and the `vm_moref` attribute is the ID of the VM in the vCenter instance. To retrieve these attributes:

1. From VCF Operations for networks, select your VMs and from the top-right menu click **Export as CSV**.
2. In the **Selected properties (CSV columns)** field, click **Add properties**.
3. Search for and add the `Vendor ID` and `Manager` properties.
4. Click **Export**.
5. Open the exported CSV file. The `vCenter` column contains the value for the `vc_ip` property and the `Vendor ID` column contains the value for the `vm_moref` property.

Use the comprehensive search, filtering, and flow analysis capabilities of VCF Operations for networks to identify and select the VMs for your workload migration. The creation of the migration plan consists of:

- Creating the scope for your workload migration. Optionally, you can upload a CSV file with more VM attributes to further enhance the scoping process.
- Adding the workload of your migration scope to migration waves.
- Organizing your migration waves into mobility groups.

After creating your migration plan in VCF Operations for networks, you export the migration waves by commiting them which imports them toVCF Operation HCX where the actual workload migration is performed.

> **Note:**
>
> The following procedure outlines how you can create a migration plan in VCF Operations for networks, you export the migration to VCF Operation HCX, You can also perform this action from VCF Operations by navigating to **Launchpad** > **Workload Mobility**.

1. From the left navigation panel, navigate to **Plan and Access** > **Migration Planning** and click **Create Plan**.
2. Add more VM attributes for your migration plan.
   a) From the **Migration Attributes** widget, select **Upload.**
   b) Select your CSV file.
   c) Verify that you are familiar with the content rules and that your CSV file includes the mandatory `vc_ip` and `vm_moref` attributes and click **Upload and Proceed**.

      After uploading the CSV file, you can see a breakdown of the total number of identified VMs, how many of them match the new attributes, and if there are any errors. The newly added attributes are available as filters in all views for VMs and migration planning.
3. Enter a name for your migration plan and click **Proceed**.
4. Define the migration scope.
   a) Filter the VMs you want to add to your migration plan by using the available attributes or add more attributes from the **Filters** tab.
   b) After selecting the VMs you want to add to the migration plan, click **Add to Scope**.
   c) Optional: By selecting **Review Network Dependency**, you can view any out-of-scope VMs identified as dependencies and can add them to the current migration scope.
5. Create migration waves.

   **Note:**

   The following procedure outlines the process of creating migration waves and groups manually. You can also generate the waves and groups in your plan automatically by selecting **Auto Generate Waves and Groups**. You can also start the process of automatic generation even if you have selected the manual generation process. After automatic generation is complete, you are sent to the **Summary** page.

   a) Select the VMs you want to add to a migration wave.

      **Note:**
      You can only add VMs belonging to the same vCenter instance in a specific migration wave. Parts of your workload from different vCenter instances must be included in a separate migration wave.
   b) Select **Add to Migration Wave**.
   c) Enter a name for the migration wave, add the destination HCX manager, and click **Proceed**.

      **Note:**

      Selecting a destination HCX manager during this step is only available if you have added that HCX manager as a data source in VCF Operations for networks.
6. Organize your migration waves into mobility groups.
   a) Select the VMs from your migration wave that you want to add to a mobility group.

      **Note:**
      You can add the VMs from a single migration wave to multiple mobility groups.
   b) Select **Create Mobility Group**.
   c) Enter a name for the mobility group and click **Proceed**.
   d) Repeat for all of your migration waves.
7. On the **Summary** page, you see an overview of your migration plan and the option to make edits to your waves and groups before commiting the plan to VCF Operation HCX.

   **Note:**

   You can remove the automatically generated migration waves from your plan by selecting **Remove Auto Generated Waves and Groups. If you have munally updated the content of these waves, they will no longer be considered automatically generated and the above option used to removed them will disappear.**

8. When you are ready to export a migration wave to VCF Operation HCX, navigate to the migration wave entry under **Migration Waves** and click **Commit**.

   The **Commit** option is only available if you have added a destination HCX manager. If you have not added an HCX manager in the previous step, you can select the migration wave and add it now. Alternatively, you can manually export the migration wave by clicking the vertical elipsis menu to the left of the migration wave and selecting **Download Wave**.

   After clicking **Commit**, the migration wave is sent to VCF Operation HCX. Depending on the validation results, the wave status is marked as either **Commited** or **Failed**. Failed migration waves include an error message describing the encountered issue and the option to re-commit the relevant wave. The status for migration waves for which the workload migration in VCF Operation HCX is in progress is marked as **Executing**.

9. Repeat for all of your migration waves.

You have created a migration plan and exported your migration waves.

Perform the workload migration in VCF Operation HCX. For more information on VCF Operation HCX, go to the About Migrating Mobility Groups from Migration Waves.

## Planning Application Migration to VMware Cloud on AWS using VCF Operations for networks

Using VCF Operations for networks, you can assess your on-premise environment for application migration to VMware Cloud on AWS.

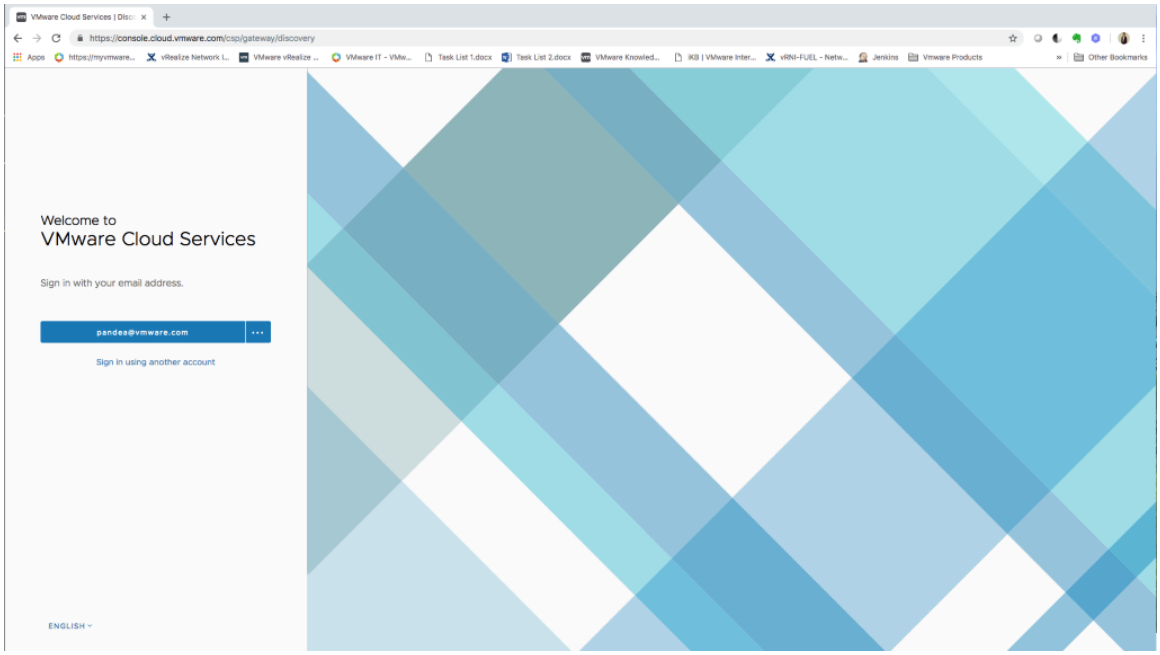
| Steps | Procedure | Description |
|---|---|---|
| Step 1 | Setting up your Environment | • Accept the End User License Agreement (EULA).<br>a. Create a VMware user account or log in to the VMware account.<br>b. Update the registration form.<br>New users will receive an email to activate their account.<br>c. Accept the VMware terms and EULA.<br>• Download the OVA files.<br>a. Log in to the VMware Product Download page at https://my.vmware.com/group/vmware/home.<br>b. Search for VCF Operations for networks.<br>c. Download the latest VCF Operations for networks platform and collector OVA files.<br>• Prepare for installation.<br>a. Verify the System Recommendations and Requirements.<br>b. Verify the Supported products and versions |
| Step 2 | Deployment | 1. Deploy the VCF Operations for networks platform OVA file.<br>2. Generate a shared secret,<br>3. Deploy the VCF Operations for networks collector OVA file.<br>4. Deploy VMware Cloud on AWS. |

| Steps | Procedure | Description |
|---|---|---|
| Step 3 | Data Source Addition | 1. Log in to VCF Operations for networks.<br>2. Add VMC vCenter<br>3. Add NSX Manager<br>4. Add VMware HCX<br>**Note:**<br>VCF Operations for networks automatically detects if you are in the process of migrating your data center using VMware HCX and generates notifications to guide you in the following scenarios:<br>• Adding cloud data sources.<br>• Gaining visibility of your hybrid cloud environments.<br>• Monitoring your cloud workloads.<br>• Gaining visibility of your migrated workloads.<br>You can click the links on the notifications to add your cloud data sources, access your on-premises and cloud environments, or gain network visibility. |
| Step 4 | Model Application | • Analyze application dependencies.<br>a. Create an Application<br>b. Creating Tiers for Physical IPs<br>c. Analyzing the Application<br>d. VMC: Planning and Micro-Segmentation<br>• Analyze recommended firewall rules<br>• Perform search<br>• Create and use dashboards |

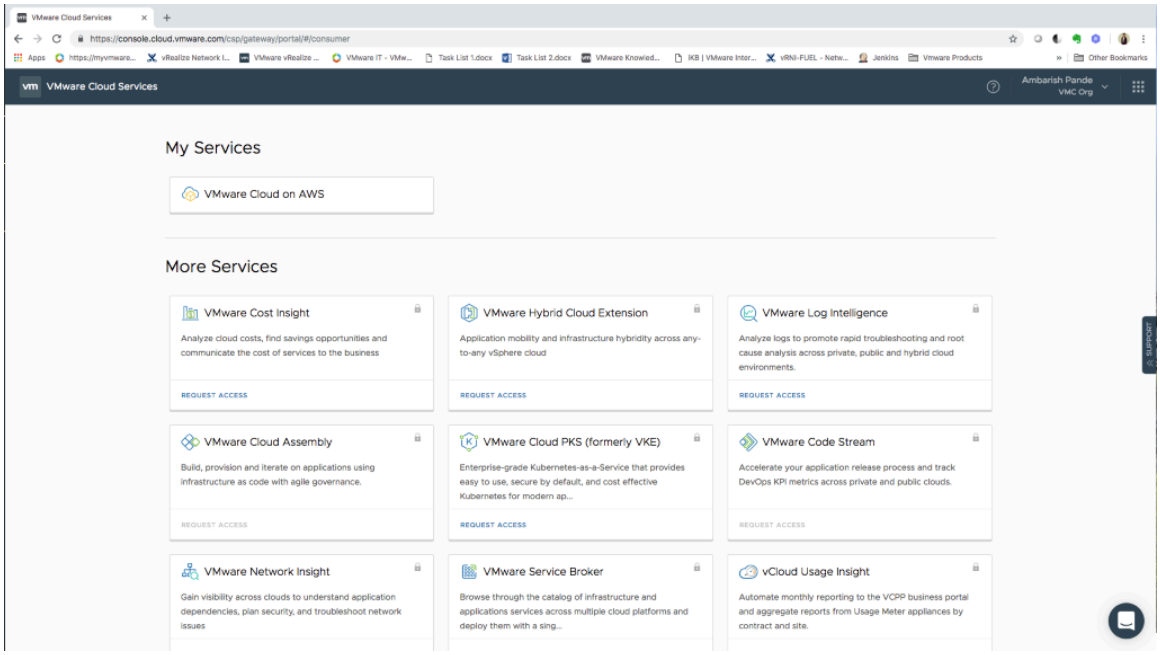
## How do I obtain the CSP Refresh Token for NSX Manager

For adding a VMware Cloud on AWS NSX Manager as a Data Source in to VCF Operations for networks, you need a refresh token.

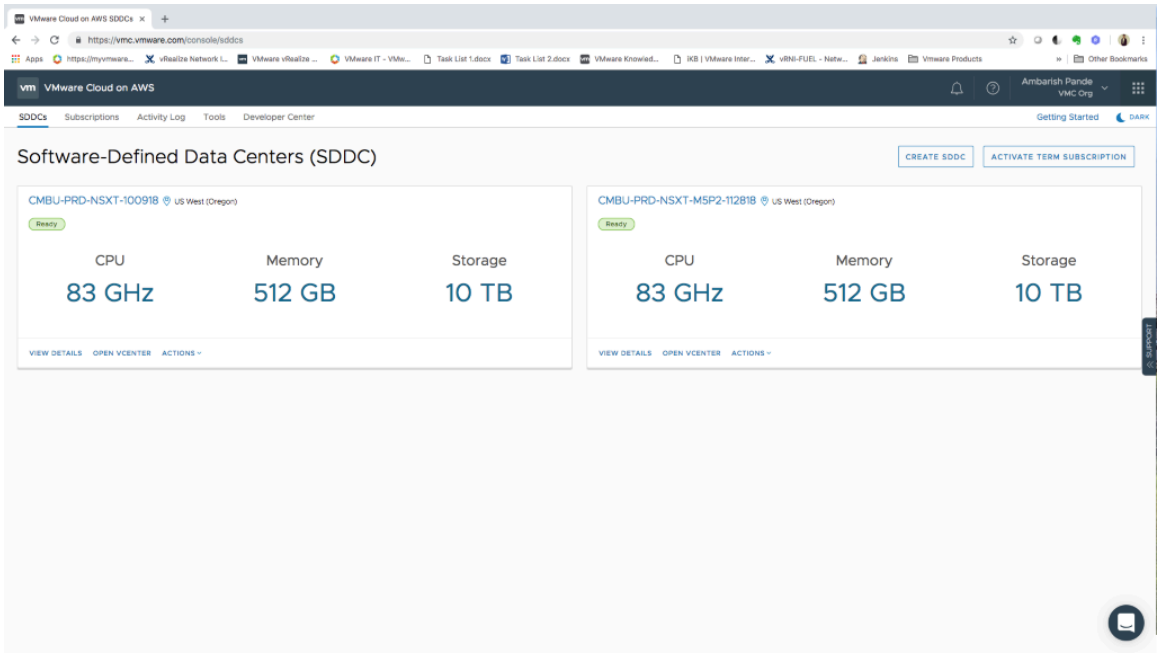
1. Log in to the vCenter services console.



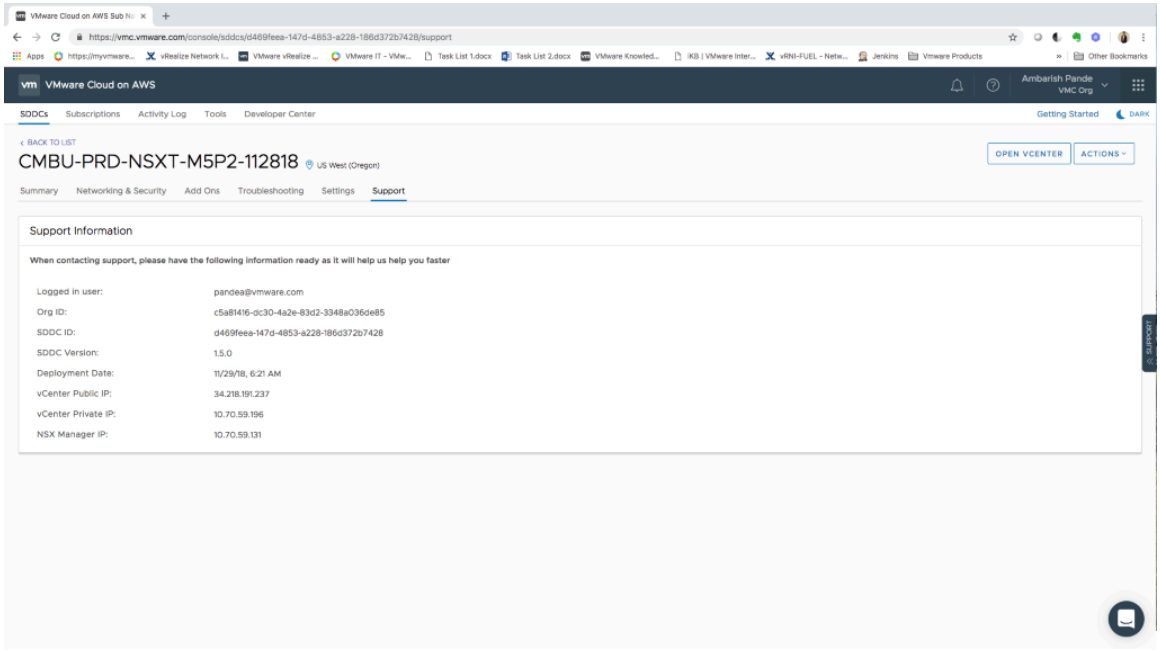
2. Under My Services, click VMware Cloud on AWS.



3. Select the desired Software-Defined Data Center (SDDC).

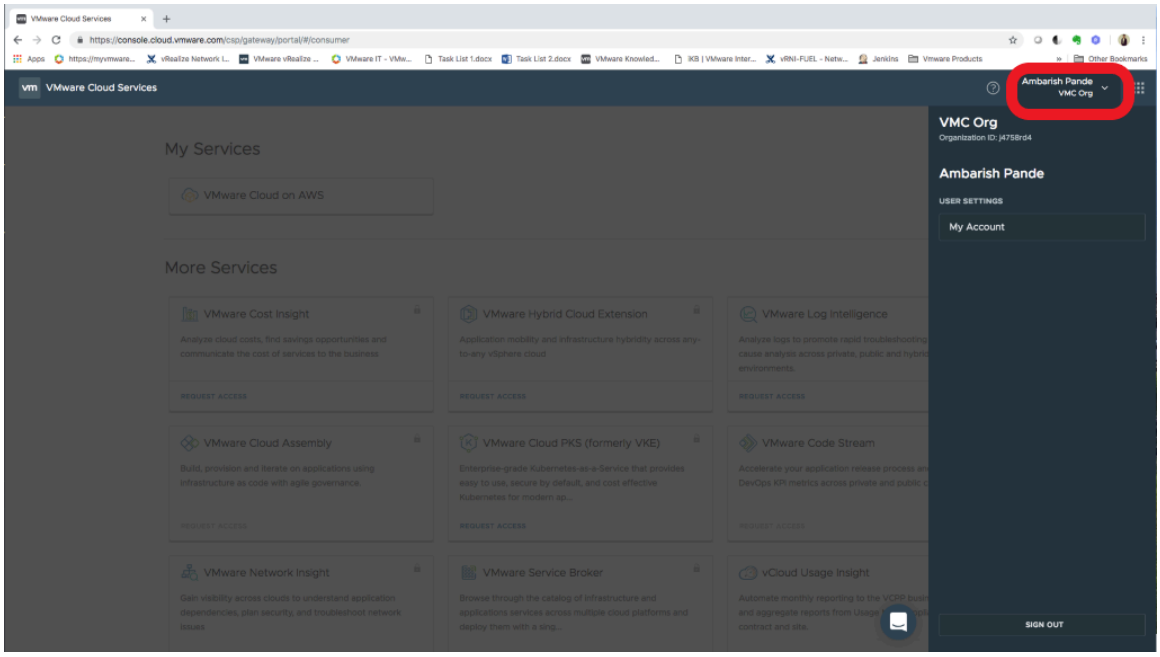


4. Click the **Support** tab.



5. Make a note of the NSX Manager IP address.
6. Click on the organization name on the top banner.

   **Note:**
   Ensure that the organization resides in the selected SDDC.



7. Generate the API token.

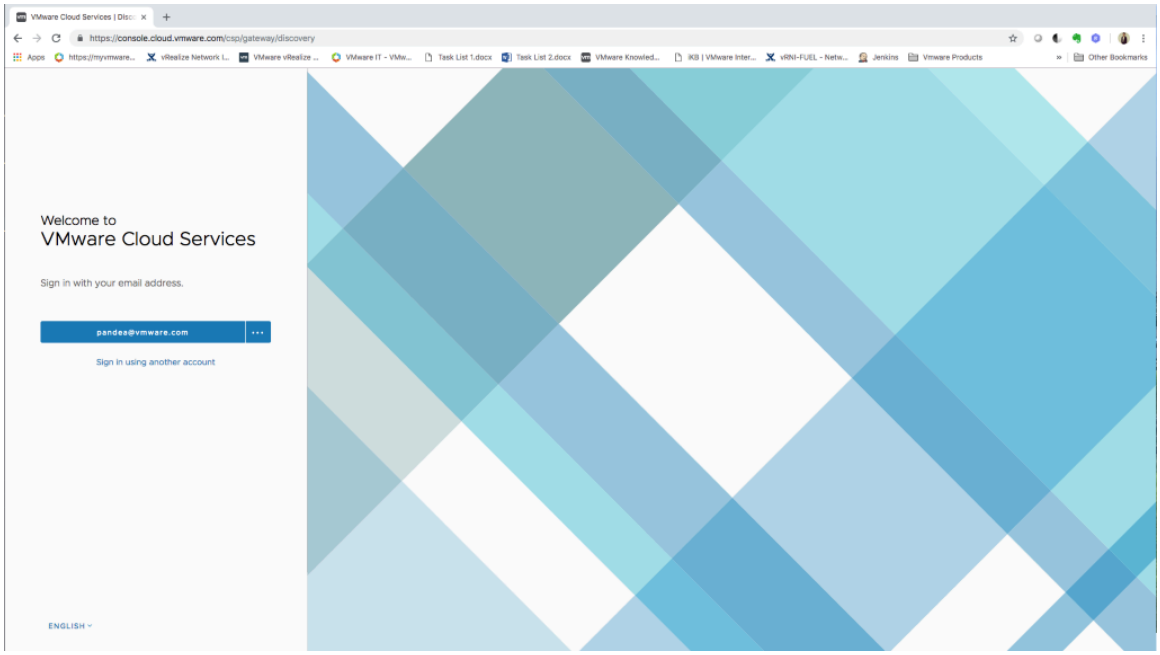
   **Note:**
   To generate the API token, you must have the **Administrator** and the **NSX Cloud Admin** privileges.

You can use this token for authenticating all VMware Cloud on AWS SDDCs on the organization.

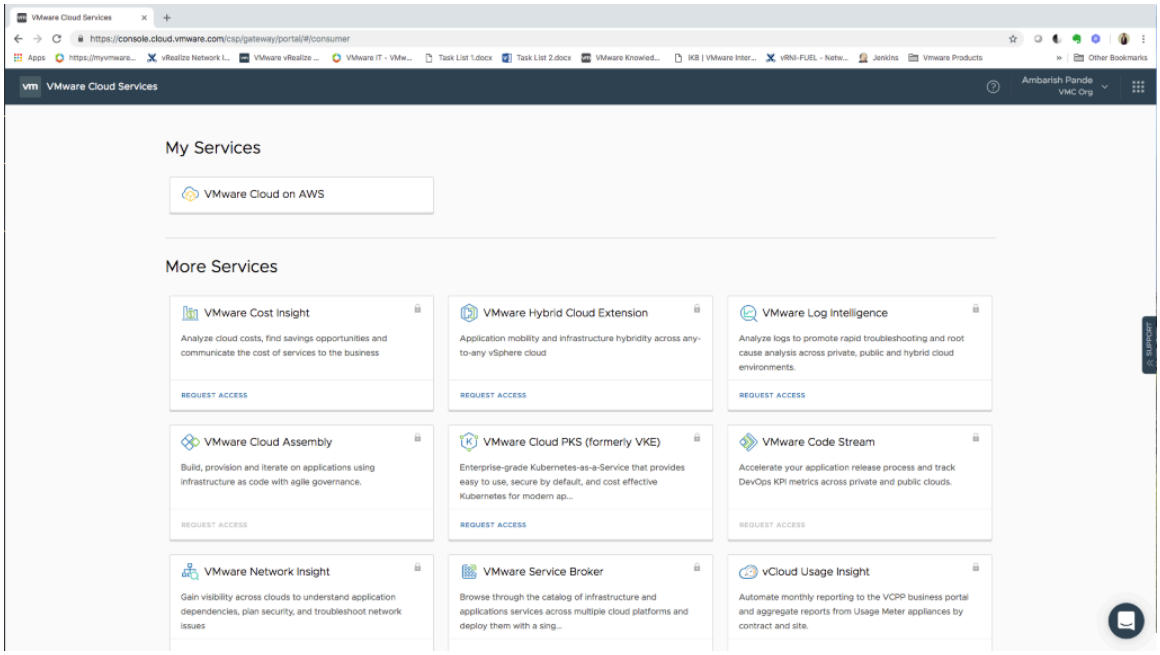
## How Do I Obtain VMware vCenter Credentials

To add a VMware vCenter data source into VCF Operations for networks, you need the VMware vCenter credentials.

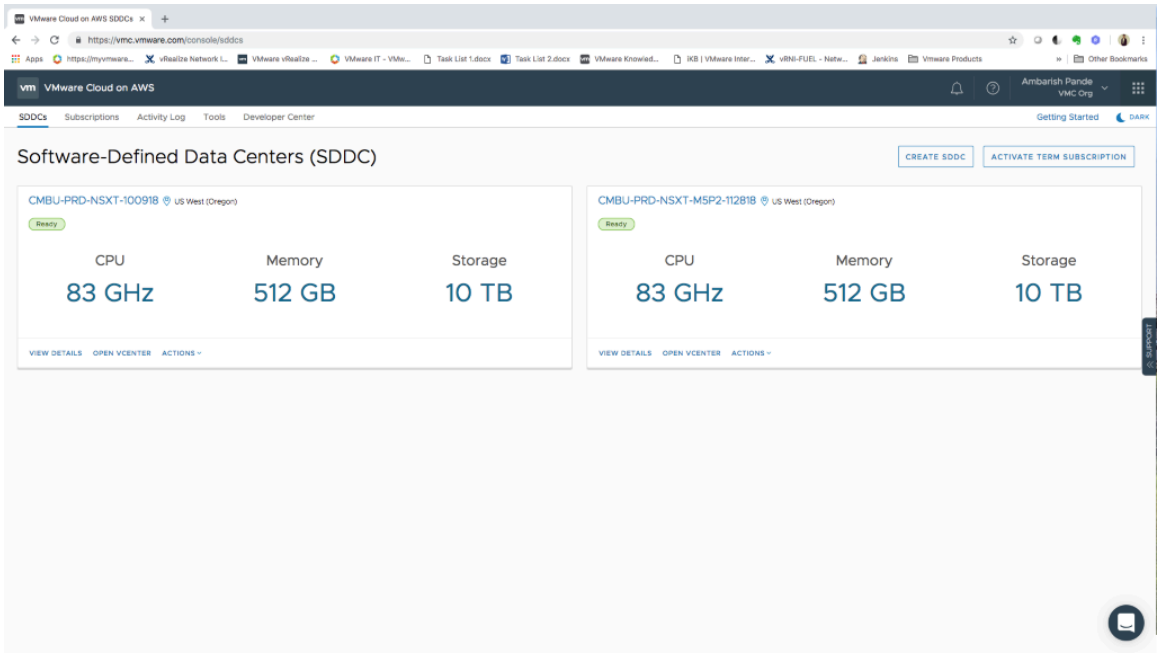
1. Log in to the vCenter services console.



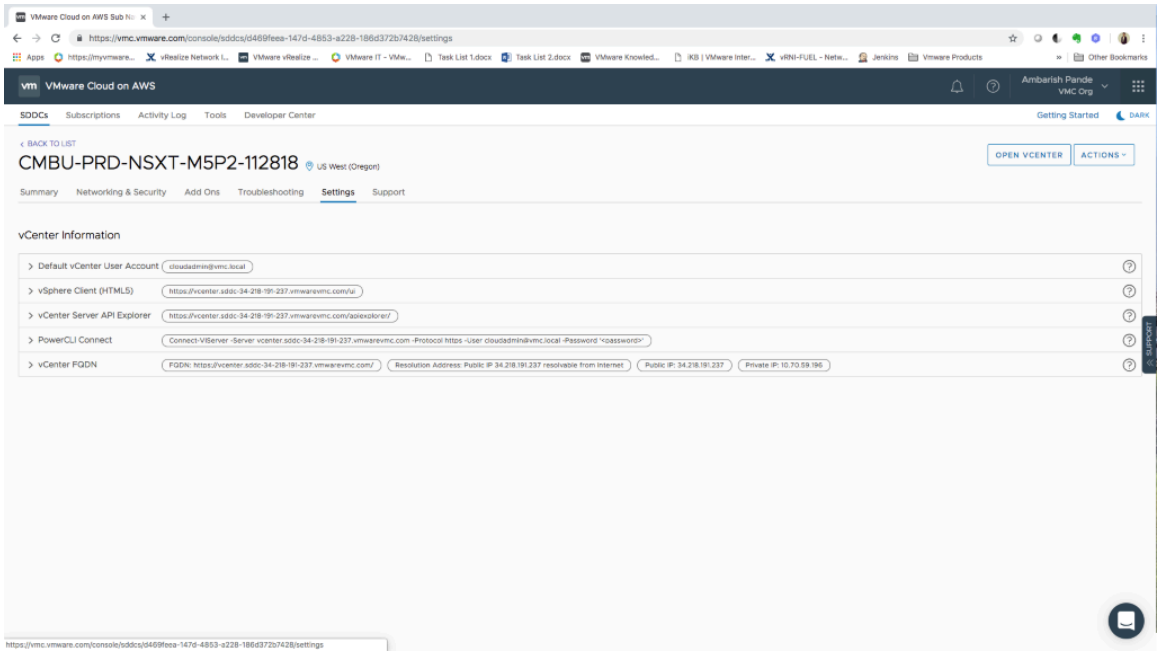
2. Under **My Services**, click **VMware Cloud on AWS**.



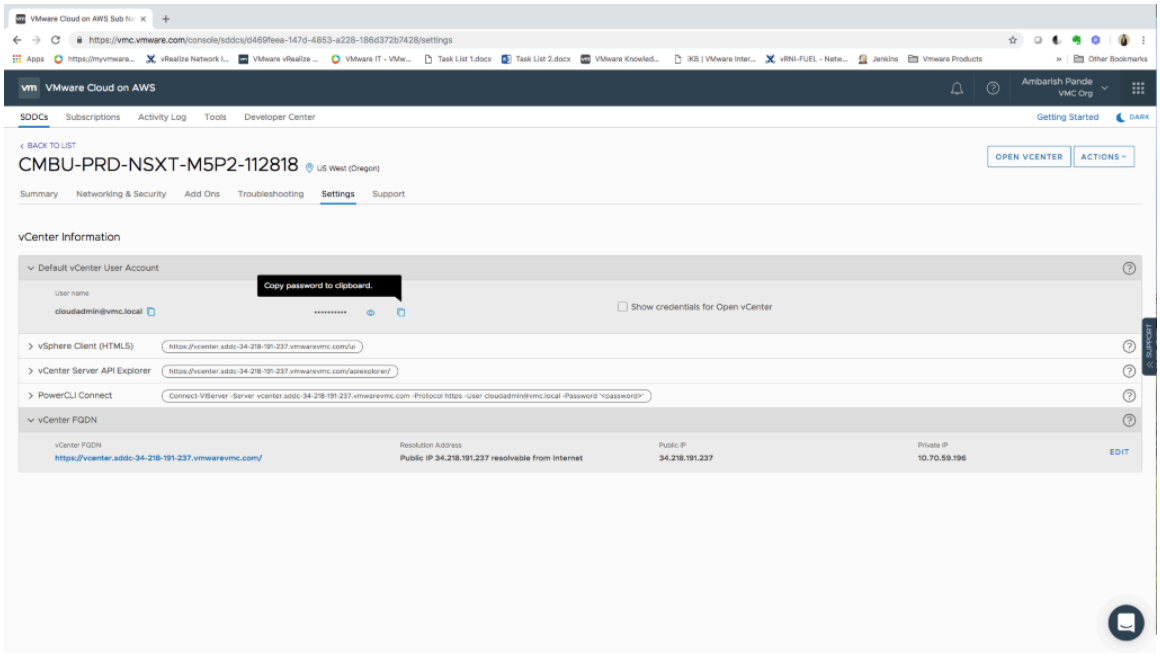
3. Select the desired Software-Defined Data Center (SDDC).



4. Select the **Settings** tab.



5. Expand **vCenter FQDN** and make a note of the vCenter FQDN details.
6. Expand **Default vCenter User account**, and copy the user name and password.



## Compute Gateway Firewall Rule

When communicating with the VCF Operations for networks platform; the collector requires HTTPS port 443 to be open for outgoing traffic.

Following VMware hosted URLs are accessed by the collector through the firewall:

- *.vmwareidentity.com
- gaz.csp-vidm-prod.com
- *.vmware.com
- *.ni-onsaas.com

Additionally, NTP and DNS traffic should be allowed for the correct functioning of the VCF Operations for networks or VCF Operations for networks collector.

Create a firewall rule with the following details:

- Name: An appropriate descriptive name
- Source: The name of the VMware Cloud on AWS Group containing the collector IP address.
- Destination: Select **ANY**
- Services – Select **HTTPS, DNS, DNS-UDP, NTP, ICMP**
- Action – **Allow**
- Applied To – **Internet Interface**
- Logging – Enable logging, if required.

# Using VCF Operations Diagnostics

Discover and remediate known issues, and monitor the operational state of the private cloud infrastructure in VCF Operations.

- How Diagnostics Helps You Keep a Healthy VCF Software Stack
- See Known Issues in Your Environment and Apply Fixes with Findings
- Overwriting the Diagnostics Configuration
- Monitor Your Environment and Prevent Issues with VCF Health
- Use Log Assist to Accelerate Your Support Cases

## How Diagnostics Helps You Keep a Healthy VCF Software Stack

With VCF Operations Health and Diagnostics, you can quickly diagnose and address issues to minimize their impact and improve operational efficiency, security, and reliability of your VCF platform.

VCF Operations Health and Diagnostics facilitates your job as a VCF private cloud infrastructure administrator, providing an in-product capability to discover, troubleshoot, and remediate known and potential issues. VCF Operations Health and Diagnostics builds on diagnostic tools and operational data to address the top drivers of service support requests to help you avoid or resolve such issues yourself. With health and diagnostics data, you can act immediately as it provides recommendations on how to resolve known issues or narrow down and even isolate possible root causes for emerging issues. If you cannot find sufficient information to resolve an issue, you can reach out to support. But you do so with proper context and using automated log bundling with Log Assist. The complexity and size of some VCF infrastructure might pose a challenge to collect and act on all operational data. VCF Operations Health and Diagnostics makes it easy by uniting all metrics in a single pane of glass and at the same time providing means of self-support on known issues. VCF Operations Health and Diagnostics solves the challenge in three ways:

- **Findings**, where you discover known issues and can apply fixes that are based on recommendations, such as best practices, knowledge base articles (KBs), and VMware Security Advisory (VMSA) notifications. Starting with VCF Operations health and diagnostics 9.1, you can also use a set of public APIs that allow you to consume findings in your own tracking and monitoring systems.
- **VCF Health**, where you proactively monitor the operational state of all components of the VCF software stack. **VCF Health** helps you prevent issues that are not related to product bugs, but are caused by factors such as:
  - Availability/Performance: issues with physical devices: servers, storage, or network components.
  - Misconfigurations: incorrect settings affecting functionality.
  - Security
  - Need for optimization
  - Lack of immediate observability: issues such as expired certificates or NTP drifts leading to integration issues.
- **Log Assist**, where you automatically generate log bundles along with other relevant context and transfer to the Broadcom support portal for a speedy resolution of issues.

VCF Operations Health and Diagnostics also helps you with identifying and resolving product bugs. With VCF Operations health and diagnostics 9.1, you can:

- Self-diagnose connectivity, availability, and performance issues impacting ESX hosts.

- Troubleshoot vSphere High Availability issues, such as failure to restart protected VMs.
- Avoid disk size breaches when VMs have a large number of snapshots.
- Track the CPU and Memory utilization on cluster level and CPU, Memory, and Disk utilization on node level for VCF services runtime.

With **Findings** and **VCF Health** combined, you can detect and remediate issues, resulting in generating a lower number of support tickets, avoiding downtime, and reducing the mean time to resolution.

For example, if you see slowness in migration tasks in your environment, you can troubleshoot vSphere vMotion operations, looking at the precopy time, duration, and bandwidth. You can also check CPU usage, CPU contention, and memory utilization, and see error logs in a single screen, without changing context and tools.

**Note:**

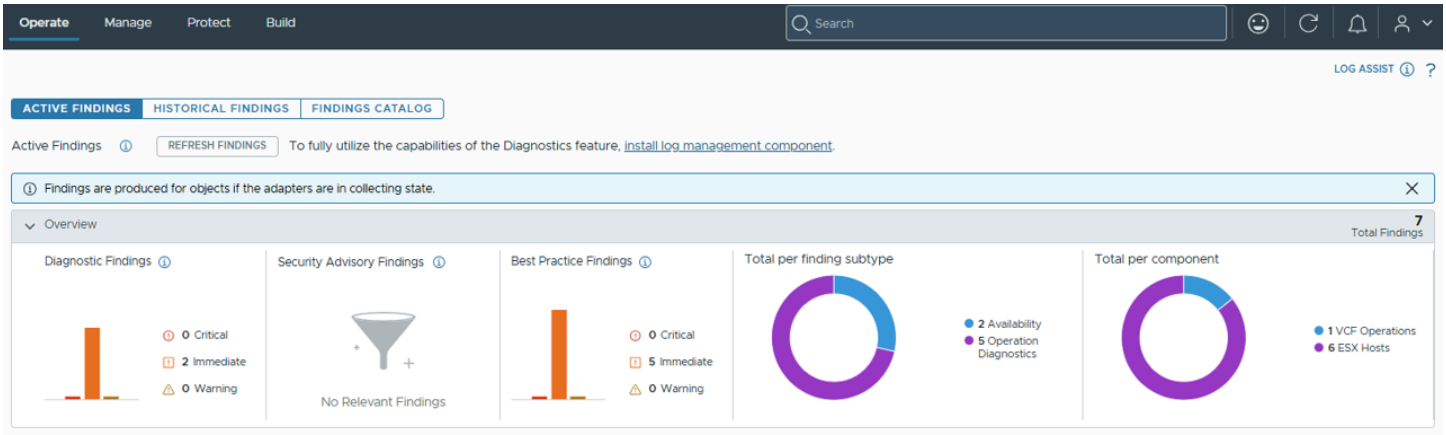
For a comprehensive experience with the diagnostics workflow, you must register your environment in Connected Mode to use the Log Assist capability. You need an Internet connection on the client browser to access KB links, troubleshooting guides, and documentation.

## What are Findings in Diagnostics

**Findings** in VCF Operations Health and Diagnostics helps you find and resolve known issues in your VCF software stack by using a list of log and property-based findings, also called diagnostic rules, or signatures.

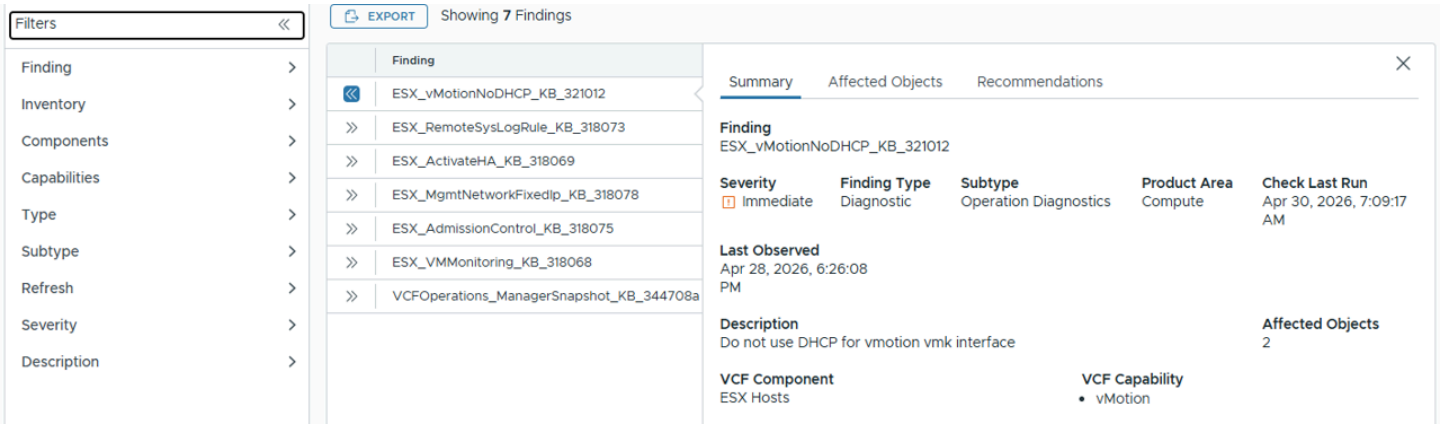
Findings result from scanning your VCF software stack for known product bugs, security notifications from VMware Security Advisory (VMSA), and actionable best practice recommendations.

**Figure 448: Diagnostic Findings Summary View**



You see what are the affected objects, details of the finding, the recommendation for resolution, and usually a link to a KB.

**Figure 449: Findings Details Grid**



The **Findings** capability in health and diagnostics also integrates with Log management to provide more depth and flexibility in troubleshooting. You review the available findings and decide on the appropriate next steps to keep your VCF platform up-to-date and healthy.

VCF Operations Health and Diagnostics works with more than 900 property and log-based rules, which are updated by the Diagnostics Content Management Pack. You can see a list of all signatures in the **Findings Catalog**.

For more information, read See Known Issues in Your Environment and Apply Fixes with Findings.

### Findings Rules

Log-based rules detect an actual occurrence of a known issue in your environment. Property-based rules indicate that the issue is present in the current build and could occur or have already occurred. All finding rules relate to specific build numbers. Depending on the finding, you can decide what corrective actions are applicable to your environment and how urgent it is to apply such actions. An example of corrective action is to apply a patch or upgrade.

For more information, read See Known Issues in Your Environment and Apply Fixes with Findings.

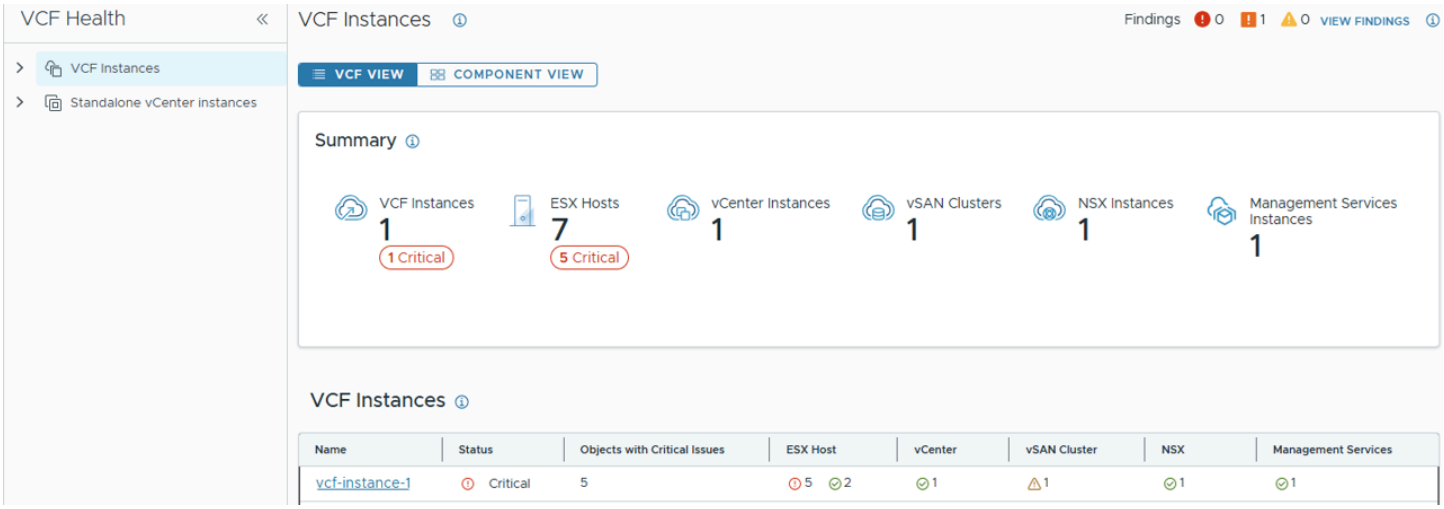
## What is VCF Health in Diagnostics

**VCF Health** is a comprehensive, high-level overview of your VCF deployment, enabling you to proactively monitor, diagnose, and remediate the operational state of your environment.

**VCF Health** is designed to reduce downtime, improve visibility, and increase operational resilience by offering actionable insights into VCF software stack, affecting compute, networking, storage, and the management layer.

The structure of **VCF Health** allows a drill-down to the hierarchy from a VCF instance to its management and workload domains, vCenter instances, NSX instances, vSAN, and ESX hosts. **VCF Health** only works on environments that are installed by using the VCF Installer and provide the level of centralized data that health and diagnostics collects, such as certificates and configurations. This data is not available if you manually add components. With **VCF Health**, you can reduce downtime or the mean time to resolution by identifying failures of underlying infrastructure such as ESX hosts or remediating emerging performance issues.

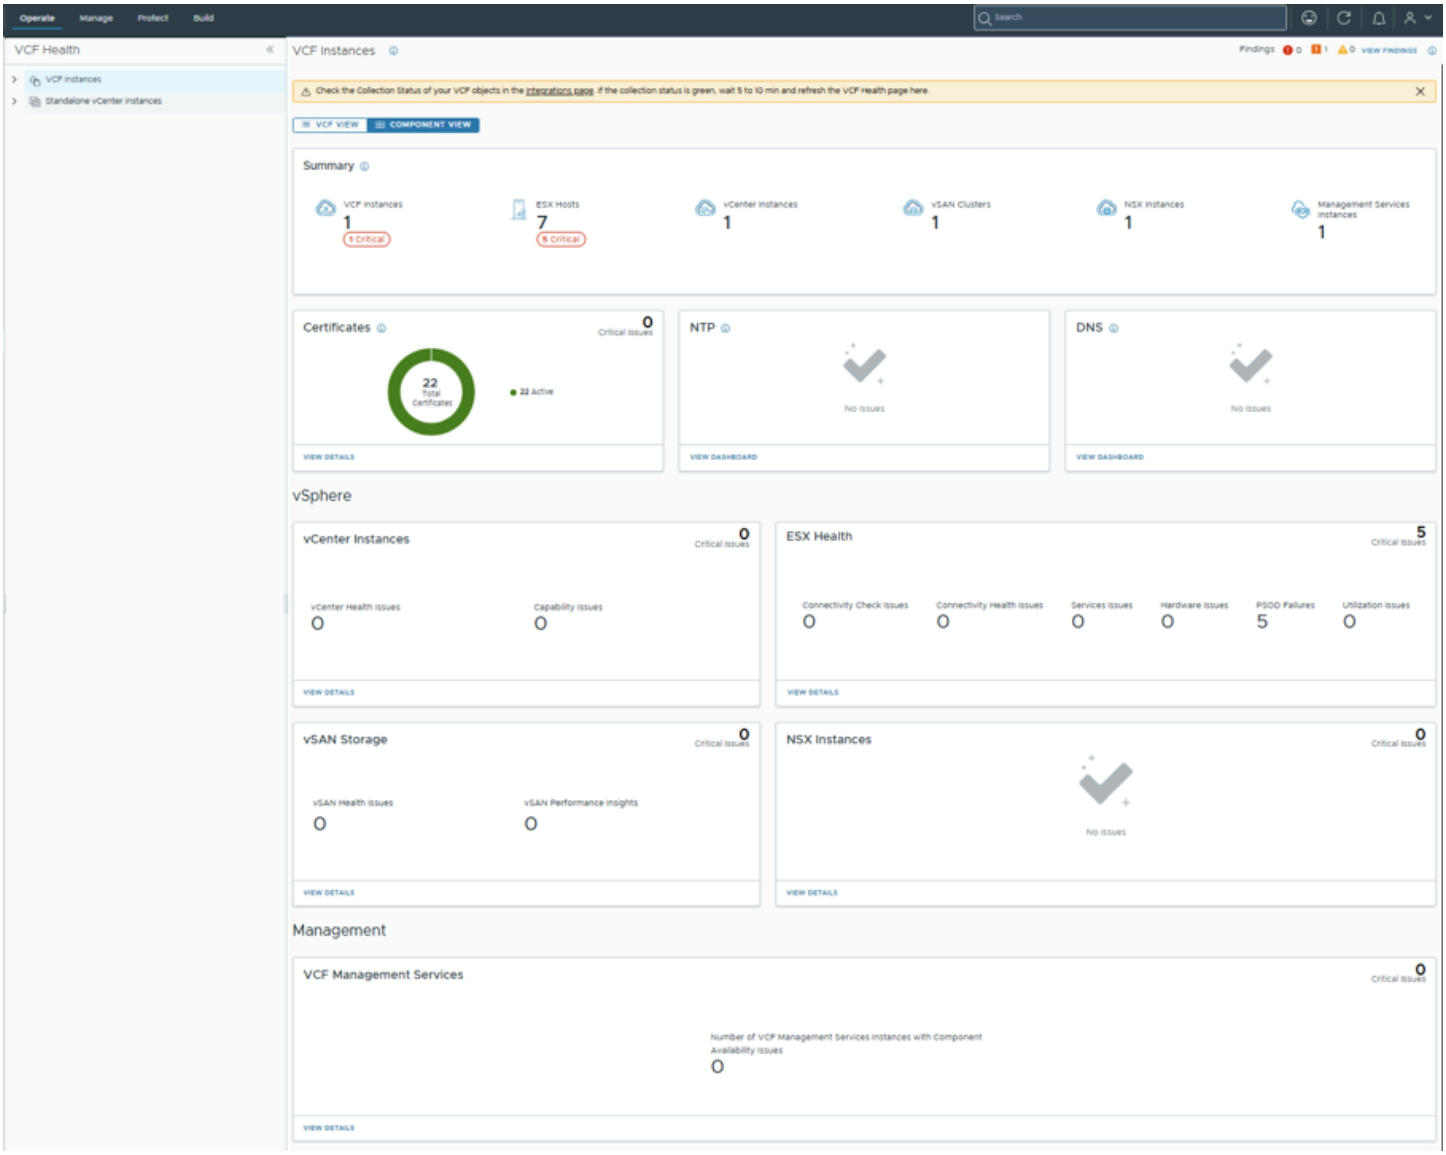
**Figure 450: VCF Health Summary View**



For example, if you see expiring certificates or notice NTP drift or DNS sync, you can avoid networking and configuration issues. Or if you see a trend of failing tasks with virtual machine snapshots or vSphere vMotion migrations: you can handle the underlying cause for the emerging negative trend to prevent issues from occurring.

From the **Component** view, you see a holistic overview, summarizing the health of all objects within the environment.

**Figure 451: VCF Health Component View**



## How to Set up and Maintain Diagnostics

Complete VCF Operations health and diagnostics for your VCF software stack by installing and configuring Log management and Real-time metrics, and setting up integration between components.

The **Findings** capability has no license dependency and works on both VCF and VMware vSphere Foundation. Anything that applies to VCF applies to vSphere Foundation as well, within the scope of your environment. You can apply only diagnostic capabilities relevant to your setup. For example, you must take care of the NSX integration only if you use NSX in your environment. You also do not need to have an SDDC Manager in your environment for **Findings** to work.

The management pack for VCF Operations health and diagnostics is automatically installed and the integration does not require manual configuration. Some VCF platform components need installation or integration by using adapters to become active and start collecting diagnostics data.

### Setup

- After the initial installation of VCF management services, make sure you install log management and real-time metrics. See Deploy Log Management and Deploy Real-Time Metrics.
- In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, select **Administration** > **Configurations** > **Log Management** to configure log collection into log management from VCF inventory objects, such as vCenter instances.
- When you install VCF by using the VCF Installer, you get by default one unified cloud proxy that facilitates log collection and the Log Assist capability. You use a unified cloud proxy to collect logs into the log cluster and to collect, and upload support bundles to the Broadcom Support Portal. For more information, see Set up Log Assist and Collecting Data with Cloud Proxy in VCF Operations.
- Make sure that you have connectivity between components in your environment. The networking port that is required between VCF Operations and endpoints in ESX , vCenter, NSX, and SDDC Manager, is SSL 443. For Log Assist, the connection is between the cloud proxy and the respective component, not from the cluster node.
- For log management, the required port is 9543. The minimum bandwidth is 200 KB/s.
- Generation of diagnostic findings depends on the following adapters:
  - VcfAdapter (VMware Cloud Foundation)
  - VMWARE (vCenter Adapter)
  - NSXTAdapter (NSX)
  - CASAdapter (VCF Automation for VM Apps Organization, formerly vRealize Automation Adapter)
  - VCF 9.1 adds an adapter for the VCF services runtime component. With the data that the adapter provides, you can self-diagnose connectivity, availability, and performance issues impacting your VCF components that are part of the VCF management services**.**

    **Note:**

    Diagnostic findings are produced for VCF components only if their adapters are in collecting state. You see property and log-based findings only for inventory objects that have an active cloud proxy and are in green Collection Status.
- For findings related to earlier versions of VCF Automation, you must:
  - add and activate the VCF Automation for VM Apps Organization adapter from the **Repository** at **Operate** > **Administration** > **Integrations**.
  - Create an account.
  - Add the account to a **Default Cloud Proxy** group.

### Scalability

Each VCF instance that you deploy gets one cloud proxy by default, but adding more cloud proxies to segregate workloads helps with accelerating computation times.

### Performance

The Diagnostics rule engine depends on I/O and requires SSD type of storage, preferably sub-millisecond access times, such as NVMe. Slower disks might lead to an increase of computation times linear to the performance of the disk.

### Update Cadence

Update cadence depends on the urgency of hot fixes and the number of accrued signatures. Usually comes along with a maintenance release of VCF Operations for which you see notifications in **Build** > **Lifecycle**. Starting from VCF 9.1, updates of the Diagnostics Content Management Pack might be released between maintenance releases as well.

The other updates are security-related and come in the form of a VMware Security Advisory (VMSA).

**Record-keeping**

Log-based findings expire 36 hours after the issue was first detected in the logs. Property-based findings are removed from the system when the issue is resolved. VCF platform private cloud infra admins can export findings in tabular format from the **Findings** tab to share with the other teams or keep for auditing purposes.

**Roles**

You use Role-Based Access Control to manage access to health and diagnostics. Normally, VCF platform private cloud infra admins manage health and diagnostics and reach out to respective teams, such as storage or networking, for further investigations outside of the VMware software stack.

## VCF Operations Health

Along with VCF Operations health and diagnostics , you can track the health and resiliency of your VCF Operations environment in a dedicated dashboard.

VCF 9.1 adds the **VCF Operations Health** dashboard to provide visibility on the health and resiliency of your VCF Operations platform, log management, and real-time metrics. In the VCF Operations navigation bar at the top, click **Operate**, in the left navigation pane select **Dashboards**, and expand **All** to get to the **VCF Operations Health**, **Log Management Health Overview**, and **Real-time metrics Health** dashboards.

In the VCF Operations Platform health section, you see the health of your VCF platform, including supporting services and integrated components, such as:

1. VCF Operations cluster - a high-level summary on the state of the cluster: if vSphere High Availability is active, the number of nodes, cloud proxies, and adapter instances in the cluster.
2. Nodes and cloud proxies - a list of all nodes and cloud proxies that are associated with the VCF Operations cluster. Shows the high-level summary of availability, number of vCPUs associated with them, and the percentage of available storage in databases and storage logs.
3. Structure - shows the interactive topology of cluster, nodes, cloud proxies, and their associated services.
4. Details of the selected object - shows detailed metrics that are associated with an object you select: either the cluster, its nodes, a cloud proxy, or any of the services.
5. License server - shows a high-level summary of the license server availability along with percentage usage of CPU, Disk, and Memory.
6. About and How To Use widgets to help with your onboarding.
7. Links to **Log Management Health Overview** and **Real-time metrics Health** dashboards for more information on the VCF services runtime cluster.

The VCF Operations Health dashboard replaces the following self-help dashboards:

- Self Performance Details
- Self Services Communications
- Self Services Summary
- Self Cluster Statistics
- Self Health
- Self Troubleshooting

## See Known Issues in Your Environment and Apply Fixes with Findings

Findings collect data from all VCF components to help you identify existing or potential issues in your environment.

Findings are derived from properties and product logs data from vCenter, ESX, NSX, SDDC Manager, VCF Operations, vSAN, and VCF Automation. Findings help you identify potential problems or inform you about existing issues in your environment, and provides steps to resolve them.

## Active Findings

In the **Findings** screen, you see **Active Findings** that shows all the findings that are discovered within the last 24 hours. Checks against property-based signatures run every four hours scanning vCenter, ESX, NSX, SDDC Manager, VCF Operations, vSAN, and VCF Automation. Within 24 hours, whenever a condition in your setup matches a signature, you see it in the **Active Findings** grid. When you expand a finding in the grid, you see:

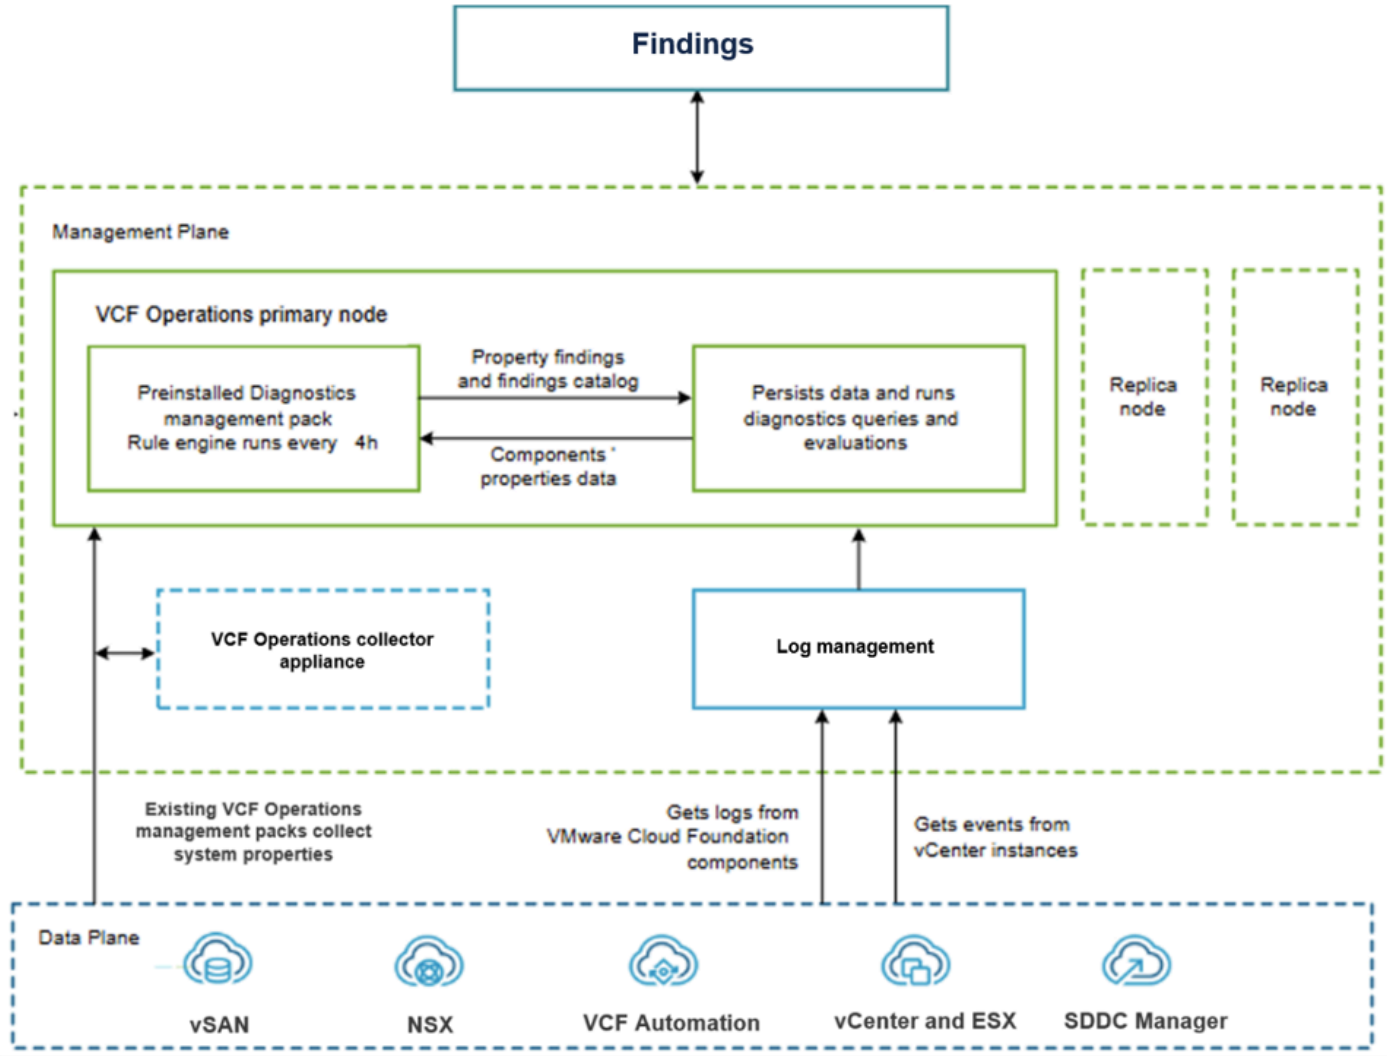
- a summary and description of the identified issue
- the affected objects with links that take you to an object summary page
- recommendations on how to handle the issue, either specific steps or a KB

The severity of a finding is defined by the following criteria:

- Critical: Findings that can cause possible data corruption, environmental outage, significant performance impact, or a moderate to important security vulnerability within your environment.
- Immediate: Findings impacting the functionality of your environment that requires immediate attention but are not critical.
- Warning: Findings that are an advanced notice of a potential issue that might result in loss of data or an error state within your environment.

In the four-hour window of checking against property-based signatures, if you see null results, then your environment is healthy.

**Figure 452: Architecture Diagram and Data Flow of Findings**



In addition to the scheduled property-based scans, within the 24-hour window of **Active Findings**, you can run on-demand log-based checks by using the **Refresh Findings** option. With that option, you can narrow down the scope of your monitoring to a specific component, capability, or functionality. To run a log scan, you must have Log management installed and integrated in your environment. For more information, see How to Set up and Maintain VCF Operations Health and Diagnostics. VCF Operations Health and Diagnostics also provides configuration findings, but they are part of the operational state workflow in VCF Health.

You can trigger **Refresh Findings** for one or more specific management appliances or ESX hosts. This capability is important for three reasons:

- Some log scans might time out, which can cause some hosts to be skipped from assessment in the final result. If you troubleshoot a problem with such hosts or a cluster comprising such hosts, a refresh guarantees that the final result includes all known issues in your system.
- Some troubleshooting flows include checks also implemented as findings, for example, known issues with vSphere vMotion. With a refresh, you do not need to scan all inventory, but limit to specific objects.
- You can use **Refresh Findings** to troubleshoot upgrade failures.

In the **Check Last Run** column, you see the date and time when automated scans were completed or a manual scan for log-based findings was triggered.

In the **Last Observed** column, you see when findings were observed or occurred. For more details, see KB 375104.

> **Note:**
>
> Diagnostic findings for all objects are displayed on the **Findings** page even if the object no longer exists in your environment. This behavior is due to the global settings of VCF Operations that retain historical objects.

Log-based rules detect an actual occurrence of a known issue while property-based rules state that the issue is present in the build or configuration and might occur, or has occurred. In previous releases, all signatures were related to specific build numbers. With VCF 9.0 and later, property-based rules are derived from the configuration of objects such as the installed network drivers and ESX host configuration, regardless of the specific version. Depending on the findings, you can decide if corrective actions are applicable to your environment and how urgent it is to apply such actions. Sometimes, the corrective action is to apply a patch or upgrade, which requires planning, and you cannot immediately apply the recommendations. Findings are categorized by severity, component, type, and capability. In **Findings**, you see the number of affected objects for each issue, which helps in assessing the impact of the findings, prioritizing their remediation.

You can review and store the results in the **Active Findings** grid in tabular format by using the **Export** button. The export function collects all available data, including automatic findings, such as the **Active Findings**, and on-demand findings, such as logs when you use **Refresh Findings** or **Historical Findings**. In the file `vcf_operations_diagnostic_findings_summary.csv` that you get from the export package, you see the three categories under the **Refresh Type** column with values `Auto`, `Manual Active`, and `Manual Historical` respectively.

### VMSA Findings

To facilitate safeguarding your infrastructure, starting with health and diagnostics 9.1.1, all security-related findings for which Broadcom issues a VMware Security Advisory (VMSA), are collected in a separate tab. You can see the VMSA-related findings in the **Active Findings** tab along with all other findings, but in the **VMSA Findings** tab these are highlighted to facilitate immediate action. In the details grid, you see the same columns as in the **Active Findings** tab, but when you expand a row, you can see a summary of the vulnerability, a list of links to the affected objects in the inventory, and the recommendations you need to follow to resolve it.

### Historical Findings

If you investigate an issue that has occurred beyond the 24-hour window of active findings, you can use the **Historical Findings** option. By using this option, you can evaluate log-based findings for a specified time in the past and for the relevant inventory. With **Historical Findings**, you can also check if an active finding that you have fixed based on the recommendations has been fully addressed. You can also see what specific fix you used for a given issue.

> **Note:**
>
> **Refresh Findings** and **Generate Findings** are active only if you configure log management or if a log scan is already in progress.

You can also export the **Historical Findings** report for auditing purposes or for sharing with other teams, or subject matter experts. The **Export** button is on the **Active Findings** tab. The export operation captures historical logs as well under the `Manual Historical` category in the **Refresh Type** column in the file `vcf_operations_diagnostic_findings_summary.csv` that you get from the export package.

**Note:**

You can run only one Historical Findings query at a time. Current results overwrite previous reports. For new installations or migrated systems, active and historical findings might not immediately show results.

### Findings Catalog

Click the **Findings Catalog** tab to see the complete list of signatures that are being checked in your environment at any given time.

**Findings Catalog** replaces KB 371661 as the central reference point for available signatures.

### Log Assist

Starting with VCF Operations 9.0, **Findings** provide a shortcut to the **Log Assist** capability. **Log Assist** extends the log exports functionality with the diagnostics capability. You can use **Log Assist** to automatically upload the support bundles and diagnostic findings to your existing support ticket for troubleshooting by Broadcom Support.

## Diagnostics Public REST API

VCF Operations Health and Diagnostics provides a set of public APIs that allow you to consume findings in your own tracking and monitoring systems.

Starting with VCF Operations health and diagnostics 9.1, you can use a set of public APIs to customize data from **Findings**. The API allows you to integrate diagnostic findings into your internal reporting and monitoring workflows such as risk management or ticketing. The VCF Operations Health and Diagnostics API allows you to centralize monitoring of real-time findings or get data for trend analyses. The VCF Operations Health and Diagnostics API provides 2 authenticated, filtered, sorted, and paginated endpoints, `Active Findings`, and `Affected Objects`. With these endpoints, you can query findings and their respective affected objects, which allow you to integrate findings into your systems or any external systems you already use. The Diagnostics API uses the underlying VCF Operations infrastructure and is compliant with all existing public APIs.

### Authentication

For authentication, you use the existing authentication endpoint in VCF Operations and running a `POST`request to `/api/auth/token/acquire` which returns a response providing validation and a token, which you can use to make requests to the public API of VCF Operations.

Example:

```
{   "token": "the-token-value",   "validity": 1739285135796, //token validity as timestamp   "expiresAt":
 "Tuesday, March 11, 2027 at 2:45:35 PM Coordinated Universal Time", //expiry date   "roles": [] }
```

After acquiring the token, you can authenticate consecutive requests by including an `Authorization` header.

Example:

```
Authorization: OpsToken the-token-value
```

### Authorization

The token used to access any of these APIs has to be issued for a user with the following privileges: `environment.vcfhealth.view` and `vcf_diagnostics.view`.

### Findings

1. Get paginated findings:
   You can stream all your findings to an authenticated endpoint that is paginated and uses filters to narrow down the returned results, excluding `Affected Objects` to reduce the response size. You get results for the `Affected Objects` for a finding from a separate endpoint.
   Request:

Finding API requests use `POST` and the request body is an object with a single field: `filters`.

Example:

```
POST /api/diagnostics/findings/query Query:
page: int, Page number for the data pagination, 0 based.
pageSize: int, Page size, the maximum number of values returned.
sortBy: string, The field to sort on. Default value: SEVERITY.
sortOrder: string. The order for the sort. Possible values: ASCENDING, DESCENDING. Default value:
 DESCENDING.

Body: {   "filter": {     "resourceIds": [       "some-resource-id"     ], //filter by the UUID of the
 resource that generated the finding
"resourceKinds": ["VMwareAdapter Instance", "CAS_HEALTH_SERVICE",     ], //filter by resource kinds
 "adapterKinds": ["VMWARE",    ], //filter by adapter kinds
"capabilities": ["Snapshot", "VM Operations"], //filter by capabilities
"categories": ["Availability", "Operation Diagnostics" ], //filter by categories
"severities": ["Warning" ], //filter by severities
"ruleUuids": ["some-uuid", "another-uuid" ], //filter by rule UUIDs
"refreshTypes": ["Manual","Auto" ], //filter by refresh types
"findingTypes": ["Diagnostic", "Security Advisory"], //filter by finding types
"fromOccurrenceTime": 1234567890 //ts in millis indicating the earliest time of occurrence for the
 returned findings. This will return only findings that have occurred since the specified time until the
 current time. } }
```

Response:

The response is an object with a single field: `findings`.

Example:

```
{ "pageInfo": { "totalCount": 39, "page": 0, "pageSize": 1000 },
"findings": [     {     "ruleUuid": "1234-abcd", // the rule UUID for this finding
"ruleName": "some-rule-name", // this will be populated from the current ruleId field, but will be
 presented as rule name as this is more fitting name for the public facing API
"ruleDescription":
"Rule Description",
"severity": "critical", // severity of the finding, possible values are: none, info, warning, immediate,
 critical, automatic
"category": "Availability", // category of the finding, possible values are: Security Advisory,
 Availability, Operation Diagnostics, Pre-Upgrade checks, Compatibility, Product Interop, Performance,
 Upgrade, Troubleshoot, Security, Deployment Integrity
"capabilities": [ "VMOperations" ], // capabilities for the finding, possible values are: vMotion, DRS,
 HA, Snapshot, Workload Provisioning, Workload Domain Provisioning, Deployment Integrity, Certificates,
 VC_Resources, VC_Services, DNS, NTP, VM Operations, Other
"refreshMode": "Manual", // refresh mode of the finding, possible values are: Manual, Auto
 "affectedObjectsCount": 15, // the count of the affected objects associated with this finding
 "findingType": "Diagnostic", // type of the finding, possible values are: Diagnostic, Security Advisory,
 Best Practice, Compliance
"lastObservedTimeInMillis": 1708705894946     }   ] }
```

2. Get affected objects for a single finding:

The endpoint uses a Rule UUID retrieved from the previous request as a path parameter to return affected objects for that specific rule.

Request:

The request uses `POST`.

Example:

```
POST /api/diagnostics/findings/{ruleUuId}/affectedobjects/query Query:  page: int, Page number for the data
 pagination, 0 based. pageSize: int, Page size, the maximum number of values returned. Body: {   "filter":
 { "resourceIds": ["some-resource-id"], //filter by the UUID of the resource that generated the finding
```

```
"fromOccurrenceTime": 1234567890 //ts in millis indicating the earliest time of occurrence for the returned affected objects. This will return only affected objects that have occurred since the specified time until the current time. } }
```

Response:

The response is an object with a single field `affectedObjects` containing the current page of affected objects.

Example:

```
{ "pageInfo": { "totalCount": 39, "page": 0, "pageSize": 1000 }, "affectedObjects": [ { "name": "object-1", "resourceId": "some-resource-id", "adapterKind": "VMWARE", "resourceKind": "VirtualMachine" "checkTime": 1712955466761, "occurrenceTime": 1712955466761 } ] }
```

## Overwriting the Diagnostics Configuration

By using a JSON solution configuration file, you can manage some parameters of VCF Operations health and diagnostics . You can deactivate rules or set defaults for some tasks, depending on your environment.

With VCF Operations health and diagnostics, you can consider sizing limits for your environment. If you use the full capabilities of a VCF platform, you aim to avoid excessive use of resources for the cloud proxies. Best practice is to segregate workloads to optimize performance and computation time of health and diagnostics. This means dividing an environment by some logical grouping, such as by geography or business function. You can manage the limit of the number of objects that are part of such workloads and can set up a cloud proxy for each workload. You see an alert for the threshold of the max object count that you must consider when segregating workloads. This alert gives you a decision point whether to segregate workloads or increase the limit if it makes sense for your setup. For more information on how to use the JSON solution configuration file, see KB 369791. For sizing considerations, see KB 397782.

## Monitor Your Environment and Prevent Issues with VCF Health

With VCF Health, private cloud infrastructure administrators can monitor the entire VCF stack in depth and breadth that goes beyond the capacity of any individual VCF component or capability.

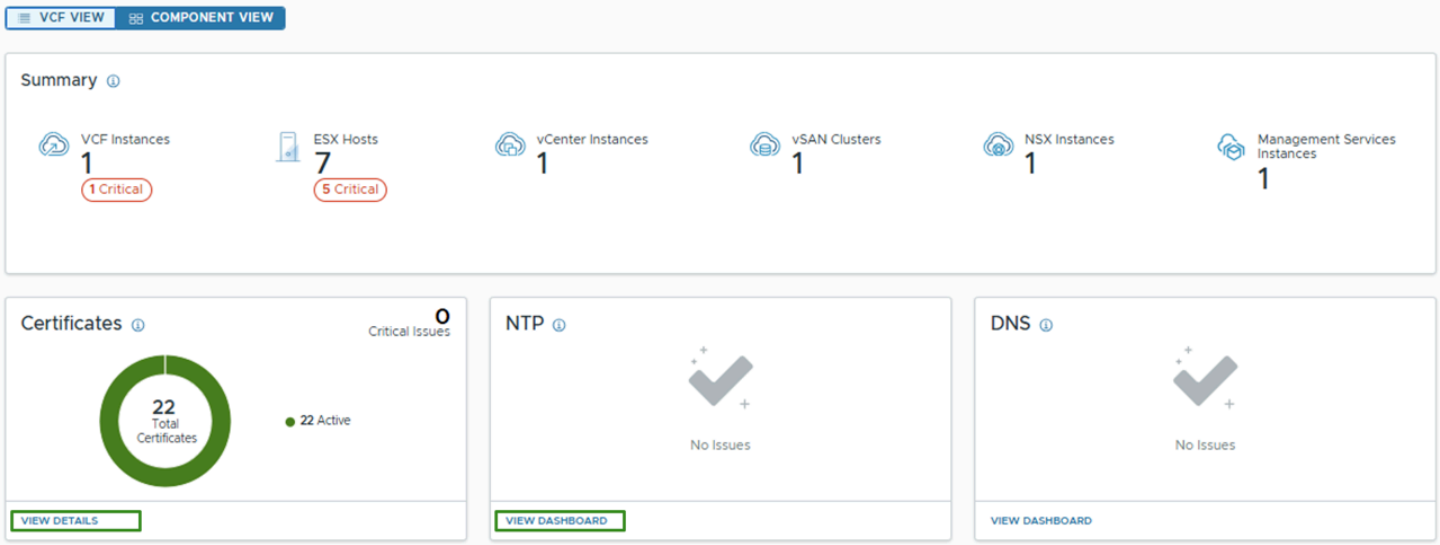
VCF Health provides a suite of monitoring capabilities that help private cloud infrastructure administrators to ensure the optimal performance, availability, and stability within private cloud environments, across all VCF instances. With VCF Health, you gain immediate insights into the overall health and status of the private cloud infrastructure and you can proactively identify and resolve issues.

**VCF Health** gives two starting points for monitoring:

- **VCF View**, which allows a drill-down in the inventory tree from a VCF instance to its management and workload domains, vCenter instances, NSX instances, vSAN, and ESX hosts..
- **Component View**, which provides a holistic view summarizing all objects in your environment.

Based on data from support requests, **VCF Health** screens are structured to help you with the most critical steps in the maintenance and management of the VCF platform. For example, tracking certificates, NTP sync, and DNS reverse lookup from operational point of view or tracking the performance of vCenter instances from infrastructure point of view. You can drill down to each tile that summarizes a VCF operational metric to an individual dashboard or panel in VCF Operations by following the **View Dashboard** or **View Details** link.

**Figure 453: Links for Drill-down from the VCF Health Tiles**



With VCF Operations health and diagnostics 9.1, the list of tracked VCF components and capabilities extends to include vSAN, NSX, ESX, VCF services runtime, and vSphere High Availability. VCF Operations health and diagnostics 9.1 adds new metrics to the existing reporting for vSphere vMotion, VM Operations, vCenter, and Snapshots.

> **Note:**
>
> VCF Health provides data only on active inventory objects. If you delete a resource, all related events are deleted immediately.

vCenter is the key object for monitoring and reporting as it is the key building block in a VCF platform. **VCF Health** also covers the key support request-generating areas in a VCF environment: health of ESX hosts, workload operations, such as deployments and updates of virtual machines, virtual machines snapshots, and vSphere vMotion tasks.

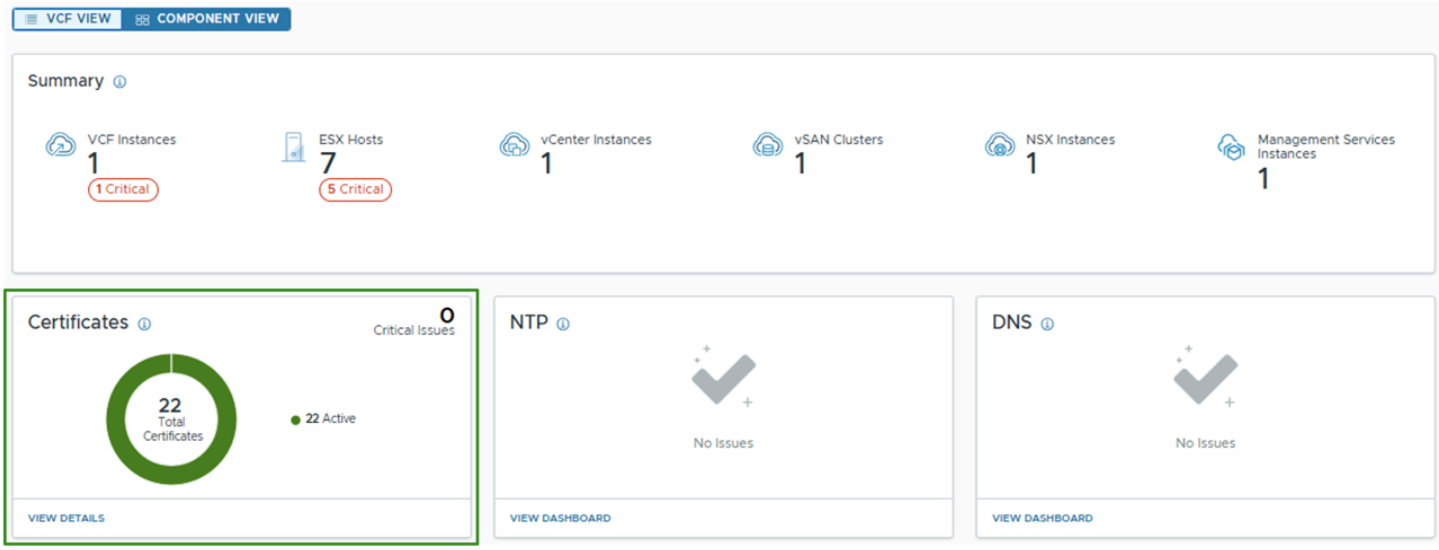
## Certificates Health in Diagnostics

VCF 9.0 and later provides centralized certificate management to monitor and manage all certificates across all VCF components.

Certificate issues are reported for objects that have a VCF 9.0 or later entitlement. A VCF domain is entitled if the vCenter in the domain is of version 9.0 or later and has a non-expired 9.0 license.

Clicking **View Details** on the **Certificates** tile takes you to the **VCF Management** screen under **Manage** > **Fleet Management** > **Certificates**, where you can take pending action on certificates as necessary: renew, import, or replace a certificate, or activate auto-renewal.

**Figure 454: Certificates Tile in VCF Health**



**Note:**

To see all certificates, data collection of each VCF Operations health and diagnostics integration must be in a healthy state.

Click any of the certificates to open the certificate details pane to see the particulars for this certificate. Use certificate management to monitor the status and expiration of the following certificate categories:

- Platform Certificate
- Root Certificate
- STS Certificate
- TLS Certificate

After you add a new certificate or update your certificate, it takes approximately 10 minutes for the certificate information to be reflected on the certificates page.

For more information, see *Managing Certificates in VMware Cloud Foundation*.

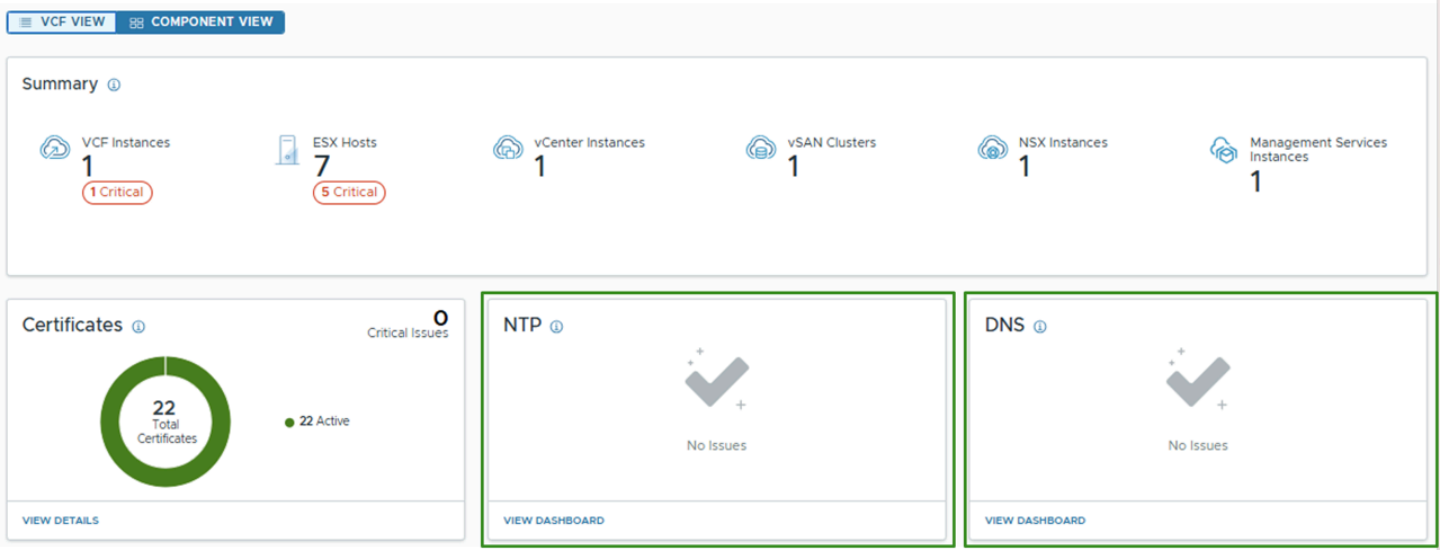
## NTP and DNS Health in Diagnostics

Monitor NTP and DNS health to avoid issues that NTP drift and DNS forward and reverse lookups might cause, such as failing vSphere vMotion tasks.

You need to monitor NTP and DNS settings over time to avoid issues that NTP drift and DNS reverse lookup might cause, such as failing vSphere vMotion tasks. For example, if you do not set up a DNS forward and reverse lookup, in some environments you get some connections labeled as insecure. As a result, certain integrations might break with errors

that no secure connection can be established. With VCF Operations health and diagnostics, you can see if NTP is not configured or is out of sync, as well as the DNS lookup issues for each object in your environment.

**Figure 455: NTP and DNS Tiles in VCF Health**



## NTP

On the NTP tile, you see if NTP is not configured on some components. You can use the dashboard that is linked to the tile to check which NTP server you must use to configure NTP. You can verify that components within each VCF deployment are configured with the correct NTP servers.

The count of configured components only includes components that are accessible. You also see the NTP server drift, which is computed for each component as follows:

1. Fetching the current time from the component
2. Subtracting the current time of the Cloud Proxy performing this check
3. Adding the result to the difference already accrued in the Cloud Proxy time drift from its NTP server

For example, the current time from the component minus the current time of the cloud proxy equals 35 seconds. We add 35 seconds to the difference already accrued in the time drift of the cloud proxy, say another 35 seconds. The result is a time drift larger than a minute and you see it on the tile. This calculation executes every 5 minutes for vCenter and every six hours for ESX and NSX.

> **Note:**
>
> You might see some transient discrepancies between **VCF Health** and the **VMware Infra Health Overview** dashboard that shows NTP configuration data. The Infra Health dashboard gets data from the SDDC Manager every 24 hours, while Health and Diagnostics gets data from the individual components in maximum six hours.

**DNS**

On the DNS tile, you see if DNS is not configured on some components. You can use the dashboard that is linked to the tile to check which DNS server you must use to configure DNS. You can verify that components within each VCF deployment are configured with the correct DNS servers.

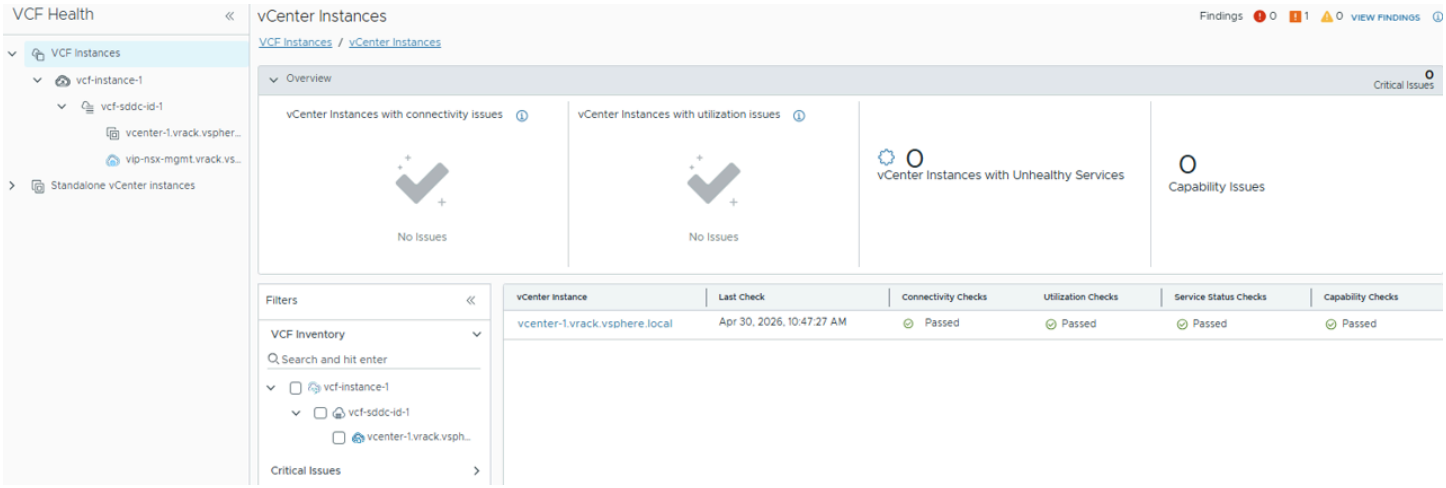
The count of configured components only includes components that are accessible. You also see a count of failed forward and reverse lookups, evaluated based on the DNS server with which the VCF Operations appliance is configured. The DNS lookups report failure if the PTR or A record lookups do not return a value.

## vCenter Health in Diagnostics

With **VCF Health**, you can track data for connectivity, utilization, and services in a vCenter system that you cannot derive from any individual tool for vCenter monitoring.

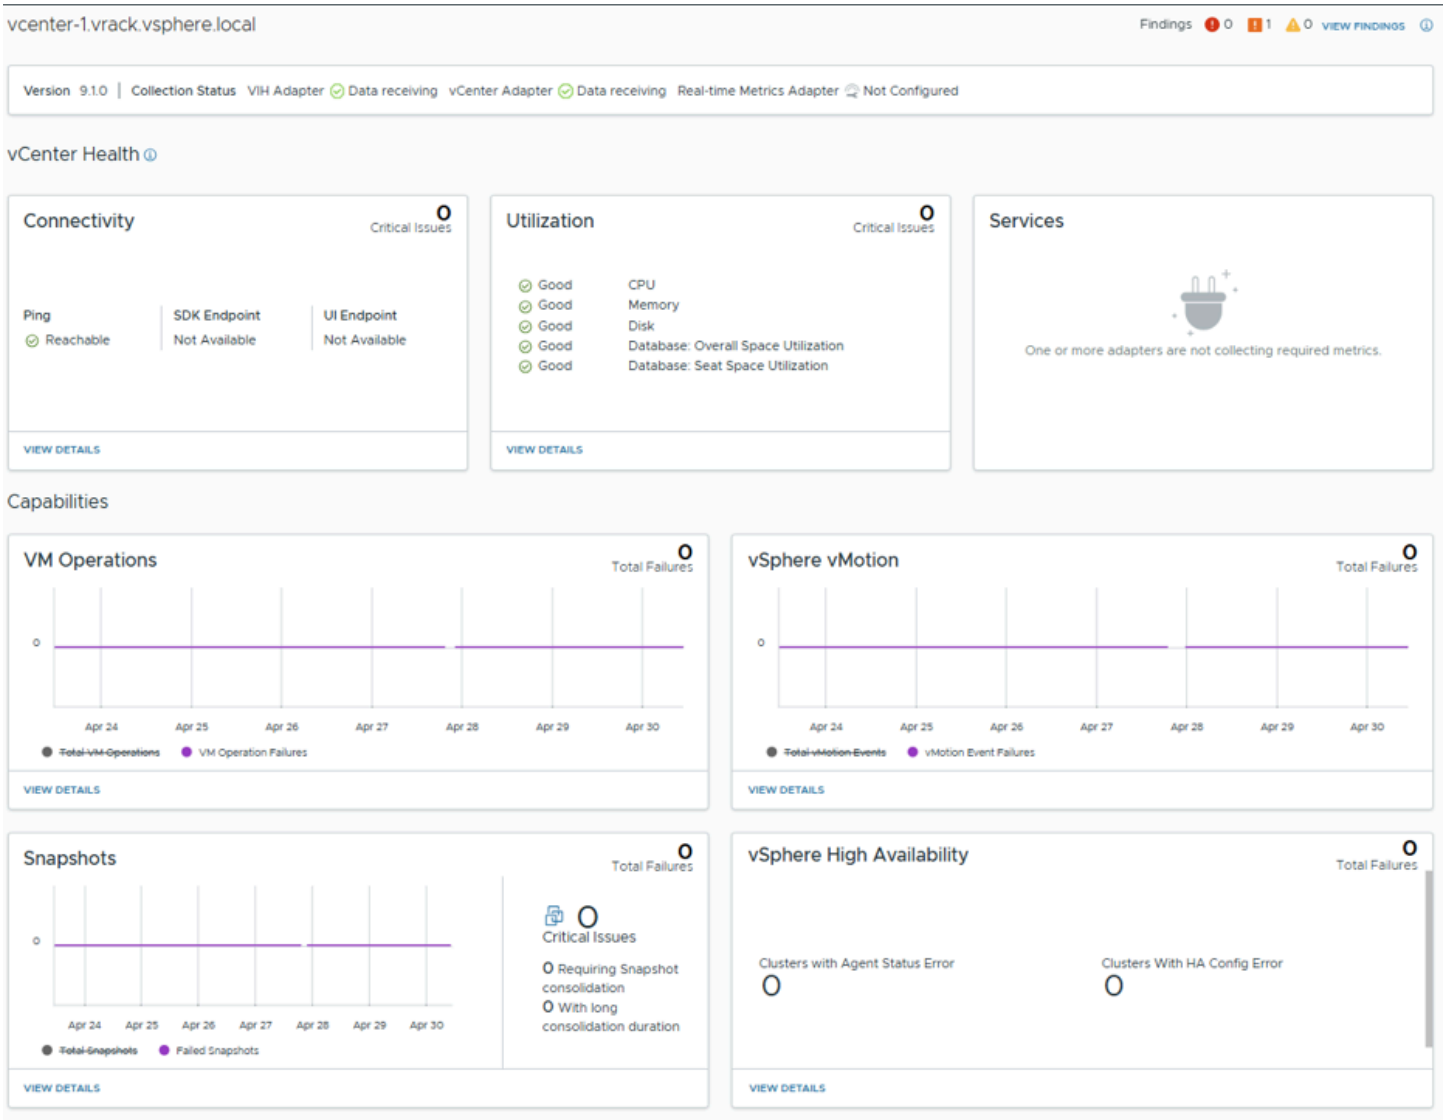
vCenter is the key object for monitoring and reporting as it is the key building block in a VCF platform. **VCF Health** helps you with that task and adds value by providing data for connectivity, utilization, and services that you cannot derive from any individual tool.

**Figure 456: vCenter Instances View in VCF Health**



Given the complexity and size of VCF deployments, testing multiple vCenter instances for reachability might be challenging. Especially if you want to confirm all aspects - networking, user interface, and API, since one does not guarantee the rest. For example, API calls to a vCenter instance might be successful, but the vSphere Client might not be reachable. Such cases might indicate issues with the vCenter services or the vCenter database.

**Figure 457: Individual vCenter Instance Level View**



## Connectivity

In the **Connectivity** screen, you see the connectivity trend over the last seven days. The data tracks the reachability of vCenter instances by network, UI, and API.

VCF Operations Health and Diagnostics 9.1 adds endpoint monitoring, replacing the ping reachable/unreachable check to the vSphere Client and APIs. The SDK/API endpoint metrics track any internal or external integration of your environment that uses API calls. The UI endpoint metrics track the vSphere Client endpoint availability, focused on vCenter. Availability by ping and UI is scored from 0 to 100 points. The check includes the `HTTP 503 Service Unavailable` server error response, and the `HTTP 429 Too Many Requests`, when API session limits are reached.

Pings to a vCenter instance check if the vCenter virtual machine is powered on and available online. Pings to a vCenter instance also check if all vCenter services are active and if the vSphere Client is responsive. Since many of the VCF integrations also occur by using APIs, VCF Health checks reachability by API.

You can drill down data for each reachability alternative and can investigate any unexpected sustained outages by reviewing findings for known issues or can use recommendations for general troubleshooting.

**Note:**

Data on the **List of failed API for SDK/UI endpoint availability** table depends on the log management adapter. Make sure that the adapter is in a connected and receiving state.

**Utilization**

In the **Utilization** screen, health and diagnostics measures thresholds for CPU, Memory, Disk, and Database space usage, so you can easily identify issues that might result from a memory leak or a scalability issue, and to proactively resolve issues before they occur.

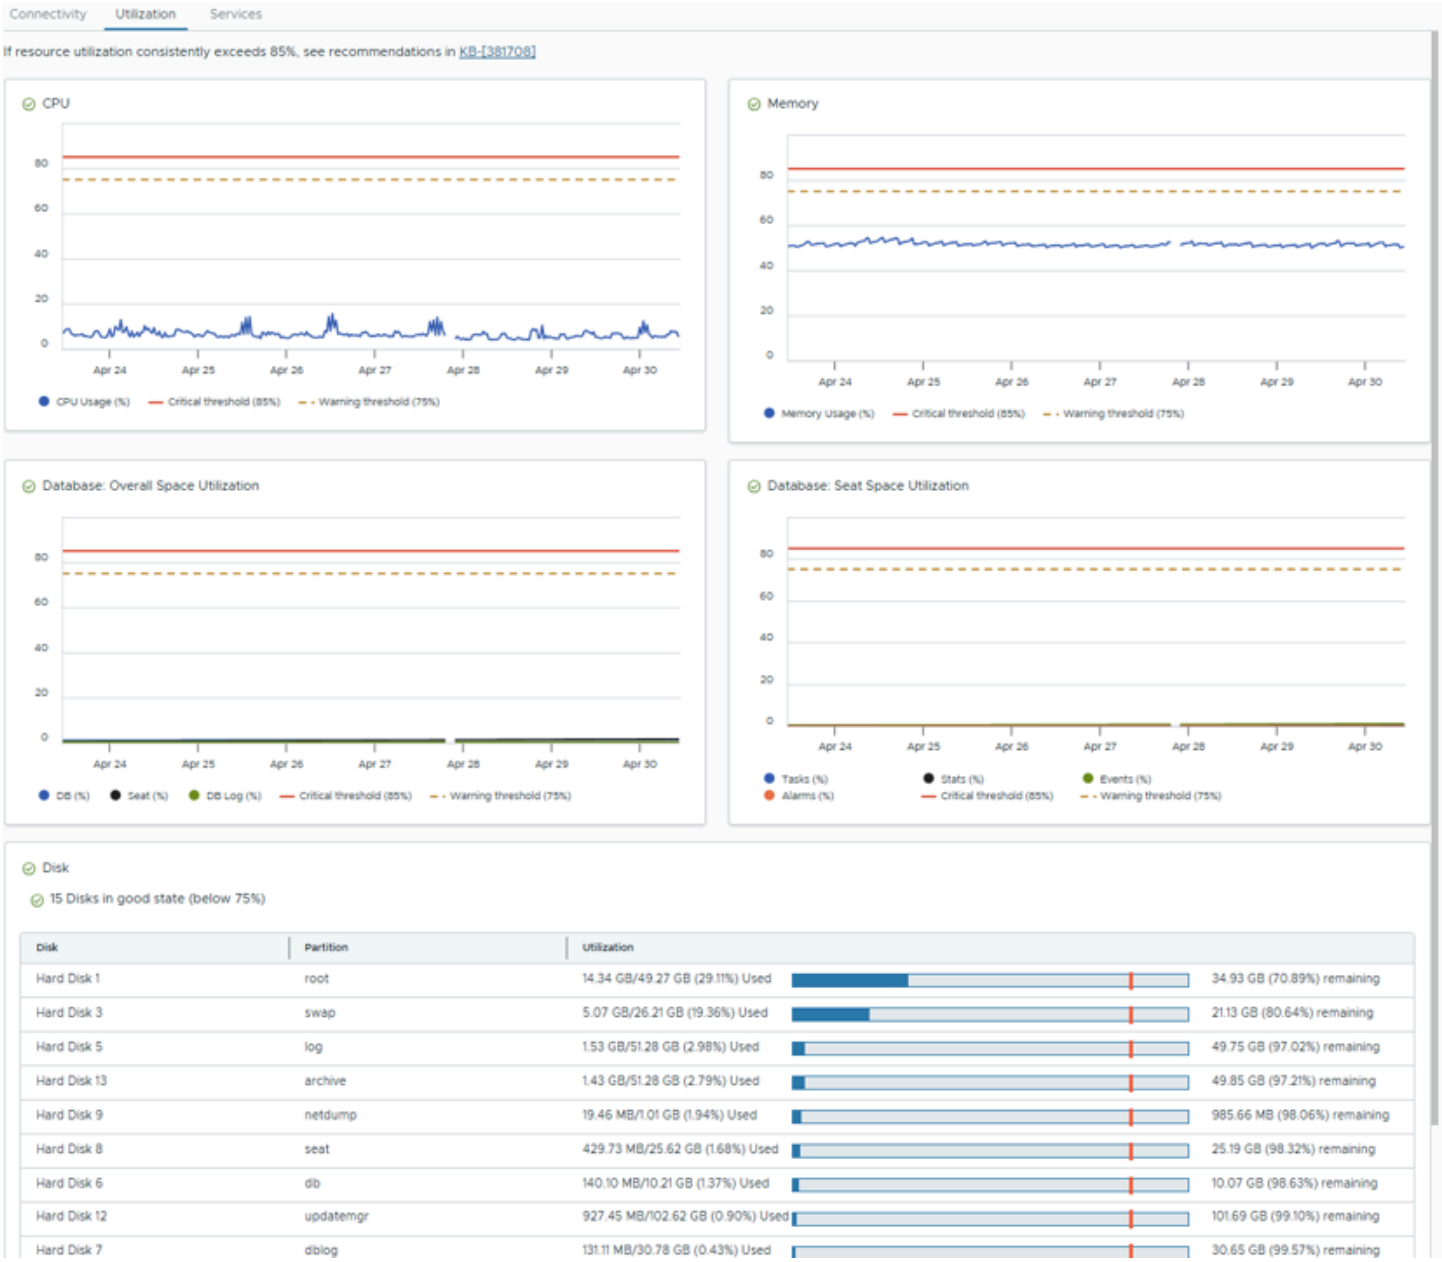
VCF Operations Health and Diagnostics 9.1 enhances the usability of the **Utilization** screen by providing details in condensed charts that give all information in one layer. You no longer have to drill down to see details in multiple charts and layers.

**Note:**

VCF Health supports the CPU, Memory, and Disk metrics on the **Utilization** dashboard under **vCenter Health** only for environments that migrate from vCenter 8.0 Update 3 and later.

The panel of each metric gives you a seven-day overview of the utilization against a warning threshold of 75% and a critical threshold of 85%. Charts are similar to this sample:

**Figure 458: CPU utilization panel**



The utilization of the vCenter Database is presented in two charts: one for the overall utilization of the vCenter DB, DB logs, and Stats, Events, Alarms, Tasks (SEAT), and another for SEAT alone, with a breakdown for each category.

The **Disk** chart is different from the other charts in the **Utilization** screen, because it provides a breakdown of the current utilization of all virtual disks in the selected vCenter instance and prompts immediate action, unlike the other charts, where you see historic results and act retroactively.

Click the **Check Recommendations** button in each metric panel to get guidance on remediation steps.

### Services

In the **Services** screen, you see the health and run state of the critical vCenter services over a period of seven days, which allows you to take immediate action on any currently unhealthy service or follow the health trend to monitor if any service is repeatedly unhealthy, or unhealthy for a prolonged period. You can troubleshoot by using the KB article available in this screen.

With VCF Operations health and diagnostics 9.1, the list of services covers all 17 critical services for vCenter, including some of its related capabilities such as the vSphere Supervisor. For more information, see KB 381709.

VCF Operations Health and Diagnostics 9.1 provides data that allows you to investigate the warning and critical states. For example, see a Memory utilization chart for the specific service that helps you realize that a certain memory limit is reached. Each service has its own set of metrics.

> **Note:**
>
> For vCenter 9.1, a Critical status is reported when the vpxd service memory, connectivity, or thread utilization exceeds 85%. Warning status is between 75% and 85%. Checks run on every 5 minutes. In earlier versions, the health status of the vpxd service was collected periodically from the vCenter Appliance Management Interface.

Status of Healthy, Warning, and Critical is based on the memory and connection state of services. The health status of vCenter services is calculated differently in VCF Operations for health and diagnostics, based on data from the Real-time metrics adapter, than in vCenter. You might see different statuses when looking at an individual service in the vSphere Client or the Virtual Appliance Management Interface.

You can drill down to see the health graph for each service.

> **Note:**
>
> The health charts depend on the Real-time metrics adapter. Make sure that the adapter is in a receiving and connected state.

### Capabilities

On the vCenter instance level, you can follow through with monitoring specific aspects of infrastructure and performance, covering:

- Virtual machine (VM) operations
- vSphere vMotion
- Snapshots
- vSphere High Availability

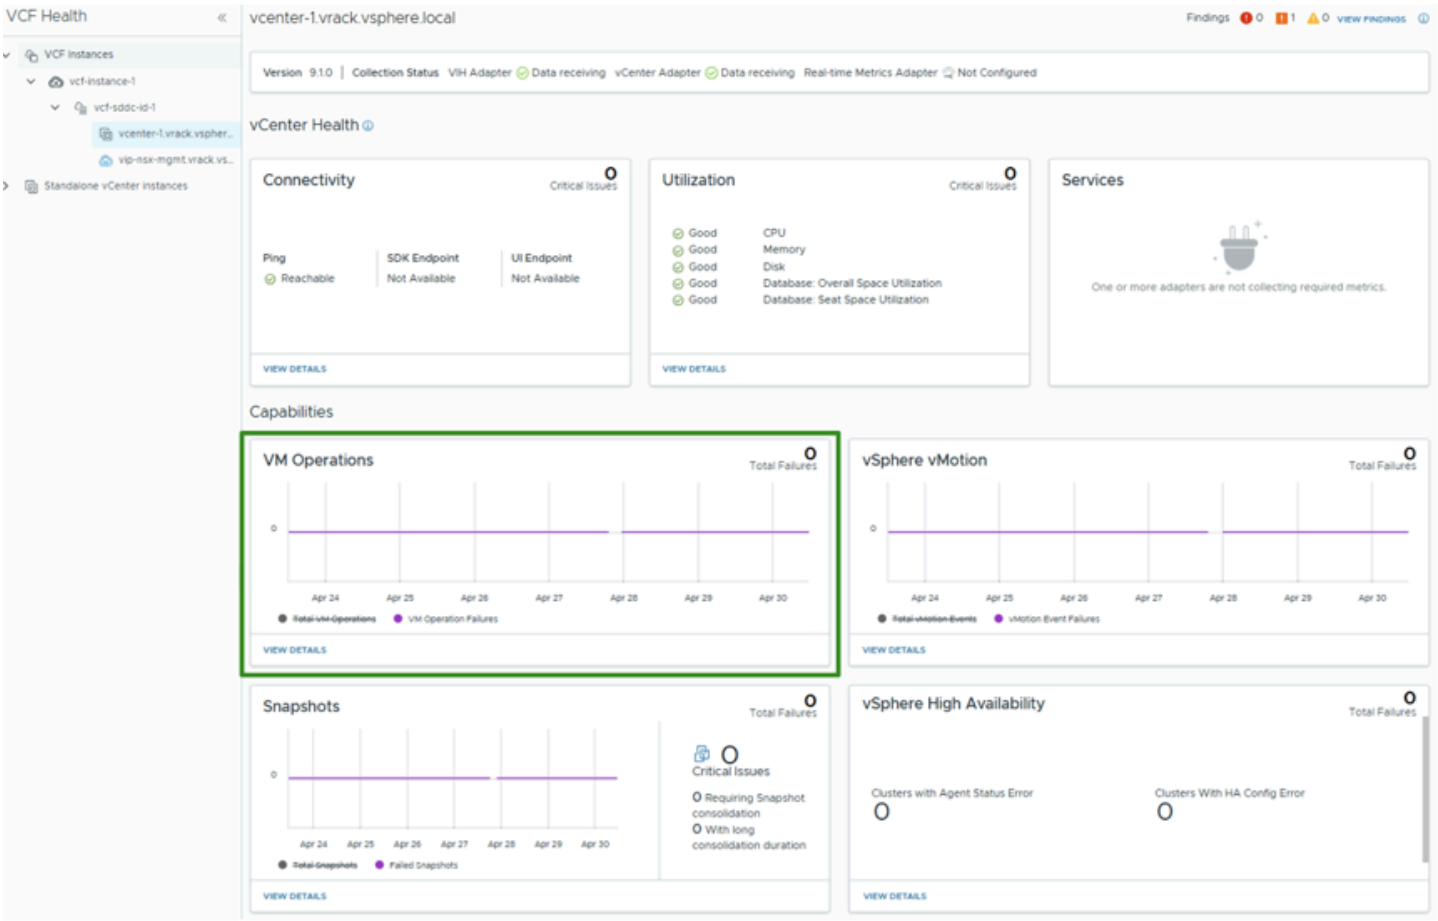
In each tile, you see an overview with data for the past seven days. You also see a ranking in each capability for the highest number of incidents, or most impactful issues, or objects with the highest number of failures.

## Virtual Machine Operations Health in Diagnostics

With VCF Operations health and diagnostics, you can track data from all tasks to create, delete, power, and reconfigure virtual machines in a vCenter instance.

**VM Operations** under **Capabilities** on vCenter instance level replaces the legacy **Workload Operations** tile in Diagnostic Findings 5.2 and later. **VM Operations** covers the entire span of tasks to create, delete, power, and reconfigure virtual machines in a vCenter instance.

**Figure 459: VM Operations Tile in VCF Health**



The VM Operations data allows you to catch issues before they occur during large or automated deployments. Often workload operational tasks are not run by a VCF admin, but from VCF Automation agents, or API tools, which create and destroy VMs in large numbers.

For example, from VM Operations you can spot when a blueprint that an automation workflow uses is failing, which might prevent production-down scenarios. With VM Operations, you see the balance between VM provisioning requests that succeed and fail, which gives you a reliable means of identifying such potential issues. In addition, you can drill down to see the distribution of failures by cause or type of initiator. You also get specific recommendations on the type of operation, such as Reconfigure, which further helps you troubleshoot existing or to catch emerging issues.

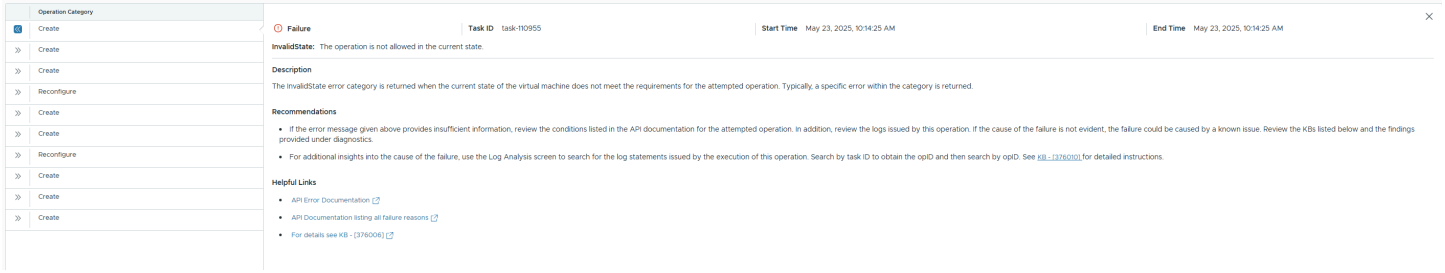
VM Operations monitors vCenter tasks and reports such that fail with context details and the respective error message, so you can proactively troubleshoot a potential issue before it occurs. To help you better understand of root cause of a failure, every report includes a link to the vCenter API documentation for the API that was invoked.

You can also see the distribution of VM Operation failures for the last seven days, the main reasons for failures, and the main initiators with failures.

VCF Operations Health and Diagnostics 9.1 adds the **VM Operations Task ID** parameter that allows a drill-down to particular task. Starting from VCF Diagnostics 9.1, you can also use the **Error Stack** panel to analyze the logs upon a VM failure, in the same screen.

When you expand a row in the grid, you see specific recommendations and links to API docs and KBs that help you identify errors:

**Figure 460: VM Operations Details Screen**



VM Operations covers the following operations, as displayed in the vSphere Client:

Create Operations Failures:

- Apply DRS clone recommendation
- Create New Virtual Machine
- Clone vApp
- Clone Virtual Machine or Template
- Deploy OVF
- Mark a template as Virtual Machine
- Register Virtual Machine

Power Operation Failures:

- Apply DRS power on recommendation
- Power on, off, and suspend virtual machine
- Initiate guest OS shutdown
- Start, stop, and suspend vApp
- Initiate guest OS standby
- Hard stop virtual machine
- Reset Virtual Machine
- Reboot Guest

Delete Operation Failures:

- Delete Virtual Machine
- Unregister and Delete Virtual Machine
- Delete and unregister vApp

Reconfigure Operation Failures:

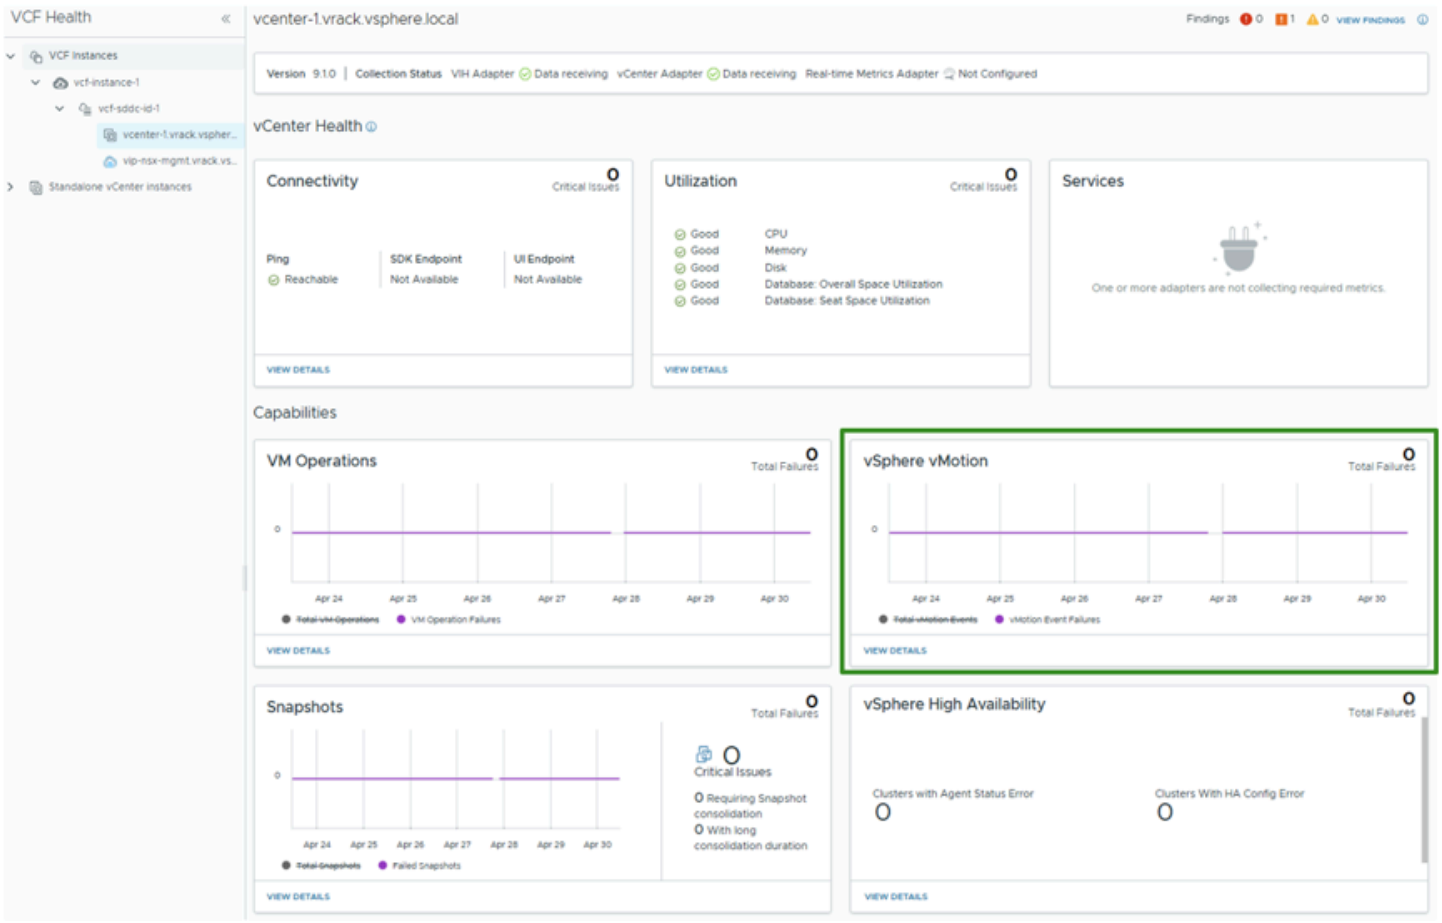
- Reconfigure Virtual Machine
- Attach or detach a virtual disk
- Update VM Hardware version
- Guest OS operations, such as VMware Tools and Guest OS Customization

## vSphere vMotion Health in Diagnostics

With vMotion Health, you can directly see the root cause of vSphere vMotion failures instead of running multiple checks or calling support.

In the **vSphere vMotion** tile under **Capabilities** on vCenter instance level, you see data from vCenter events and log statements that are collected and analyzed to help you troubleshoot possible failures. The span of vCenter monitoring under **Tasks and Events** is relatively short and vSphere vMotion failure events roll over quickly. You might not identify an issue before you see an impact on the operations, such as applications slowing down or failing. vMotion Health provides you with this capability at a glance, allowing you to see critical issues as they emerge.

**Figure 461: vSphere vMotion Tile in VCF Health**



Critical issues indicate definite failure of vMotion tasks. If such an issue affects either the source or destination host, or the connection between them, VM migrations fail. Warning issues indicate a possible failure, depending on the VMNICs, configuration, and connectivity.

> **Note:**
>
> If you see no vMotion operations available on the screen, confirm that you have configured log management to collect events from your vCenter instances.
>
> If you see no time or bandwidth values available for successful vMotion operations, check if log management receives events from vCenter instances.

In the **vMotion** screen, you not only get all data in real time, but also see breakdown by status, failed or success, and by reason, such as **Invalid state** or **Invalid Power state.** You also see a description of the possible issue and recommendations for resolution. In the success scenario, you see data for the pre-copy time, pre-copy bandwidth, and switchover time. These metrics help you see how well your infrastructure is configured and provide insight into why a vMotion could take longer than expected.

For example, an increase in the pre-copy time and switchover time compared to earlier vMotion tasks of the same VM indicates a possible issue with your physical network and infrastructure: it might be a physical switch too busy or a NIC driver dropping packets. Or, it could be that the vMotion task was run while the VM was issuing many writes or the source/destination hosts were overloaded at the time.

For failure scenarios, you see the type of failure, such as timeout, and an explanation of this failure type. For failure types that can result in a vMotion task timing out, VCF Health provides a troubleshooting flow.

From the cluster level in the details grid, you see the Configuration and Connection checks, which create an inventory of issues on several categories. These checks evaluate both the source and destination host that is involved in the task, including VMkernel port groups, network connectivity, and jumbo frames. You can expand each of the checks and can see details. For example, you might see that the root cause for a failure are MTU of different sizes, 9000 and 1500.

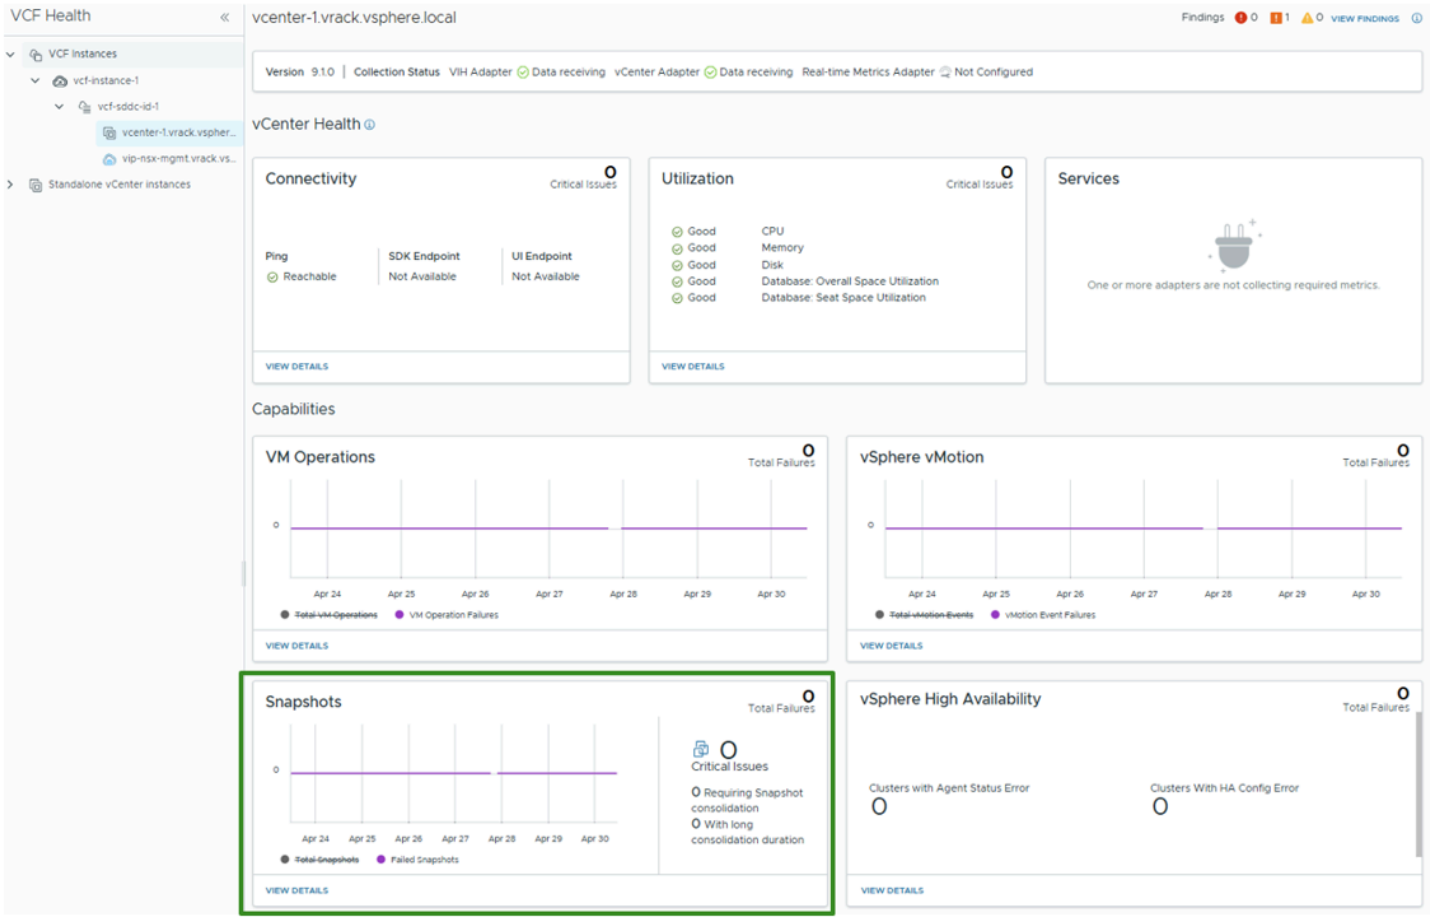
Other important vMotion health checks are available in the **Findings** tab. If the troubleshooting flow reports no issue, review the manual and auto-refreshed findings on vSphere vMotion. After the troubleshooting is complete, you can see the details on recommended steps to fix the parameter after you click **Check Results**. You can export the results or can rerun the troubleshooting.

## Virtual Machine Snapshots Health in Diagnostics

With VCF Operations health and diagnostics, you can track long-running snapshot delete, create, and consolidation operations, and details on failed snapshots, or disks in need of consolidation.

VCF Health monitors vCenter snapshot tasks of every virtual machine, VMs that need consolidation, and VMs with too many or too large snapshots. Similar to vSphere vMotion tasks, you cannot consistently track snapshot operations in the vCenter **Tasks and Events** because they are rolling over fast, and you come to know about an underlying issue with snapshots too late. Snapshots in production environments are not best practice, but any VM backup software uses snapshots and such use drives a serious number of support requests.

**Figure 462: Snapshots Tile in VCF Health**



In the **Overview** panel of the **Snapshots** tile under **Capabilities** on vCenter level, you see a list of critical issues that are related to snapshots and the following data for the last seven days:

- Ratio of failed snapshots
- VMs with most failed snapshots
- Top initiators of failed snapshots
- A chart for the deletion and consolidation time.

### Snapshot Operations

In the **Snapshot Operations** screen, you see the status of ongoing snapshot delete, create, and consolidate operations, and details on snapshots that have failed. You can filter out snapshot operations that run for 4 or more hours. Such operations might be a business problem and might require to consider a cancellation of the operation. To see data latency of the source data stores, click **Check** under the **Check Latency** column of the detail grid. You can see relevant data such as the actual data store latency, I/Os for the VM, and the overall write I/O load for the data store. Assess if networking, storage, or system contention are increasing the time to complete the operation. If networking or storage issues are suspected, you might need to involve your infrastructure team or vendor.

For snapshot failures, you see the error that vCenter reports. You can expand each row in the data grid to see details on the error and recommendations for troubleshooting. Recommendations include KBs and links to API documentation, similar to the other detail grids in **VCF Health**.

> **Note:**
>
> The list of snapshot failures does not include snapshot delete operations that fail during the second step of a delete operation. In the first step, snapshots are removed from the snapshot tree, and the second, snapshot data is consolidated to the parent snapshot. If a snapshot delete fails in the second step, vCenter intentionally reports the task as successful and issues events to warn about the failure. The **Snapshot Operations** screen does not report this type of failure. When a failure occurs in this second step, such VMs show in the **VMs that need consolidation** screen.
>
> If the underlying datastore is using native snapshots, long-running snapshot delete and consolidate operations are not expected. Native snapshots do not involve the movement of data when deleting snapshots.

For failed events, VCF Operations health and diagnostics 9.1 adds the task ID, which is linked to the respective vCenter instance and provides all details on the failed task in the same screen. In addition, the details screen includes the **Fault stack trace** section, where you directly see the error logs. This section saves you logging in to a shell of an ESX host and using ESXCLI commands to get the logs, which requires training and experience. Even if you need to contact the support team, you can do so with the logs and details ready.

### VMs needing consolidation

In the **VMs needing consolidation** screen, you see the allocation of VMs on datastores and the free space so that you can decide whether to run a consolidation.

Snapshot delete operations can fail if the space on a datastore is not sufficient to consolidate the disks. You can use the **VMs needing consolidation** screen to determine the storage used by a VM on each of its datastores. Space can be freed up on a datastore by consolidating VMs with smaller footprints first, deleting all snapshots, or moving the disks to other datastores. Act before the free space falls below 200 MB.

When consolidation is initiated, the task might take long, depending on the size of the disk and the data store performance. Consolidation tasks might also affect latency and some tasks that take seconds might turn into minutes. In the **VMs needing consolidation** tab, you can see such conditions and can prevent them from aggravating. For example, you can:

- Reduce the number of users accessing an application,
- Schedule a consolidation window and inform users not to access the app,
- Move to other VMs from the data store.

The view also adds the **Max data to consolidate** parameter for the running consolidation so that you make sure to allocate the necessary space and avoid memory outages.

### VMs with Snapshots

VMs with too many or too large snapshots can cause performance and storage issues.

You might not know that a VM runs on a snapshot: for example, when a backup software takes care of snapshots. Snapshot files can also significantly increase in size with every snapshot taken and by the time of consolidation, the size might become huge. The unhandled volume of such automatic snapshots can affect the performance of the VM and other VMs in the same datastore. To provide visibility on such scenarios, VCF Operations health and diagnostics 9.1 adds tracking of the number of snapshots per VM, the pace of growth in size, and the biggest VMs with snapshots.

In the **Overview** panel of the **VMs with snapshots** tab, you see VMs with fast-growing snapshot sizes, the biggest VMs in terms of snapshot size, and VMs with more than three snapshots. These metrics help you prevent a situation when a datastore goes out of space due to unattended snapshot issues.

In the details grid, you get all metrics that you need to decide how to handle VMs with large snapshots that might affect your environment.

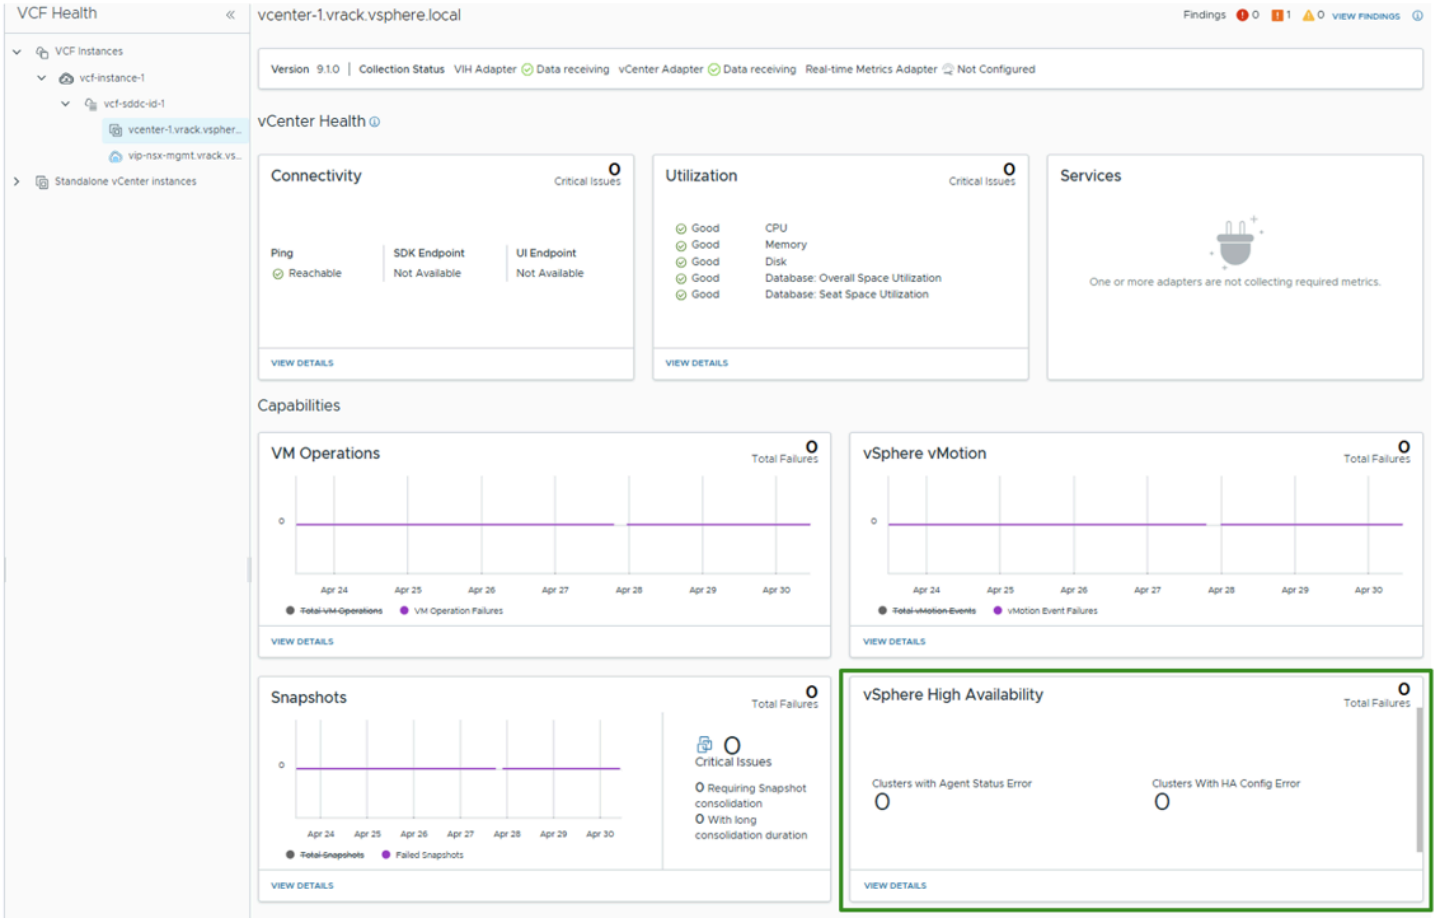
## vSphere High Availability Health in Diagnostics

vSphere High Availability metrics help proactive identification of issues and preventive resolution from a view that lists all high availability clusters with their operational state.

In the **vSphere High Availability** tile under **Capabilities** on vCenter instance level, you see all configuration issues and High Availability agents with errors.

You can drill down to specific configuration issues or agent errors per cluster by expanding the details grid on the landing page.

**Figure 463: vSphere High Availability Tile in VCF Health**

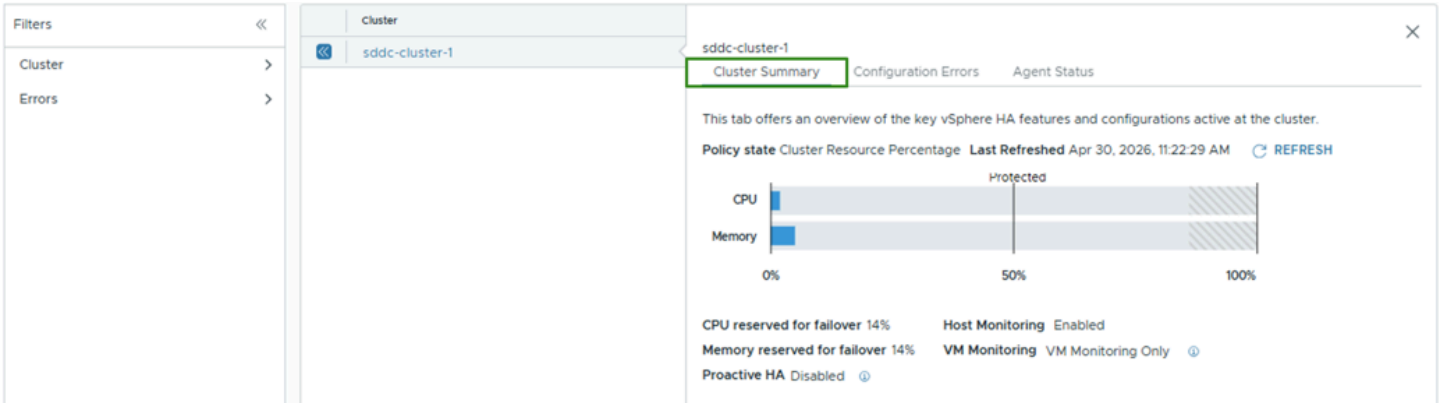


In the detail view per cluster, under the **Cluster Summary** tab, you can see a summary of the cluster in terms of CPU and Memory reservations, and policies.

**Note:**

The CPU and Memory chart data depends on the HA configuration policy. You can see the current policy in the **Admission Control Policy** field on the cluster level in the vSphere Client, before you drill down to the details view.

**Figure 464: Cluster Summary View**



In the other tabs, **Configuration Errors** and **Agent Status**, you see cluster and host-specific configuration issues, and agent status, along with recommendations for resolution.

> **Note:**
>
> Diagnostics track a curated list of critical HA configuration issues that require immediate attention. In the vSphere Client, you might see more HA configuration errors but they might not be critical.

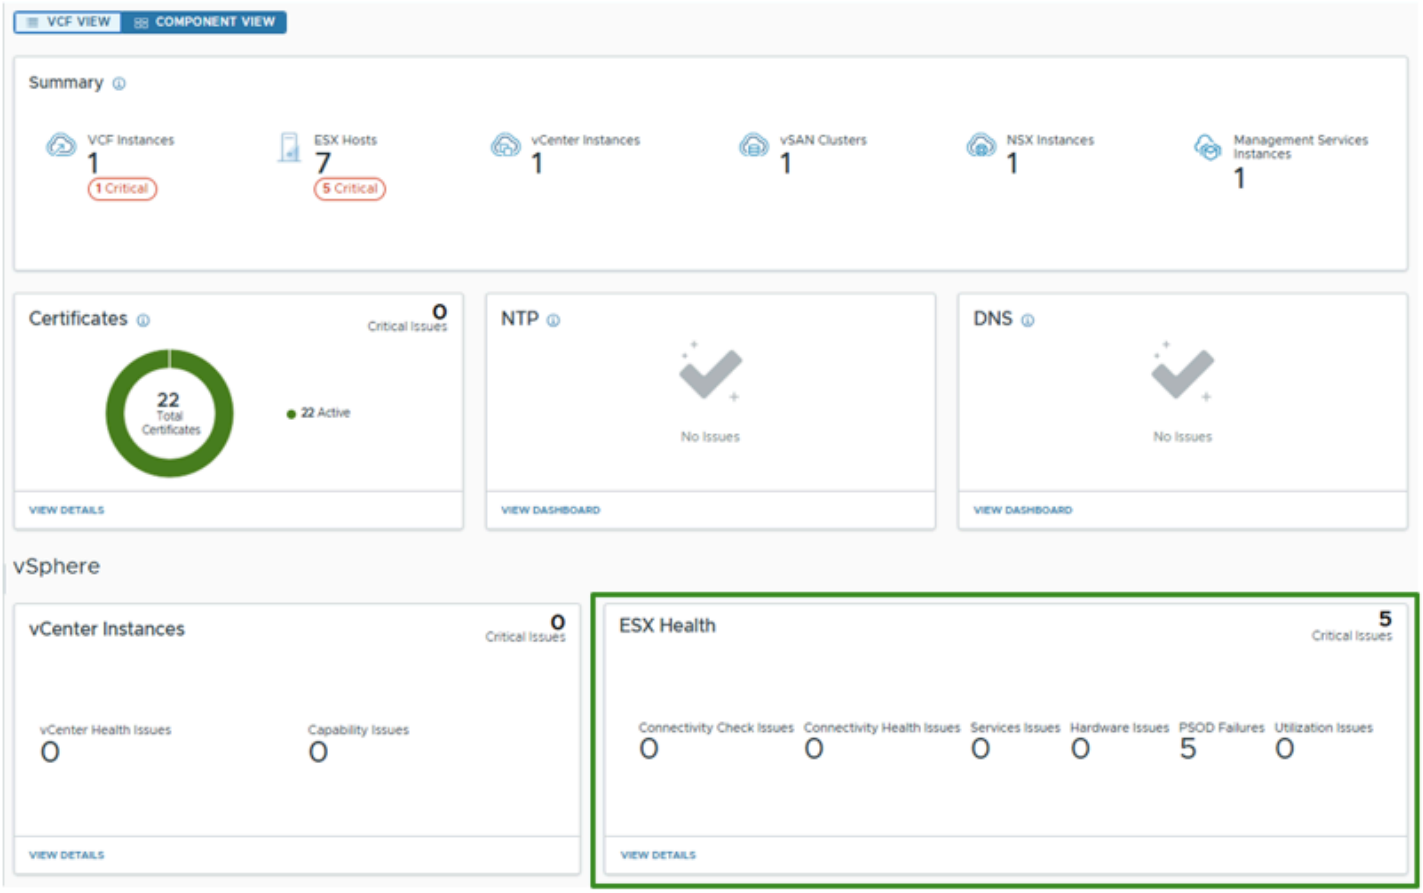
In both sections, you can use the **REFRESH** button to get the latest list of issues and respective recommendations, and the **DOWNLOAD OUTPUT** button to export the list.

## ESX Health in Diagnostics

With VCF Operations health and diagnostics 9.1, you can monitor all ESX hosts in your environment in a single screen, diagnose all aspects of operation and performance, and proactively resolve issues.

VCF Operations Health and Diagnostics 9.1 adds a gateway to monitor the operational state of ESX hosts across your environment. You can track the connectivity and availability of ESX hosts and the state of critical services in a single screen.

**Figure 465: ESX Tile in VCF Health**



ESX metrics are available in several layers of progressive disclosure. You start from a landing page with a summary of the critical issues for the entire fleet. Next, you can see a breakdown by metric on the level of a VCF instance or domain. Finally, you can get to detail on specific checks for capabilities and services for each ESX host.

The **ESX Health** tile on the VCF instance and domain levels summarizes the critical issues that impact availability and connectivity of ESX hosts, which are grouped in the following categories:

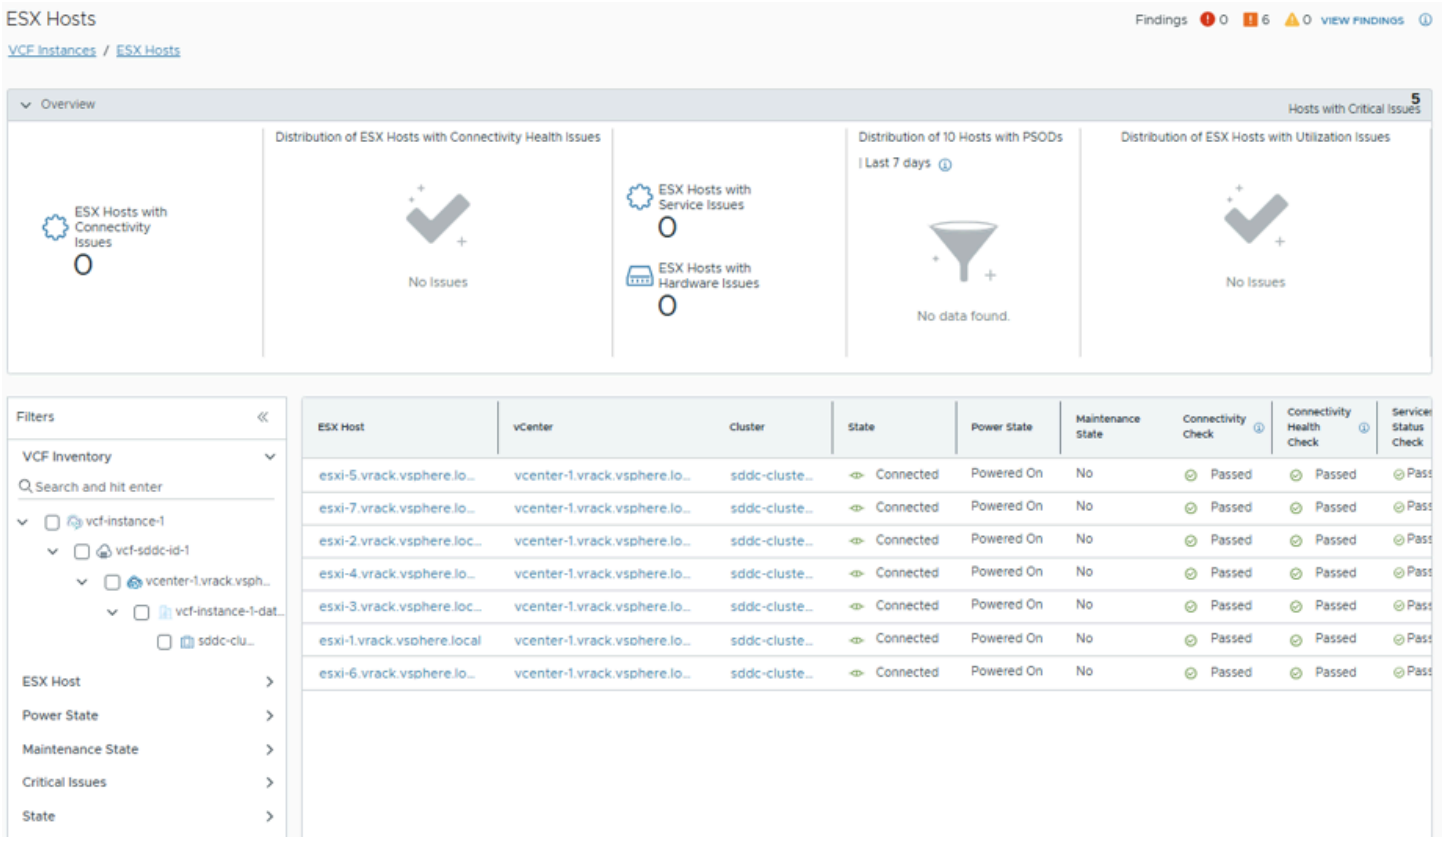
- Reachability
- Connectivity
- Services
- Hardware (Memory and SSD)
- Purple Screen of Diagnostic Failures (PSOD)
- Utilization

For each category, you can drill down to see health details, investigate the root cause, and get guidance for resolving the issues that you identify.

When you click **View Details** on the ESX tile on the **Component View** on a VCF instance level or on a domain-level page, you end up on the **ESX Hosts** page. This page lists all hosts in the selected instance or domain, and summarizes results from checks that run every 5 minutes for each ESX health category. You can see a summary of the critical issues, but also a breakdown of the results from the checks for each host in the details grid below the **Overview** panel.

The **Filters** menu in the left-hand side of the details grid mirrors the columns in the grid to allow you quickly getting to specific insights.

**Figure 466: ESX Details View**



From the host-level page, you have three levels of drill-down:

- When you select an ESX host, you get a details page, where you see the breakdown of issues per category or service. You also see an NSX-specific panel, and separate tabs for health-related, and network-related checks and statuses.
- You can drill down to health-related and network-related checks and statuses:
  - From the **Health** tab, you see groups of ESX-related checks that return either a system status, such as `Expired` for certificates, or an operational status, such as `Critical` for the hostd service, which indicates that the hostd process is down on the given host.

    The ESX-related checks are grouped as follows:
    - Connectivity: Checks the connection state between ESX hosts and vCenter, VCF Operations, and NSX.
    - Connectivity Health: Checks certificates, NTP, and DNS health to avoid issues that expired ceritifcates, NTP drift, and DNS reverse lookup might cause, such as failing vSphere vMotion tasks.
    - Services Status: Checks the three key daemons that work to manage compute and storage in your environment.

      **Note:**

      To get data for the Services Status section, you need to obtain an API session token by making a POST request to the vCenter REST API endpoint `https://<vcenter-ip-or-fqdn>/api/session`. Using that token, you can connect to ESX hosts and get the health report for each host for each service. The report is generated on each ESX host, and the API is exposed by the ESX hosts. These reports do not exist in vCenter and require a separate connection to ESX hosts. You can use a Cloud Proxy to handle restrictions such as firewalls, but such proxies also needs to first get a vCenter token to ensure connectivity.
    - Hardware Status: Checks the memory, SSD storage, and hardware sensors health.

VCF Operations health and diagnostics 9.1 also tracks the most impactful operational state, which is the failure of ESX hosts with a purple diagnostic screen. In the **PSOD (Purple Screen of Diagnostic) Failure** tile, you can see a **Warning** flag for PSOD events in the last seven days or a **Critical** flag, which indicate three or more PSODs in the last 15 days or invalid core dump target configuration. For the core dump target, either a file or partition is missing or is set at less than the minimum size that you see in the tile.

**Note:**

Always set up a scratch partition when installing ESX. The scratch partition collects the core dumps on persistent memory, as opposed to RAM, and allows better traceability of PSOD events.

If the core dump target configuration is not valid, you see the PSOD Status as Critical.

When you click on **View Details** under the **PSOD (Purple Screen of Diagnostic) Failure** tile, you can see the PSOD stack trace and history. From the PSOD details tile, you can also navigate to **Findings** to check for an underlying known issue.

  - From the **Network Stats**, you see charts of the Host CPU and Datapath CPU usage over the past seven days with a threshold of 85% utilization that triggers a Critical status.
- For operational issues, each section in the host-specific view provides either:
  - A KB to troubleshoot or resolve an unhealthy or critical status;
  - A link to a details page, where you see the current status, historic status, description of the status if unhealthy, and recommendations for resolution.

ESX metrics also provide a series of data that is important from the perspective of NSX:

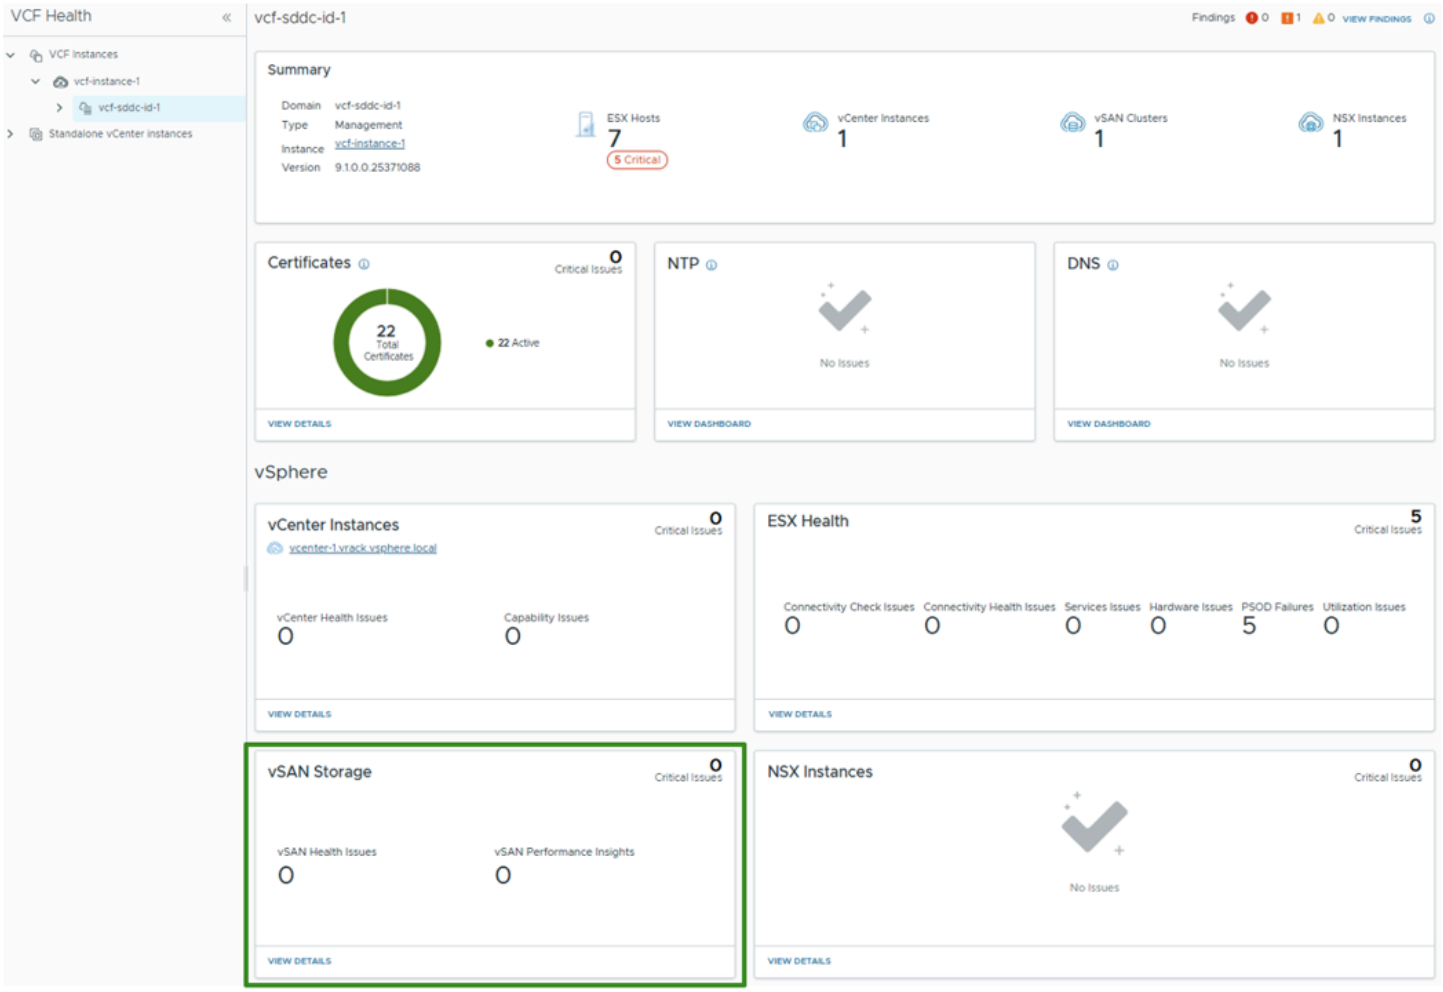
- The details grid on the **ESX Hosts** landing page adds the **Tunnels** column that tracks critical issues with NSX tunnels.
- In the **Summary** panel of the domain-level page, you see NSX-related data, such as running state of NSX tunnels, PNIC/Bond, and TEP IP.
- The **Network Utilization** tab of the ESX landing page adds a section for PNIC Network Statistic, the physical network tile of ESX hosts. This tab provides interface statistics, such as bits per second, packets per second, and dropped packets percentage.

## vSAN Health in Diagnostics

VCF Operations Health and Diagnostics 9.1 gives you a single pane of glass for any vSAN-related monitoring, issue detection, and troubleshooting tasks.

VCF Operations Health and Diagnostics 9.1 builds on the **Storage Operations** capability, which is a centralized monitoring console that is configured to observe storage across VCF deployments. **Storage Operations** removed the limitation that vSAN performance and health metrics were only available in vCenter instances. Collecting vSAN data required logging in to each vCenter instance. Such a task was difficult, but also unreliable, because in this case you do not find the most urgent issues first. VCF Operations Health and Diagnostics 9.1 gives you all operational data and insights at a glance. You can see the actual health status of all storage clusters across the fleet at any time, and can act on the most urgent ones without a delay. And you can drill down from the high-level metrics to specific clusters and vCenter instances from a single screen.

**Figure 467: vSAN Tile in VCF Health**



In VCF Operations health and diagnostics 9.1, **Storage Operations** is integrated with the **VCF Health** capability to add value by combining health scores and metrics with the means of accessing vCenter instances from the same screen. With the combined capability, you can spot a negative health condition in the **vSAN Health** screen, follow up on the root cause, and take guided remediation steps in the vCenter instance.

In VCF 9.1, you have three entry points to vSAN storage metrics. Under **VCF Health**, you can get to the vSAN storage metrics from either the VCF fleet level view or the vCenter level view. You can also get to the vSAN tile in **VCF Health** from **Storage Operations**.

- From **Operate** > **Overview** > **Storage**, you see a summary of the critical and warning health issues, and the count of important performance insights for vSAN clusters.

- From the VCF fleet level, under **Operate** > **VCF Health** > **VCF Instances**, you have two entry points: the **VCF View** and **Components View** respectively:
  - In the details grid of the **VCF View**, when you select an instance with issues that are highlighted in the **vSAN Cluster** column, you get to the **vSAN Storage** view.
    - The **Health** view lists all vSAN clusters for the given VCF instance and provides a details grid with row for each error on each cluster. When you expand a row, you see details on the issue, description, risk if no action is taken, and the impact that the issue has or might have on other issues in your environment.

      **Note:**

      In the **Health** tab, you can set the sequence and number of columns in the details grid by using the **Manage Columns** button. For example, the **Score Impact** column is hidden by default, but you can make it available by managing the columns.

      You can click the **Troubleshoot in vCenter** button to get into the vSphere Client, where you can follow the prescribed remediation directly in the vCenter instance managing the vSAN cluster.

      **Figure 468: Link for Troubleshooting in the vSphere Client**

      You can click the **Troubleshoot in vCenter** button to get into the vSphere Client, where you can follow the prescribed remediation directly in the vCenter instance managing the vSAN cluster.

    - The **Performance Insights** view, you can drill down the inventory to check for specific insights, severity, and type over a given period. Similar to the **Health** tab, when you expand a row, you see details on the issue, description, charts, and a link to the vCenter instance, where you can take corrective action.
  - In the **Component View**, you see a summary of the availability, performance, capacity, and compliance issues across your fleet. When you click **View Details**, you get to the **vSAN Storage** view and can follow up on the health or performance issues respectively.
- When you drill down to the **vCenter Health** view from the VCF instance view, you see a summary of health and performance issues on the vSAN storage for the specific vCenter instance.

For more information, see Monitoring Storage Operations, Configuring a vCenter Account in VCF Operations, and Configuring a vSAN Account.

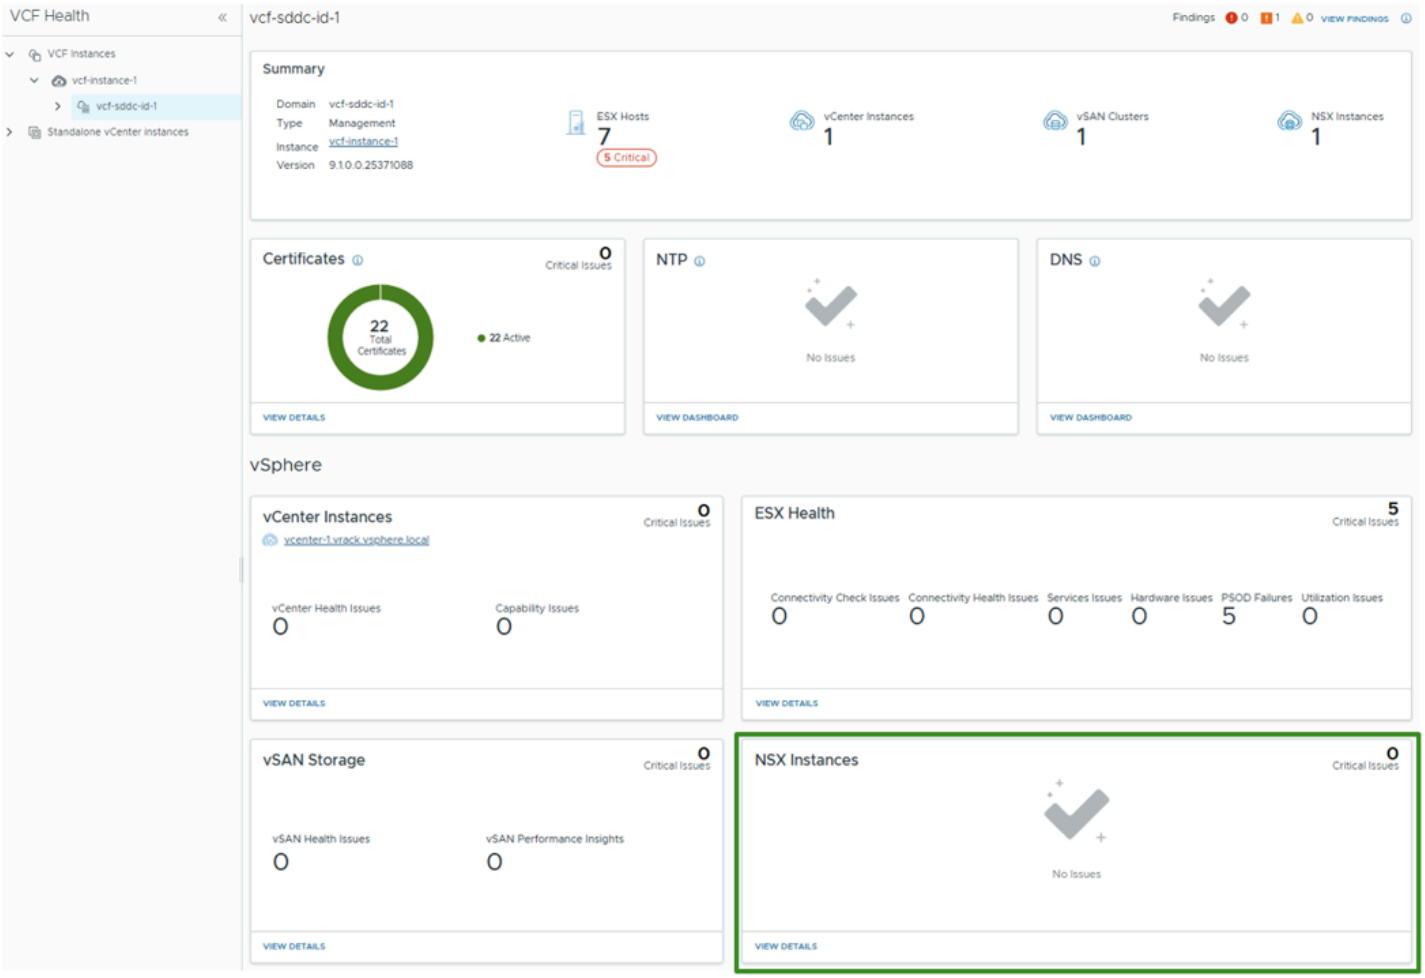
## NSX Health in Diagnostics

VCF Operations Health and Diagnostics 9.1 provides the key metrics for NSX building blocks that help you track points of failure to prevent overutilization and optimize performance in your system.

VCF Operations Health and Diagnostics 9.1 adds a tile with NSX metrics to answer the most important question in infrastructure operations - what is wrong and how to fix it. NSX-related data covers all operational aspects of the underlying infrastructure and appliances, and leads you to resolution such as balancing loads or moving around workloads. NSX metrics in VCF Operations health and diagnostics 9.1 are helpful to both infrastructure admins and NSX

experts. Infrastructure admins can holistically monitor the performance of the VCF environment, while NSX experts can dig into data for troubleshooting and creating action plans based on the real-time metrics.

**Figure 469: NSX Tile in VCF Health**



VCF Operations Health and Diagnostics 9.1 replaces the use of different screens or tools just to get data and adds further value by directly providing actionable insights. The **NSX Instances** tile in **VCF Health** gives you a summary of the critical issues, which require immediate attention across NSX building blocks, and is an instant starting point for troubleshooting.

NSX data is available from two paths:

1. **Operate** > **VCF Health** > **VCF Instances** > **Component View**for infrastructure admins, who need a high-level view of NSX in parallel to other VCF components.

2. **Operate** > **Overview** > **Network**, for networking admins who directly need access to NSX status.

You can drill down to all network-related operational and performance details on component and infrastructure level from both starting points..

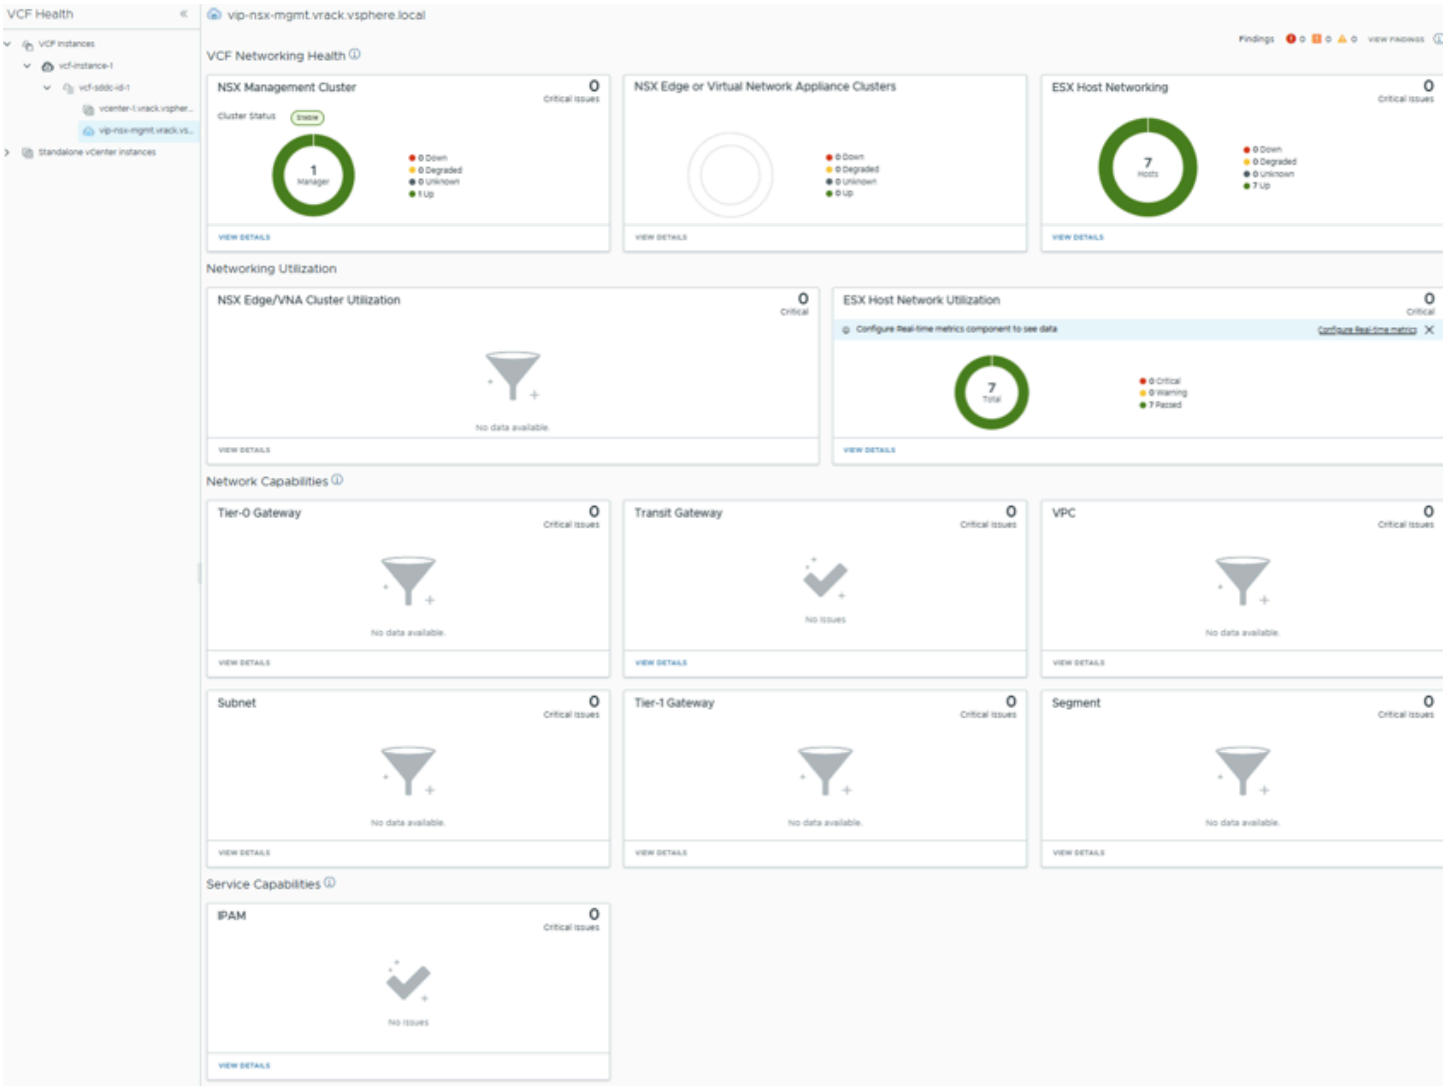
The NSX critical issues are split in four categories: NSX Manager, Edge/Virtual Network Assessment (VNA), ESX hosts networking, and Capabilities.

You get to the NSX tile from the**Component View**in either:

- **VCF Instances**, where you see the critical issues count for each category summarized across the entire fleet
- Individual VCF Instance views, where the summary is narrowed down to the specific deployment.

Clicking **View Details** on the **NSX Instances** tile takes you to the details page, listing NSX instances in scope. You see a summary of the most urgent issues and their type, such as application or capability issues, or NSX Manager issues. A pie chart for each of the metrics provides better visualization for the most urgent or wide-spread ones.

**Figure 470: NSX Details View**



When you drill down to a specific NSX instance, you get to the **VCF Networking Health** screen, which tracks four areas for the selected instance:

- VCF Networking Health
- Networking Utilization
- Network Capabilities
- Services Capabilities

> **Note:**
>
> An NSX instance might stretch across multiple workload domains and the same NSX instance tile appears in each of the domains that use that NSX instance.

### VCF Networking Health

**VCF Networking Health** provides you with data on the operational state, such as cluster and node status, and adds the infrastructure aspect: you get data for underlying networking issues of ESX hosts.

**View Details** on the **NSX Management Cluster** tile under **VCF Networking Health,** takes you to a screen that gives the following information for the management cluster:

- Overview: provides operational statuses for the management node and underlying ESX hosts
- Utilization: tracking CPU, Memory, Disk, and Current Usage Per Partition
- Services: operational and performance status for NSX-related services
- API Metrics, summarizing API requests and response statistics.

**View Details** on the **NSX Edge or Virtual Network Appliance Clusters** tile under **VCF Networking Health,** takes you to a screen that gives operational and performance status for NSX Edge or VNA Cluster.

**View Details** on the **ESX Host Networking** tile under **VCF Networking Health,** takes you to the **ESX Hosts** detail view under the ESX tile in **VCF Health**.

On ESX host level, compute and network details are combined in a single view. ESX and NSX track similar metrics, but apart from the common issues, such as connectivity status, the ESX landing page also shows NSX-specific metrics such as Tunnels and Utilization. The ESX landing page provides an NSX-specific summary of the NSX versions, tunnels, PNICs, and Tunnel End Point (TEP) IPs in your environment.

If you want to drill down to utilization metrics, in the **ESX Hosts** landing page you get to the **Network Utilization** tab. This tab gives you a visual representation of historic data on the key performance indicators per host. For example, when your network is dropping packets, you can quickly check if the condition comes from a resource perspective due to a specific utilization issue.

- In the **Interface Stats** tab, you also have the key metrics that are related to packet drops, such as packets per second, bits per second, or dropped packets percentage. For each metric in the **Statistics** column, data is provided in five-minute intervals and the **View Details** button provides time series data over a period of time.
- In the **Resources** tab, you can see if the cause for current networking issues is the CPU utilization of the ESX host.

### Networking Utilization

If you want to focus on troubleshooting network-related utilization issues, the **Networking Utilization** section combines the **NSX Edge/ VNA Cluster Utilization** and **ESX Host Network Utilization** views.

When you click **View Details** on the **NSX Edge/ VNA Cluster Utilization** tile, you can get to a specific NSX edge or VNA cluster view. When you drill down to a particular cluster, you can see the specific status and configuration details, and the underlying ESX host information.

The **Network Utilization** tab provides edge datapath and service metrics. The datapath metrics provide usage details around datapath CPU, memory pools, interface statistics, and and insight to NSX Capabilities such as T0, T1, and VPCs configured to use the edge node. Service metrics provide information about services CPU, memory, and associated Load Balancer usage.

When you drill down into the edges, you can bridge the operational state with performance issues. If an edge is down, you can see what is the cause. For example, you can see that an edge is down because of a connectivity issue or an issue with the underlying ESX host. This association can be found on the overview tab for easy navigation.

### Network Capabilities

In the **Network Capabilities**, you see details on:

- Tier-0 Gateway
- Tier-1 Gateway
- Transit Gateway
- VPC
- Subnet
- Segment

Each tile in this panel tracks the Realization Status and Runtime State of the capabilities and gives you an immediate entry point to troubleshoot critical issues.

### Services Capabilities

VCF Operations health and diagnostics 9.1 also adds a view to track details on the IP address management (IPAM). You see where each IPAM is used, the realization status, and the percentage of usage so that you can quickly spot issues and act to resolve them.

Some scenarios, related to each screen, with recommended resolutions, starting from the NSX instance level:

**Table 1356: NSX Management Cluster**

| Problem scenario | Potential causes | Diagnostics screen | Remediation |
|---|---|---|---|
| Management plane service is degraded<br>• NSX Manager status is down or degraded<br>• NSX Services are down or degraded<br>• Management and control plane communication between NSX Managers and ESX hosts is down or degraded | High memory or CPU on an the NSX Manager instance | **NSX Networking Health** > **NSX Manager Cluster** > **View Details** > **Utilization** | High NSX Manager CPU: KB 375209<br>High NSX Manager Memory: KB 375215 |
| | Degraded control or management channel | **NSX Networking Health** > **NSX Manager Cluster** > **View Details** > **Underlying ESX Host Information** | Follow up on the information for the specific ESX host in the **ESX Host Networking** tile. |
| Unavailable API on NSX Manager | API rate limit has been reached | **NSX Networking Health** > **NSX Manager Cluster** > **View Details** > **API Metrics** | Based on the data for API requests, either lower the concurrent requests or increase the rate limit. |

### Table 1357: NSX Edge Cluster

| Problem scenario | Potential causes | Diagnostics screen | Remediation |
|---|---|---|---|
| Dropped north/south packets<br>High throughput | Service router (SR) on NSX edge is impacted, high datapath CPU or interface is down | Review drops:<br>**Networking Utilization** > **NSX Edge/VNA Cluster Utilization** > **View Details** > **NSX Edge or VNA Cluster** > **NSX Edge** > **Network Utilization** > **Datapath Metrics** > **Interface Statistics**<br>Review CPU:<br>**Networking Utilization** > **NSX Edge/VNA Cluster Utilization** > **View Details** > **NSX Edge or VNA Cluster** > **NSX Edge** > **Network Utilization** > **Datapath Metrics** > **Datapath CPU** | Interface statistics: KB 324167.<br>High Datapath CPU: https://knowledge.broadcom.com/external/article/330483 |
| | Degraded ESX host. | To find the ESX host on which the edge is running:<br>**Networking Utilization** > **NSX Edge/VNA Cluster Utilization** > **View Details** > **NSX Edge or VNA Cluster** > **NSX Edge** > **Underlying ESX Host** | Follow up on the information for the specific ESX host in the **ESX Host Networking** tile. |
| Degraded performance for network services (Load Balancer or VPN) | High services CPU and/or Datapath CPU | Review Datapath CPU:<br>**Networking Utilization** > **NSX Edge/VNA Cluster Utilization** > **View Details** > **NSX Edcge or VNA Cluster** > **NSX Edge** > **Network Utilization** > **Datapath Metrics** > **Datapath CPU**<br>Review Services CPU:<br>**Networking Utilization** > **NSX Edge/VNA Cluster Utilization** > **View Details** > **NSX Edcge or VNA Cluster** > **NSX Edge** > **Network Utilization** > **Service Metrics** > **Services CPU** | High Datapath CPU: KB 330483<br>High Services CPU: KB 368272 |
| Degraded performance for network services (NAT) | High Datapath CPU and/or high NAT sessions | Review Datapath CPU:<br>**Networking Utilization** > **NSX Edge/VNA Cluster Utilization** > **View Details** > **NSX Edcge or VNA Cluster** > **NSX Edge** > **Network Utilization** > **Datapath Metrics** > **Datapath CPU**<br>Review NAT sessions:<br>**Networking Utilization** > **NSX Edge/VNA Cluster Utilization** > **View Details** > **NSX Edcge or VNA Cluster** > **NSX Edge** > **Network Utilization** > **Datapath Metrics** > **NAT** | High Datapath CPU: KB 330483 |

**Table 1358: ESX Hosts**

| Problem scenario | Potential causes | Diagnostics screen | Remediation |
|---|---|---|---|
| Dropped east/west packets | High vCPU<br>Reaching Network Capacity | Review overall drops:<br>**Networking Utilization** > **ESX Host Networking** > **View Details** > **ESX Host** > **Network Utilization** > **Interface Stats**<br>See either of the **Aggregated VNIC Statistics**, **VMKernal NIC Statistics**, or **PNIC Statistics** charts. | Network Performance Monitoring for ESX Hosts: KB 419008 |
| | High vCPU<br>Reaching Network Capacity | Review CPU:<br>**Networking Utilization** > **ESX Host Networking** > **View Details** > **ESX Host** > **Network Utilization** > **Resources**<br>See the **vCPU and Datapath CPU** charts. | Network Performance Monitoring for ESX Hosts: KB 419008<br>High ESX CPU: KB 395309 |
| | High vCPU<br>Reaching Network Capacity | Review drops:<br>**Networking Utilization** > **ESX Host Networking** > **View Details** > **ESX Host** > **Network Utilization** > **Interface Stats**<br>See either the **Aggregated VNIC Statistics** or **VMKernal NIC Statistics** charts. | Network Performance Monitoring for ESX Hosts: KB 419008 |
| | High VM Contention | **Networking Utilization** > **ESX Host Networking** > **View Details** > **ESX Host** > **Network Utilization** > **Resources**<br>See the **Max Ready Time for vCPU** chart. | Network Performance Monitoring for ESX Hosts: KB 419008 |

## VCF Management Services Health in Diagnostics

With VCF Operations health and diagnostics 9.1, you can monitor the health of VCF management services, the group of components that run on the VCF services runtime component.

With VCF 9.1, the following components are deployed as part of VCF management services:

- Real-time metrics, which provides real-time data analytics
- Log management, which is the VCF log analysis solution
- Salt master, which provides centralized management of configuration drift and compliance
- Real-time metrics store, which helps to store data at scale and short interval metrics.
- Software depot, the unified depot that consolidates all VCF component binaries and metadata
- Fleet lifecycle, which provides a centralized and automated management of multiple VCF instances
- Identity broker, the dedicated authentication solution for the VCF components
- SDDC lifecycle, which handles automated updates and essential maintenance tasks
- Telemetry, which collects configuration, performance, and feature usage data

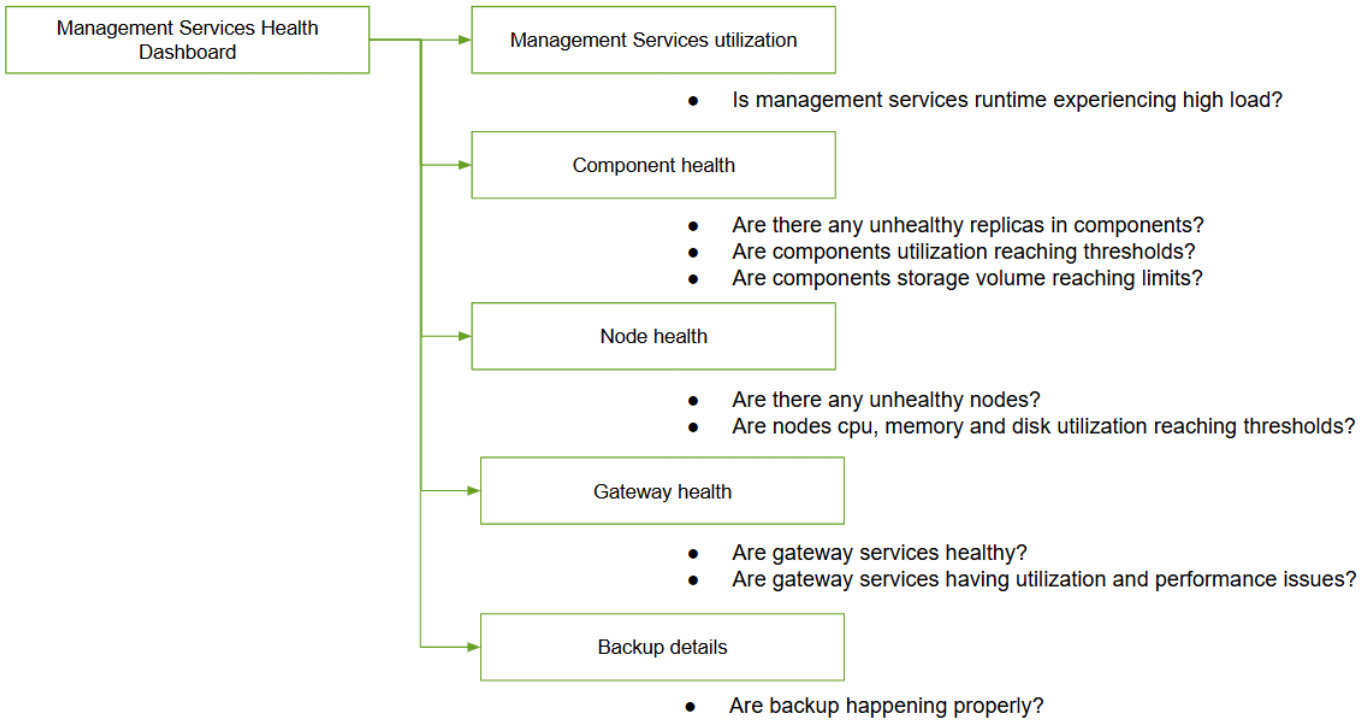
With VCF Operations health and diagnostics 9.1, you can self-diagnose scaling, performance, connectivity, and availability issues impacting theReal-time metrics, Log management, Identity broker, Fleet lifecycle, and Salt master components that run on VCF services runtime component.

**Note:**

The term VCF management services refers to the group of management components deployed in each VCF instance that runs on the VCF services runtime component, which provides a standard and common runtime.

**Figure 471: Structure of the VCF management services metrics and health in VCF Operations health and diagnostics**

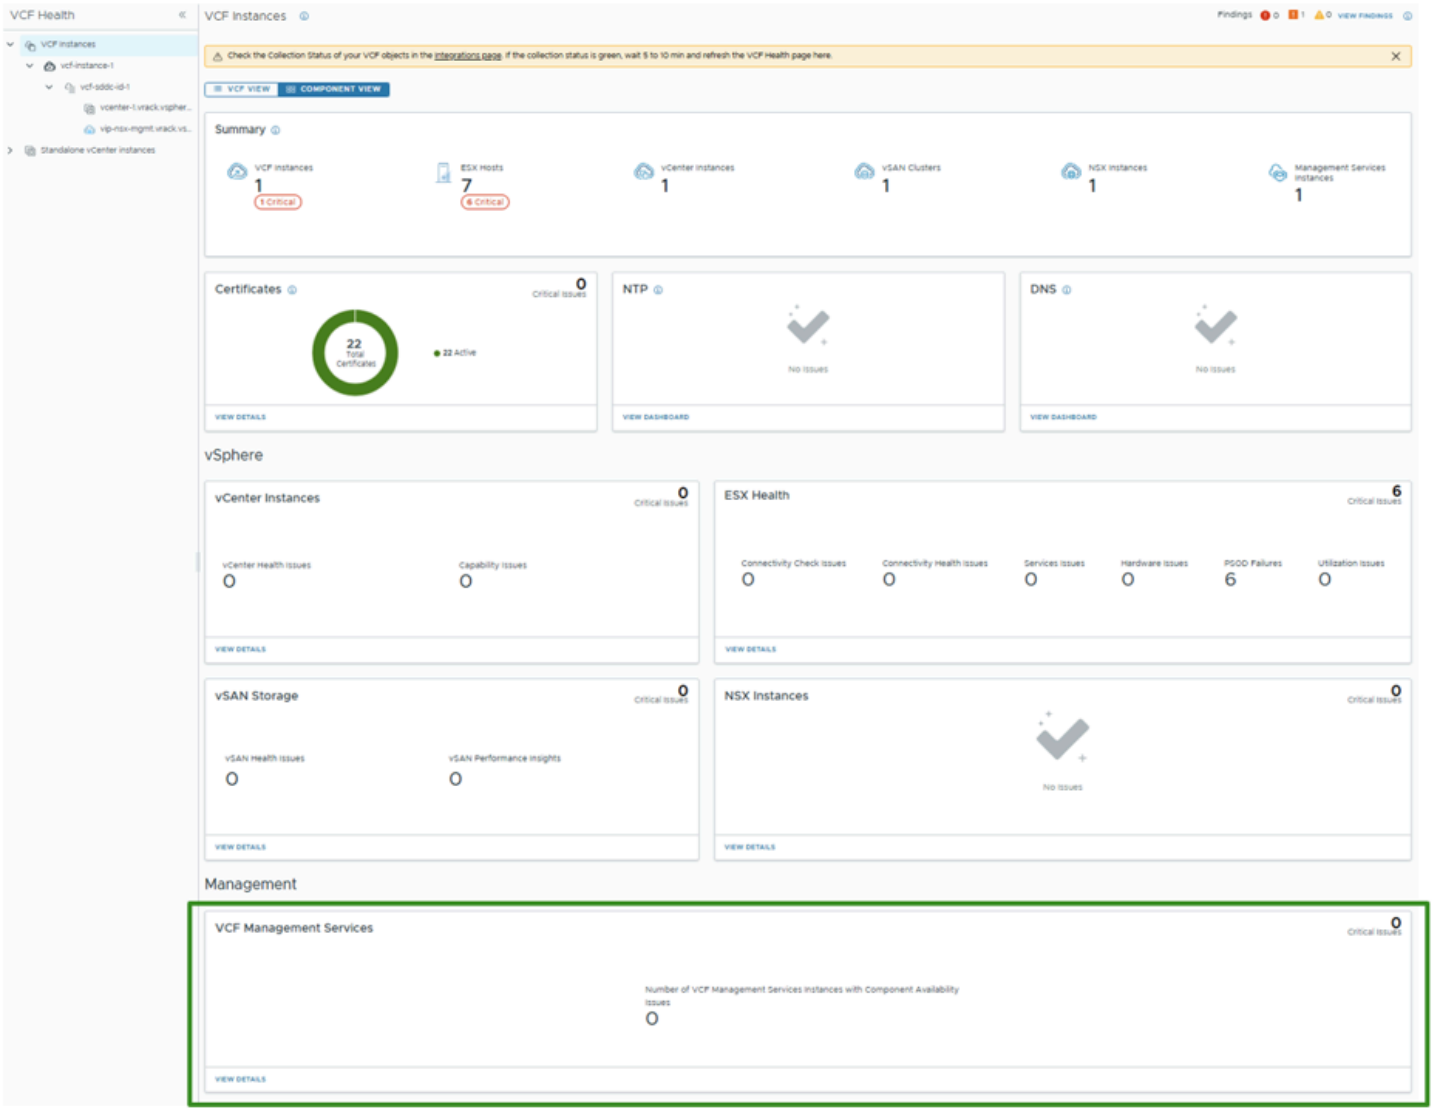
Structure of the VCF management services metrics and health in VCF Operations health and diagnostics



From the **VCF View**, you can see the summary of critical issues for either services that enable components running on VCF services runtime or the respective components running on it. From the**VCF View**, you can drill down to VCF instances, VCF domains, and vCenter instances.

In the **Management** tile of the **Component View**, you see the number of VCF instances with component availability issues. From the **Component View**, click **View Details** to go to the **VCF Management Services** page.

**Figure 472: VCF Management Services Tile in VCF Health**



The **VCF Management Services** dashboard provides health metrics for components including services runtime nodes and services, focusing on essential issues such as utilization and availability.

In the **Overview** panel of the **VCF Management Services** page, you see the number of issues that need immediate attention from either component or services runtime perspective. You drill down to specific metrics per component, node, or service in the **Components** panel.

In the **Management Services Utilization Overview** panel under **VCF Management Services**, you can see the overall CPU and memory utilization details focusing on scale and performance issues. The scale-related metrics are static and you get recommendations on thresholds and actions by KBs.

In the **Components** panel, you can track the availability and memory utilization for each component and the storage utilization of storage volumes.

In the **Backup Details** panel, you see the status of backup jobs for the past 24 hours.

> **Note:**
>
> When you first run a backup of a VCF instance, you see the task as complete, but you do not immediately see a record in the **Backup Details** panel. It takes two completed tasks to trigger the count of backup jobs in the **Backup Details** panel.

In the **Gateway Services** panel, you can also track the utilization of the underlying services for the containerized environment and see the health of each service, based on its specific performance parameters. For example, request sizes, request/response sizes, and latency.

In the **Nodes** panel, you see the breakdown by CPU, memory, and disk utilization per node, and the health status.

See some scenarios, related to each screen, with recommended resolutions:

| Problem Scenario | Panel | Potential Causes | Recommended Action |
|---|---|---|---|
| Component is down due to an infrastructure issue<br>or<br>Component is degraded due to overutilization | **Management Services Utilization Overview**<br>(Monitoring the combined CPU and memory usage across all nodes in the services runtime cluster.) | The overall utilization of the cluster is consistently exceeding pre-defined operational thresholds of 90% for Warning or 95% for Critical status. Such conditions typically come from an increase in workloads such as API calls, processing of monitoring data, Day-N actions, or logs forwarding. Indicates that the current cluster might require more resources. | Resize the services runtime cluster by using fleet lifecycle.<br>Add more resources (CPU/ memory) to the existing nodes or scale out by adding new nodes to the cluster to accommodate the increased load. |
| | **Components**<br>(Availability column: status check on the operational state of individual components) | Operations: A patch, upgrade, or other maintenance procedure such as scaling is in progress. During such operations, components might be temporarily restarted, leading to a down status.<br>Service Instability: When no maintenance operations are running and the component status remains down for multiple monitoring cycles, typically 5 minutes per cycle. This suggests an unexpected failure or deadlock within the service. | Check Maintenance: Check if a patch or upgrade is in progress. If a maintenance job is running, the temporary unavailability is expected.<br>Restart Services: If the component is continuously down for an extended period, restart the affected services by using fleet lifecycle to attempt recovery. If the issue persists, collect logs and create a support ticket. |
| | **Components**<br>(Memory Utilization column: tracks the threshold for each component) | Components are consistently processing workloads that exceed their current capacity and you see memory utilization spiking. | If this behavior is consistent, not a temporary peak:<br>• If the component has a VCF Operations dashboard, such as for logs management, see the dashboard for memory limits and other remediation.<br>• Allocate more memory/CPU to the component by using fleet lifecycle. |

| Problem Scenario | Panel | Potential Causes | Recommended Action |
|---|---|---|---|
| | **Nodes**<br>(Utilization and health of the nodes) | Potential causes for component downtime.<br>Node failures can result from resource constraints, such as high memory, CPU, or disk pressure. Other reasons can be underlying infrastructure problems, including connectivity issues with vSAN, vCenter clusters, or networking.<br>For example, a vCenter cluster in which the nodes are running, might have insufficient resources. Or the persistent volumes that back stateful services might be inaccessible due to an APD condition. | Check the component utilization. Assess underlying infrastructure utilization through the vCenter, vSAN, or NSX Health tiles.<br>• If the component has a VCF Operations dashboard such as the logs management dashboard, refer to the component-specific dashboards for memory limits and other remediations. |
| Component is running out of space | **Components**<br>(Volume column: Monitoring the disk space utilization for persistent storage volumes used by specific components, such as databases and log storage. | The storage volume allocated to a component is nearing the available capacity due to the accumulated size of the workload data (database size, retained logs, metrics, binaries). If the volume exceeds the available capacity, it can impact the availability or can degrade the performance of the component. | Resize the storage volume. Increase the disk capacity for the affected component by using fleet lifecycle.<br>• If the component has a VCF Operations dashboard such as the logs management dashboard, refer to the component-specific dashboards for memory limits and other remediations. |
| Component is facing a latency issue | **Gateway Services**<br>(Check for lower-than-expected network response time or significant delay when interacting with the management services.) | This condition can be due to several factors:<br>1. An increase in the workload that a component is processing. High request volume can lead to queue buildup and delayed processing, manifesting as network latency.<br>2. Issues in the underlying network infrastructure that might be impacting response times. | If the Gateway service is down, you can use the API to restart the service.<br>If the slowdown is consistent with high utilization, it might be necessary to add more capacity to handle the increased load. You either:<br>1. Increase the size of the VCF services runtime cluster.<br>2. Add virtual IPs (VIPs) to the component for more load balancing of incoming requests across the available cluster nodes.<br>If the slowdown is not related to increased load, look for outstanding issues with the virtual or physical networking layer. |

| Problem Scenario | Panel | Potential Causes | Recommended Action |
|---|---|---|---|
| Component backup fails or does not run | **Backup Details**<br>(The scheduled or on-demand backup operation for the management services component has failed to complete successfully.) | SFTP Reachability: The configured Secure File Transfer Protocol (SFTP) target server is not reachable. Network connectivity issue, firewall blocking, incorrect credentials, or SFTP service down might be the reason. Or authentication is failing to the SFTP server.<br>Storage Capacity: The SFTP storage location is full, preventing the backup archive from being written.<br>Internal Service Issues: An internal service issue within the management component or the backup process itself cause a failure. | Review Task Details: See the task details for the failed backup job in the management interface to check for immediate error messages.<br>Check the SFTP server: Confirm that the SFTP server is reachable and has sufficient disk space. If a backup fails due to an authentication failure, update the password for the VCF services runtime in the backup settings in VCF Operations.<br>Check for component health: If the cause is not readily apparent from task details or logs, collect error information and raise a support ticket. |

For more information, see KB 417255 and Performing Day-N Actions on Components.

## Use Log Assist to Accelerate Your Support Cases

To accelerate resolution of support cases, you can use Log Assist to automatically generate log bundles and attach diagnostic findings data.

Log Assist provides a streamlined mechanism for creating and securely transferring support bundles to Broadcom Support, accelerating the resolution of technical issues related to VCF. Log Assist automates processes to eliminate the manual effort that is usually required to collect and upload logs and diagnostic information. The automated gathering of pertinent technical data allows Broadcom Technical Support to diagnose and resolve issues faster and more efficiently.

Sometimes, in **Findings** you might not see a known issue reflecting a problem in your environment. Or you cannot proactively identify the issue by drilling down to the VCF infrastructure metrics that **VCF Health** provides. In such cases, you can reach out to Broadcom support, but you do so with context and automatically generated log bundles by using Log Assist.

Log Assist adds both property and log-based findings that are active at the time of downloading the diagnostic report to your automatically generated log bundles. A link to Log Assist is available from **Findings**.

You can also add log-based findings that you generate by using the **Refresh Findings** workflow in **Findings** and the **Export** functionality. Broadcom Support uses the diagnostic findings data to identify known issues that might contribute to the issue in the support case. For more details, see KB 375820.

**Note:**

Log Assist does not perform cleanups. You can manually remove support bundles when no longer necessary.

After an upgrade to VCF Operations 9.1 or later, make sure Log management is also on the same version. Otherwise, you do not see it in the Log Assist inventory and Log Assist cannot collect bundles from Log management.

**Important:**

To use the online functionalities of Log Assist and send log bundles, you must provide access from the could proxy in your environment to the eapi.broadcom.com URL. For more information, see Public URLs Required for Online Functionalities for VCF and vSphere Foundation.

Before generating a log bundle for the selected inventory object, Log Assist runs several connectivity checks:

1. Connectivity from your environment to the assigned cloud proxy.
2. Connectivity from the assigned cloud proxy to the selected component.
3. Connectivity of your environment to the Broadcom Support Portal to make sure that you can upload the log bundles.

4. Validates that the permissions of the integration are sufficient for downloading a log bundle.

Upon failure, you see error-specific messages and directions for resolution.

For the log bundle type that Log Assist generates for each of the supported VCF components, see the following table:

| VCF Components that Log Assist Supports | Log Bundle Type |
|---|---|
| VCF Operations cluster | FULL support bundle |
| vCenter | Standard log bundle that you get with the `GenerateLogBundles_Task` method in the `DiagnosticManager` service interface in vCenter |
| ESX | Standard log bundle from the Direct Console User Interface (DCUI) |
| NSX | Uses the `DEFAULT` content filter with no core dumps and audit logs, log age limit = 5 days, on transport or management nodes |
| Cloud Proxies | Standard log bundle from **Operate** > **Administration** > **Control Panel** > **Support Bundles** |
| SDDC Manager | API logs + SDDC Manager logs, no explicit manifests |
| VCF services runtime | Default log bundle with `type: vsp` and all `dataTypes`<br>The `lookBackWindow` for all VCF services runtime-related log bundle types is 14 days. |
| Log management | Default log bundle with `type: ops-logs` and `dataType: service-logs, service-heapdumps` |
| Identity broker | Default log bundle with `type: vidb` and `dataType: service-logs, service-heapdumps` |

**Note:**

Each unified Cloud Proxy that you use with Log Assist supports up to five parallel support bundles at a time. If you select more components, they are grouped in a queue. The speed of the support bundle upload depends on the uplink bandwidth.

The upload of log bundles to Broadcom support servers does not require external FTP clients.

With VCF Operations health and diagnostics 9.1, Log Assist adds the following options:

- Generate bundles for selected VCF Operations nodes, not only the cluster-level bundle option.
- Transfer log bundles from Log management and Identity broker under VCF services runtime.

**Note:**

The support bundles for VCF services runtime cannot transfer when the management cluster is down.

## Set up Log Assist

Starting with VCF 9.1.1, Log Assist is enabled by default and you do not need to activate it on the Cloud Proxies page.

Starting with VCF 9.1.1, Log Assist is active by default on all cloud proxies in your environment.

**Important:**

You still need to assign objects from the Inventory for each cloud proxy, as described in step 4 in this procedure.

For VCF versions earlier than VCF 9.1.1, to start using Log Assist you must make sure that your environment is registered in Connected Mode, activate Log Assist on a cloud proxy, and assign Inventory objects to the cloud proxy.

- In the VCF Operations navigation bar at the top, click **Manage** and in the left navigation pane, select **Licenses** > **Registration** and make sure you register your licenses in **Connected Mode**.

- See the topic Collecting Data with Cloud Proxy in VCF Operations on how to add a unified cloud proxy to your environment. The legacy cloud proxy capability, which in VCF 9.0 and later is defined as the Classic type, does not work with Log Assist.
- Provide access from the could proxy in your environment to the `eapi.broadcom.com` URL. For more information, see Public URLs Required for Online Functionalities for VCF and vSphere Foundation.
- Verify the connectivity between the cloud proxy and objects from the VCF Inventory that you assign to Log Assist. The required connection is between the cloud proxy and the respective component, not to the cluster node.

After you activate Log Assist on a cloud proxy, you can assign Inventory objects to Log Assist as described in Step 4. You can map different Inventory objects to specific could proxies.

1. In the VCF Operations navigation bar at the top, select **Operate** > **Administration** > **Cloud Proxies**.
2. Select a cloud proxy. Click the ellipsis next to the check mark, and select **Activate Log Assist**.

   The Log Assist adapter only runs in standalone mode, no groups are supported.
3. (Optional) If you want to activate Log Assist on all cloud proxies:
   a) Select the checkbox on top.
   b) Click the ellipsis next to the **Add** button.
   c) Select **Activate Log Assist**.
4. Go to **Operate** > **Administration** > **Configurations** > **Log Assist Assignments** and assign objects from the Inventory to the Log Assist-enabled cloud proxy by drag-and-drop.

## Attach Logs and Diagnostic Findings to Support Tickets with Log Assist

You can generate a log bundle for any selected inventory object, link and upload it to your support case with Broadcom.

With Log Assist, you can:

- Generate a log bundle on demand
- Link the bundle to a support case
- Attach diagnostic findings to your support case

1. Log in to the Broadcom Support Portal with your credentials.
2. Select the component for which you file a support case and create the case.

   With creating a case, you get a case number. Keep this number for further reference in your support workflow. If you get support from a Broadcom partner, you should note the partner ID along with the case number.
3. Upload data to the case.
   a) Log in to VCF Operations.
   b) In the **Control Panel**, navigate to the **Log Assist** card.
   c) Click **Prepare a Transfer**.

      In the new screen, the **Select an inventory object** tab is automatically selected.
   d) Select the affected object from the VCF inventory tree.

      You can select objects from the VCF inventory tree up to the ESX host level. You cannot select an individual virtual machine. Dimmed check boxes indicate that the object has no mapping to a unified collector. To configure the mapping, go to **Infrastructure Operations** > **Configurations** > **Log Assist Assignment** and drag and drop the required object. After assignment is complete, continue with your cloud transfer.
   e) Click **Next** and wait for the connectivity validation.

      The check might fail due to intermittent connectivity issues and you can click **RE-VALIDATE** to get the latest connectivity status for your environment. If the check fails again, you must troubleshoot your network connectivity and click **RE-VALIDATE** when you resolve the underlying issue.

      The connectivity check might also fail due to missing required privileges for the object. To fix privileges and connectivity, see KBs 375817 and 375818.

4. On the **Transfer to Support Portal** tab, enter your case number in the **Support case ID** field.
5. Click **Transfer**.

   If the transfer is successful, you return to the **Operate** page.
6. In case a transfer fails, you can see the errors for specific objects and can retry the task.

   Log Assist is designed to handle intermittent network or infrastructure issues automatically before requiring user intervention.

   If a log bundle operation or transfer fails, Log Assist automatically retries the task up to three times. If the issue persists, the task is marked as failed.

   VCF Operations Health and Diagnostics 9.1 adds the **Retry** button to facilitate manual retries of failed log bundle operations.

   a) In the **Log Assist** page, under **Transfer History**, expand the row for the current **Support Case** and look at the **Activity Feed**, where you see a breakdown of the successfully completed and failed log bundle operations.
   b) Click the **Retry** button to re-run only the failed tasks that you see in the **Activity Feed**.

      VCF Operations Health and Diagnostics 9.1 simplifies the retry process by pre-populating the Support Case ID and inventory selections from the original request, so you only re-run the failed tasks.

# Troubleshooting with the Workbench

The **Workbench** is where teams can collaborate, build a knowledge base of issue investigations which can be saved for future reference, and enhance troubleshooting by viewing real time data. You can view data with 20-second granularity for real-time performance evaluation by default in the **Real Time Analysis** tab, selecting the **Overview** sub-tab. For Host System and Virtual Machine object types, an additional ESX Top view is available that provides 2-second granularity data. To enable this view, activate the ESX Top category under Real time metrics for ESX hosts being investigated, in the policy settings.

## What Does the Troubleshooting Workbench Do

The **Workbench** page is where you investigate your VCF stack comprising of the following components:

- vCenter
- ESX
- vSAN
- NSX

The new observability engine, introduced in VCF 9.1, collects metrics in real time, provides alerts and notifications, analyzes and summarizes rich data, provides data enrichment, recommends actions and provides user-driven enrichment. The real-time data component must be installed, and is not available by default.

The **Workbench** page provides:

- Unified visibility into all operational data
- Real-time data at 20-second, and 2-second granularity for mission-critical workloads, containers, and applications hosted on ESX.
- Summary dashboard for selected objects
- Top N data for VM, Host, Cluster, Datacenter type of objects
- Quick access to metrics and alerts
- SSH access and Script execution
- Collaboration tools and note taking
- Log Analysis
- Network Flow Analysis

## Where You Find the Troubleshooting Workbench Home Page

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Workbench**.

The **Workbench** home page displays a search bar, a list of troubleshooting sessions, and recent searches. You can open a session to find potential evidence for your problems.

### How Workbench Home Page Works

All troubleshooting sessions that are active in the current login are displayed in the **Workbench** home page. The Workbench now organizes investigations into two distinct sections:

| | |
|---|---|
| **Draft Sessions** | Your active investigations are automatically preserved as drafts. Any changes made to the scope, time settings, and notes are retained upon logout. When you log back in, you can resume your work from the Draft Sessions section, where your previous context is restored. |
| **Saved Sessions** | Investigations that you explicitly save are stored in the Saved Sessions section. These sessions permanently retain your specific scope, time parameters, and notes for future reference. |

## Starting the Troubleshooting Workbench

The Troubleshooting Workbench is where you perform advanced troubleshooting tasks on an alert that triggered on an object. You can investigate both known and unknown issues in VCF Operations .

### Where You Find the Troubleshooting Workbench

You can start the troubleshooting session with an alert in context from the alert information page, or you can search for an object and start the troubleshooting session to investigate known or unknown issues related to the object.

- To start the Workbench with an alert in context, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Alerts**.
- To start the Workbench with an alert in context, but for a specific object, select a group, custom data center, application, or inventory object from the **Inventory**. Click the object and then the **Alerts** tab. Click the **TROUBLESHOOT** button on the top right.
- On the **Workbench** page to investigate known or unknown issues with an object in context, search for the object.

The Workbench navigation bar provides quick access to the following tabs for comprehensive investigation:

- Potential Evidence
- Real Time Analysis (containing Overview, Top N, and Custom Query)
- Logs
- Flows
- Metrics
- Alerts
- Tools
- Notes

## Potential Evidence in Workbench

You look for potential evidences of a problem within a specific scope and time range in the **Potential Evidence** tab. The Selected Scope control on the left of the **Workbench** page is where you vary the scope.

You can vary the scope in the following ways:

- You can select only the object that you are investigating, or include several upstream and downstream relationships by increasing the scope. As you increase the scope, more objects are displayed in the inventory tree. The number of objects in scope should not exceed 300.
- You can select a custom scope to include objects of your choice. Click **Custom** to open an interactive window where you use the pointer to visually rearrange your objects, view relationships and add peers to modify the relationships. To see details about the object, place the pointer for a few seconds above the object. You can reset a custom scope to start all over again.
- You can use the drop-down menu to narrow down the type of objects displayed.

The default time range is two hours before and thirty minutes after the alert triggered when the context is alert based, or when the context is object based, the default time range is last 6 hours. You can select a different time range, up to 7 days, using the date and time controls.

The time range selector offers a split view:

- Presets: Quickly select from Last hour, Last 6 hours, Last 12 hours, Last 24 hours, Last 7 days, Today, Last day, Last week
- Custom Range: Manually define a specific Start date/time and End date/time for precise analysis. The custom selection date range should not exceed 7 days.

The potential evidence is based on Events, Property Changes, and Anomalous Metrics which are displayed on the right of the Workbench change in the **Potential Evidence** tab. Information in these sections is displayed as cards.

| | |
|---|---|
| **Events** | Displays events, based on a change in the metrics. Events for metrics that have breached the usual behavior, and major events that have occurred within the selected scope and time are displayed. The cards are based on dynamic thresholds for a metric, which is calculated based on historical and incoming data. |
| **Property Changes** | Displays important configuration changes that occurred within the selected scope and time. Both single and multiple property changes are displayed. For multiple property changes, you can view the latest and previous changes. |
| **Anomalous Metrics** | Metrics which have shown drastic changes within the selected scope and time. Ranks the results based on the degree of change. The most recent anomalous metric based on a time-sliced comparison in the current time range is given the highest weightage. |

You can explore more details about any of the cards that are displayed in the Workbench by clicking the card pop-out option. You can close a card and it is no longer displayed in the Workbench. To load the cards again, click **Go** in the **Time Range**.

## Real-time Data in the Workbench

The **Real Time Analysis** tab in the Workbench page helps you visualize near real-time data, offering live performance data streaming at 20-second granularity. The **Real Time Analysis** is the central hub for performance analysis and is divided into three sub-tabs, namely, **OVERVIEW**, **TOP N**, and **CUSTOM QUERY**. **OVERVIEW** and **TOP N** sub-tabs in the **Workbench** page help you visualize near real-time data, offering performance data streaming at 20 seconds (or more) and 2-second granularity and covering **esxtop** use cases. The Real-time functionality offers high-granularity metrics, interactive charts, date range pickers, and the ability to add chart screenshots to notes. The Real-time metrics component of VCF works on supported objects in the Inventory.

### Real-time Troubleshooting

The **OVERVIEW** sub-tab under the **Real Time Analysis** tab provides instant visibility into system performance metrics across ESX, virtual machines (VMs), NSX Transport nodes, Edge (for transport nodes object type objects), and other vSphere components. It is designed to help you diagnose issues such as sudden performance drops, CPU spikes, or memory overuse.

The tab applies the observability engine that streams real-time performance data at 20 seconds (or more) and 2-second granularity for selected objects within a defined scope and category. You can view, filter, and interact with performance data to isolate problems in real time.

The key features of the real-time troubleshooting in the **OVERVIEW** sub-tab are as follows:

- High-Granularity Data. The performance metrics refreshed every 20 seconds (or more) and 2 seconds for **esxtop** subset of metrics in the **OVERVIEW** sub-tab. For more information how to change the metric collection to 2-second interval, see Real-Time Metrics Details.
- Custom Time Range Selection. You can focus on specific time periods for detailed analysis.
- Multiple Views. You can switch between summary, CPU, or targeted troubleshooting views.
- With interactive charts, you can do the following:
  - Zoom: Zoom in on a single view or use **Zoom All Charts** to apply changes globally.

  - Focus Mode: **Enable Single Series Focus Mode** to isolate specific metric lines for clearer analysis.
  - Use the **Chart height** slider to adjust the vertical size of graphs (Min to Max) for better visibility.
  - Legends: Toggle **Show Chart Legends** to identify data series without cluttering the view.
- Policy-Based Data Collection: Supports configurable data collection, retention, and roll-up policies.
- With chart actions, you can do the following:
  - Refresh data instantly.
  - Save charts as PDF.
  - Copy chart data to clipboard.
  - Add screenshots or notes directly to the Notes section.
- Context Switching: You can connect via SSH to run command-line utilities for deeper investigation on ESX hosts. These commands provide real-time statistics on CPU, memory, disk, and network utilization.

**Note:**

Before you get started with the **Real Time Analysis** tab, you must Deploy Real-Time Metrics.

## Reporting Intervals for Resource Types

The frequency at which performance data is collected and reported depends on the specific resource type and the source of the metrics.

| Resource Type | Reporting Interval | Details |
|---|---|---|
| Host System and Virtual Machine | 2 seconds | High-granularity collection for a limited set of approximately 21 specific metrics. |
| | 20 seconds | Standard real time performance interval. |
| | 5 minutes | Default PerformanceManager historical interval. |
| Cluster and Datacenter | 60 seconds | Metrics sourced directly from the VPXD Stats Registry. |
| | 5 minutes | Standard relevant PerformanceManager metrics. |
| NSX (Transport Node) | 60 seconds | High-frequency metric availability. |
| | 5 minutes | Standard monitoring frequency. |

## Top N Troubleshooting

Located within the **Real Time Analysis** tab, the **TOP N** sub-tab, helps you identify and analyze the top resource consumers for VM, Host, Cluster, Datacenter, NSX and vSAN type of objects, without using command-line tools. Top N metrics now feature explicit labeling. This ensures that the most resource-intensive objects are easily identifiable within the charts. The system displays child metrics, offering deeper visibility into the performance of underlying sub-components and object hierarchies.

It presents the Top N descendant objects of the same type based on selected performance metrics, simplifying the detection of resource bottlenecks and abnormal activity.

The key features of the Top N tab are as follows:

- Configurable Visualization: The **Visualise Top N** panel lets you drill down to different levels of the Inventory to see the objects with the worst metrics or performance in the given hierarchy or object over the selected period. You can refine your view as follows:
  - Metric Selection: Choose the specific metric you wish to analyze (for example, CPU Contention).
  - Visualise Limits: toggle between viewing the **Top 5**, **Top 10**, or **All objects** to focus on the most critical offenders.
  - Multi-Metric Support: Click **Add Another Metric** to compare different performance indicators simultaneously.
- Interactive Charts:
  - Zoom in or reset zoom for comparative views.

  - Reload data to refresh metrics.
  - Export charts as PDF, copy to clipboard, or add to notes.
- Custom Time and Value Ranges: Enables detailed comparisons of performance values over selected periods.

**Note:**

2-second interval metrics are not available in the **TOP-N** sub-tab.

## 2-Second Granularity

The **Workbench** page offers high-resolution (2-second) metrics in the **OVERVIEW** sub-view. Once the **ESX Top** policy is activated for your Host Systems, the Troubleshooting Workbench provides access to 2-second granularity data. However, the availability and behavior of this high-resolution data vary depending on the specific view you are using within the **OVERVIEW** sub-tab.

In the **OVERVIEW** sub-tab, you can view 2-second data for specific objects.

- Supported Objects**:** High-resolution data is available when you select a Host System or a Virtual Machine from the scope.
- Enabling the View**:** You must explicitly select the **ESX Top** view from the view dropdown menu to see 2-second granularity.
- Time Range Constraint**:** High-resolution data is resource-intensive. If you select a time range greater than 6 hours while in the **ESX Top** view, the system will display an error message rather than showing the data. You must reduce the time range to 6 hours or less to view these metrics.

The **Top N** sub-tab behavior differs from the Overview. Data in the **Top N** view is always displayed at 20-second granularity, regardless of whether the **ESX Top** policy is enabled or if the metric supports higher resolution. This design choice prevents clutter and confusion by maintaining a consistent step window for ranked lists.

When using the **Custom Query** sub-tab to analyze metrics with `esxtop: true` enabled, you may encounter duplicate data lines if not filtered correctly.

By default, if you query a metric that has both standard and high-resolution data, the chart will display two concurrent lines: one for 2-second data and one for 20-second data. This can make the chart difficult to read and may show conflicting spikes due to aggregation differences.

To view only the 2-second granularity data, you must filter your PromQL query using the **ESX_TOP** feature flag.

When building your query, ensure you add a filter for `Feature equal to ESX_TOP` (syntax: for example mem.tier.consumed.MEMTYPE{feature='ESX_TOP'}) to exclude the standard 20-second data stream.

## Custom Query

The **Custom Query** sub-tab, located within the **Real Time Analysis** tab, allows you to execute specific queries using PromQL (Prometheus Query Language) to retrieve granular performance data that may not be covered by standard dashboards. This tool is essential for deep-dive analysis where specific, custom metric correlations are required.

Use the **Add Query** input field to enter and run your PromQL query. To assist you in constructing valid queries without autocomplete, the **Query Builder Help** section provides three tabbed resources below the input field.

**Note:**

This field does not provide autocomplete or suggestions. You must enter a complete PromQL query exactly as you want it to run. Ensure you have the exact metric names and syntax ready before typing.

When you click **Need help? Use the quick Query Builder**, the query builder displays the following tabs.

**Functions**

Lists all supported PromQL functions available for your queries.

- Usage**:** Browse this list to find mathematical or aggregation functions such as `sum`, `min`, `max`, `avg`, and `topk`.
- Description**:** Each function includes a brief description of its logic (for example, `sum` calculates the Sum of values across all time series).
- Copy**:** Click the copy icon next to a function name to paste it into your query string.

| | |
|---|---|
| **Metrics** | Provides a searchable catalog of all available performance metrics in the system.<br>• Search: Use the search bar to find specific metrics (for example, IOPS or Packet Drop).<br>• Reference: This is critical for finding the exact internal name of a metric (for example, `LWD_SNAP_SES_TOTAL_WRITE_TIME`) since there is no autocomplete.<br>• Copy: Locate the metric you need and click the copy icon to add it to your query. |
| **Sample Queries** | Offers pre-built templates to help you understand syntax and structure. These samples demonstrate how to combine metrics and functions correctly. You can copy these samples and replace the metric names with those relevant to your specific investigation.<br>• Sample query for host system `cpu.ready.HOST`<br>• Sample query for host system filtered for 2 sec granularity, after the 2 sec policy is configured for the selected host: `cpu.ready.HOST{feature='ESX_TOP'}`<br>• Sample query for host system filtered for 20 sec granularity `cpu.ready.HOST{feature='TROUBLESHOOTING'}` |

## Alerts and Metrics in the Workbench

When you pin a metric, it appears in the **Metrics** tab of the **Workbench** page. You can perform further investigation on the metric in the Metrics tab. You can compare the pinned metrics with other metrics that are displayed in the tab. You can close the pinned metrics and browse other metrics for specific objects. Similarly, the **Alerts** and **Events** tabs are where you investigate the potential evidences further. You can filter and group alerts. If you want to focus on the alerts for a specific object in your selected scope, you can clear all the alerts and then click the object in the scope.

## Collaboration in the Workbench

You can add notes and save troubleshooting sessions for further investigation. Investigations can be marked as resolved, shared with other users or teams, or deleted if no longer needed. You can add comments and screenshots. The collaborative feature allows seamless handover of investigations between users.

### Saving and Sharing Sessions

When an issue arises with the resource, administrators typically begin their investigation on the **Workbench** page by adjusting the scope and time settings to help identify the root cause. However, investigations may be interrupted by higher-priority tasks or require an extended period to complete, risking the loss of progress.

The Save and Share feature lets you preserve your current troubleshooting state and resume it later. Additionally, a sharing feature enables you to invite colleagues into the same troubleshooting session, creating a shared space for joint investigation.

Each troubleshooting session includes a status indicator that reflects its current progress through the investigation workflow:

| Status | Description | Behavior |
|---|---|---|
| Draft | Unsaved session | Changes made to the scope, time settings, and notes do not persist after logout. |
| In-Progress | Saved session with ongoing investigation | The session is persisted and can be accessed later. Investigation is actively ongoing. |
| Resolved | Issue identified and documented | The session is marked as complete. The investigation findings have been documented, and the issue is considered closed. |

Other users that you collaborate with can view saved investigations with the following details:

- Troubleshooting Name

- Object Name
- Object Type
- Status
- Created On
- Created By

Collaborative sessions can be edited, further shared and deleted.

### Saving Notes

From the **Notes** tab, you can add notes, including text and screenshots to document findings, ensuring all collaborators have access to the same context and inside.

When viewing metric charts, click the vertical ellipsis on any widget to access the following options:

| | |
|---|---|
| **Copy to clipboard** | The copied image is formatted for internal use within the Notes feature. Pasting into external applications is not supported. |
| **Add to Notes** | Saves the chart directly to the session's Notes tab |

The Notes section has a maximum size of 400 KB. Prioritize key charts and remove outdated notes to stay within the limit.

The following options are available to manage Notes:

| | |
|---|---|
| **Add** | Create notes with text or chart attachments |
| **Edit** | Update existing notes |
| **Delete** | Remove outdated notes to keep the workspace clean. In shared sessions, all notes are visible to collaborators, ensuring shared context and preserving a full audit trail of the investigation. |

## Scripting and SSH Access in the Workbench

The **Tools** tab in the **Workbench** page provides you with an SSH-based access terminal (SSH Access) allowing you to establish secure shell connections to your infrastructure components. This feature enables you to execute command-line tools, run diagnostics, and troubleshoot issues directly from VCF Operations.

### SSH Access

SSH Access is available for the following resource types:

- Virtual Machine
- Host System
- vCenter.

> **Note:**
>
> For Virtual Machine resource types, VMware Tools is required to open SSH connections to the endpoints

### Prerequisites

Before using SSH Access: -

| | |
|---|---|
| **Permissions** | You must have the "SSH Access" privilege assigned to your role. |
| **Network** | Target system must be reachable from VCF Operations or VCF Operations Collector (Cloud proxy) |
| **SSH Service** | SSH must be enabled on the target<br>• ESX: SSH service must be running<br>• vCenter: SSH must be enabled on the appliance<br>• VMs: SSH server must be installed and running |
| **Credentials** | Valid credentials for the target system. For Virtual machine the credential provided should be an administrator account. |

## Connection Workflow

The SSH Access feature utilizes a two-step wizard to establish a secure connection to your resources.

**Step 1: Connect to Terminal**

1. Select a supported resource (Virtual Machine, Host System, or vCenter) from the inventory tree. Or Navigate to Workbench and type the resource name in the search box
2. Navigate to **Tools** > **SSH Access**.
3. Enter the required credentials (refer to the **Authentication Options** section below for specific requirements).
4. Click **Connect**.

**Step 2: Terminal Access**

Once the connection is established, you will have full interactive shell access to the target system.

## Authentication Options

Authentication requirements vary based on the type of resource you are connecting to.

**Virtual Machines**

Virtual Machines utilize a two-tier authentication approach:

1. Admin Credentials (Validation)
   - Username**:** Enter the username for the admin account. *(Note: This provides credentials for the endpoint guest OS).*
   - Password**:** Enter the password associated with the admin account.
2. SSH Credentials (Access)
   - Use same credentials: Select this option to reuse the admin credentials provided above for the SSH session.
   - Paste Key**:** Select this option to provide an SSH private key for authentication.
3. Port**:** Enter the SSH port number (typically 22).

**Host Systems and vCenter**

Host Systems and vCenter resources utilize a single-tier authentication approach:

1. Admin Credentials (Validation and Access)
   - Username**:** Enter the username for the endpoint.
   - Provide one of the following access details:
     - Password**:** Enter the SSH password.
     - Paste Key: Provide an SSH private key.
2. Port**:** Enter the SSH port number (typically 22).

## Terminal Capabilities

The **SSH access** page allows you to execute command-line tools to diagnose network connectivity and system performance. Commands are categorized by their output behavior.

Once connected, you have full interactive shell access. The commands available depend on the target system:

**ESX Host Commands**

- `esxtop` - Real-time performance monitoring
- `esxcli` - ESX command-line interface
- `vim-cmd` - Virtual machine management
- `vmkping` - Network connectivity testing
- `tcpdump-uw` / `pktcap-uw` - Packet capture

**vCenter Commands**

- `service-control` - Service management
- `vpxd` - vCenter service
- Standard Linux commands (`top`, `tail`, `grep`, and so on.)

**Virtual Machine Commands**

- Depends on guest OS (Linux or Windows)
- Full access to installed tools and utilities

## Scripting

You can execute tailored diagnostic scripts directly on Virtual Machines (VMs).

1. Scope the Target: Select a specific VM to narrow the diagnostic scope.
2. Execute: Navigate to the **Tools** tab and select **EXECUTE SCRIPT**.

## Flows in the Workbench

The troubleshooting workbench includes a Flows tab which displays network flows collected from VCF Operations for networks.

### Supported Content Types

The troubleshooting workbench collects flow information about the following content types:

- VM
- Host
- Cluster
- Datacenter
- Folder
- Project
- VPC
- Security group
- Transport node

Flow information about other content types is not collected and displayed in the troubleshooting workbench.

### Requirements

To view network flow information in the troubleshooting workbench, verify that the following requirements are met:

- VCF Operations for networks is installed and paired with VCF Operations.
- Flow collection is activated in your data sources.
- The data sources are added as integrations in VCF Operations.
- Navigate to the VCF Operations Integrations page and validate that there are no issues with the connectivity between VCF Operations and VCF Operations for networks.
- Navigate your data sources and validate that there are no issues with flow collection.

## Logs in the Workbench

The Workbench provides a tab to view Logs. The Log management component must be installed to view Logs. When you click **Operate** in the top navigation bar, and in the left navigation pane, click **Logs** and select the **Logs** tab, you will see all the collected logs which are collected. The **Logs** tab in Workbench shows the logs of the specific object which is monitored. For example, if you collected the vCenters logs, you see all the vCenter logs in the Logs tab. While in Workench you see object-specific logs, such us specific ESX logs. You can also compare logs from the **Compare Log** tab.

For more information on Log Management, see Configuring and Analyzing Logs.

# Configuring Green Score

Green Score is used to measure energy efficiency in digital operations through data center virtualization. Green Score is comprised of multiple parameters for effective measurement of the score. Virtualization plays a crucial role in optimizing resource utilization, helping reduce hardware footprints in the data centers and further enables savings in power consumption and floor space.

You can configure Green Score at the Organization level and for physical data centers.

**Disclaimer:**

The conversion calculators and information shown in this documentation reference public information and have been provided to help translate abstract carbon emissions numbers into easily understandable terms solely for informational

purposes. You should not rely on the calculators or information provided herein for any other purpose, including for any regulatory disclosure or diligence purposes. Broadcom may update, upgrade, revise, adjust or otherwise change the features and conversion methodologies at any time. Broadcom has not separately reviewed, approved, or endorsed the public information or third-party websites. No representation or warranty is made by Broadcom as to the accuracy, reasonableness, or completeness of the calculations and related information herein.

# Configuring Green Score Data at the Organization Level

Virtualization plays a crucial role in data center consolidation and thereby helps in the reduction of hardware footprint in the data centers. Virtualization enables lower power consumption and floor space usage in data centers, which can improve the overall energy efficiency and decrease related carbon emissions. Use this page to configure Green Score data in VCF Operations. Using Green Score, organizations can track where they are in their Green Score journey and how they are progressing over time.

**Note:**
Ensure that the following permissions are assigned:

- Capacity > Green Score > Change Organization Settings
- Capacity > Green Score > View Green Score Page

## Configuring Green Score for the First Time

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Green Score**. From the **Green Score** page, click **Configure** from the Green Score panel. Enter the details in the **Organization** tab.

**Table 1359: Organization Details**

| Option | Description |
|---|---|
| **Green Score Component Input - Virtualization Ratio(%)** | |
| Compute Virtualization | Enter the percentage of compute services that are virtual. Default value is 80%. The default values are based on the VMware estimate of the most common numbers. |
| Network Virtualization | Enter the percentage of network services that are virtual. Default value is 30%. The default values are based on the VMware estimate of the most common numbers. |
| Storage Virtualization | Enter the percentage of storage technologies that are virtual. Default value is 40%. The default values are based on the VMware estimate of the most common numbers. |
| Desktop Virtualization | Enter the percentage of desktops that are virtual. Default value is 20%. The default values are based on the VMware estimate of the most common numbers. |
| **Power Sources (%)** | |
| Add Power Source | Click this option to add the share of power sources that you use. The total should add up to 100%.<br>The power sources are coal, oil, natural gas, hydroelectric, solar photovoltaic, wind, biomass, and nuclear.<br>The default value for coal is 79.2% and the default value for hydroelectric is 20.8%. |
| **Average Age of Hardware in years (as of today)** | |
| Servers (years) | Enter the average age of the servers in your organization. Default age is two years. The default values are based on the VMware estimate of the most common numbers. The value changes dynamically each day (For example, if the average server age is 2 years on day 1, the average server age will change to 2.5 years after 6 months automatically). |

| Option | Description |
|---|---|
| Storage (years) | Enter the average age of storage in your organization. Default age is two years. The default values are based on the VMware estimate of the most common numbers. The value changes dynamically each day (For example, if the average server age is 2 years on day 1, the average server age will change to 2.5 years after 6 months automatically). |
| Network (years) | Enter the average age of network in your organization. Default age is three years. The default values are based on the VMware estimate of the most common numbers. The value changes dynamically each day (For example, if the average server age is 2 years on day 1, the average server age will change to 2.5 years after 6 months automatically). |
| Desktop (years) | Enter the average age of the desktops in your organization. Default age is five years. The default values are based on the VMware estimate of the most common numbers. The value changes dynamically each day (For example, if the average server age is 2 years on day 1, the average server age will change to 2.5 years after 6 months automatically). |

After you click **Save**, the Green Score data is calculated. Calculation of the Green Score data may take some time.

### Green Score Details

Green Score is calculated based on five components, which are: Workload Efficiency, Resource Utilization, the extent of Virtualization, Power Source, and Hardware Efficiency. Each of these components has varying levels of impact on the energy usage within a data center and hence has a different weightage when contributing to a common Green Score.

- **Workload Efficiency**: Contributes to 22.5% weightage Efficiency = Non Wastage / (Wastage + Non Wastage)
- **Resource Utilization**: Contributes to 12.5% weightage based on the utilization of hardware from the absolute capacity without considering buffers and High Availability.
- **Virtualization**: Contributes to 15% weightage.
- **Power Source**: Contributes to 37.5% weightage. Scoring is based on the carbon intensity (defined here: https://www.eia.gov/tools/glossary/?id=C) of the power source used.
- **Hardware Efficiency**: Contributes to 12.5% weightage, based on the assumption that newer generation hardware will be more energy efficient.

**Table 1360: Green Score Details and Dependencies**

| Name | Description |
|---|---|
| Green Score Meter | A higher score indicates a greater Green Score. Green Score is calculated based on the different values calculated for workload efficiency, resource utilization, virtualization, power source, and hardware efficiency. |
| Green Score Trend | Indicates the Green Score trend of the company. You can view daily, weekly, and monthly trends. |
| **Optimized Demand** | |

| Name | Description |
| --- | --- |
| Workload Efficiency | Measures the wastage in the data center and calculates a score based on various waste sources. The workload efficiency value is calculated based on different metrics, such as powered off VMs, oversized VMs, idle VMs, snapshots, and orphaned disks. The metrics are as follows:<br>Total Consumption CPU = (vCenter) CPU\|vCPUs Allocated on all Powered On Consumers<br>Total Consumption Memory (GB) = (vCenter) Memory\|Host Usage (KB)<br>Total Consumption Disk (TB) = (vCenter) Disk Space\|Total Provisioned Disk Space (GB)<br>Oversized VM\|vCPU = (VM) Summary\|Oversized\|Virtual CPUs and Oversized VM\|Memory (GB) = (VM) Summary\|Oversized\| Memory (KB) - These metrics are used to calculate workload efficiency only for powered on VMs. This means that vCPUs and memory of powered off and oversized VMs are excluded from the calculation.<br>Idle VM\|Disk (TB) = (Cluster) Reclaimable\|Idle VMs\|Disk Space (GB)<br>Idle VM\|vCPU = (Cluster) Reclaimable\|Idle VMs\|CPU (vCPUs)<br>Idle VM\|Memory (GB) = (Cluster) Reclaimable\|Idle VMs\|Memory (KB)<br>Powered Off VM\|Disk (TB) = (Cluster) Reclaimable\|Powered Off VMs\|Disk Space (GB)<br>Snapshot\|Disk (TB) = (Cluster) Reclaimable\|VM Snapshots\|Disk Space (GB)<br>Orphaned VMDK\|Disk (TB) = (Datastore) Reclaimable\|Orphaned Disks\|Disk Space (GB) |
| **Lean Operations** | |
| Resource Utilization | Provides a value based on server and storage utilization. The score is based on the utilization of hardware from absolute capacity without considering buffers and HA. Here are the metrics used:<br>Total ESX Hosts CPU Utilization (GHz) = (vCenter) CPU\|Usage (MHz)<br>Total ESX Hosts CPU Capacity (GHz) = (vCenter) CPU\|Total Capacity (MHz)<br>Total ESX Hosts Memory Utilization (TB) = (vCenter) Memory\|Host Usage (KB)<br>Total ESX Hosts Memory Capacity (TB) = (vCenter) Memory\|Total Capacity (KB) Organization/Physical<br>Total datastores capacity = (vCenter) Disk Space\|Total Capacity (GB)<br>Total datastores utilization = (vCenter) Disk Space\|Utilization (GB)<br>Total RDM = Sum((VM) Virtual Disk \ Configured Size) |
| Virtualization | Virtualization score is calculated based on the virtualization percentage of compute, storage, network, and desktop entered in the **Organization Details** page. The formula is a weighted average of virtualization percentages with 40%, 30%, 20%, and 10% corresponding weights.<br>**Note:**<br>At the organization level, Green Score is calculated based on physical data centers that are configured for Green Score. In addition, Green Score calculation at the organization level also includes vCenter instances that are not associated with any physical data center. |

| Name | Description |
|---|---|
| **Energy Efficient Infrastructure** | |
| Power Source | The score is based on the carbon intensity (defined here: https://www.eia.gov/tools/glossary/?id=C) of the power source used. For example, traditional coal based power sources will have a carbon intensity rate of 888 g/kWh while wind based power source will have a carbon intensity of 26 only (Reference : WNA Report - Comparison of Lifecycle Greenhouse Gas Emissions of Various Electricity Generation Sources).<br>**Note**: A 100% badge score indicates zero carbon emissions, and a 0% badge score indicates full amount of possible carbon emissions.<br>Each value is calculated based on the share of the power sources entered in the **Organization Details** page, after which the average value is calculated. The value for each of the power resources is calculated as follows:<br>Green Factor Shares (100%) Adjusted Score (Green Factor * Shares)<br>Coal = 17% (Green Factor)<br>Oil = 31% (Green Factor)<br>Natural Gas = 53% (Green Factor)<br>Solar Photovoltaic = 92% (Green Factor)<br>Biomass = 96% (Green Factor)<br>Nuclear = 97% (Green Factor)<br>Hydroelectric = 98% (Green Factor)<br>Wind = 98% (Green Factor)<br>**Note:**<br>Shares are user inputs in the **Organization Details** page.<br>**Note:**<br>At the organization level, Green Score is calculated based on physical data centers that are configured for Green Score. In addition, Green Score calculation at the organization level also includes vCenter instances that are not associated with any physical data center. |
| Hardware Efficiency | The hardware efficiency badge is based on the assumption that newer generation hardware is more energy efficient than the older generation hardware - by being able to run more workloads on the same sized newer hardware and also the ability of newer hardware to optimize energy consumption. The efficiency of hardware which includes server, storage, network, and desktop is based on the average age of the hardware entered in the **Organization Details** page. For example, if you had entered the age of your servers as 2 years, then the hardware efficiency for servers would be 80%, because the useful life duration is considered as 10 years.<br>**Note:**<br>At the organization level, Green Score is calculated based on physical data centers that are configured for Green Score. In addition, Green Score calculation at the organization level also includes vCenter instances that are not associated with any physical data center. |

### Power Consumption Chart

The power consumption chart displays the cumulative power consumption for the last 30 days. It is calculated using the power usage metrics and is the sum of the last month's daily power consumption. When you click the Power Consumption option, you can also view the **Power Consumption** trend which can be daily, weekly, or monthly.

### Estimated Carbon Footprint Chart

This estimated carbon footprint calculation represents the amount of Scope 2 greenhouse gas emissions, expressed as carbon dioxide equivalents, emitted indirectly as a result of datacenter operations during a given period.

### Environmental Impact

The environmental impact converts the greenhouse gas emissions numbers from power consumed into an equivalent number of carbon emissions emitted from the number of smartphones charged, as per the calculations based on Greenhouse Gas Equivalencies Calculator. For detailed info on this please refer to https://www.epa.gov/energy/greenhouse-gases-equivalencies-calculator-calculations-and-references#smartphones.

For information about Green Score dashboards, see Green Score Dashboards.

## Configuring Green Score Data for Physical Data Centers

Virtualization plays a crucial role in data center consolidation and thereby helps in the reduction of hardware footprint in the data centers. Virtualization enables lower power consumption and floor space usage in data centers, which can improve the overall energy efficiency and decrease related carbon emissions. Use this page to configure Green Score data in VCF Operations for physical data centers that have been added to a vCenter account or to a VCF account and configured for Green Score. Using Green Score, organizations can track where they are in their Green Score journey and how they are progressing over time.

> **Note:**
>
> Ensure that the following permissions are assigned:
>
> - Capacity > Green Score > Change Organization Settings
> - Capacity > Green Score > View Green Score Page

### Configuring Green Score for the First Time for Physical Data Centers

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Green Score**.
2. From the **Green Score** page, click **Configure** from the Green Score panel. Enter the details in the **Organization** tab.

   > **Note:**
   > You must configure Green Score data at the Organization level and only then will you be able to configure Green Score for physical data centers. For information about configuring Green Score at the Organization level, see Configuring Green Score Data at the Organization Level.
3. Click the **Save** button in the **Organization** tab to save the Organization level details and to activate the **Physical Data Centers** tab.
4. From the **Physical Data Centers** tab, click the **Add Physical Data Center** button to add a physical data center to a vCenter Server account or to a VCF account if you have not previously added a physical data center from the **Administration** > **Control Panel** > **Physical Data Center** page. For more information about adding physical data centers, see Adding Physical Data Centers in VCF Operations.

5. When you create a physical data center, the Green Score configuration page for that physical data center is displayed and you can fill in all the details.

   **Note:**
   If you have already added a physical data center from the **Administration** > **Physical Data Center** page, a list of physical data centers appears on the **Physical Data Centers** tab. You can select each of the physical data centers from the vertical ellipses called **Add Green Score Configuration**.
6. Select a physical data center from the Physical Data Centers list and then enter the details in the **Physical Data Centers** tab.

**Table 1361: Physical Data Center Details**

| Option | Description |
|---|---|
| **Green Score Component Input - Virtualization Ratio(%)** | |
| Compute Virtualization | Enter the percentage of compute services that are virtual. Default values for the physical data center Green Score configuration are inherited from Organization level inputs. |
| Network Virtualization | Enter the percentage of network services that are virtual. Default values for the physical data center Green Score configuration are inherited from Organization level inputs. |
| Storage Virtualization | Enter the percentage of storage technologies that are virtual. Default values for the physical data center Green Score configuration are inherited from Organization level inputs. |
| Desktop Virtualization | Enter the percentage of desktops that are virtual. Default values for the physical data center Green Score configuration are inherited from Organization level inputs. |
| **Power Sources (%)** | |
| Add Power Source | Click this option to add the share of power sources that you use. The total should add up to 100%.<br>The power sources are coal, oil, natural gas, hydroelectric, solar photovoltaic, wind, biomass, and nuclear.<br>The default value for coal is 79.2% and the default value for hydroelectric is 20.8%. |
| **Average Age of Hardware in years (as of today)** | |
| Servers (years) | Enter the average age of the servers for your physical data center. Default values for the physical data center Green Score configuration are inherited from Organization level inputs. . The value changes dynamically each day (For example, if the average server age is 2 years on day 1, the average server age will change to 2.5 years after 6 months automatically). |
| Storage (years) | Enter the average age of the servers for your physical data center. Default values for the physical data center Green Score configuration are inherited from Organization level inputs. The value changes dynamically each day (For example, if the average server age is 2 years on day 1, the average server age will change to 2.5 years after 6 months automatically). |
| Network (years) | Enter the average age of the servers for your physical data center. Default values for the physical data center Green Score configuration are inherited from Organization level inputs. The value changes dynamically each day (For example, if the average server age is 2 years on day 1, the average server age will change to 2.5 years after 6 months automatically). |

| Option | Description |
|---|---|
| Desktop (years) | Enter the average age of the servers for your physical data center. Default values for the physical data center Green Score configuration are inherited from Organization level inputs. The value changes dynamically each day (For example, if the average server age is 2 years on day 1, the average server age will change to 2.5 years after 6 months automatically). |

After you click **Save**, the Green Score data is calculated. Calculation of the Green Score data may take some time.

## Green Score Details

Green Score is calculated based on five components, which are: Workload Efficiency, Resource Utilization, the extent of Virtualization, Power Source, and Hardware Efficiency. Each of these components has varying levels of impact on the energy usage within a data center and hence has a different weightage when contributing to a common Green Score.

- **Workload Efficiency**: Contributes to 22.5% weightage Efficiency = Non Wastage / (Wastage + Non Wastage).
- **Resource Utilization**: Contributes to 12.5% weightage based on the utilization of hardware from the absolute capacity without considering buffers and High Availability.
- **Virtualization**: Contributes to 15% weightage.
- **Power Source**: Contributes to 37.5% weightage – scoring based on the carbon intensity (defined here: https://www.eia.gov/tools/glossary/?id=C) of the power source used.
- **Hardware Efficiency**: Contributes to 12.5% weightage, based on the assumption that newer generation hardware will be more energy efficient.

**Table 1362: Green Score Details and Dependencies**

| Name | Description |
|---|---|
| Physical Data Centers (list) | Displays the configured physical data centers in a list. Select the physical data center for which you want to see Green Score details in a map view or from a list using the options at the top-right corner.<br>To reset to the Organizational level, click the **X** button for the selected physical data center. |
| Physical Data Centers by Green Score | Displays the number of all physical data centers. At the bottom of the panel, you can view the number physical data centers that are configured (green in color) and not configured (gray in color) for Green Score. For configured physical data centers, you can view the range of Green Score values applicable to the configured physical data center. |
| Green Score Meter | A higher score indicates a greater Green Score. Green Score is calculated based on the different values calculated for workload efficiency, resource utilization, virtualization, power source, and hardware efficiency. |
| Green Score Trend | Indicates the Green Score trend of the company. You can view daily, weekly, and monthly trends. |
| **Optimized Demand** | |

| Name | Description |
|---|---|
| Workload Efficiency | Measures the wastage in the data center and calculates a score based on various waste sources. The workload efficiency value is calculated based on different metrics, such as powered off VMs, oversized VMs, idle VMs, snapshots, and orphaned disks. The metrics are as follows:<br>Total Consumption CPU = (vCenter) CPU\|vCPUs Allocated on all Powered On Consumers<br>Total Consumption Memory (GB) = (vCenter) Memory\|Host Usage (KB)<br>Total Consumption Disk (TB) = (vCenter) Disk Space\|Total Provisioned Disk Space (GB)<br>Oversized VM\|vCPU = (VM) Summary\|Oversized\|Virtual CPUs and Oversized VM\|Memory (GB) = (VM) Summary\|Oversized\|Memory (KB) - These metrics are used to calculate workload efficiency only for powered on VMs. This means that vCPUs and memory of powered off and oversized VMs are excluded from the calculation.<br>Idle VM\|Disk (TB) = (Cluster) Reclaimable\|Idle VMs\|Disk Space (GB)<br>Idle VM\|vCPU = (Cluster) Reclaimable\|Idle VMs\|CPU (vCPUs)<br>Idle VM\|Memory (GB) = (Cluster) Reclaimable\|Idle VMs\|Memory (KB)<br>Powered Off VM\|Disk (TB) = (Cluster) Reclaimable\|Powered Off VMs\|Disk Space (GB)<br>Snapshot\|Disk (TB) = (Cluster) Reclaimable\|VM Snapshots\|Disk Space (GB)<br>Orphaned VMDK\|Disk (TB) = (Data store) Reclaimable\|Orphaned Disks\|Disk Space (GB) |
| **Lean Operations** | |
| Resource Utilization | Provides a value based on server and storage utilization. The score is based on the utilization of hardware from absolute capacity without considering buffers and HA. Here are the metrics used:<br>Total ESX Hosts CPU Utilization (GHz) = (vCenter) CPU\|Usage (MHz)<br>Total ESX Hosts CPU Capacity (GHz) = (vCenter) CPU\|Total Capacity (MHz)<br>Total ESX Hosts Memory Utilization (TB) = (vCenter) Memory\|Host Usage (KB)<br>Total ESX Hosts Memory Capacity (TB) = (vCenter) Memory\|Total Capacity (KB) Organization/Physical<br>Total datastores capacity = (vCenter) Disk Space\|Total Capacity (GB)<br>Total datastores utilization = (vCenter) Disk Space\|Utilization (GB)<br>Total RDM = Sum((VM) Virtual Disk \ Configured Size) |
| Virtualization | Virtualization score is calculated based on the virtualization percentage of compute, storage, network, and desktop entered in the corresponding physical data center's configuration. The formula is a weighted average of virtualization percentages with 40%, 30%, 20%, and 10% corresponding weights. |
| **Energy Efficient Infrastructure** | |

| Name | Description |
| --- | --- |
| Power Source | The score is based on the carbon intensity (defined here: https://www.eia.gov/tools/glossary/?id=C) of the power source used. For example, traditional coal based power sources will have a carbon intensity rate of 888 g/kWh while wind based power source will have a carbon intensity of 26 only (Reference : WNA Report - Comparison of Lifecycle Greenhouse Gas Emissions of Various Electricity Generation Sources.)<br>**Note**: A 100% badge score indicates zero carbon emissions and a 0% badge score indicates full amount of possible carbon emissions.<br>Each value is calculated based on the share of the power sources entered in the **Organization Details** page, after which the average value is calculated. The value for each of the power resources is calculated as follows:<br>Green Factor Shares (100%) Adjusted Score (Green Factor * Shares)<br>Coal = 17% (Green Factor)<br>Oil = 31% (Green Factor)<br>Natural Gas = 53% (Green Factor)<br>Solar Photovoltaic = 92% (Green Factor)<br>Biomass = 96% (Green Factor)<br>Nuclear = 97% (Green Factor)<br>Hydroelectric = 98% (Green Factor)<br>Wind = 98% (Green Factor)<br>**Note:**<br>Shares are user inputs in the corresponding physical data center's page. |
| Hardware Efficiency | The hardware efficiency badge is based on the assumption that newer generation hardware is more energy efficient than the older generation hardware - by being able to run more workloads on the same sized newer hardware and also the ability of newer hardware to optimize energy consumption. The efficiency of hardware which includes server, storage, network, and desktop is based on the average age of the hardware entered in the **Organization Details** page. However, you can change and input ages that are specific to the physical data center. For example, if you had entered the age of your servers as 2 years, then the hardware efficiency for servers would be 80%, because the useful life duration is considered as 10 years. |

### Power Consumption Chart

The power consumption chart displays the cumulative power consumption for the last 30 days. It is calculated using the power usage metrics and is the sum of the last month's daily power consumption. When you click the Power Consumption option, you can also view the **Power Consumption** trend which can be daily, weekly, or monthly.

### Estimated Carbon Footprint Chart

This estimated carbon footprint calculation represents the amount of Scope 2 greenhouse gas emissions, expressed as carbon dioxide equivalents, emitted indirectly as a result of datacenter operations during a given period.

### Environmental Impact

The environmental impact converts the greenhouse gas emissions numbers from power consumed into an equivalent number of carbon emissions emitted from the number of smartphones charged, as per the calculations based on Greenhouse Gas Equivalencies Calculator. For detailed info on this please refer to https://www.epa.gov/energy/greenhouse-gases-equivalencies-calculator-calculations-and-references#smartphones.

For information about Green Score dashboards, see Green Score Dashboards.

# Green Score Dashboards

Using the Green Score dashboards in VCF Operations, you can view the estimated reduction in carbon footprint achieved using virtualization; you can view clusters and data centers and compare them based on estimated $CO_2$ emissions or power consumption; you can identify idle VMs; and identify old hardware, such as compute and storage.

The following Green Score dashboards are added to the predefined VCF Operations dashboards:

- Energy Efficiency with Virtualization Dashboard
- Energy Efficient Clusters Dashboard
- Environmental Impact of Idle VMs Dashboard
- Energy Efficient Infrastructure Dashboard

**Disclaimer:**

The conversion calculators and information shown in this documentation reference public information and have been provided to help translate abstract carbon emissions numbers into easily understandable terms solely for informational purposes. You should not rely on the calculators or information provided herein for any other purpose, including for any regulatory disclosure or diligence purposes. ## Energy Efficiency with Virtualization Dashboard

Use this dashboard to view information on how much power consumption you have already saved with Virtualization.

### How to Use the Dashboard

- The banner at the top of the dashboard is a sample image, and you can upload your company logo, tag line, and so on.
- The **Optimization by Virtualization** widget provides details of power saved for the vSphere World object in percent and compares the power consumption of a vCenter environment before and after virtualization assuming that 100W is the power consumption for a low-range server before virtualization.
- Use the $CO_2$ **Emissions Avoided (Tonnes)** widget to view the estimated sum of carbon emissions avoided for the last 24 hours. $CO_2$ emission per kWh is assumed as 0.672 kg (based on reference values from Greenhouse Gas Equivalencies Calculator).
- Using the **Power Consumption** widget, you can view estimated power consumed before and after virtualization. Power consumption before virtualization is based on the assumption that a low-range server consumes 100W. Hence, power consumption before virtualization is calculated using the count of VMs, which is the number of physical servers if not virtualized, at 100W per server.
- Using the $CO_2$ **Emission** widget, you can view estimated $CO_2$ emissions before and after virtualization. $CO_2$ emission per kWh is assumed as 0.672 kg (based on reference values from Greenhouse Gas Equivalencies Calculator). The value is calculated in Kilogram (kg).
- The $CO_2$ **Emission Chart** and the **Power Consumption Chart** provide estimated $CO_2$ emissions (in kg) for the last 24 hours and power consumption (in kWh) for the last 24 hours, respectively.

### Custom Values

- **Predefined Values**
  - Power consumption of a small server (1 socket, 10 cores, 32 GB RAM) = 0.1 kW (Assumption used in calculating power consumption before virtualization).
  - $CO_2$ emission per kWh = 0.672 kg (Reference values from Greenhouse Gas Equivalencies Calculator).
- You can add a custom property for $CO_2$ emission, which can be applied per cluster compute resource.
  Custom values of $CO_2$ emission per kWh can be added to each cluster compute resource by creating a custom property with the name $CO_2$ **Emission** and type as **Numeric** and the relevant custom values.

  **Note:**
  If you do not define custom properties, predefined values for $CO_2$ emission are used.

### Points to Note

Your actual savings may be different. The following are not included:

- Physical buildings and land. With virtualization, you can decrease your hardware footprint by having less physical racks, and therefore have a potentially lower carbon footprint.
- Network equipment. Fewer number of physical servers results in lesser network ports. Because firewall, load balancers, IDS, and IPS can be virtual machines, you have less equipment.
- Other components like Uninterrupted Power Supply (UPS), lighting, cooling, and labor.

**Disclaimer:**

The conversion calculators and information shown in this documentation reference public information and have been provided to help translate abstract carbon emissions numbers into easily understandable terms solely for informational purposes. You should not rely on the calculators or information provided herein for any other purpose, including for any regulatory disclosure or diligence purposes. Broadcom may update, upgrade, revise, adjust or otherwise change the features and conversion methodologies at any time. Broadcom has not separately reviewed, approved, or endorsed the public information or third party websites. No representation or warranty is made by Broadcom as to the accuracy, reasonableness or completeness of the calculations and related information herein.

## Energy Efficient Clusters Dashboard

Use this dashboard to view clusters and data centers and compare them based on estimated $CO_2$ emissions or power consumption. You can then identify the most energy efficient cluster to provision workloads. You can compare the power consumption of each compute component in the data center, showcase all the compute components with the lowest power consumption, compare physical data centers based on power consumption, and compare hardware models to find optimal power consumption.

### How to Use the Dashboard

As larger clusters consume more power than smaller clusters, the total power consumption cannot be used to determine a cluster to provision the next workload. Hence Power Efficiency is calculated based on the power consumption per GHz of CPU usage.

- The banner at the top of the dashboard is a sample image, and you can upload your company logo, tag line, and so on.
- Use the **Top-10 Energy Efficient Clusters by Power Efficiency** table to view clusters that are "power efficient." Power efficiency is calculated as power usage per GHz of CPU Usage. Power efficiency alone cannot be used as the criteria to provision a VM, capacity must also be available in the cluster. View the Capacity Remaining% and Time Remaining information for each cluster to make an informed decision.
- Use the **Top-10 Energy Efficient Clusters by Power Consumption** table to view clusters that consume less power. Use this table when you compare clusters based on the total power consumption. Larger clusters will consume more power than smaller clusters, but may still not be the most efficient cluster based on power efficiency. Power consumption alone cannot be used as the criteria to provision a VM, capacity must also be available in the cluster. View the Capacity Remaining% and Time Remaining information for each cluster to make an informed decision.

- The goal of the **Energy Efficient Clusters** dashboard is to help you identify the most energy efficient cluster to provision the next VM. However, the most energy efficient cluster may not have enough capacity to provision a VM, and hence you also need to check capacity before you decide on the most energy efficient cluster to provision. Use relevant metrics for the selected cluster which can help you identify a target cluster. The metrics are: Power Consumption of the Cluster (kWh), CPU Usage% in the cluster, and Memory usage% in the cluster. Use the associated widgets to view the metrics. The metrics are available for the last 30 days to help you identify the target energy efficient cluster to provision the next VM.
- Use the **Heatmap of vSphere Clusters based on Power Consumption** to view all the clusters based on Power Consumption in kWh. The size of each cluster in the heatmap is determined by the number of VMs in the cluster.
- When you add geo tags to clusters or physical data centers, those objects can be mapped in the **Geo** widget. Ensure that you add geo tags to the relevant objects.

**Disclaimer:**

The conversion calculators and information shown in this documentation reference public information and have been provided to help translate abstract carbon emissions numbers into easily understandable terms solely for informational purposes. You should not rely on the calculators or information provided herein for any other purpose, including for any regulatory disclosure or diligence purposes. Broadcom may update, upgrade, revise, adjust or otherwise change the features and conversion methodologies at any time. Broadcom has not separately reviewed, approved, or endorsed the public information or third-party websites. No representation or warranty is made by Broadcom as to the accuracy, reasonableness or completeness of the calculations and related information herein.

## Environmental Impact of Idle VMs Dashboard

Use this dashboard to identify idle VMs in the data center, power off/delete idle VMs to reduce power consumption and improve data center efficiency, and identify remediation plans to offset the damage caused by those idle VMs which cannot be removed.

### How to Use the Dashboard

- The banner at the top of the dashboard is a sample image, and you can upload your company logo, tag line, and so on.
- The **Cluster's Idle VM** table provides a list of clusters with reclaimable memory, vCPUs, and disk space from idle VMs. You can also view the total resources that can be reclaimed from idle VMs. Click a cluster row to view the relevant Green Score metrics.
- Use the **Relevant Metrics of Selected Cluster** widget to view metrics of the selected cluster, such as power wasted by idle VMs (Wh) and estimated $CO_2$ emissions by idle VMs (kg).
- The **Wasted Power from Idle VMs** heatmap allows you to view vSphere clusters configured to display wasted power from idle VMs. Power in watt-hour (Wh) is used to build the heatmap. A threshold value of 800 Wh changes the heatmap to red.
- The $CO_2$ **Emission from Idle VMs** heatmap allows you to view vSphere clusters configured to display estimated $CO_2$ Emission from idle VMs. $CO_2$ emission in kilogram (kg) is used to build the heatmap. A threshold value of 750 kg changes the heatmap to red.

### Custom Values

- **Predefined Values**
  - $CO_2$ emission per kWh = 0.672 kg (Reference values from Greenhouse Gas Equivalencies Calculator).
- Custom values for $CO_2$ emission can be applied per cluster compute resource by adding a custom property. Custom values of $CO_2$ emission per kWh can be added to each cluster compute resource by creating a custom property with the name $CO_2$ **Emission** and type as **Numeric** and the relevant custom values.

  **Note:**
  If no custom properties are defined, predefined values for $CO_2$ emission are used.

**Disclaimer:**

The conversion calculators and information shown in this documentation reference public information and have been provided to help translate abstract carbon emissions numbers into easily understandable terms solely for informational

purposes. You should not rely on the calculators or information provided herein for any other purpose, including for any regulatory disclosure or diligence purposes. Broadcom may update, upgrade, revise, adjust or otherwise change the features and conversion methodologies at any time. Broadcom has not separately reviewed, approved, or endorsed the public information or third-party websites. ### Energy Efficient Infrastructure Dashboard

Use this dashboard to identify old hardware, such as compute and storage, in the data center and replace them with new generation hardware components that are more power efficient. You can also use this dashboard to reduce the overheads and buffers and identify smaller clusters that have higher overheads. The aim is to run with fewer overheads and buffer, without compromising on performance.

**How to Use the Dashboard**

- Smaller clusters have a relatively higher overhead. A cluster with two nodes has 50% overhead, while a cluster with 10 nodes has only 10% overhead. Clusters with lesser capacity require more hosts and hence consume more electricity. The **Small Clusters** table lists clusters that meet one of the following criteria:
  - <=4 nodes
  - <=120 CPU cores and < 1 TB memory

  Click a cluster row to view the context of the selected cluster. An empty widget indicates that the defined efficiency goals are met.
- Advancements in technology help ESX hosts to deliver higher efficiency. ESX hosts can deliver more CPU and memory capacity, often with low power requirements. The **Ageing Compute Hardware** table lists ESX hosts that meet one of the following criteria:
  - ESX version 6 or later
  - <=40 CPU cores and < 256 GB of memory

  Click a cluster row to view the context of the selected cluster. An empty widget indicates that the defined efficiency goals are met.
- Just like compute hardware, newer storage hardware is typically more power efficient than older storage hardware. The **Ageing Storage Hardware** table lists datastores that meet the following criteria:
  - VMFS version 5 or older.
  - Not a local datastore.

  Click a cluster row to view the context of the selected cluster. An empty widget indicates that the defined efficiency goals are met.

  If you have goals that are different from those defined, you can modify the criteria of the widgets by updating the filters.

# Configuring Dashboards and Widgets

Dashboards present a visual overview of the performance and state of objects in your virtual infrastructure. Widgets are the visual components used to build dashboards, displaying information about attributes, resources, applications, or overall processes within your environment.

# Dashboards in VCF Operations

Dashboards present a visual overview of the performance and state of objects in your virtual infrastructure. You use dashboards to determine the nature and timeframe of existing and potential issues with your environment. You create dashboards by adding widgets to a dashboard and configuring them.

VCF Operations collects performance data from monitored software and hardware resources in your enterprise and provides predictive analysis and real-time information about problems. The data and analysis are presented through alerts, in configurable dashboards, on predefined pages, and in several predefined dashboards.

- You can start with several predefined dashboards in VCF Operations.
- You can create extra ones that meet your specific needs using widgets, views, badges, and filters to change the focus of the information.
- You can clone and edit the predefined dashboards or start from scratch.
- To display data that shows dependencies, you can add widget interactions in dashboards.
- You can provide role-based access to various dashboards for better collaboration in teams.

**Table 1363: Features**

| Features | Description |
|---|---|
| Manage | You can also manage dashboards by navigating to the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. Click **Dashboards** > **Manage** from the centre pane. |
| Create | Use this option to create a dashboard. See Create and Configure Dashboards. |
| Search | You can search for a dashboard across the **Favorites**, **Recents**, and **All** folders in the **Dashboards** pane in the centre. |
| Favorites | You can mark a dashboard as a favorite using the **Favorite** icon at the top of each dashboard. All the dashboards that you have marked as a favorite, are listed under the Favorites folder in the **Dashboards** pane in the centre. |
| Recents | The dashboards are listed in the order in which you select them, with the most recent dashboard that you selected, appearing at the top. Up to ten dashboards can be displayed as Recent dashboards.<br>If you do not pin the dashboard and log out of the user interface, on logging back in, the dashboard is removed from the Recents folder. |
| Shared | If you have shared the dashboard, the shared icon is displayed against the dashboard name. |
| All | Lists the dashboard folders and the dashboards that are activated. You can use this menu for quick navigation through your dashboards. To view the dashboards that are listed in the panel under **All**, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All**. You can also search for dashboards using keywords and letters. |

| Features | Description |
|---|---|
| Actions | Available dashboard actions, such as edit, delete, Set as Dashboards Home, and Add to Product Home. These actions are applied directly to the dashboard that you are on.<br>**Set as Dashboards Home**: Adds the dashboard to the **Favorites** list. To remove the dashboard from the **Favorites** list, select **Actions** > **Unset as Dashboards Home**.<br>**Add to Product Home**: Adds the dashboard as a tab in the **Home** page. You can also reorder the tabs in the **Home** page using drag and drop. You can also set this option by clicking the **Home** icon at the top right side of the dashboard. To remove the dashboard from the Home page, select **Actions** > **Remove from Product Home**.<br>**Note:**<br>You can add up to 5 dashboards to the **Home** page. |
| Dashboard Time | The dashboard time panel is activated by default on all predefined and user-created dashboards. Using this option, you can select a time for the widgets in the dashboard. The default time is 6 hours. The pre-defined time/day options in the panel are 1 hour, 6 hours, 24 hours, or 7 days. You can also set a customized time option.<br>To activate widgets to use the dashboard time, select ***Date Controls/Time Range*** > **Dashboard Time** from the widget toolbar. Some widgets have **Dashboard Time** as the default option. For example, **Metric Chart**, **View**, **Rolling View**, **Sparkline**, **Health Chart**, and **Mashup Chart** widgets.<br>Dashboard time persists if:<br>• You activate a widget in a dashboard to use the dashboard time and then log out and log back in, or<br>• You activate a widget in a dashboard to use the dashboard time, and you export and then import the dashboard into another instance of VCF Operations. |

## Accessing Predefined Dashboards

You can access some of the useful, predefined dashboards from the **Dashboards** home page.

To access these dashboards, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All**.

The dashboards are categorized as follows: Availability, Configuration, Inventory, Performance, Capacity, and Cost to name a few. To easily access some of the useful, predefined dashboards under these categories, click on the drop-down button against the selected category and click on the specific dashboard.

## Types of Dashboards

You can use the predefined dashboards or create your own custom dashboard in VCF Operations.

See Using Predefined Dashboards for Quick Insights for more information.

### Custom Dashboards

You can create dashboards that meet your environment needs in VCF Operations.

For information about creating a dashboard, see Create and Configure Dashboards.

## Create and Configure Dashboards

To view the status of all objects in VCF Operations, create a dashboard by adding widgets or views. You can create and modify dashboards and configure them to meet your environment needs.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**.
2. Click **Dashboards** > **Create** from the centre pane.
3. Complete the following steps to:
   a) Enter a name for the dashboard.
      Dashboard Name
   b) Add widgets or views to the dashboard.
      Widget or View List Details
   c) Configure widget interactions.
      Widget and View Interactions Details
   d) Create dashboard navigation.
      Dashboard Navigation Details
4. Click **Save**.
5. Click **Actions** > **Edit Dashboard** to modify the dashboard.

### Dashboard Name

The name and visualization of the dashboard as it appears on the VCF Operations Home page.

#### Where You Add a Name in a Dashboard

To create your dashboard, in the VCF Operations navigation bar at the top, click **Operations** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **Create**. Enter a name in the **New Dashboard** field.

To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operations** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All**. Click on the dashboard you want to edit and select **Actions** > **Edit Dashboard**.

If you use a forward slash while entering a name, the forward slash acts as a group divider and creates a folder with the specified name in the dashboards list if the name does not exist. For example, if you name a dashboard `clusters/hosts`, the dashboard is named `hosts` under the group `clusters`.

#### Related Concepts

Widget Interactions

Widget interactions are the configured relationships between widgets in a dashboard where one widget provides information to a receiving widget. When you are using a widget in the dashboard, you select data on one widget to limit the data that appears in another widget, allowing you to focus on a smaller subset data.

Widget Definitions List

A widget is a pane on a dashboard that contains information about configured attributes, resources, applications, or the overall processes in your environment. Widgets can provide a holistic, end-to-end view of the health of all the objects and applications in your enterprise. If your user account has the necessary access rights, you can add and remove widgets from your dashboards.

### Widget or View List Details

VCF Operations provides a list of widgets or views that you can add to your dashboard to monitor specific metrics and properties of objects in your environment.

## Where You Add Widgets or Views to a Dashboard

To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **Create** to add a dashboard.

To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All**. Click on the dashboard you want to edit and select **Actions** > **Edit Dashboard**.

## How to Add Widgets or Views to a Dashboard

In the widgets list panel, you see a list of predefined VCF Operations widgets or views that are most commonly used. Click **Show More** to view all the widgets and views. Click **Add Section** to add sections to the dashboard. You can drag and drop widgets under each section. While creating a dashboard, you can provide a name, description, edit, delete, collapse, and expand the sections in a dashboard. If you add sections and do not add widget/s to the sections, by default the widgets are displayed under the last section in the dashboard.

To add a widget or view to the dashboard workspace in the upper panel, you can:

- Drag the widget or view to the dashboard workspace or a section in the dashboard workspace in the upper panel, or
- Click on a widget or view from the widgets list panel, view a brief description of the widget or view from the pop up box and then click **Add to Dashboard**, or
- Double-click on the widget or view.

To locate a widget or view, you can enter the name or part of the name of a widget or view in the **Filter** > **Name** option. For example, when you enter `top`, the list is filtered to display the Top Alerts, Top-N, and Topology Graph widgets. You can then select the widget you require. You can also filter by either widgets or views by selecting **Filter** > **Show** to add a widget or view to the dashboard. Drag the widget or view to the dashboard workspace in the upper panel.

> **Note:**
> The following widgets are deprecated. Usage of these widgets is discouraged as they will be phased out in future releases. Deprecated widgets are marked with a yellow triangle.
>
> - Current Policy
> - Weather Map
> - Anomalies
> - DRS Cluster Settings
> - Efficiency
> - Environment Status
> - Risk
> - Environment
> - Container Overview
> - Faults

Most widgets or views must be configured individually to display information. For more information about how to configure each widget, see Widgets in VCF Operations.

## How to Arrange Widgets or Views in a Dashboard

You can modify your dashboard layout to suit your needs. By default, the first widgets or views that you add are automatically arranged horizontally wherever you place them.

- To position a widget or a view, drag the widget or view to the desired location in the layout. Other widgets and views automatically rearrange to make room.
- To resize a widget or a view, drag the bottom-right corner of the widget or the view.
- To maximize or minimize a widget or a view, use the maximize and minimize options in the top-right corner.

### Related Concepts

Widget Interactions

Widget interactions are the configured relationships between widgets in a dashboard where one widget provides information to a receiving widget. When you are using a widget in the dashboard, you select data on one widget to limit the data that appears in another widget, allowing you to focus on a smaller subset data.

Widget Definitions List

A widget is a pane on a dashboard that contains information about configured attributes, resources, applications, or the overall processes in your environment. Widgets can provide a holistic, end-to-end view of the health of all the objects and applications in your enterprise. If your user account has the necessary access rights, you can add and remove widgets from your dashboards.

## Widget and View Interactions Details

You can connect widgets and views so that the information they show depends on each other.

### Where You Create Widget and View Interactions

To create interactions for widgets or views in a dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **Create** to add a dashboard. From the toolbar, turn on the **Interaction Mode** toggle.

To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All**. Click on the dashboard you want to edit and select **Actions** > **Edit Dashboard**.

Internal interactions are interactions defined between widgets in a single dashboard. External interactions are interactions defined between a widget in one dashboard and widget/s in another dashboard.

### How to Create and Remove Widget Interactions

The list of available interactions depends on the widgets or views in the dashboard. Widgets and views can provide, receive, and can both provide and receive interactions at the same time.

To create interactions, turn on the **Interaction Mode** toggle. Click a provider plug and drag to the receiver. You can also apply interactions from receiver to provider plugs. For more information about how interactions work, see Widget Interactions.

To remove interactions, turn off the **Interaction Mode** toggle. You can also click the provider plug and select **Remove Interaction** > **<widget name>**.

**Note:**
You can create up to 25 widget interactions in a dashboard.

### How to Easily View Widget Interactions

To view widget interactions from a dashboard, click on an object from a provider widget that has widget interactions defined. A window appears with the external and internal widget interaction details. Clicking on an external interaction takes you to the external dashboard. Click on the internal interaction to view the details in the receiver widget.

**Related Concepts**

Widget Interactions

Widget interactions are the configured relationships between widgets in a dashboard where one widget provides information to a receiving widget. When you are using a widget in the dashboard, you select data on one widget to limit the data that appears in another widget, allowing you to focus on a smaller subset data.

Widget Definitions List

A widget is a pane on a dashboard that contains information about configured attributes, resources, applications, or the overall processes in your environment. Widgets can provide a holistic, end-to-end view of the health of all the objects and applications in your enterprise. If your user account has the necessary access rights, you can add and remove widgets from your dashboards.

## Dashboard Navigation Details

You can apply sections or context from one dashboard to another. You can connect widgets and views to widgets and views in the same dashboard or to other dashboards to investigate problems or better analyze the provided information.

### Where You Add Another Dashboard

To create dashboard navigation to a dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **Create** to add a dashboard. In the dashboard workspace, turn on the **Interaction Mode** toggle. From the **Select Another Dashboard** drop-down menu, select the dashboard to which you want to navigate.

To edit your dashboard, fin the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All**. Click on the dashboard you want to edit and select **Actions** > **Edit Dashboard**.

### How Dashboard Navigation Works

You can create dashboard navigation only for provider widgets and views. The provider widget or view sends information to the destination widget or view. When you create dashboard navigation, the destination widgets or views are filtered based on the information type they can receive.

### How to Add Dashboard Navigation to a Dashboard

The list of available dashboards for navigation depends on the available dashboards and the widgets and views in the current dashboard. To add navigation, you can drag from a sender widget interaction plug to a receiver widget interaction plug. You can select more than one applicable widget or view.

> **Note:**
> If a dashboard is unavailable for selection, it is unavailable for dashboard navigation.

The Dashboard Navigation icon
(
) appears in the top menu of each widget or view when a dashboard navigation is available.

After you have set widget interaction in the provider dashboard, the widget and menu bar are highlighted and two arrows appear in the top-left corner of the widget. After you have set widget interaction, clicking the object in the provider widget takes you to the receiver widget of the navigated dashboard.

**Related Concepts**

Widget Interactions

Widget interactions are the configured relationships between widgets in a dashboard where one widget provides information to a receiving widget. When you are using a widget in the dashboard, you select data on one widget to limit the data that appears in another widget, allowing you to focus on a smaller subset data.

Widget Definitions List

A widget is a pane on a dashboard that contains information about configured attributes, resources, applications, or the overall processes in your environment. Widgets can provide a holistic, end-to-end view of the health of all the objects and applications in your enterprise. If your user account has the necessary access rights, you can add and remove widgets from your dashboards.

## Manage Dashboards

You can select dashboards individually or as a group and perform several actions.

To manage your dashboards, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **Manage**. Use the options from the horizontal ellipsis next to the **Add** option.

All the dashboards are listed on this page. You can filter the dashboards based on the name of the dashboard, the dashboard folder, activated dashboards, shared dashboards, or the dashboard owner. You can click **Add** to create a dashboard. For information about creating a dashboard, see Create and Configure Dashboards.

You can select a dashboard from the list, click the vertical ellipsis against each dashboard, and select the various options such as edit, delete, clone, and deactivate a dashboard. You can also change ownership of dashboards and export the dashboard. By default, the list of dashboards is sorted by name and all the columns can be sorted.

> **Note:**
> A wrench icon appears when the data in an imported dashboard depends on the existence of one or more adapters that are currently not present. The wrench icon disappears if the required data in an imported dashboard appears in VCF Operations after configuration.
>
> Imported dashboards regardless of used data, remain stuck and include a wrench icon if the dashboard that is stuck (with the wrench icon), already exists.

**Datagrid Options**

| Column Names | Description |
|---|---|
| Name | Displays the name of the dashboard. |
| Folder | Lists the folder to which each dashboard belongs. |
| Description | Displays the description of the dashboard. |
| Activated | Displays whether the dashboard is activated or not. You can also activate and deactivate the dashboard. |
| URL | Displays whether the dashboard is shared externally. For dashboards that have been shared, click to view the shared links. |
| Shared | Displays whether the dashboard is shared internally. Click the icon to view and edit the groups to which the dashboard has been shared from the **Group Sharing** dialog box.<br>From the **Group Sharing** dialog box, to share dashboard edit privileges with the group, you can click the **Allow Editing** check box or click the pencil icon if a dashboard is shared with a group.<br>**Note:**<br>Users who are part of the user group to whom the dashboard has been shared, will see an unlocked or locked icon in the **Shared** column. The icon is unlocked when the user with whom the dashboard is shared can edit it, and the icon is locked when the dashboard cannot be edited. |
| Editable | Displays if the dashboard is editable. |
| Owner | Displays the owner of the dashboard. |
| Report Usage | Displays the number of reports where the dashboard is used. Click the number in the column to view the name of the report/s. Click the report name to navigate to the report template in edit mode. |
| Last Modified | Displays the date the dashboard was last modified. |
| Modified By | Displays the user who last modified the dashboard. |

You can select more than one dashboard and perform a set of options by clicking the horizontal ellipsis next to the **Add** option.

**Table 1364: Dashboards Options**

| Option | Description | Usage |
|---|---|---|
| Delete | Deletes a dashboard. | |
| Activate | Activates a dashboard that was previously deactivated. | |
| Deactivate | Deactivates a dashboard. | |
| Change Ownership | Assigns a new owner to the dashboard. | After you assign a dashboard to a new owner, the dashboard is no longer displayed as one of your dashboards.<br>When you transfer a dashboard that was previously shared with user groups, information about the shared user groups and group hierarchy is retained. |
| Export | When you export a dashboard, VCF Operations creates a dashboard file in JSON format. | You can export a dashboard from one VCF Operations instance and import it to another.<br>To export a dashboard, select the dashboard that you want to export, and click **Export** from the horizontal ellipsis. |
| Import | A PAK or JSON file that contains dashboard information from VCF Operations. | You can import a dashboard that was exported from another VCF Operations instance.<br>To import a dashboard:<br>1. Click the **Import** option from horizontal ellipsis.<br>2. Click **Browse** and select a Dashboard ZIP, PAK, or JSON file to import.<br>3. Select if you want to **Overwrite** or **Rename** the file in case of a conflict.<br>4. Click **Import** to import the dashboard, and click **Done**. |
| Auto-rotate Dashboards | Changes the order of the dashboard tabs on VCF Operations home page. | You can configure VCF Operations to switch from one dashboard to another. For more information, see Auto-Rotate Dashboards. |
| Manage Summary Dashboards | Provides you with an overview of the state of the selected object, group, or application. | You can change the **Summary** tab with a dashboard to get information specific to your needs. For more information, see Manage Summary Dashboards |
| Manage Dashboard Folders | Groups dashboards in folders. | You can create dashboard folders to group the dashboards in a way that is meaningful to you. For more information, see Manage Dashboard Folders. |
| Manage Dashboard Sharing | Makes a dashboard available to other users or user groups. | You can share a dashboard or dashboard template with one or more user groups. For more information, see Share Dashboards with Users. |

The dashboard list depends on your access rights.

## Manage Summary Dashboards

The **Summary** tab provides you with an overview of the state of the selected object, group, or application. You can change the **Summary** tab with a dashboard to get information specific to your needs.

### Where You Configure a Summary Tab Dashboard

To manage the summary dashboards, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **Manage**. Click the horizontal ellipsis next to the **Add** option and select **Manage Summary Dashboards**.

### How You Manage the Summary Dashboards

**Table 1365: Manage Summary Dashboards Toolbar Options**

| Option | Description |
|---|---|
| Use Default | Click to use VCF Operations default **Summary** tab. |
| Assign a Dashboard | Click to view the Dashboard List dialog box that lists all the available dashboards. |
| Adapter Type | Adapter type for which you configure a summary dashboard. |
| Filter | Use a word search to limit the number of adapter types that appear in the list. |

To change the Summary tab for an object, select the object in the left panel, click the **Assign a Dashboard** icon. Select a dashboard for it from the All Dashboards dialog box and click **OK**. From the Manage Summary Dashboards dialog box click **Save**. You see the dashboard that you have associated to the object type when you navigate to the **Summary** tab of the object details page.

## Auto-Rotate Dashboards

You can change the order of the dashboard tabs on your home page. You can configure VCF Operations to switch from one dashboard to another. This feature is useful if you have several dashboards that show different aspects of your enterprise's performance and you want to look at each dashboard in turn.

### Where You Configure Auto-Rotation of a Dashboard

To reorder and configure a dashboard switch, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **Manage**. Select **Auto-rotate Dashboards** from the horizontal ellipsis next to the **Add** option.

### How You Reorder the Dashboards

The list shows the dashboards as they are ordered. Drag the dashboards up and down to change their order on the home page.

### How You Configure an Automatic Dashboard Rotation

1. Double-click a dashboard from the list to configure.
2. From the Rotation drop-down menus, select **On**.
3. Select the time interval in seconds.
4. Select the dashboard to switch and click **Update**.
5. Click **Save** to save your changes.

On the home page, the current dashboard will switch to the dashboard that is defined after the specified time interval.

## Manage Dashboard Folders

You can create dashboard folders to group the dashboards in a way that is meaningful to you.

#### Where You Manage Dashboard Folders

To manage the dashboard folders, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **Manage**. Click the horizontal ellipsis next to the **Add** option and click **Manage Dashboard Folders**.

#### How You Manage the Dashboard Folders

**Table 1366: Manage Dashboard Folders Options**

| Option | Description |
|---|---|
| Folders | A hierarchy tree with all the available group folders. |
| Dashboards List | A list with all available dashboards. |

To create a dashboard folder, click **New Folder** in the **Folders** pane and enter the name of the folder. If you want to create a folder under another folder, select a parent folder under which you want to create the child folder, then click **New Folder**. To add a dashboard, drag one from the dashboards list to the selected folder in the **Folders** pane.

You can delete folders and/or detach dashboards from a folder, by selecting one or more folders and dashboards from the **Folders** pane and by clicking **Actions** > **Delete**.

You can rename a folder by selecting a single folder from the **Folders** pane and by clicking **Actions** > **Rename**.

### Share Dashboards with Users

You can share a dashboard with one or more user groups. When you share a dashboard, it becomes available to all the users in the user group that you select. The dashboard appears the same to all the users who share it. If you edit a shared dashboard, the dashboard changes for all users. Other users can only view a shared dashboard. They cannot change it.

#### Where You Share a Dashboard From

To share a dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **Manage**. Click the horizontal ellipsis next to the **Add** option and click **Manage Dashboard Sharing**.

**Table 1367: Dashboard Sharing Options**

| Option | Description |
|---|---|
| All Dashboards | Link to view all the available dashboards that you can share. The dashboards are displayed on the right side in the dashboards list. |
| User Groups | Lists the available user groups that you can share a dashboard with. The list includes the **Everyone** group. |
| Dashboard List | List of shared dashboards with the selected user group or all the available dashboards that you can share, if no user group is selected. |

#### Manage Dashboard Sharing

To share a dashboard, navigate to the dashboard in the list of dashboards and drag it to the group to share it with, on the left.

To stop sharing a dashboard with a group, click that group on the left panel, navigate to the dashboard in the right panel, and click **Stop Sharing** above the list.

**Table 1368: Datagrid Options**

| Column Name | Description |
|---|---|
| Name | Displays the name of the dashboard. |
| Folder | Displays the folder where the dashboard is located. |
| Description | Displays the description of the dashboard. |
| Activated | Displays whether the dashboard is activated for viewing. |
| Shared | Displays if the dashboard is shared with user groups. |
| Editable | Click the check box to share dashboard edit privileges with the specific group. |
| Owner | Displays the owner of the dashboard. |
| Last Modified | Displays the date the dashboard was last modified. |
| Modified By | Displays who modified the dashboard. |

## Dashboards Actions and Options

You can change the order of the dashboard tabs, configure VCF Operations to switch from one dashboard to another, create dashboard folders to group the dashboards in a way that is meaningful to you, share a dashboard or dashboard template with one or more user groups, and transfer selected dashboards to a new owner.

### Options for Sharing Dashboards

You can share predefined or custom dashboards using URLs, emails, and by copying the code to embed the dashboard into confluence or other internal official web pages. You can also assign and unassign a dashboard to specific user groups and export the dashboard configuration details.

When you use a non-authenticated shared URL, as a user you can open the dashboard in a new browser session. If you have already logged into VCF Operations in another session, you are redirected to this dashboard and the user authentication permissions apply. To ensure that the non-authenticated URL opens the intended dashboard, as a user you must log out from all existing user sessions.

The dashboard shared with the URL opens in a page where you can access all the widgets within the dashboard and you can interact with the given widgets at the same time. A non-authenticated dashboard however, does not allow you to browse to other areas of VCF Operations.

Dashboard sharing can only be applied to Groups with a VCF Operations Standard Edition license.

#### Where You Can Access the Options to Share Dashboards

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards**, and then click on an existing dashboard and then click the **Share Dashboard** icon in the top-right corner.

**Table 1369: Options in the Share Dashboard Dialog Box**

| Option | Description |
|---|---|
| URL | Allows you to copy the tiny URL for the selected dashboard.<br>• Set the expiry period for the link to **1 day**, **1 week**, **1 month**, **3 Months**, or **Never Expire**.<br>• Click **Copy Link** to copy the link to a new window from where you can view the dashboard.<br>**Note:**<br>• As a user, if you open a shared link and you are logged into VCF Operations, you are navigated to your default dashboard, instead of viewing the shared one.<br>• As a user, if you log in to the same IP that was shared with you previously, you cannot access the page with the same browser.<br>• As a user, ensure that you have the following permission: **Dashboards > Dashboard Management > Share (Public)**.<br>You can stop sharing a dashboard you had previously shared. To stop sharing a dashboard, click the **Unshare Link** option and enter the URL of the dashboard that you want to stop sharing and click **Unshare**.<br>Authentication is not required to view the shared dashboard. |
| Email | Allows you to send an email with the URL details of the dashboard, to a specific person.<br>• Set the expiry period for the link to **1 day**, **1 week**, **1 month**, **3 months**, or **Never Expire**.<br>• Configure an SMTP instance. See Add a Standard Email Plug-In for VCF Operations Outbound Alerts.<br>• Enter an email address and click the **Send Email** button to send an email with the URL details of the dashboard.<br>Authentication is not required to view the shared dashboard. |
| Embed | Provides an embedded code for the dashboard. You can use this code to embed the dashboard in relevant confluence pages that your company executives routinely use and analyze.<br>• Set the expiry period for the link to **1 day**, **1 week**, **1 month**, **3 Months**, or **Never Expire**.<br>**Note:**<br>• If you embed a dashboard in the **Text** widget, the widget does not display any data.<br>• When you open an HTML/confluence page with an embedded dashboard from the same browser that you have logged into VCF Operations, the dashboard does not load.<br>Authentication is not required to view the shared dashboard. |
| Groups | Allows you to assign and unassign a dashboard to specific user groups.<br>• Select the group to which you want to grant dashboard access from the drop-down menu.<br>• To share dashboard edit privileges with the group, select the **Allow Editing** check box if a dashboard is shared with a group.<br>• Click **Include**. You can include more than one group.<br>• From the label, select the cross mark to unassign the dashboard.<br>Log in to VCF Operations to view the shared dashboard. |
| Export | Allows you to export the dashboard configuration details.<br>Log in to VCF Operations to export/import a dashboard. |

### Manage Widgets in Dashboards

You can replicate widgets multiple times in a dashboard by using the copy and paste functionality.

Navigate to the dashboard from which you want to copy widgets. Select **Actions** > **Edit Dashboard**. Select one or more widgets that you want to copy by clicking the title of the widget and then select **Actions** > **Copy Widget(s)**. Click **Actions** > **Paste Widget(s)** to paste one or more widgets in the same dashboard.

To paste one or more widgets into another dashboard, exit the edit screen of the dashboard by selecting **Cancel**. Navigate to the dashboard to which you want to paste one or more widgets and select **Actions** > **Edit Dashboard** and then **Actions** > **Paste Widget(s)**.

## Widgets in VCF Operations

Widgets are the panes on your dashboards. You add widgets to a dashboard to create a dashboard. Widgets display information about attributes, resources, applications, or the overall processes in your environment.

You can configure widgets to reflect your specific needs. The available configuration options vary depending on the widget type. You must configure some of the widgets before they display any data. Many widgets can provide or accept data from one or more widgets. You can use this feature to set the data from one widget as filter and display related information on a single dashboard.

### Widget Interactions

Widget interactions are the configured relationships between widgets in a dashboard where one widget provides information to a receiving widget. When you are using a widget in the dashboard, you select data on one widget to limit the data that appears in another widget, allowing you to focus on a smaller subset data.

#### How Interactions Work

If you configured interactions between widget at the dashboard level, you can then select one or more objects in the providing widget to filter the data that appears in the receiving widget, allowing you to focus on data related to an object.

To use the interaction option between the widgets in a dashboard, you configure interactions at the dashboard level. If you do not configure any interactions, the data that appears in the widgets is based on how the widget is configured.

When you configure widget interaction, you specify the providing widget for the receiving widget. For some widgets, you can define two providing widgets, each of which can be used to filter data in the receiving widget.

For example, if you configured the Object List widget to be a provider widget for the Top-N widget, you can select one or more objects in the Object List widget and the Top-N displays data only for the selected objects.

For some widgets, you can define more than one providing widget. For example, you can configure the Metric Chart widget to receive data from a metrics provider widget and an objects providing widget. In such case, the Metric Chart widget shows data for any object that you select in the two provider widgets.

**Related reference**

Dashboard Navigation Details

You can apply sections or context from one dashboard to another. You can connect widgets and views to widgets and views in the same dashboard or to other dashboards to investigate problems or better analyze the provided information.

Dashboard Name

The name and visualization of the dashboard as it appears on the VCF Operations Home page.

Widget and View Interactions Details

You can connect widgets and views so that the information they show depends on each other.

Widget or View List Details

VCF Operations provides a list of widgets or views that you can add to your dashboard to monitor specific metrics and properties of objects in your environment.

# Configuration Files

You can create configuration files to upload SVG content and define topological hierarchies in dashboards through supported widgets. You can also create configuration files that display adapter kind, resource kind, and the associated metrics that can be displayed in dashboards using supported widgets.

## Configuration Files for Widget Metric Configuration

You can create an XML file that displays the adapter type, resource kind, and the associated metrics that can be displayed in a widget and dashboard.

### How Configuration Files Work

From the **Configuration Files** page, you can create a XML configuration file with the adapter type, object type, and metric details to be displayed in a dashboard. The final output is an XML file. The supported widgets are Metric Chart, Property List, Rolling View Chart, Scoreboard, Sparkline Chart, and Topology Graph. To use the metric configuration, you must set the widget Self Provider to **Off** and create a widget interaction with a provider widget.

### Where You Find Widget Metric Configuration File

To manage the configuration files, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Configurations,** and then click the **Widget Metric Configuration** tile. To add a configuration file, click the **Add** button. You see the **Create Configuration File** page.

**Table 1370: New Configuration File Page Options**

| Option | Description |
|---|---|
| Name | Enter a name for the configuration file. |
| Description | Enter a description for the configuration file. |
| Containing Folder | Select the folder under which you want to store the new configuration file. If you have not created a folder, you can select the **User Defined** folder if it appears. The **System Defined** folder will not appear for selection. |
| Text box | You can define the adapter type, object type, and metrics.<br>From the **Adapter Kind** drop down above the text box, select the adapter type. From the **Resource Kind** drop down above the text box, select the object type. From the **Metric** drop down above the text box, select a metric.<br>Use the orange **Format XML** button to format the XML content. Click **Save**. You see the configuration file under the selected folder. You can preview the XML that was created. |

**Table 1371: Widget Metric Configuration Toolbar and Data Grid Options**

| Option | Description |
|---|---|
| Filter | Click the filter icon to filter the configuration files using the following criteria: Name, Description, Last Modified, and Modified By. |
| **Options from the horizontal ellipsis** | |
| Edit | Select a configuration file to edit the contents of the configuration file. |
| Delete | Select one or more configuration files if you want to delete them. You cannot delete configuration files under the **System Defined** folder. |

| Option | Description |
|---|---|
| Clone | Select a configuration file to clone. You can edit the configuration file options in the **New Configuration File** page and click **Save** |
| Move | Select one or more configuration files if you want to move them to another folder. You can also move configuration files using the drag and drop option. You cannot move a configuration file to or from the **System Defined** folder. |
| Export | Select one or more configuration files if you want to download them. |
| Import | Select this option if you want to import configuration files. To import:<br>• Click the **Import** option from the horizontal ellipsis.<br>• Click **Browse** and select the file to import.<br>• Select if you want to Overwrite or Skip the file in case of a conflict.<br>• Click **Import** to import the configuration file, and click **Done**. |
| Create New Folder | Enter a name for the folder and click **OK**. You can create a new folder for meaningful grouping. |
| Rename Folder | Select a folder created by a user and rename the folder. You cannot rename the **System Defined** and **User Defined** folders. |
| **Data Grid Options** | |
| Name | Lists the configuration files that have been created. The **System Defined** folder contains configuration files that are predefined. The **User Defined** folder contains orphan configuration files that were created by users but not assigned to a folder. |
| In Use | Indicates whether the configuration file is in use in a dashboard and supported widget.<br>**Yes**: Indicates that the configuration file is used in a dashboard. Hover and click on the green tick mark to view the name of the dashboard and the widget that uses this configuration file.<br>**No**: Indicates that the configuration file is not used in a dashboard. |
| Description | Displays the description entered while creating/editing the configuration file. |
| Last Modified | Displays when the configuration file was last updated. |
| Modified By | Displays who last modified the configuration file. For example, *admin* or *maintenanceAdmin*. |

## Configuration Files for Text Widget Content

You can upload an SVG in Text widgets that are utilized in different dashboards.

### How Configuration Files Work

From the **Configuration Files** page, you can upload an SVG file to be displayed in a Text widget.

### Where You Find Text Widget Configuration File

To manage the configuration files, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Configurations,** and then click the **Text Widget Content** tile. To add a configuration file, click the **Add** button. You see the **Text Widget Content** page.

**Table 1372: New Configuration File Page Options**

| Option | Description |
|---|---|
| Name | Enter a name for the configuration file. |
| Description | Enter a description for the configuration file. |
| Containing Folder | Select the folder under which you want to store the new configuration file. If you have not created a folder, you can select the **User Defined** folder if it appears. The **System Defined** folder will not appear for selection. |
| Text box | From your system, using an XML editor, open the SVG file to be uploaded. Copy the text from the SVG file into the text box. Use the orange **Format XML** button to format the XML content. Click **Save**. You see the configuration file under the selected folder. You can preview the SVG that was uploaded.<br>**Note:**<br>Ensure that the text in the text box starts with `<svg`. |

**Table 1373: Text Widget Toolbar and Data Grid Options**

| Option | Description |
|---|---|
| Filter | Click the filter icon to filter the configuration files using the following criteria: Name, Description, Last Modified, and Modified By. |
| **Options from the horizontal ellipsis** | |
| Edit | Select a configuration file to edit the contents of the configuration file. |
| Delete | Select one or more configuration files if you want to delete them. You cannot delete configuration files under the **System Defined** folder. |
| Clone | Select a configuration file to clone. You can edit the configuration file options in the **New Configuration File** page and click **Save**. |
| Move | Select one or more configuration files if you want to move them to another folder. You can also move configuration files using the drag and drop option. You cannot move a configuration file to or from the **System Defined** folder. |
| Export | Select one or more configuration files if you want to download them. |
| Import | Select this option if you want to import configuration files. To import:<br>• Click the **Import** option from the horizontal ellipsis.<br>• Click **Browse** and select the file to import.<br>• Select if you want to Overwrite or Skip the file in case of a conflict.<br>• Click **Import** to import the configuration file, and click **Done**. |
| Create New Folder | Enter a name for the folder and click **OK**. You can create a new folder for meaningful grouping. |
| Rename Folder | Select a folder created by a user and rename the folder. You cannot rename the **System Defined** and **User Defined** folders. |
| **Data Grid Options** | |

| Option | Description |
|---|---|
| Name | Lists the configuration files that have been created. The **System Defined** folder contains configuration files that are predefined. The **User Defined** folder contains orphan configuration files that were created by users but not assigned to a folder. |
| In Use | Indicates whether the configuration file is in use in a Text widget and dashboard.<br>**Yes**: Indicates that the configuration file is used in a **Text** widget. Hover and click on the green tick mark to view the name of the dashboard and the Text widget that uses this configuration file.<br>**No**: Indicates that the configuration file is not used in a dashboard. |
| Description | Displays the description entered while creating/editing the configuration file. |
| Last Modified | Displays when the configuration file was last updated. |
| Modified By | Displays who last modified the configuration file. For example, *admin* or *maintenanceAdmin*. |

## Management Packs Configuration

You can create an XML file for specific adapter kinds with additional threshold details such as configuration limits, name, type, and value. The configuration file can be used in a widget and dashboard.

### How Configuration Files Work

From the **Management Packs Configuration** page, you can create a XML file with adapter specific details with additional thresholds to be displayed in dashboards and widgets. The final output is an XML file. The final output is an XML file. The supported widgets are Metric Chart, Property List, Rolling View Chart, Scoreboard, Sparkline Chart, and Topology Graph.

### Where You Find Resource Kind Metric Configuration File

To manage the configuration files, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Configurations,** and then click the **Management Packs Configuration** tile. To add a configuration file, click the **Add** button. You see the **Create Configuration File** page.

**Table 1374: New Configuration File Page Options**

| Option | Description |

| Delete | Select one or more configuration files if you want to delete them. You cannot delete configuration files under the **System Defined** folder. |
| Clone | Select a configuration file to clone. You can edit the configuration file options in the **New Configuration File** page and click **Save** |
| Move | Select one or more configuration files if you want to move them to another folder. You can also move configuration files using the drag and drop option. You cannot move a configuration file to or from the **System Defined** folder. |
| Export | Select one or more configuration files if you want to download them. |
| Import | Select this option if you want to import configuration files. To import:<br>• Click the **Import** option from the horizontal ellipsis.<br>• Click **Browse** and select the file to import.<br>• Select if you want to Overwrite or Skip the file in case of a conflict.<br>• Click **Import** to import the configuration file, and click **Done**. |
| Create New Folder | Enter a name for the folder and click **OK**. You can create a new folder for meaningful grouping. |
| Rename Folder | Select a folder created by a user and rename the folder. You cannot rename the **System Defined** and **User Defined** folders. |
| **Data Grid Options** | |
| Name | Lists the configuration files that have been created. The **System Defined** folder contains configuration files that are predefined. The **User Defined** folder contains orphan configuration files that were created by users but not assigned to a folder. |
| Description | Displays the description entered while creating/editing the configuration file. |
| Last Modified | Displays when the configuration file was last updated. |
| Modified By | Displays who last modified the configuration file. For example, *admin* or *maintenanceAdmin*. |

## Configuration Files for the Topology Widget

You can create an XML file with topology hierarchies to be displayed in a Topology widget.

### How Configuration Files Work

From the **Configuration Files** page, you can create a XML file with topology hierarchies to be displayed in a Topology widget. The final output is an XML file.

## Where You Find Resource Kind Metric Configuration File

To manage the configuration files, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Configurations,** and then click the **Topology Widget Configuration** tile. To add a configuration file, click the **Add** button. You see the **Create Configuration File** page.

### Table 1376: New Configuration File Page Options

| Option | Description |
|---|---|
| Name | Enter a name for the configuration file. |
| Description | Enter a description for the configuration file. |
| Containing Folder | Select the folder under which you want to store the new configuration file. If you have not created a folder, you can select the **User Defined** folder if it appears. The **System Defined** folder will not appear for selection. |
| Text box | You can define the topology hierarchies.<br>Select the tags above the text box to add to the configuration file. Use the orange **Format XML** button to format the XML content. Click **Save**. You see the configuration file under the selected folder. You can preview the XML that was created. |

### Table 1377: Topology Widget Configuration Toolbar and Data Grid Options

| Option | Description |
|---|---|
| Filter | Click the filter icon to filter the configuration files using the following criteria: Name, Description, Last Modified, and Modified By. |
| **Options from the horizontal ellipsis** | |
| Edit | Select a configuration file to edit the contents of the configuration file. |
| Delete | Select one or more configuration files if you want to delete them. You cannot delete configuration files under the **System Defined** folder. |
| Clone | Select a configuration file to clone. You can edit the configuration file options in the **New Configuration File** page and click **Save** |
| Move | Select one or more configuration files if you want to move them to another folder. You can also move configuration files using the drag and drop option. You cannot move a configuration file to or from the **System Defined** folder. |
| Export | Select one or more configuration files if you want to download them |
| Import | Select this option if you want to import configuration files. To import:<br>• Click the **Import** option from the horizontal ellipsis.<br>• Click **Browse** and select the file to import.<br>• Select if you want to Overwrite or Skip the file in case of a conflict.<br>• Click **Import** to import the configuration file, and click **Done**. |
| Create New Folder | Enter a name for the folder and click **OK**. You can create a new folder for meaningful grouping. |
| Rename Folder | Select a folder created by a user and rename the folder. You cannot rename the **System Defined** and **User Defined** folders. |
| **Data Grid Options** | |

| Option | Description |
|---|---|
| Name | Lists the configuration files that have been created. The **System Defined** folder contains configuration files that are predefined. The **User Defined** folder contains orphan configuration files that were created by users but not assigned to a folder. |
| In Use | Indicates whether the configuration file is in use in a dashboard and topology widget.<br>**Yes**: Indicates that the configuration file is used in a dashboard. Hover and click on the green tick mark to view the name of the dashboard and the widget that uses this configuration file.<br>**No**: Indicates that the configuration file is not used in a dashboard. |
| Description | Displays the description entered while creating/editing the configuration file. |
| Last Modified | Displays when the configuration file was last updated. |
| Modified By | Displays who last modified the configuration file. For example, *admin* or *maintenanceAdmin*. |

## Widget Definitions List

A widget is a pane on a dashboard that contains information about configured attributes, resources, applications, or the overall processes in your environment. Widgets can provide a holistic, end-to-end view of the health of all the objects and applications in your enterprise. If your user account has the necessary access rights, you can add and remove widgets from your dashboards.

**Table 1378: Summary of Widgets**

| Widget Name | Description |
|---|---|
| Alert List | Shows a list of alerts for the objects that the widget is configured to monitor. If no objects are configure, the list displays all alerts in your environment. |
| Alert Volume | Shows a trend report for the last seven days of alerts generated for the objects it is configured to monitor. |
| Anomalies | Shows a chart of the anomalies count for the past 6 hours. |
| Anomaly Breakdown | Shows the likely root causes for symptoms for a selected resource. |
| Capacity Remaining | Shows a percentage indicating the remaining computing resources as a percent of the total consumer capacity. It also displays the most constrained resource. |
| Container Details | Shows the health and alert counts for each tier in a single selected container. |
| Container Overview | Shows the overall health and the health of each tier for one or more containers. |
| Current Policy | Shows the highest priority policy applied to a custom group. |
| Data Collection Results | Shows a list of all supported actions specific for a selected object. |
| DRS Cluster Settings | Shows the workload of the available clusters and the associated hosts. |
| Efficiency | Shows the status of the efficiency-related alerts for the objects that it is configured to monitor. Efficiency is based on generated efficiency alerts in your environment. |
| Environment | Lists the number of resources by object or groups them by object type. |
| Environment Overview | Shows the performance status of objects in your virtual environment and their relationships. You can click an object to highlight its related objects and double-click an object to view its Resource Detail page. |
| Environment Status | Shows statistics for the overall monitored environment. |
| Faults | Shows a list of availability and configuration issues for a selected resource. |
| Forensics | Shows how often a metric had a particular value, as a percentage of all values, within a given time period. It can also compare percentages for two time periods. |

| Widget Name | Description |
|---|---|
| Health | Shows the status of the health-related alerts for the objects that it is configured to monitor. Health is based on generated health alerts in your environment. |
| Health Chart | Shows health information for selected resources, or all resources that have a selected tag. |
| Heat Map | Shows a heat map with the performance information for a selected resource. |
| Mashup Chart | Brings together disparate pieces of information for a resource. It shows a health chart and metric graphs for key performance indicators (KPIs). This widget is typically used for a container. |
| Metric Chart | Shows a chart with the workload of the object over time based on the selected metrics. |
| Metric Picker | Shows a list of available metrics for a selected resource. It works with any widget that can provide resource ID. |
| Object List | Shows a list of all defined resources. |
| Object Relationship | Shows the hierarchy tree for the selected object. |
| Object Relationship (Advanced) | Shows the hierarchy tree for the selected objects. It provides advanced configuration options. |
| Property List | Shows the properties and their values of an object that you select. |
| PromQL Viewer | Uses the Prometheus Query Language to identify real time data to be visualized. |
| Recommended Actions | Displays recommendations to solve problems in your vCenter instances. With recommendations, you can run actions on your data centers, clusters, hosts, and virtual machines. |
| Risk | Shows the status of the risk-related alerts for the objects that it is configured to monitor. Risk is based on generated risk alerts in your environment. |
| Rolling View Chart | Cycles through selected metrics at an interval that you define and shows one metric graph at a time. Miniature graphs, which you can expand, appear for all selected metrics at the bottom of the widget. |
| Scoreboard | Shows values for selected metrics, which are typically KPIs, with color coding for defined value ranges. |
| Scoreboard Health | Shows color-coded health, risk, and efficiency scores for selected resources. |
| Sparkline Chart | Shows graphs that contain metrics for an object . If all the metrics in the Sparkline Chart widget are for an object that another widget provides, the object name appears at the top right of the widget. |
| Tag Picker | Lists all defined resource tags. |
| Text Display | Reads text from a Web page or text file and shows the text in the user interface. |
| Time Remaining | Shows a chart of the Time Remaining values for a specific resource over the past 7 days. |
| Top Alerts | Lists the alerts most likely to negatively affect your environment based on the configured alert type and objects. |
| Top-N | Shows the top or bottom N number metrics or resources in various categories, such as the five applications that have the best or worst health. |
| Topology Graph | Shows multiple levels of resources between nodes. |
| View | Shows a defined view depending on the configured resource. |
| Weather Map | Uses changing colors to show the behavior of a selected metric over time for multiple resources. |
| Workload | Shows workload information for a selected resource. |
| Workload Pattern | Shows a historical view of the hourly workload pattern of an object. |

For more information about the widgets, see the VCF Operations help.

**Related reference**

Dashboard Navigation Details

You can apply sections or context from one dashboard to another. You can connect widgets and views to widgets and views in the same dashboard or to other dashboards to investigate problems or better analyze the provided information.

Dashboard Name

The name and visualization of the dashboard as it appears on the VCF Operations Home page.

Widget and View Interactions Details

You can connect widgets and views so that the information they show depends on each other.

Widget or View List Details

VCF Operations provides a list of widgets or views that you can add to your dashboard to monitor specific metrics and properties of objects in your environment.

## Alert List Widget

The Alert List widget is a list of alerts for the objects it is configured to monitor. You can create one or more alert lists in VCF Operations for objects that you add to your custom dashboards. The widget provides you with a customized list of alerts on objects in your environment.

### How the Alert List Widget and Configuration Options Work

You can add the Alert List widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance. You edit an Alert List widget after you add it to a dashboard. The changes you make to the options create a custom alert list to meet the needs of the dashboard users.

### Where You Find the Alert List Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Alert List Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Dashboard Navigation | Actions you can run on the selected alert.<br>For example, you use the option to open a vCenter, data center, virtual machine, or in the vSphere Web Client, allowing you to directly modify an object for which an alert was generated and fix any problems. |
| Reset Interaction | Returns the widget to its initial configured state and undoes any interactions selected in a providing widget.<br>Interactions are usually between widgets in the same dashboard, or you can configure interactions between widgets on different dashboards. |
| Perform Multi-Select Interaction | If the widget is a provider for another widget on the dashboard, you can select multiple rows and click this button. The receiving widget then displays only the data related to the selected interaction items.<br>Use Ctrl+click for Windows, or Cmd+click for Mac OS X, to select multiple individual objects or Shift+click to select a range of objects, and click the icon to activate the interaction. |
| Display Filtering Criteria | Displays the object information on which this widget is based. |
| Select Date Range | Limits the alerts that appear in the list to the selected date range. |

| Option | Description |
|---|---|
| Cancel Alert | Cancels the selected alerts. If you configure the alert list to display only active alerts, the canceled alert is removed from the list.<br>You cancel alerts when you do not need to address them. Canceling the alert does not cancel the underlying condition that generated the alert. Canceling alerts is effective if the alert is generated by triggered fault and event symptoms because these symptoms are triggered again only when subsequent faults or events occur on the monitored objects. If the alert is generated based on metric or property symptoms, the alert is canceled only until the next collection and analysis cycle. If the violating values are still present, the alert is generated again. |
| Suspend | Suspend an alert for a specified number of minutes.<br>You suspend alerts when you are investigating an alert and do not want the alert to affect the health, risk, or efficiency of the object while you are working. If the problem persists after the elapsed time, the alert is reactivated and it will again affect the health, risk, or efficiency of the object.<br>The user who suspends the alert becomes the assigned owner.<br>**Note:**<br>You can cancel or retrigger the alert, if it is still active when its suspension period has ended, by rerunning the automated actions connected to the alert. In this case, you can suppress cancelation and update on all instances of an alert on an object. To activate this option, open the property file `/usr/lib/vmware-vcops/user/conf/analytics/advanced.properties` and add `retriggerExpiredSuspendedActiveAlerts = true` to the property file, and restart the VCF Operations analytics service or the VCF Operations cluster. |
| Take Ownership | As the current user, you make yourself the owner of the alert.<br>You can only take ownership of an alert, you cannot assign ownership. |
| Release Ownership | Alert is released from all ownership. |
| Group By | Group alerts by the options in the drop-down menu. |
| Filter | Locate data in the widget. |

**Table 1379: Group By Options**

| Option | Description |
|---|---|
| None | Alerts are not sorted into specific groupings. |
| Time | Group alerts by time triggered. The default. |
| Criticality | Group alerts by criticality. Values are, from the least critical: Info/ Warning/Immediate/Critical. See also Criticality in the Alert List Widget Data Grid table. |
| Definition | Group alerts by definition, that is, group like alerts together. |
| Object Type | Group alerts by the type of object that triggered the alert. For example, group alerts on hosts together. |

## Alert List Widget Data Grid Options

The data grid provides information on which you can sort and search.

Expand the grouped alerts to view the data grid.

| Option | Description |
|---|---|
| Criticality | Criticality is the level of importance of the alert in your environment. The alert criticality appears in a tooltip when you hover the mouse over the criticality icon.<br>The level is based on the level assigned when the alert definition was created, or on the highest symptom criticality, if the assigned level was **Symptom Based**. |
| Alert | Description of the alert. |
| Triggered On | Name of the object for which the alert was generated. |
| Created On | Date and time when the alert was generated. |
| Status | Current state of the alert. |
| Alert Type | Alert type is assigned when you create the alert definition. It helps you categorize and route the alert to the appropriate domain administrator for resolution.<br>The possible values include:<br>• Application<br>• Virtualization/Hypervisor<br>• Hardware (OSI)<br>• Storage<br>• Network |
| Alert Sub-Type | Alert subtype is assigned when you create the alert definition. It helps you categorize and route the alert to the appropriate domain administrator for resolution.<br>The possible values include:<br>• Availability<br>• Performance<br>• Capacity<br>• Compliance<br>• Configuration |
| Importance | Displays the priority of the alert. The importance level of the alert is determined using a smart ranking algorithm. |

## Alert List Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |
| **Output Filter** | |

| Option | Description |
| --- | --- |
| Basic | Pick tags to refine the widget data. The widget data is based on the objects that have the picked tags applied. If you pick more than one value for the same tag, the widget includes objects that have any of the tags applied. If you pick more than one value for different tags, the widget includes only the objects that have all the tags applied.<br>If the objects have an input transformation applied, you select tag values for the transformed objects. |
| Advanced | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |
| Alert Related | A group of filters limits the alerts that appear in this alert list to those that meet the selected criteria.<br>If the objects on which the alerts are based have an input transformation applied, you define filters for the alerts based on the transformed objects.<br>You can configure the following filters:<br>• Status. Select one or more alert states to include in the list.<br>• Criticality. Select one or more levels of criticality.<br>• Control State. Select one or more control states to include in the list.<br>• Impact. Select one or more alert badges to include in the list.<br>• Actions.<br>• Alert Type. Select the subtype in the type list. This value was assigned when you configured the alert definition.<br>• Alert Definition. Drag and drop the alert definitions to the left pane from the Alert Definitions list. Click **OK** to filter by the selected Alert Definitions.<br>The selections you make for each filter are displayed as labels for easy visibility. |

## Alert Volume Widget

The Alert Volume widget is a trend report for the last seven days of alerts generated for the objects it is configured to monitor in VCF Operations. You can create one or more alert volume widgets for objects that you add to your dashboards. The alert volume provides you with a customized trend report on objects that helps you identify changes in alert volume, indicating a problem in your environment.

## How the Alert Volume Widget and Configuration Options Work

You can add the Alert Volume widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance. The changes you make to the options create a custom widget to meet the needs of the dashboard users.

## Where You Find the Alert Volume Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Alert Volume Widget Display Options

The Alert Volume widget displays a trend chart, symptoms by criticality, and active alerts.

| Option | Description |
|---|---|
| Trend chart | Volume of critical, immediate, and warning symptoms for the configured objects. |
| Symptoms by criticality | Number of symptoms for each criticality level. |
| Active Alerts | Number of active alerts. Alerts can have more than one triggering symptom. |

## Alert Volume Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |

| Option | Description |
|---|---|
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Anomalies Widget

The Anomalies widget displays the anomalies for a resource for the past 6 hours at time intervals you set.

The Anomalies widget shows or hides time periods when the metric violates a threshold that is configured. The widget color indicates the criticality of the violation.

### Where You Find the Anomalies Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Anomalies Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | • On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Anomaly Breakdown Widget

The Anomaly Breakdown widget shows the likely root causes for symptoms for a selected resource.

### How the Anomaly Breakdown Widget and Configuration Options Work

### Where You Find the Anomaly Breakdown Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Anomaly Breakdown Widget Display Options

The Anomaly Breakdown widget displays scores, volume, and a list of anomaly metrics.

| Option | Description |
|---|---|
| Score | Anomaly value. |
| Volume | VCF Operations full set metric count for the selected object in the specified time range. |
| Anomaly Metrics List | List of alarms for the selected object in the specified time range. |

### Anomaly Breakdown Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Show Bar Details | If the widget is displaying data for multiple objects, you can select a row and click this button to view the list of alarms for the selected object. |
| Perform Multiple Interaction | If the widget is a provider for another widget on the dashboard, you can select multiple rows and click this button. The receiving widget then displays only the data related to the selected interaction items.<br>Use Ctrl+click for Windows, or Cmd+click for Mac OS X, to select multiple individual objects or Shift+click to select a range of objects, and click the icon to activate the interaction. |

### Anomaly Breakdown Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |

| Option | Description |
|---|---|
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Mode | Display a single object or multiple objects. |
| Show | Select the number of objects to display in multiple objects mode. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |
| **Output Filter** | |
| Basic | Pick tags to refine the widget data. The widget data is based on the objects that have the picked tags applied. If you pick more than one value for the same tag, the widget includes objects that have any of the tags applied. If you pick more than one value for different tags, the widget includes only the objects that have all the tags applied. |

## Container Details Widget

The Container Details widget displays graphs that show a summary of child objects, metrics, and alerts of an object in the inventory.

### How the Container Details Widget and Configuration Options Work

The Container Details widget treats objects from the inventory as containers and objects. Containers are objects that contain other objects. The widget lists the containers and shows the number of containers, objects, metrics, and alerts of the observed object. The widget also displays the alerts of each container and an icon links to its child objects. For example, if you select from the inventory a host that contains three objects such as, two virtual machines and one datastore, the Container Details widget displays summary information with three containers, two objects that are the child objects of the two virtual machines, and the number of alerts for the host and the number of metrics for the child objects of the host. The widget also lists each of the three containers, with the number of alerts for each object. Clicking an object in the graph takes you to the object details page. When you point to the icon next to the object, a tool tip shows the name of the related resource and its health. For example, when you point to the icon next to a virtual machine, the tool tip shows a related datastore and its health. Clicking the icon takes you to the object detail page of the related object, which is the datastore following the example.

You edit a container details widget after you add it to a dashboard. You can configure the widget to take information from another widget in the dashboard and to analyze it. When you select **Off** from the Self Provider option and set source and receiver widgets in the **Widget Interactions** menu during editing of the dashboard, the receiver widget shows information about an object that you select from the source widget. For example, you can configure the Container Details widget to display information about an object that you select from the Object Relationship widget in the same dashboard.

## Where You Find the Container Details Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Container Details Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Mode | You can change the size of the graph using the Compact or Large buttons. |
| **Input Data** | |

| Option | Description |
|---|---|
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Capacity Remaining Widget

The Capacity Remaining widget displays a percentage indicating the remaining computing resources as a percent of the total consumer capacity. It also displays the most constrained resource.

### Where You Find the Capacity Remaining Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Capacity Remaining Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |

| Option | Description |
|---|---|
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Container Overview Widget

The Container Overview widget gives a graphical presentation of the health, risk, and efficiency of an object or list of objects in the environment.

### How the Container Overview Widget and Configuration Options Work

The Container Overview widget displays the current status, the status for a previous time period of the health, risk, and the efficiency of an object or list of objects. You can configure the widget to display information for one or more objects that you are interested in when you select the **Object** mode during configuration of the widget. The widget displays information for all objects from an object type or types when you select the **Object Type** mode during configuration of the widget. You can open the object detailed page of each object in the data grid when you click the object.

You edit a container overview widget after you add it to a dashboard. You can configure the widget to display information about an object or to display information about all objects from an object type by using the **Object** or **Object Type** mode. The configuration options change depending on your selection of mode.

### Where You Find the Container Overview Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Container Overview Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

The toolbar contains icons that you can use to get more information about other widgets or dashboards.

| Option | Description |
|---|---|
| Perform Multi-Select Interaction | If the widget is a provider for another widget on the dashboard, you can select multiple rows and click this button. The receiving widget then displays only the data related to the selected interaction items. Use Ctrl+click for Windows, or Cmd+click for Mac OS X, to select multiple individual objects or Shift+click to select a range of objects, and click the icon to activate the interaction. |
| Filter | You can filter the objects in the data grid. |

| Option | Description |
|---|---|
| Dashboard Navigation | You can explore information from another dashboard.<br>**Note:**<br>This toolbar icon exists when you configure the widget to interact with a widget from another dashboard.<br>Use **Dashboard Navigation** menu during dashboard configuration to configure the widgets to interact.<br>When you select an object from an object data grid and click the toolbar icon, it takes you to a related dashboard. For example, you can configure the widget to send information to a Topology Graph widget that is on another dashboard, for example dashboard 1. When you select a VM from the data grid, click **Perform Multi-Select Interaction** , click **Dashboard Navigation** and select **Navigate** > **dashboard 1**. It takes you to dashboard 1, where you can observe selected VM and objects related to it. |

## Container Overview Widget Data Grid Options

The data grid provides information on which you can sort and search.

| Option | Description |
|---|---|
| Name | Name of the object |
| Health | Shows information about the health parameter.<br>Status displays the badge of the current health status of an object. You can check the status in a tool tip when you point to the badge.<br>Last 24 Hours displays the statistic of health parameter for last 24 hours. |
| Risk | Shows information about the risk parameter.<br>Status displays the badge of the current risk status of an object. You can check the status in a tool tip when you point to the badge.<br>Last Week displays the statistics of the health parameter for the last week. |
| Efficiency | Shows information about the efficiency parameter.<br>Status displays the badge of the current efficiency status of an object. You can check the status in a tool tip when you point to the badge.<br>Last Week displays statistic of the efficiency parameter for the last week. |

## Container Overview Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Mode | Use **Object** to select an object from the environment to observe.<br>Use **Object Type** to select the type of the objects to observe. |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Object | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |

| Option | Description |
| --- | --- |
| Object Type | Select an object type in your environment on which you want to base the widget data.<br>1. Click the **Add Object Type** icon to search for and add an object type.<br>When you search for object types, you can filter the types in the list by selecting a type from the **Adapter Type** drop-down menu or by using the **Filter** text box.<br>2. Optionally, select the object type from the list and click the **Delete Object Type** icon to remove the selected object type. |

## Current Policy Widget

The Current Policy widget displays the active operational policy that is assigned to your object or object group. VCF Operations uses the assigned policy to analyze your objects, control the data that is collected from those objects, generate alerts when problems occur, and display the results in the dashboards.

### How the Current Policy Widget and Configuration Options Work

You add the Current Policy widget to a dashboard so that you can quickly see which operational policy is applied to an object or object group. To add the widget to a dashboard, you must have access permissions associated with the roles assigned to your user account.

The configuration changes that you make to the widget creates a custom instance of the widget that you use in your dashboard to identify the current policy assigned to an object or object group. When you select an object on the dashboard, the policy applied to the object appears in the Current Policy widget, with an embedded link to the policy details. To display the inherited and local settings for the applied policy, click the link.

### Where You Find the Current Policy Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Current Policy Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options.<br>For example, to view the policy applied to each object that you select in the Object List widget, select **Off** for Self Provider. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Data Collection Results Widget

The Data Collection Result widget shows a list of all supported actions specific for a selected object. The widget retrieves data specific to a selected object actions and uses the action framework to run data collection actions.

### How the Data Collection Results Widget and Configuration Options Work

You can add the Data Collection Results widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance.

The Data Collection Results widget is a receiver of a resource or metric ID. It can interact with any resource or metric ID that provides widgets such as Object List and Metric Picker. To use the widget, you must have an environment that contains the following items.

- A vCenter Adapter instance
- A VCF Operations for Horizon View Adapter
- A VCF Operations for Horizon View Connection Server

You edit a Data Collection Result widget after you add it to a dashboard. The changes you make to the options create a custom widget to meet the needs of the dashboard users.

## Where You Find the Data Collection Results Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Data Collection Results Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Results | Shows all finished and currently running actions for the selected object. |
| Choose Action | Shows a list with all supported actions specific for the selected object. The selected object is a result of widget interactions. |

## Data Collection Results Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget updates only when you open the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |

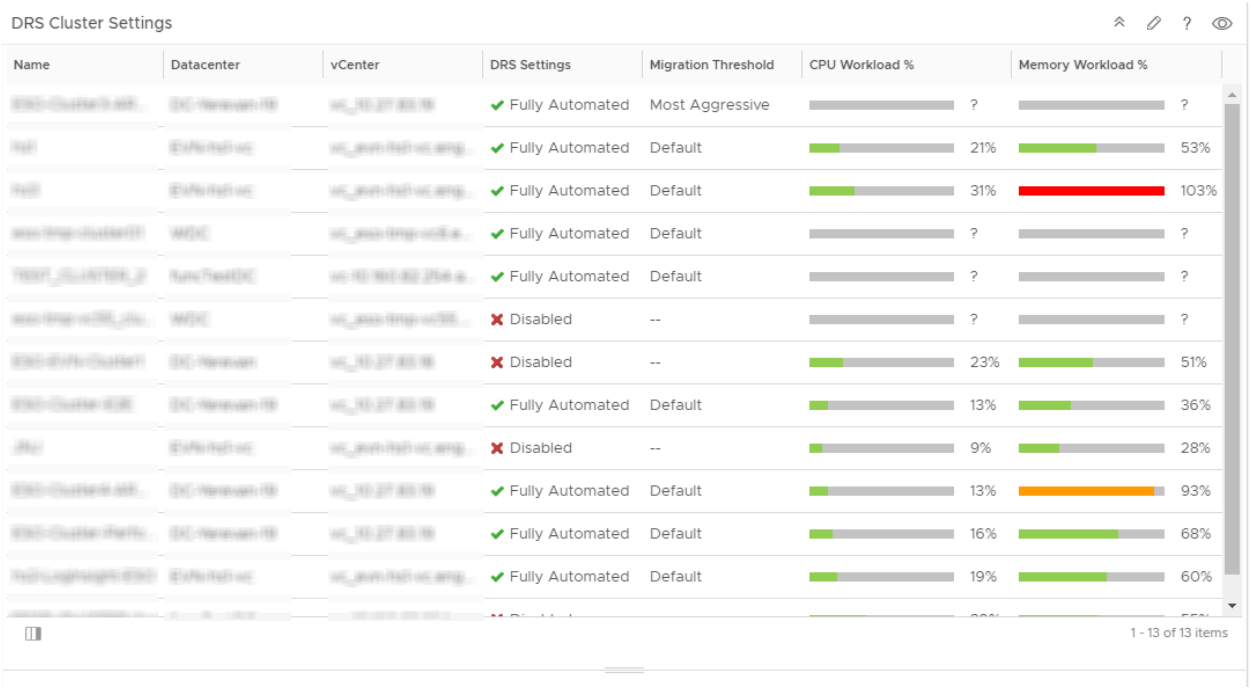
| Option | Description |
|---|---|
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Config | Specifies self provider choice and selection of a resource instance. |
| Selected Object | When you select an object, this text box is populated by the object. |
| Start new data collection on interaction change | Indicates whether to start a new data collection action when the object selection changes in the source widget. |
| Objects | List of objects in your environment that you can search or sort by column so that you can locate the object on which you are basing the data that appears in the widget. |
| Defaults | Specifies the default data collection action selected for each object type. |
| Object Types | List of object types in your environment that you can search or sort by column so that you can locate the object type on which you are basing the data that appears in the widget. You can filter the types in the list by selecting a type from the **Adapter Type** drop-down menu or by using the **Filter** text box. |
| Default Data Collection Action | This panel is populated by the object type that you select in the object types list.<br>You can select only one default data collection action for an object type. |

## DRS Cluster Settings Widget

The DRS Cluster Settings widget displays the workload of the available clusters and the associated hosts. You can change the Distributed Resource Scheduler (DRS) automation rules for each cluster.

### How the DRS Cluster Settings Widget and Configuration Options Work

You can view CPU workload and memory workload percentages for each of the clusters. You can view CPU workload and memory workload percentages for each host in the cluster by selecting a cluster in the data grid. The details are displayed in the data grid below. You can set the level of DRS automation and the migration threshold by selecting a cluster and clicking **Cluster Actions** > **Set DRS Automation**.



You edit a DRS Cluster Settings widget after you add it to a dashboard. To configure the widget, click the edit icon at the upper-right corner of the widget window. You can add the DRS Cluster Settings widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance.

The DRS Cluster Settings widget appears on the dashboard named vSphere DRS Cluster Settings, which is provided with VCF Operations.

## Where You Find the DRS Cluster Settings Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## DRS Cluster Settings Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Cluster Actions | Limits the list to actions that match the cluster you select. |
| Show | The drop-down menu displays the parent vCenter instances where the clusters reside. You can also view the data centers under each parent vCenter instance. Select a parent vCenter to view the workload of the available clusters in the data grid.<br>The default setting displays the clusters across all vCenters. |

| Option | Description |
|---|---|
| Filter | Filters the data grid by name, data center, vCenter, DRS settings, and migration threshold. |

### DRS Cluster Settings Widget Data Grid Options

The data grid provides information on which you can sort and search.

| Option | Description |
|---|---|
| Name | Displays the names of the clusters in the selected parent vCenter instance. |
| Datacenter | Displays the data centers that belong to each cluster. |
| vCenter | Displays the parent vCenter instance where the cluster resides. |
| DRS Settings | Displays the level of DRS automation for the cluster.<br>To change the level of DRS automation for the cluster, select **Cluster Actions** > **Set DRS Automation** from the toolbar. You can change the automation level by selecting an option from the drop-down menu in the Automation Level column. |
| Migration Threshold | Recommendations for the migration level of virtual machines. Migration thresholds are based on DRS priority levels, and are computed based on the workload imbalance metric for the cluster. |
| CPU Workload % | Displays the percentage of CPU in GHz available on the cluster. |
| Memory Workload % | Displays the percentage of memory in GB available on the cluster. |

### DRS Cluster Settings Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |

## Efficiency Widget

The efficiency widget is the status of the efficiency-related alerts for the objects it is configured to monitor. Efficiency alerts in VCF Operations usually indicate that you can reclaim resources. You can create one or more efficiency widgets for objects that you add to your custom dashboards.

### How the Efficiency Widget and Configuration Options Work

You can add the efficiency widget to one or more custom dashboards and configure it to display data that is important to the dashboard users.

The state of the badge is based on your alert definitions. Click the badge to see the **Summary** tab for objects or groups configured in the widget. From the **Summary** tab, you can begin determining what caused the current state. If the widget is configured for an object that has descendants, you should also check the state of descendants. Child objects might have alerts that do not impact the parent.

If the **Badge Mode** configuration option is set to **Off**, the badge and a chart appears. The type of chart depends on the object that the widget is configured to monitor.

- A population criticality chart displays the percentage of group members with critical, immediate, and warning efficiency alerts generated over time, if the monitored object is a group.
- A trend line displays the efficiency status of the monitored object over time if the object does not provide its resources to any other object, or where no other object depends on the monitored object's resources. For example, if the monitored object is a virtual machine or a distributed switch.
- A pie chart displays the reclaimable, stress, and optimal percentages for the virtual machines that are descendants of the monitored object for all other object types. You use the chart to identify objects in your environment from which you can reclaim resources. For example, if the object is a host or datastore.

If the **Badge Mode** is set to **On**, only the badge appears.

Edit an efficiency widget after you add it to a dashboard. The changes you make to the options create a custom widget that provides information about an individual object, a custom group of objects, or all the objects in your environment.

### Where You Find the Efficiency Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Efficiency Widget Display Options

The Efficiency widget displays an efficiency badge. The widget also displays an efficiency trend when not in badge mode.

| Option | Description |
|---|---|
| Efficiency Badge | Status of the objects configured for this instance of the widget.<br>Click the badge to open the **Alerts** tab for the object that provides data to the widget. |
| Efficiency Trend | Displays a chart, depending on the selected or configured object. The charts vary, depending on whether the monitored object is a group, a descendent object, or an object that provides resources to other objects. The chart appears only if the **Badge Mode** configuration option is off. If the **Badge Mode** is on, only the badge appears. |

## Efficiency Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |

| Option | Description |
|---|---|
| Badge Mode | Determines whether the widget displays only the badge, or the badge and a weather map or trend chart.<br>Select one of the following options:<br>• On. Only the badge appears in the widget.<br>• Off. The badge and a chart appear in the widget. The chart provides additional information about the state of the object. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

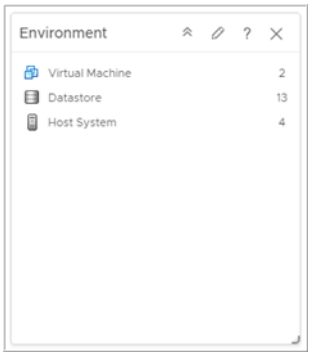
## Environment Widget

The Environment widget displays the resources which collects data. You can create one or more lists in VCF Operations for the resources that you add to your custom dashboards.

### How the Environment Widget and Configuration Options Work

The Environment widget lists the number of resources by object or groups them by object type. You can add the Environment widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance.

You edit an Environment widget after you add it to a dashboard. The changes you make to the options help create a custom widget to meet the needs of the dashboard users.



### Where You Find the Environment Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Environment Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Environment Overview Widget

The Environment Overview widget displays the health, risk, and efficiency of resources for a given object from the managed inventory.

### How the Environment Overview Widget and Configuration Options Work

You can add the Environment Overview widget to one or more custom dashboards.

The widget displays data for objects from one or several types. The data that the widget displays depends on the object type and category that you selected when you configured the widget.

The objects in the widget are ordered by object type.

The parameters for the health, risk, and efficiency of an object appear in a tool tip when you point to the object.

When you double-click an object on the Environment Overview widget, you can view detailed information for the object.

To use the Environment Overview widget, you must add it to the dashboard and configure the data that appears in the widget. You must select at least one badge and an object. Additionally, you can select an object type.

The Environment Overview widget has basic and advanced configuration options. The basic configuration options are activated by default.

To use all features of the Environment Overview widget, you must change the default configuration of the widget. Log in to the VCF Operations machine and set `skittlesCustomMetricAllowed` to `true` in the `web.properties` file. The `web.properties` file is located in the `/usr/lib/vmware-vcops/user/conf/web` folder. The change is propagated after you use the `service vmware-vcops-web restart` command to restart the UI.

You must use the **Badge** tab to select the badge parameters that the widget shows for each object. You must use the **Config** tab to select an object or object type. To observe a concrete object from the inventory, you can use the **Basic** option. To observe a group of objects or objects from different types, you must use the **Advanced** option.

### Where You Find the Environment Overview Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Environment Overview Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

The toolbar contains icons that you can use to get more information about badges.

| Option | Description |
|---|---|
| Badge | You can select a Health, Risk, or Efficiency badge for objects that appear in the widget. The tool tip of a badge shows the standard name of the badge. |
| Status | You can filter objects based on their badge status and their state. |
| Sort | You can sort objects by letter or by number. |

### Environment Overview Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |

| Option | Description |
| --- | --- |
| Selected Object | Object that is the basis for the widget data.<br>To populate the text box, select **Config** > **Basic** and select an object from the list. |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Badge | Defines a parameter to observe. You can select or deselect Health, Risk, and Efficiency parameters using check boxes. Default configuration of the widget selects all badges.<br>Select at least one badge parameter. |
| Config | **Basic**<br>List of objects in your environment that you can search or sort by column so that you can locate the object on which you are basing the data that appears in the widget. |

| Option | Description |
| --- | --- |
| | **Advanced**<br>You can use Object Types to select a type of the objects to observe information about health, risk, and efficiency. Double-click the object type to select it.<br>Use the **Adapter Type** drop-down menu to filter the objects types based on an adapter.<br>You can use the **Use vSphere Default** button to observe the main vSphere object types.<br>To remove an object type from the list, click **Remove Selected** next to **Use vSphere Default**.<br>You can use the **Object Type Categories** menu to select a group or groups of object types to observe.<br>You can use the Object tree to select an object to filter the displayed objects. For example, to observe a datastore of a VM, double-click **Datastore** from the **Object Types** menu to select it. Click the datastore when it is in the list of object types, and find the VM in the object tree and select it. To return to your previous configuration of the widget, click **Datastore** from the list of object types and click **Deselect All** in the object tree window.<br>The metrics tree and badge data grids are available configuration options only if the default configuration of the widget is changed. To use these configuration options, log in to the VCF Operations machine and set `skittlesCustomMetricAllowed` to `true` in the `web.properties` file. The `web.properties` file is located in the `/usr/lib/vmware-vcops/user/conf/web` folder. |

## Environment Status Widget

The Environment Status widget displays the statistics for the overall monitored environment.

### How the Environment Status Widget and Configuration Options Work

You customize the output of the widget by choosing a category such as Objects, Metrics, Applications, Alerts, Analytics, and Users. You can filter the data by using the tags tree from **Select which tags to filter** in the configuration window.

You edit an environment status widget after you add it to a dashboard. To configure the widget, click the pencil at the right corner of the widget window. You must select at least one type of information from **OBJECTS**, **METRICS**, **APPLICATIONS**, **ALERTS**, **ANALYTICS**, **USERS** categories for the widget to display. By default, the widget displays statistics information about all objects in the inventory. You can use the Select which tags to filter option to filter the information. The widget can interact with other widgets in the dashboard, taking data from them and displaying statistics . For example, you can have a Object List widget , which is the source of the data and an Environment Status widget, which is the destination. If you select objects and perform a multiselection interaction from the Object List widget, the Environment Status widget results are updated based on the selections you made in the Object List.

### Where You Find the Environment Status Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a

widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Environment Status Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Data** section provides options to select object types on which you are basing the widget data.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard.<br>The widget is also updated when it is in interaction mode. For example, when an item is selected in the provider widget, the content of the Environment Status widgets is refreshed. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |

| Option | Description |
|---|---|
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |
| **Output Data** | |
| Objects | The widget shows summarized information about the objects in your environment. You can filter the information that appears in self provider mode when you select an object from Select which tag to filter. You can select what type of information to include in the summary of resources. For example, if you select **Adapter Types** > **Container** from Select which tag to filter and click **Objects** and **Objects Collecting** , the widget displays the number of containers and collecting containers. |
| Metrics | The widget shows summarized information about available metrics. You can filter the information that appears in self provider mode when you select an object from Select which tag to filter. You can select what type of information to include in the summary of metrics. |
| Applications | The widget shows summarized information about available applications. You can filter the information that appears in self provider mode when you select an object from Select which tag to filter. You can select what type of information to include in the summary of applications. |
| Alerts | The widget shows summarized information about alerts in your environment. You can filter the information that appears in self provider mode when you select an object from Select which tag to filter. You can select what type of information to include in the summary of alerts. |

| Option | Description |
|---|---|
| Analytics | The widget shows summarized information about the analytics plug-ins. You can filter the information that appears in self provider mode when you select an object from Select which tag to filter. You can select what type of information to include in the summary of analytics. |
| Users | The widget shows the number of users defined in VCF Operations. Select **Administration** > **Access Control** > **User Accounts**. |
| **Output Filter** | |
| Basic | Pick tags to refine the widget data. The widget data is based on the objects that have the picked tags applied. If you pick more than one value for the same tag, the widget includes objects that have any of the tags applied. If you pick more than one value for different tags, the widget includes only the objects that have all the tags applied.<br>If the objects have an input transformation applied, you select tag values for the transformed objects. |
| Advanced | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

## Faults Widget

The Faults widget displays detailed information about faults experienced by an object

The Faults widget configuration options are used to customize each instance of the widget that you add to your dashboards.

### Where You Find the Faults Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you

want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Faults Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Forensics Widget

The Forensics widget shows how often a metric has a particular value as a percentage of all values, within a given time period. It can also compare percentages for two time periods.

## How the Forensics Widget and Configuration Options Work

You can add the Forensics widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance.

You edit the Forensics widget after you add it to a dashboard. The changes you make to the options create a custom widget to meet the needs of the dashboard users.

## Where you Find the Forensics Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Forensics Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |

| Option | Description |
|---|---|
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Percentile | Indicates how much data is above or below the specific value. For example, it indicates that 90% of the data is more than 4 when a vertical line occurs on the value 4. |
| **Input Data** | |
| | Select metrics on which you want to base the widget data. You can select an object and pick its metrics.<br>1. Click the **Add New Metrics** icon to add metrics for the widget data. Select an object to view its metric tree and pick metrics for the object. The picked metrics appear in a list in this section.<br>The metric tree shows common metrics for several objects when you click the **Show common metrics** icon.<br>While selecting objects for which you want to pick metrics, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select metrics from the list and click the **Remove Selected Metrics** icon to remove the selected metrics.<br>Click the **Select All** icon to select all the metrics in the list.<br>Click the **Clear Selection** icon to clear your selection of metrics in the list. |

## Heatmap Widget

The Heatmap widget contains graphical indicators that display the current value of two selected attributes of objects of tag values that you select. In most cases, you can select only from internally generated attributes that describe the general operation of the objects, such as health or the active anomaly count. When you select a single object, you can select any metric for that object.

### How the Heatmap Widget and Configuration Options Work

You can add the Heatmap widget to one or more custom dashboards and configure it to display data that is important to the dashboard users.

The Heatmap widget has a General mode and an Instance mode. The General mode shows a colored rectangle for each selected resource. In the Instance mode, each rectangle represents a single instance of the selected metric for an object.

You can click a color or the size metric box in the bottom of the Heatmap widget to filter the display of cells in the widget. You can click and drag the color filter to select a range of colors. The Heatmap widget displays cells that match the range of colors.

When you point to a rectangle for an object, the widget shows the resource name, group-by values, the current values of the two tracked attributes, virtual machine details, the metric name, and the value of the color. Click **Show Sparkline** to view the value.

You edit a Heatmap widget after you add it to a dashboard. The changes you make to the options create a custom widget that provides information about an individual object, a custom group of objects, or all the objects in your environment.

### Where You Find the Heatmap Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Heatmap Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Dashboard Navigation | Actions you can run on the selected alert.<br>For example, you use the option to open a vCenter, data center, virtual machine, or in the vSphere Web Client, allowing you to directly modify an object for which an alert was generated and fix any problems. |
| Group Zoom | You can roll-up non-significant resources with similar characteristics into groups to obtain only the relevant data among the thousands of resources in the system. The roll-up method improves performance and decreases the memory usage. The roll-up box encompasses the average color and the sum of the sizes of all the resources. You can view all the resources by zooming in the roll-up box. |
| Show/Hide Text | Show or hide the cell name on the heatmap rectangle. |
| Show Details | If you configure the Heatmap widget as a provider to another widget, such as the Metric Chart widget , you can double-click a rectangle to select that object for the widget. If the widget is in Metric mode, double-clicking a rectangle selects the resource associated with the metric and provides that resource to the receiving widget. Optionally, you can select a cell from the heatmap and click the **Show Details** icon to see details about the cell. |
| Reset Interaction | Returns the widget to its initial configured state and undoes any interactions selected in a providing widget. |
| Reset Zoom | Resets the heatmap display to fit in the available space. |
| Heatmap Configuration Drop-down | Select from a list of predefined heatmaps. |

### Heatmap Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Data** section provides options to select object types on which you are basing the widget data.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |

| Option | Description |
|---|---|
| **Output Data** | |
| Configurations | List of saved heatmap configuration options. You can create a configuration and save it in the list. From the options on the right, you can also delete, clone, and reorder the configurations. |
| Name | Name of the widget. |
| Group by | First-level grouping of the objects in the heatmap. |
| Then by | Second-level grouping of the objects in the heatmap. |
| Relational Grouping | After you select the Group by and Then by objects, select the **Relational Grouping** check box to reorganize the grouping of the objects, and to relate the objects selected in the Group by text box with the objects selected in the Then by text box. |
| Mode | **General mode** The widget shows a colored rectangle for each selected resource. The size of the rectangle indicates the value of one selected attribute. The color of the rectangle indicates the value of another selected attribute.<br>**Instance mode** Each rectangle represents a single instance of the selected metric for a resource. A resource can have multiple instances of the same metric. The rectangles are all the same size. The color of the rectangles varies based on the instance value. You can use instance mode only if you select a single resource kind. |
| Object Type | Object that is the basis for the widget data. |
| Size by | An attribute to set the size of the rectangle for each resource. Resources that have higher values for the Size By attribute have larger areas of the widget display. You can also select fixed-size rectangles. In most cases, the attribute lists include only metrics that VCF Operations generates. If you select a resource kind, the list shows all the attributes that are defined for the resource kind. |
| Color by | An attribute to set the color of the rectangle for each resource. |
| Solid Coloring | Select this option to use solid colors instead of a color gradient. By default, the widget assigns red color for high value, brown color for intermediate value and green color for low value. Click the color box to set a different color for the values. You can add up to seven color thresholds by clicking color range. |
| Color | Shows the color range for high, intermediate and low values. You can set each color and type minimum and maximum color values in the **Min Value** and **Max Value** text boxes. By default, green indicates a low value and red indicates the high end of the value range. You can change the high and low values to any color and set the color to use for the midpoint of the range. You can also set the values to use for either end of the color range, or let VCF Operations define the colors based on the range of values for the attribute.<br>If you leave the text boxes blank, VCF Operations maps the highest and lowest values for the **Color By** metric to the end colors. If you set a minimum or maximum value, any metric at or beyond that value appears in the end color. |
| **Output Filter** | |

| Option | Description |
|---|---|
| Basic | Pick tags to refine the widget data. The widget data is based on the objects that have the picked tags applied. If you pick more than one value for the same tag, the widget includes objects that have any of the tags applied. If you pick more than one value for different tags, the widget includes only the objects that have all the tags applied.<br>If the objects have an input transformation applied, you select tag values for the transformed objects. |
| Advanced | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

## Health Widget

The Health widget is the status of the health-related alerts for the objects it is configured to monitor in VCF Operations. Health alerts usually require immediate attention. You can create one or more health widgets for different objects that you add to your custom dashboards.

### How the Health Widget and Configuration Options Work

You can add the Health widget to one or more custom dashboards and configure it to display data that is important to the dashboard users. The information that it displays depends on how the widget is configured.

The state of the badge is based on your alert definitions. Click the badge to see the **Summary** tab for objects or groups configured in the widget. From the **Summary** tab, you can begin determining what caused the current state. If the widget is configured for an object that has descendants, you should also check the state of descendants. Child objects might have alerts that do not impact the parent.

If the **Badge Mode** configuration option is set to **Off**, the badge and a chart appears. The type of chart depends on the object that the widget is configured to monitor.

- A trend line displays the health status of the monitored object if the object does not provide its resources to any other object. For example, if the monitored object is a virtual machine or a distributed switch.
- A weather map displays the health of the ancestor and descendant objects of the monitored object for all other object types. For example, if the monitored object is a host that provides CPU and memory to a virtual machine.

If the **Badge Mode** is set to **On**, only the badge appears.

You edit a Health widget after you add it to a dashboard. The changes you make to the options create a custom widget that provides information about an individual object, a custom group of objects, or all the objects in your environment.

## Where You Find the Health Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Heath Widget Display Options

The Health widget displays a health badge. The widget also displays a health trend when not in badge mode.

| Option | Description |
|---|---|
| Health Badge | Status of the objects configured for this instance of the widget.<br>Click the badge to open the **Alerts** tab for the object that provides data to the widget.<br>If the **Badge Mode** option is off, a health weather map or trend chart appears for the object. Whether the map or chart appears depends on the object type. The health weather map displays tool tips for up to1000 objects. |
| Health Trend | Displays a chart, depending on the selected or configured object. The charts vary, depending on whether the monitored object is a group, a descendent object, or an object that provides resources to other objects. The chart appears only if the **Badge Mode** configuration option is off. If the **Badge Mode** is on, only the badge appears. |

## Heath Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |

| Option | Description |
|---|---|
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Badge Mode | Determines whether the widget displays only the badge, or the badge and a weather map or trend chart.<br>Select one of the following options:<br>• On. Only the badge appears in the widget.<br>• Off. The badge and a chart appear in the widget. The chart provides additional information about the state of the object. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Health Chart Widget

The Health Chart widget displays Health, Risk, Efficiency, or custom metric charts for selected objects. You use the widget to compare the status of similar objects based on the same value or name.

### How the Health Chart Widget and Configuration Options Work

You can add the Health Chart widget to one or more custom dashboards and configure it to display data that is important to the dashboard users. The information that it displays depends on how the widget is configured.

If the widget is configured to display Health, Risk, or Efficiency, the chart values are based on the generated alerts for the selected alert type for the selected objects.

If the widget is configured to display custom metrics, chart values are based on the metric value for the configured time period.

You edit the Health Chart widget after you add it to the dashboard. The changes you make to the options create a custom widget with the selected charts.

The charts are based either on Health, Risk, or Efficiency alert status, or you can base them on a selected metric. You can include a single object, multiple objects, or all objects of a selected type.

To view the value of the object at a particular time, point your cursor over the chart. A date range and metric value tool tip appear.

A context drop-down menu for each chart can be accessed at the top-right corner after the last metric value.

For each chart, you can view the minimum, maximum, and last metric values. The values are displayed at the top-right corner of each chart. Each of the values is preceded by an appropriate icon of the same color as the state of the metric value.

If there is not enough space to view the metric values, a blue information icon is displayed. Point your cursor over the icon to view the metric value details.

### Where You Find the Health Chart Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Health Chart Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Date Controls | Use the date selector to limit the data that appears in each chart to the time period you are examining.<br>Select **Dashboard Time** to activate the dashboard time panel. The option chosen in the dashboard time panel is effective. The default time is 6 hours.<br>**Dashboard Time** is the default option. |

### Health Chart Widget Graph Selector Options

The graph selector options determine how individual data appears in the graph.

| Option | Description |
|---|---|
| Close | Deletes the chart. |
| Save a snapshot | Creates a PNG file of the current chart. The image is the size that appears on your screen. You can retrieve the file in your browser's download folder. |
| Save a full screen snapshot | Downloads the current graph image as a full-page PNG file, which you can display or save. You can retrieve the file in your browser's download folder. |
| Download comma-separated data | Creates a CSV file that includes the data in the current chart. You can retrieve the file in your browser's download folder. |
| Units | Select the units in which the widget displays data. This option is visible when you select a custom source of data in the widget configuration. |

### Health Chart Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Order By | Determines how the object charts appear in the widget.<br>You can order them based on value or name, and in ascending or descending order. |
| Chart Height | Controls the height of all charts. Choose from three possible choices - Small, Medium, Large. Default is Medium. |
| Pagination number | Number of charts that appears on a page.<br>If you prefer scrolling through the charts, select a higher number. If you prefer to page through the results, select a lower number. |
| Auto Select First Row | Determines whether to start with the first row of data. |
| Metric | Determines the source of the data.<br>• Health, Risk, or Efficiency. The displayed charts are based on one of these alert badges.<br>• Custom. The displayed charts are based on the selected metric and use either alert symptom state colors or the selected custom color. You can select a unit for the custom metric from the drop-down menu or choose to allow the widget to automatically pick a unit.<br>If you apply custom colors, enter the value in each box that is the highest or lowest value that should be that color. You can select a unit for the metric. |
| Metric Unit | Select a unit for the custom metric. |

| Option | Description |
| --- | --- |
| Show | Select one or more of the following items to display in the widget:<br>• Select **Object Name** to display the name of the object in the widget.<br>• Select **Metric Name** to display the name of the metric in the widget. |
| **Input Data** | |
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |
| **Output Filter** | |
| Basic | Pick tags to refine the widget data. The widget data is based on the objects that have the picked tags applied. If you pick more than one value for the same tag, the widget includes objects that have any of the tags applied. If you pick more than one value for different tags, the widget includes only the objects that have all the tags applied.<br>If the objects have an input transformation applied, you select tag values for the transformed objects. |

| Option | Description |
| --- | --- |
| Advanced | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

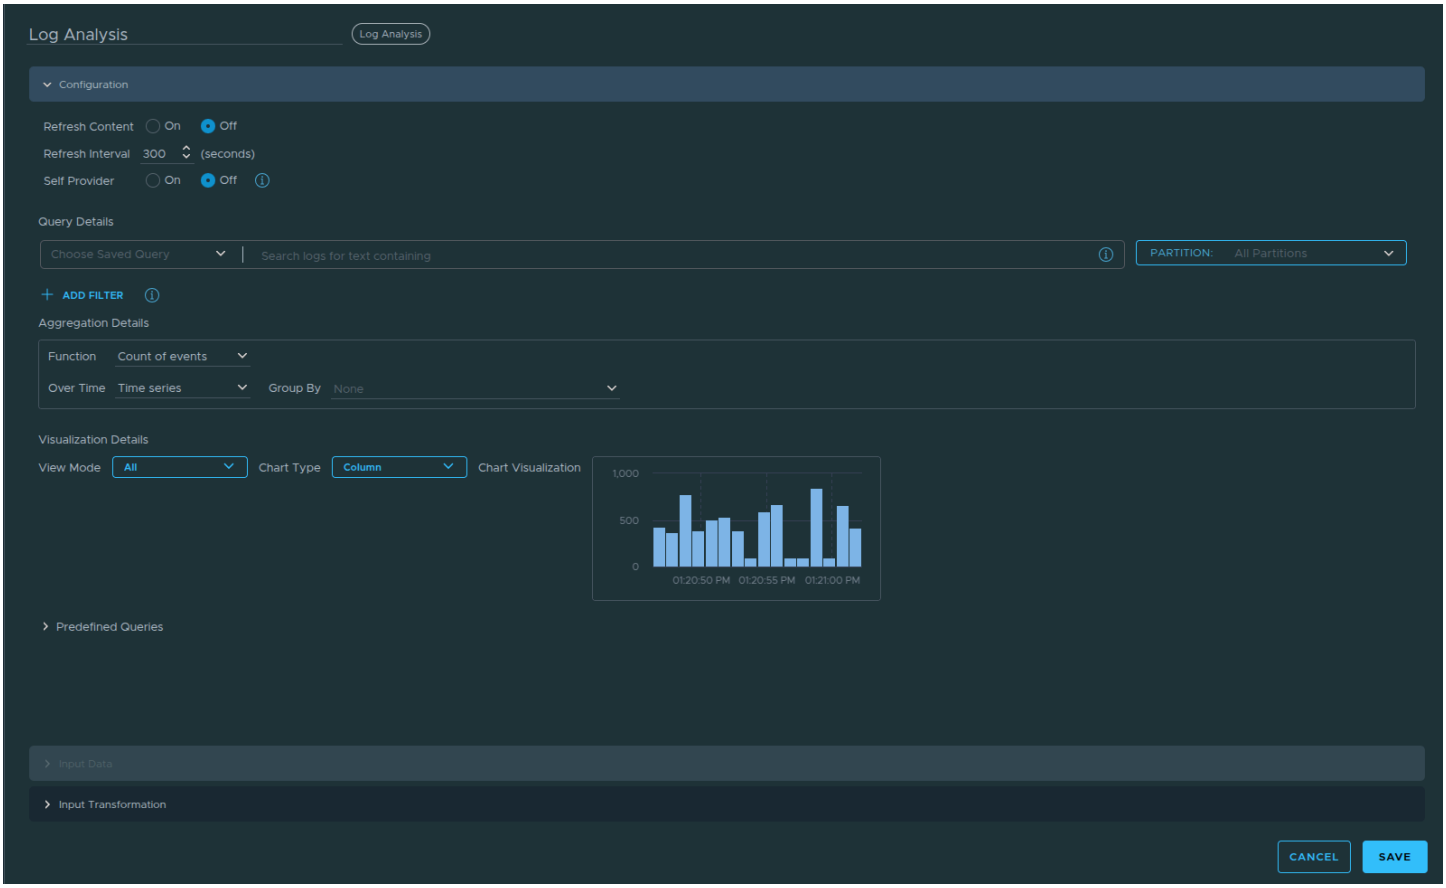
## Log Analysis Widget

The Log Analysis widget displays the logs after you have integrated VCF Operations and Log management. You can filter logs based on chart and message queries.

The following screenshot shows the log analysis widget.

**Figure 473: Log management widget**

Log management widget in VCF Operations console.



You can view, filter, and search the logs that are displayed.

## Where You Find the Log Analysis Widget

Create a new dashboard with the Log Analysis widget. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All**to see your configured dashboards. Cick **Create**. The widget panel in the dashboard page shows a list of available widgets. If you cannot find the Log Analysis widget, click **SHOW MORE**. Drag the Log Analysis widget to the dashboard workspace in the upper panel. In the title bar of the widget, click the **Edit Widget** icon to configure the widget.

## Log Analysis Widget Configuration Options

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |

| Option | Description |
|---|---|
| Self Provider | • On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Query Details | • Choose saved chart and message queries from the drop down list. You can create and save queries from the **Infrastructure Operations** > **Analyze** page.<br>• Search for logs using keywords.<br>• Select the index partition from the drop-down list. |
| Add Filter | Click **ADD FILTER** to add more filters. |
| Aggregation Details | Customize the visual representation of events by using aggregation queries. |
| Visualization Details | Change the view mode and chart type from the drop-down lists. A visualization displays how the chart will look. The aggregation details determines what types of visualization you can choose. You can also choose to display event stream, event types or event trends. |
| Predefined Queries | Click the **+** icon to add a list of predefined queries. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

**Note:**
Do not use the log analysis form widget for reporting. The widget requires user inputs to show results. The widget is interactive and performs cross-product queries.

## Mashup Chart Widget

The Mashup Chart widget shows disparate pieces of information for a resource. It shows a health chart and metric graphs for key performance indicators (KPIs).

### How the Mashup Chart Widget and Configuration Options Work

The Mashup Chart widget contains charts that show different aspects of the behavior of a selected resource. By default, the charts show data for the past six hours.

The Mashup Chart widget contains the following charts.

- A Health chart for the object, which can include each alert for the specified time period. Click an alert to see more information, or double-click an alert to open the Alert Summary page.
- Metric graphs for any or all the KPIs for any objects listed as a root cause object. For an application, this chart shows the application and any tiers that contain root causes. You can select the KPI to include by selecting **Chart Controls** > **KPIs** on the widget toolbar. Any shared area on a graph indicates that the KPI violated its threshold during that time period.

The metric graphs reflect up to five levels of resources, including the selected object and four child levels.

You edit a Mashup Chart widget after you add it to a dashboard. The changes you make to the options create a custom widget to meet the needs of the dashboard users.

## Where You Find the Mashup Chart Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Mashup Chart Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

The toolbar contains icons that you can use to change the view.

| Option | Description |
|---|---|
| Filters | Filter data based on criticality, status, and alert type. |
| Event Filters | Filter based on the type of event such as, change, notification, and fault. |
| Date Controls | Use the date selector to limit the data that appears in each chart to the time period you are examining.<br>Select **Dashboard Time** to activate the dashboard time panel. The option chosen in the dashboard time panel is effective. The default time is 6 hours.<br>**Dashboard Time** is the default option. |
| Dashboard Navigation | You can navigate to another dashboard when the object under consideration is also available in the dashboard to which you navigate. |

## Mashup Chart Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |

| Option | Description |
|---|---|
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Metric Chart Widget

You can use the Metric Chart widget to monitor the workload of your objects over time. The widget displays data based on the metrics that you select.

### How the Metric Chart Widget and Configuration Options Work

You can add the Metric Chart widget to one or more custom dashboards and configure it to display the workload for your objects. The data that appears in the widget is based on the configured menu items for each widget instance.

You edit the Metric Chart widget after you add it to a dashboard. The changes you make to the menu items create a custom widget with the selected metrics that display the workload on your objects.

To select metrics, you can select an object from the object list, then select the metrics. Or, you can select a tag from the object tag list to limit the object list, then select an object. You can configure multiple charts for the same object or multiple charts for different objects.

To use the metric configuration, which displays a set of metrics that you defined in an XML file, the dashboard and widget configuration must meet the following criteria:

- The dashboard **Widget Interaction** menu items are configured so that another widget provides objects to the target widget. For example, an Object List widget provides the object interaction to a chart widget.
- The widget **Self Provider** options are set to **Off**.
- The custom XML file in the **Metric Configuration** drop-down menu is in the `/usr/lib/vmware-vcops/tools/opscli` directory and has been imported into the global storage using the import command.

### Where You Find the Metric Chart Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Metric Chart Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

The toolbar contains icons that you can use to change the view of the graphs.

| Option | Description |
|---|---|
| Split Charts | Displays each metric in a separate chart. |
| Stacked Chart | Consolidates all charts into one chart. This chart is useful for seeing how the total or sum of the metric values vary over time. To view the stacked chart, ensure that the split chart option is turned off. |
| Dynamic Thresholds | Shows or hides the calculated dynamic threshold values for a 24-hour period. |
| Show Entire Period Dynamic Thresholds | Shows or hides dynamic thresholds for the entire time period of the graph. |
| Static Thresholds | Shows or hides the threshold values that have been set for a single metric. |
| Anomalies | Shows or hides anomalies. Time periods when the metric violates a threshold are shaded. Anomalies are generated when a metric crosses a dynamic or static threshold, either above or below. |
| Trend Line | Shows or hides the line and data points that represents the metric trend. The trend line filters out metric noise along the timeline by plotting each data point relative to the average of its adjoining data points. |
| Show Data Values | Activates the data point tooltips if you switched to a zoom or pan option. **Show Data Point Tips** must be activated. |
| Zoom All Charts | Resizes all the charts that are open in the chart pane based on the area captured when you use the range selector.<br>You can switch between this option and **Zoom the View**. |
| Zoom the View | Resizes the current chart when you use the range selector. |
| Pan | When you are in zoom mode, allows you to drag the enlarged section of the chart so that you can view higher or lower, earlier or later values for the metric. |
| Zoom to Fit | Resets the chart to fit in the available space. |
| Remove All | Removes all the charts from the chart pane, allowing to you begin constructing a new set of charts. |
| Refresh Charts | Reloads the charts with current data. |
| Date Controls | Opens the date selector.<br>Use the date selector to limit the data that appears in each chart to the time period you are examining.<br>Select **Dashboard Time** to activate the dashboard time panel. The option chosen in the dashboard time panel is effective. The default time is 6 hours.<br>**Dashboard Time** is the default option. |
| Generate Dashboard | Saves the current charts as a dashboard. |

| Option | Description |
|---|---|
| Save as PDF | Saves the current metric chart as a PDF file.<br>If you have added many metrics for different objects to a metric chart, you can quickly download and share the PDF file with another user or VM owner. You can create ad-hoc reports when analyzing metrics. You can also add notes to the metrics to provide context to the user. |

### Metric Chart Widget Graph Selector Options

The graph selector options determine how individual data appears in the graph.

| Option | Description |
|---|---|
| Close | Deletes the chart. |
| Save a snapshot | Creates a PNG file of the current chart. The image is the size that appears on your screen. You can retrieve the file in your browser's download folder. |
| Download comma-separated data | Creates a CSV file that includes the data in the current chart.<br>You can retrieve the file in your browser's download folder. |
| Save a full screen snapshot | Downloads the current graph image as a full-page PNG file, which you can display or save.<br>You can retrieve the file in your browser's download folder. |
| Units | You can display the data with dots or as a percentage. |
| Thresholds | You can choose to show/hide **Critical**, **Immediate**, and **Warning** thresholds in the current chart. |
| Scales | You can choose a scale for a stacked chart.<br>• Select **Linear** to view a chart in which the Y axis scale increases in a linear manner. For example, the Y axis can have ranges from 0 to 100, 100 to 200, 200 to 300, and so on.<br>• Select **Logarithmic** to view a chart in which the Y axis scale increases in a logarithmic manner. For example, the Y axis can have ranges from 10 to 20, 20 to 300, 300 to 4000, and so on. This scale gives a better visibility of minimum and maximum values in the chart when you have a large range of metric values.<br>**Note:**<br>If you select a logarithmic scale, the chart does not display data points for metric values less than or equal to 0, which leads to gaps in the graph.<br>• Select **Combined** to view overlapping graphs for the metrics. The chart uses individual scales for each graph instead of using a relative scale, and displays a combined view of the graphs.<br>• Select **Combined by Unit** to view a chart that groups the graphs for similar metric units together. The chart uses a common scale for the combined graphs. |
| Move Down | Moves the chart down one position. |
| Move Up | Moves the chart up one position. |

You can take the following actions on the Metric Chart graph.

| Option | Description |
|---|---|
| Y Axis | Shows or hides the Y-axis scale. |
| Chart | Shows or hides the line that connects the data points on the chart. |
| Data Point Tips | Shows or hides the data point tooltips when you hover the mouse over a data point in the chart. |
| Zoom by X | Enlarges the selected area on the X axis when you use the range selector in the chart to select a subset of the chart. You can use **Zoom by X** and **Zoom by Y** simultaneously. |
| Zoom by Y | Enlarges the selected area on the Y axis when you use the range selector in the chart to select a subset of the chart. You can use **Zoom by X** and **Zoom by Y** simultaneously. |

| Option | Description |
|---|---|
| Zoom by Dynamic Thresholds | Resizes the Y axis of the chart so that the highest and the lowest values on the axis are the highest and the lowest values of the dynamic threshold calculated for this metric. |
| Vertical resize | Resizes the height of a graph in the chart. |
| **Remove** icon next to each metric name in a stacked chart | Removes the graph for the metric from the chart. |

**Metric Chart Configuration Options**

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Data** section provides options to select object types on which you are basing the widget data.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |

| Option | Description |
|---|---|
| Metrics | Select metrics on which you want to base the widget data. You can select an object and pick its metrics.<br>1. Click the **Add New Metrics** icon to add metrics for the widget data. Select an object to view its metric tree and pick metrics for the object. The picked metrics appear in a list in this section.<br>The metric tree shows common metrics for several objects when you click the **Show common metrics** icon.<br>While selecting objects for which you want to pick metrics, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select metrics from the list and click the **Remove Selected Metrics** icon to remove the selected metrics.<br>Click the **Select All** icon to select all the metrics in the list.<br>Click the **Clear Selection** icon to clear your selection of metrics in the list.<br>Optionally, you can customize a metric and apply the customization to other metrics in the list.<br>1. Double-click a metric box in the list to customize the metric and click **Update**.<br>You can use the **Box Label** text box to customize the label of a metric box.<br>You can use the **Unit** text box to define a measurement unit of each metric.<br>You can use the **Color Method** option to define a coloring criteria for each metric. If this option is set to **Custom**, you can enter color values in the **Yellow**, **Orange**, and **Red** text boxes. You can also set coloring by symptom definition. If you do not want to use color, select **None**.<br>For example, to view the remaining memory capacity of a VM, select **Virtual Machine** as an object type, expand the **Memory** from the metric tree and double-click **Capacity Remaining(%)**. Define a meaningful label name and measurement unit to help you when you observe the metrics. You can select **Custom** from the **Color Method** drop-down menu and specify different values for each color, for example 50 for **Yellow**, 20 for **Orange**, and 10 for **Red**.<br>2. Select a metric and click the **Apply to All** icon to apply the customization for the selected metric to all the metrics in the list. |
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |
| **Output Data** | |
| Empty drop-down menu | Specifies a list with attributes to display. |

| Option | Description |
|---|---|
| | Select metrics on which you want to base the widget data. You can select an object and pick its metrics.<br>1. Click the **Add New Metrics** icon to add metrics for the widget data. Select an object to view its metric tree and pick metrics for the object. The picked metrics appear in a list in this section.<br>The metric tree shows common metrics for several objects when you click the **Show common metrics** icon.<br>While selecting objects for which you want to pick metrics, you can use the **Filter** text box to search for objects. You can select **Custom** from the **Color Method** drop-down menu and specify different values for each color, for example 50 for **Yellow**, 20 for **Orange**, and 10 for **Red**.<br>2. Select a metric and click the **Apply to All** icon to apply the customization for the selected metric to all the metrics in the list. |
| **Output Filter** | |
| | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

## Metric Picker Widget

The Metric Picker widget displays a list of available metrics for a selected object.

### How the Metric Picker Widget and Configuration Options Work

With the Metric Picker widget, you can check the list of the object's metrics. To select an object to pick its metrics, you use another widget as a source of data, for example, Topology Graph widget. To set a source widget that is on the same dashboard, you use the Widget Interactions menu when you edit a dashboard. To set a source widget that is on another dashboard, use the **Dashboard Navigation** menu when you edit a dashboard that contains the source widget. You can also search for objects using tags.

You edit a Metric Picker widget after you add it to a dashboard. The changes you make to the options create a custom chart to meet the needs of the dashboard users.

### Where You Find the Metric Picker Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Metric Picker Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

The toolbar contains icons that you can use to change the view of the graphs.

| Option | Description |
|---|---|
| Show common metrics | Filter based on common metrics. |
| Show collecting metrics | Filter based on collecting metrics. |
| Metrics or Properties | Filter based on metrics or property metrics. |
| Time Range | Filter based on selected time range. |
| Search | Search for dashboards, views, and network IP addresses using tags. |

### Metric Picker Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

| Option | Action |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |

| Option | Action |
|---|---|
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |

## Object List Widget

The Object List widget displays a list of the objects available in the environment.

### How the Object List Widget and Configuration Options Work

The Object List widget displays a data grid with objects in the inventory. The default configuration of the data grid appears in Object List Widget Options section. You can customize it by adding or removing default columns. You can use the **Additional Column** option to add metrics when you configure the widget.

You edit an Object List widget after you add it to a dashboard. Configuration of the widget helps you observe parent and child objects. You can configure the widget to display the child objects of an object selected from another widget, for example, another Object List or Object Relationship widget, in the same dashboard.

Click the legend at the bottom of the widget to filter the objects based on threshold. Point your cursor over any of the boxes to view tooltips.

### Where You Find the Object List Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Object List Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Action | Selects from a set of actions specific for each object type. To see available actions, select an object from the list of objects and click the toolbar icon to select an action. For example, when you select a datastore object in the graph, you can select **Delete Unused Snapshots for Datastore**. |
| Dashboard Navigation | Navigates you to the object. For example, when you select a datastore from the list of objects and click **Dashboard Navigation**, you can open the datastore in vSphere Web Client. |
| Reset Grid Sort | Returns the list of resources to its original order. |

| Option | Description |
|---|---|
| Reset Interaction | Returns the widget to its initial configured state and undoes any interactions selected in a providing widget.<br>Interactions are usually between widgets in the same dashboard, or you can configure interactions between widgets on different dashboards. |
| Object Detail | Select an object and click this icon to show the Object Detail page for the object. |
| Perform Multi-Select Interaction | If the widget is a provider for another widget on the dashboard, you can select multiple rows and click this button. The receiving widget then displays only the data related to the selected interaction items.<br>Use Ctrl+click for Windows, or Cmd+click for Mac OS X, to select multiple individual objects or Shift+click to select a range of objects, and click the icon to activate the interaction. |
| Display Filtering Criteria | Displays the object information on which this widget is based. |
| Page Size | |
| Filter | Locate data in the widget.<br>You can search for objects or filter the list based on the values of the metrics or properties in the additional columns of the Configuration section. |

## Object List Widget Data Grid Options

The data grid provides a list of inventory objects on which you can sort and search.

| Option | Description |
|---|---|
| ID | Unique ID for each object in the inventory, randomly generated and produced by VCF Operations. |
| Name | Name of the object in the inventory. |
| Description | Displays the short description of the object given during creation of the object |
| Adapter Type | Shows the adapter type for each object. |
| Object Type | Displays the type of the object in the inventory. |
| Policy | Displays policies that are applied to the object. To see policy details and create policy configurations, in the menu click **Administration**, and then in the left pane click **Policies**. |
| Creation Time | Displays the date, time, and time zone of the creation of an object that was created in the inventory. |
| Identifier 1 | Can contain the custom name of the object in the inventory or default unique identifier, depending on the type of inventory object. For example, My_VM_1 for a VM in the inventory, or 64-bit hexadecimal value for VCF Operations Node. |
| Identifier 2 | Can contain the abbreviation of an object type and the unique decimal number or parent instance, depending on the type of the object. For example, vm-457 for a VM and an IP address for VCF Operations Node. |
| Identifier 3 | Can contain a unique number identifying an adapter type. For example, 64-bit hexadecimal value for vCenter Adapter |
| Identifier 4 | Additional unique identifiers for the object. This option varies and depends on the adapter type that the object uses. |

| Option | Description |
|---|---|
| Identifier 5 | Additional unique identifiers for the object. This option varies and depends on the adapter type that the object uses. |
| Object Flag | Displays a badge icon for each object. You can see the status when you point to the badge. |
| Collection State | Displays the collection state of an adapter instance of each object. You can see the name of the adapter instance and its state in a tool tip when you point to the state icon. To manage an adapter instance to start and stop collection of data, in the menu, click **Ad ministration**, and then in the left pane click **Inventory**. |
| Collection Status | Displays the collection status of the adapter instance of each object. You can see the name of the adapter instance and its status in a tool tip when you point to the status icon. To manage an adapter instance to start and stop collection of data, in the menu, click **Administration**, and then in the left pane click **Inventory**. |
| Relevance | Displays the user interest on objects based on the number of clicks. The relevance is determined using a system-wide ranking algorithm that rates the object with most clicks as most relevant object. |
| Internal ID | Unique number that VCF Operations uses to identify the object internally. For example, the internal ID appears in log files used for troubleshooting. |

## Object List Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

The **Additional Columns** section provides options to select metrics that are displayed as additional columns in the widget.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |

| Option | Description |
|---|---|
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Auto Select First Row | Determines whether to start with the first row of data. |
| **Input Data** | |
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |
| **Output Filter**<br>**Note:**<br>If there are more than ten objects under a section in the inventory tree, you can search for an object using the search option. If there are more than thousand objects in a section, use the **View More** button under the last object that is displayed to view the rest of the objects. | |

| Option | Description |
| --- | --- |
| Basic | Pick tags to refine the widget data. The widget data is based on the objects that have the picked tags applied. If you pick more than one value for the same tag, the widget includes objects that have any of the tags applied. If you pick more than one value for different tags, the widget includes only the objects that have all the tags applied.<br>If the objects have an input transformation applied, you select tag values for the transformed objects. |
| Advanced | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |
| **Additional Columns** | |
| Empty drop-down menu | Specifies a list with attributes to display. |
| | Add metrics based on object types. The selected metrics are displayed as additional columns in the widget.<br>1. Click the **Add New Metrics** icon to add metrics based on object types. The metrics that you add appear in a list in this section.<br>While selecting object types for which you want to pick metrics, you can filter the object types by adapter type to pick an object type. On the metrics pane, click the **Select Object** icon to select an object for the object type. Pick metrics of the selected object from the metric tree.<br>For example, you can select the **Datacenter** object type, click the **Select Object** icon to display the list of data centers in your environment, and pick metrics of the selected data center.<br>2. Optionally, you can double-click a metric box in the list to customize the label of the metric and click **Update**. |

## Object Relationship Widget

The Object Relationship widget displays the hierarchy tree for the selected object. You can create one or more hierarchy trees in VCF Operations for the selected objects that you add to your custom dashboards.

## How the Object Relationship Widget and Configuration Options Work

You can add the Object Relationship widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance.

You edit an Object Relationship widget after you add it to a dashboard. The changes you make to the options help create a custom widget to meet the needs of the dashboard users.

## Where You Find the Object Relationship Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Object Relationship Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Dashboard Navigation | You can navigate to another dashboard when the object under consideration is also available in the dashboard to which you navigate. To be able to navigate to another dashboard, configure the relevant option when you create or edit the dashboard. |
| Badge | Displays the Health, Risk, or Efficiency alerts on the objects in the relationship map. You can select a badge for objects that appear in the widget. The tool tip of a badge shows the object name, object type, and the name of the selected badge with the value of the badge. You can only select one badge at a time. |
| Zoom to fit | Resets the chart to fit in the available space. |
| Pan | Click this icon and click and drag the hierarchy to show different parts of the hierarchy. |
| Show values on point | Shows or hides the data point tooltips when you hover the mouse over a data point in the chart. |
| Zoom the view | Click this icon and drag to outline a part of the hierarchy. The display zooms to show only the outlined section. |
| Display Filtering Criteria | Shows the filtering settings for the widget in a pop-up window. |
| Zoom in | Zooms in on the hierarchy. |
| Zoom out | Zooms out on the hierarchy. |
| Reset to Initial Object | If you change the hierarchy of the initial configuration or the widget interactions, click this icon to return to the initial resource. Clicking this icon also resets the initial display size. |
| Object Detail | Select an object and click this icon to show the Object Detail page for the object. |
| Show Alerts | Select the resource in the hierarchy and click this icon to show alerts for the resource. Alerts appear in a pop-up window. You can double-click an alert to view its Alert Summary page. |

## Object Relationship Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Auto Zoom to Fixed Node Size | You can configure a fixed zoom level for object icons in the widget display.<br>If your widget display contains many objects and you always need to use manual zooming, this feature is useful because you can use it to set the zoom level only once. |
| Node Size | You can set the fixed zoom level at which the object icons display. Enter the size of the icon in pixels.<br>The widget shows object icons at the pixel size that you configure. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |
| **Output Filter** | |

| Option | Description |
|---|---|
| Basic | Pick tags to refine the widget data. The widget data is based on the objects that have the picked tags applied. If you pick more than one value for the same tag, the widget includes objects that have any of the tags applied. If you pick more than one value for different tags, the widget includes only the objects that have all the tags applied. |
| Advanced | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

## Object Relationship (Advanced) Widget

The Object Relationship (Advanced) widget displays a graph or tree view, or a hexagon view that depicts the parent-child relationship of the selected object. It provides advanced configuration options. You can create a graph or tree view, or a hexagon view in VCF Operations for the selected objects that you add to your custom dashboards.

### How the Object Relationship (Advanced) Widget and Configuration Options Work

You can add the **Object Relationship (Advanced)** widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance.

You can edit an **Object Relationship (Advanced)** widget after you add it to a dashboard. The changes you make to the options help create a custom widget to meet the needs of the dashboard users.

There are two modes, the Classic view mode is a hierarchy tree view, and relationships between objects are represented by corresponding colors. The Hexagon view mode is displayed as a ring around the hexagon grid, with each segment representing all the criticalities in the current grid.

You can double-click any object in the graph or tree view, or hexagon view and see the specific parent-child objects for the focus object. If you point your cursor over an object icon, you see the health, risk, and efficiency details. You can also click the **Alerts** link for the number of generated alerts.

In the hexagon view, you can see the total object count. The parent-child view is listed on the left side as you click on each object. You can view the criticality of the objects as depicted by the color by hovering your cursor over the hexagon or ring around the hexagon.

### Where You Find the Object Relationship (Advanced) Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Object Relationship (Advanced) Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Options | Description |
|---|---|
| Dashboard Navigation | You can navigate to another dashboard when the object under consideration is also available in the dashboard to which you navigate. To navigate to another dashboard, configure the relevant option when you create or edit the dashboard. |
| Back to Initial Object | If you change the hierarchy of the initial configuration or the widget interactions, click this icon to return to the initial resource. Clicking this icon also resets the initial display size. |
| View Tree/View graph<br>(Displayed when you select the Classic view mode) | Displays a tree or graph view of the relationships. |
| Applications<br>(Displayed when you select the Classic view mode) | Displays relationships that are of the type 'application'. |
| Vertical/Horizontal<br>(Displayed when you select the Classic view mode) | Displays a vertical or horizontal view of the graph or tree view. |
| Hide Text/Show Text<br>(Displayed when you select the Classic view mode) | Hides or displays the object names. |
| Standard View/Fit View | The **Standard View** option fixes the view to a specific zoom level<br>The **Fit View** option adjusts the graph or tree view to fit the screen. |
| View Additional Links | Displays additional links for the applications. |
| Quick Filter | Enter the name of an object that you want to see in the graph or tree view or in the hexagon view. |
| View Parents/View Children<br>(Displayed when you select the Hexagon view mode) | Click the arrows on the left side of the grid to view the parents or children for the selected object, in the hexagon. |

**Table 1380: Specific Functions from the Object Relationship (Advanced) Grid View**

| Function | Description |
|---|---|
| Filter By Type | The filtering button appears in the upper right corner of the grid in Classic mode if any 'Relationship Type' defined by its corresponding color, exists.<br>You can filter by the type of relationship between parent and child. For example, filter by Runson, Application, Location, and so on. Each relationship type is associated with a color and the connections in the tree view between the parent-child objects are depicted in the specific color. |
| Hide Node | Hover your cursor over an object and click the **Hide Node** icon to hide the specific node. |

| Function | Description |
|---|---|
| Show Peers/Hide Peers | Hover your cursor over the selected object in the grid view and select **ShowPeers/Hide Peers** to view or hide other objects of the same type that exist under the parent object. |
| Pagination/Next Page/Previous Page | At the bottom of the grid view you can view the page number and also move to the next/previous page. |
| Filter | At the bottom of the grid view you can use the filter option to search for objects. |
| Arrows | Use the arrows on each object to view relationships of each object. |

### Object Relationship (Advanced) Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Name | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |

| Option | Description |
|---|---|
| View Mode | Select either Classic or Hexagon.<br>If you choose Classic, you can view a graph or tree, that depicts the parent-child relationship of the selected object after you configure the widget.<br>If you select Hexagon, you see a hexagon view that depicts the parent-child relationship of the selected object after you configure the widget. |
| Inventory trees | Select an existing predefined traversal spec for the initial object relationship graph or tree view. |
| Relationship Types<br>(Displayed when you select the Classic view mode) | Select the relationship type you want displayed in the dashboard. Each type of relationship type is associated with a color.<br>**Note:**<br>The relationship type filter you select here takes precedence over the 'Filter By Type' option you see in the datagrid of the widget. |
| Parents Depth<br>(Displayed when you select the Classic view mode) | Select the depth of parent objects to be displayed. |
| Children Depth<br>(Displayed when you select the Classic view mode) | Select the depth of child objects to be displayed. |
| Page Size<br>(Displayed when you select the Classic view mode) | Select the number of objects to list per page. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |
| **Output Filter** | |
| Basic | Pick tags to refine the widget data. The widget data is based on the objects that have the picked tags applied. If you pick more than one value for the same tag, the widget includes objects that have any of the tags applied. If you pick more than one value for different tags, the widget includes only the objects that have all the tags applied. |
| Advanced | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

## Property List Widget

You can use the Property List widget to view the properties of objects and their values.

### How the Property List Widget and Configuration Options Work

To observe the properties of objects in the Property List widget, you can select object property metrics when you configure the widget itself (Self Provider mode activated). Alternatively, you can select objects or object property metrics from another widget (Self Provider mode deactivated). You can also view a default or custom set of properties by selecting a preconfigured XML file in the Metric Configuration drop-down menu of the widget configuration window.

You edit a Property List widget after you add it to a dashboard. You can configure a widget to receive data from another widget by selecting **Off** for Self Provider mode. When the widget is not in Self Provider mode, it displays a set of predefined properties and their values of an object that you select on the source widget. For example, you can select a host on a Topology widget and observe its properties in the Property List widget. To configure the Property List as a receiver widget that is on the same dashboard, use the **Widget Interactions** menu when you edit a dashboard. To configure a receiver widget that is on another dashboard, use the **Dashboard Navigation** menu when you edit a source dashboard.

### Where You Find the Property List Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Property List Widget Data Grid Options

The data grid provides information on which you can sort and search.

| Option | Description |
|---|---|
| Object Name | Name of the object, whose properties you observe. You can sort the properties by object name. To open the Object Details page, click an object name. |
| Property Name | Name of the property. You can sort the properties by property name. |
| Value | Value of the property. You can sort the properties by value. |

### Property List Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Data** section provides options to select object types on which you are basing the widget data.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget. If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Visual Theme | Select a predefined visual style for each instance of the widget. The options are: Original and Compact. |
| Show Metric Full Name | You can choose to view the full name of the metrics. The options are: On and Off. |
| **Input Data** | |

| Option | Description |
| --- | --- |
| Metrics | Select metrics on which you want to base the widget data. You can select an object and pick its metrics.<br>1. Click the **Add New Metrics** icon to add metrics for the widget data. Select an object to view its metric tree and pick metrics for the object. The picked metrics appear in a list in this section.<br>The metric tree shows common metrics for several objects when you click the **Show common metrics** icon.<br>While selecting objects for which you want to pick metrics, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select metrics from the list and click the **Remove Selected Metrics** icon to remove the selected metrics.<br>Click the **Select All** icon to select all the metrics in the list.<br>Click the **Clear Selection** icon to clear your selection of metrics in the list.<br>You can define measurement units for the metrics in the list. Double-click a metric box in the list, select a measurement unit in the **Unit** drop-down menu, and click **Update**. |
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |
| **Output Data** | |
| Empty drop-down menu | Specifies a list with attributes to display. |

| Option | Description |
|---|---|
| | 1. Click the **Add New Metrics** icon to add metrics based on object types. The metrics that you add appear in a list in this section.<br>While selecting object types for which you want to pick metrics, you can filter the object types by adapter type to pick an object type. On the metrics pane, click the **Select Object** icon to select an object for the object type. Pick metrics of the selected object from the metric tree.<br>For example, you can select the **Datacenter** object type, click the **Select Object** icon to display the list of data centers in your environment, and pick metrics of the selected data center.<br>2. Optionally, you can define measurement units for the metrics and properties in the list. Double-click a metric or properties box in the list, select a measurement unit in the **Unit** drop-down menu, and click **Update**.<br>3. You can use the **Color Method** option to define a coloring criteria for each metric. If this option is set to **Custom**, you can enter color values in the **Yellow**, **Orange**, and **Red** text boxes. You can also set coloring by symptom definition. If you do not want to use color, select **None**. |
| **Output Filter** | |
| | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

## PromQL Viewer Widget

The PromQL Viewer widget uses the Prometheus Query Language to identify real-time data to be visualized. As an admin, you can modify PromQL queries to create advanced queries and transformations. You can also create a PromQL query by browsing and choosing relevant metrics from the Query Builder Help. You can then validate the syntax of the query.

### How the PromQL Viewer Widget and Configuration Options Work

#### Prerequisites

- Ensure that the real-time metrics component has been installed before you configure the PromQL Viewer widget. For more information, see Deploy Real-Time Metrics.
- Ensure that you have deployed a VCF Instance. For more information, see Start a New VCF Fleet or a New VCF Instance Deployment by Using the VCF Installer Deployment Wizard.

The PromQL Viewer widget displays operational insights using PromQL. As an admin you can visualize metrics using PromQL.

You can edit the PromQL Viewer widget on the Home dashboard, or on another dashboard where you add the widget. With the widget configuration options, you can assign a new name to the widget, set the refresh content, set the refresh interval, and so on.

### Where You Find the PromQL Viewer Widget

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the PromQL Viewer widget to the dashboard workspace in the upper panel.

### PromQL Viewer Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Date Controls | Use the date selector to limit the data that appears in each chart to the time period you are examining.\<br>Select **Dashboard Time** to activate the dashboard time panel. The option chosen in the dashboard time panel is effective. The default time is 6 hours. **Dashboard Time** is the default option. |
| Single series focus mode | The single series focus mode highlights one trend at a time for more straightforward analysis.<br>When this option is activated, hovering your cursor over a point makes that series the sole one displayed, allowing the chosen point and line to stand out distinctly. Additionally, you can select one or more legends to retain only those lines on the chart, concealing all other series until you choose to deselect them.<br>If the option is not enabled, when you click on an legend from the list, it will be deselected. |
| Show Chart Legend | Shows or hides the legend chart. |
| Refresh | Activate or deactivate the automatic refreshing of data in this widget. |
| Chart Height | Resize the height of the chart. |

### PromQL Viewer Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |

| Option | Description |
|---|---|
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Output Data** | |
| Source | • If the widget is in self provider mode, from the drop-down list, select the domain as source, and then select if the object type is vCenter/vSAN or NSX. The default selection is vCenter/vSAN.<br>• If the widget is not in self provider mode, select the VCF Instance as the source. |
| Query | Enter a complete PromQL query exactly as you want it to run. As there are no autocomplete suggestions, ensure that the entire expression is complete.<br>Ensure that the query is relevant for the selected object. If the query is not relevant, the chart will not display any data. |
| Need Help? Use the Quick Query Filter | Click the **Need Help? Use the Quick Query Filter** link to use the Query Builder Help. From the Query Builder Help, you can copy the relevant Function, Metric, or a Sample Query and paste it in the **Query** field. |
| Validate | Click **Validate** to validate the syntax of the query, |

**PromQL Queries**

The PromQL Viewer widget allows you to run raw PromQL queries directly against the metric data within your VCF Operations environment. This topic covers the core concepts, supported features, syntax, and limitations of PromQL queries.

**Procedure:**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**.
2. Click **Create**, and add the **PromQL Viewer** widget.
3. Enter your PromQL query in the query field.
4. Select your time range and click **Execute**.

**Points to Note:**

- **Start simple:** Test your metric selector before adding functions or aggregations.
- **Verify label names:** Label names are case-sensitive.
- **Use appropriate time ranges:** Large ranges may impact performance.

## Core Concepts

| Concept | Description | Example |
|---|---|---|
| Instant Vector | A set of time series with a single sample value at a specific point in time. | `cpu.capacity.usage.HOST` |
| Range Vector | A set of time series with a range of samples over a time window. | `cpu.capacity.usage.HOST[5m]` |
| Label Matchers | Filters that restrict which time series are returned. | `cpu.capacity.usage.HOST{HOST='host-17'}` |
| Scalar | A simple numeric value. | 42, 3.14 |
| Subquery | A query evaluated over a range with a specified step. | `cpu.capacity.usage.HOST[30m:5m]` |

## Selectors

1. **Instant Vector Selectors.** Allows you to select a set of time series and a single sample value for each at a specific point in time.
    1. **Simple Match.** Select a metric across all time series: `cpu.capacity.usage.HOST`.
    2. **With Label Matchers.** Filter time series using label conditions. VCF 9.1 supports four matcher types:

| Matcher | Operator | Description | Example |
|---|---|---|---|
| Equality | **=** | Label equals value. | `cpu.capacity.usage.HOST{HOST='host-17'}` |
| Non-equality | **!=** | Label does not equal value. | `cpu.capacity.usage.HOST{HOST!='host-17'}` |
| Regex match | **=~** | Label matches regex pattern.<br>**Note:**<br>Regex matches are fully anchored. A match of `HOST=~"foo"` is treated as `HOST=~"^foo$"`. | `cpu.capacity.usage.HOST{HOST=~'host-1.*'}` |
| Regex non-match | **!~** | Label does not match regex. | `cpu.capacity.usage.HOST{HOST!~'host-1.*'}` |

**Note:**

You can combine multiple matchers with commas: `cpu.capacity.usage.HOST{HOST!='host-17', vc_ip='127.0.0.1'}`.

2. **Range Vector Selectors.** Selects a set of time series containing all the data points that are found within a specified duration of time (for example, `[5m]`) back from the current instant.

**Note:**

Range vector selectors are not allowed as outermost selector in the range queries.

a. **Simple Match.** Append a duration in brackets to select samples over a time window: `cpu.capacity.usage.HOST[5m]`.
b. **With label matchers.** `cpu.capacity.usage.HOST{HOST='host-17'}[5m]`

### Supported duration units

| Unit | Meaning |
|---|---|
| ms | milliseconds |
| s | seconds |

| Unit | Meaning |
|---|---|
| m | minutes |
| h | hours |
| d | days |
| w | weeks |

**Note:**

Common durations: `1m`, `5m`, `30m`, `1h`, `24h`, `7d`

## Operators

1. **Arithmetic Operators**. Execute scalar or vector-to-vector math by automatically matching pairs with identical label sets.

| Operator | Description | Example |
|---|---|---|
| **+** | Addition | cpu.usage.HOST + 100 |
| **-** | Subtraction | mem.total.HOST - mem.used.HOST |
| ***** | Multiplication | cpu.usage.HOST * 2 |
| **/** | Division | mem.used.HOST / mem.total.HOST |
| **%** | Modulo | cpu.usage.HOST % 10 |
| **^** | Exponentiation | cpu.usage.HOST ^ 2 |

Examples:
- # Scalar arithmetic: `5 * 2`
- # Vector multiplied by scalar: `cpu.capacity.usage.HOST{HOST='host-17'} * 2`
- # Vector arithmetic (element-wise): `cpu.capacity.usage.HOST{HOST='host-17'} * memory.usage.HOST{HOST='host-17'}`

2. **Comparison Operators.** Compare values and optionally return boolean results.

| Operator | Description |
|---|---|
| **==** | Equal |
| **!=** | Not equal |
| **>** | Greater than |
| **<** | Less than |
| **>=** | Greater than or equal |
| **<=** | Less than or equal |

Using the `bool` modifier:
When comparing two scalars, you must use the `bool` modifier to return 0 or 1:
Examples:
# Scalar vs scalar (bool required): `5 > bool 3`
# Vector vs scalar (bool optional - filters by default, returns 0/1 with bool): `cpu.capacity.usage.HOST > bool 80`
# Vector vs vector: `cpu.capacity.usage.HOST == memory.usage.HOST`

3. **Logical Operators.** Combine instant vectors using set operations.

| Operator | Description | Example |
|---|---|---|
| `and` | Intersection (series present in both) | `cpu.usage.HOST and net.usage.HOST` |
| `or` | Union (series present in either) | `cpu.usage.HOST or net.usage.HOST` |
| `unless` | Complement (left minus right) | `cpu.usage.HOST unless net.usage.HOST` |

**Note:**

Logical operators work only between instant vectors, not scalars.

## Aggregation Operators

Aggregations reduce multiple time series into fewer series.

### Supported Aggregations

| Operator | Description |
|---|---|
| `sum` | Sum of values |
| `min` | Minimum value |
| `max` | Maximum value |
| `avg` | Average value |
| `count` | Count of series |
| `topk` | Top K series by value |
| `bottomk` | Bottom K series by value |
| `topn_sum` | Top N series by sum *(VCF extension)* |
| `bottomn_sum` | Bottom N series by sum *(VCF extension)* |

### Syntax:

- Basic aggregation: `sum(cpu.capacity.usage.HOST)`
- With `by` clause (group by specific labels):

```
sum by (host) (cpu.usage.HOST)
# or
sum(cpu.usage.HOST) by (host)
```

- With without clause (exclude specific labels from grouping):

```
sum without (host, host_ip) (cpu.usage.HOST)
# or
sum(cpu.usage.HOST) without (host, host_ip)
```

### Examples:

- sum
  - `sum(cpu.capacity.usage.HOST)`
  - `sum by (host) (cpu.usage.HOST)`
  - `sum without (host, host_ip) (cpu.usage.HOST)`
- min/max/ avg/count
  - `min(cpu.capacity.usage.HOST)`
  - `max by (host) (cpu.capacity.usage.HOST)`
  - `avg without (host) (cpu.capacity.usage.HOST)`
  - `count(cpu.capacity.usage.HOST) by (host)`

- topk/bottomk
  - # Top 3 series by value: `topk(3, cpu.capacity.usage.HOST)`
  - # Top 3 per group: `topk(3, cpu.capacity.usage.HOST) by (HOST)`
  - # Bottom 3 excluding certain labels: `bottomk(3, cpu.capacity.usage.HOST) without (VM)`
- topn_sum/bottomn_sum
  - # Top 3 series by sum of values: `topn_sum(3, cpu.usage.HOST)`
  - # Bottom 3 series by sum: `bottomn_sum(3, cpu.usage.HOST)`

    **Note:**

    `topn_sum` and `bottomn_sum` are VCF-specific extensions (not part of standard PromQL) and do not support `by` or `without` clauses.

**Functions**

1. **Over-Time Functions.** Transform a range vector into an instant vector by calculating a single aggregate value for each individual time series over the specified time window.

| Function | Description | Example |
|---|---|---|
| avg_over_time | Average value over the range. | `avg_over_time(cpu.usage.HOST[5m])` |
| min_over_time | Minimum value over the range. | `min_over_time(cpu.usage.HOST[1h])` |
| max_over_time | Maximum value over the range. | `max_over_time(cpu.usage.HOST[30m])` |
| sum_over_time | Sum of values over the range. | `sum_over_time(cpu.usage.HOST[24h])` |
| count_over_time | Count of samples over the range. | `count_over_time(cpu.usage.HOST[7d])` |
| last_over_time | Most recent value in the range. | `last_over_time(cpu.usage.HOST[5m])` |

   **Example with label matcher:** `avg_over_time(cpu.capacity.usage.HOST{HOST='host-17'}[5m])`
2. **Rate and Counter Functions**

| Function | Description | Example |
|---|---|---|
| rate | Per-second average rate of increase. | **rate(http.requests.total[5m])** |
| irate | Instant rate using the last two data points. | `irate(http.requests.total[5m])` |
| resets | Number of counter resets in the range. | `resets(http.requests.total[5m])` |

   **Examples:**
   - `rate(cpu.capacity.usage.HOST{host='host-17'}[5m])`
   - `irate(cpu.capacity.usage.HOST[5m])`
   - `resets(mem.physical.total.HOST[5m])`
3. **Math Functions.** Functions performing mathematical operations.

| Function | Description | Example |
|---|---|---|
| abs | Absolute value | `abs(cpu.capacity.usage.HOST)` |
| ceil | Round up to nearest integer | `ceil(cpu.capacity.usage.HOST)` |
| floor | Round down to nearest integer | `floor(cpu.capacity.usage.HOST)` |

   **Examples:**
   - `abs(cpu.capacity.usage.HOST{host='host-17'})`
   - `ceil(cpu.capacity.usage.HOST)`
   - `floor(cpu.capacity.usage.HOST{host='host-17'})`

4. **Absence Functions.** Detect missing data.

| Function | Description | Example |
|---|---|---|
| absent | Returns 1 if the instant vector is empty | `absent(cpu.capacity.usage.HOST)` |
| absent_over_time | Returns 1 if no samples exist in the range | `absent_over_time(cpu.usage.HOST[5m])` |

**Examples:**

- `absent(cpu.capacity.usage.HOST{HOST='nonexistent'})`
- `absent_over_time(cpu.capacity.usage.HOST{HOST='host-17'}[5m])`

## Subqueries

Subqueries evaluate an expression over a time range with a specified resolution step.

**Syntax:**

```
<expression>[<range>:<step>]
```

**Note:**

The **<step>** (resolution) is optional. If omitted, it defaults to the global evaluation interval.

**Examples:**

- # Evaluate metric over 30 minutes with 5-minute steps: `cpu.usage.HOST{host='host-15'}[30m:5m]`
- # Function result as subquery: `count_over_time(cpu.usage.HOST{host='host-15'}[5m])[30m:1m]`

**Important:**

Subqueries only support instant queries in VCF 9.1. See the limitations listed in the table called **Limitations in VCF 9.1**.

## Limitations in VCF 9.1

The following PromQL features are not supported in VCF Operations 9.1.

| Limitation | Description |
|---|---|
| Subqueries in range queries | Subqueries only work with instant queries. |
| Nested subqueries | Cannot nest a subquery inside another function. For example, `sum_over_time(cpu.usage.HOST[30m:5m])` is not supported |
| Unary operators | `-metric` and `+metric prefix` operators are not supported. |
| Vector matching modifiers | `on`, `ignoring`, `group_left`, and `group_right` are not supported. |
| Some aggregation operators | `group`, `stddev`, `stdvar`, `count_values`, and `quantile` are not implemented. |
| Some functions | `delta`, `deriv`, `idelta`, `changes`, `clamp`, `clamp_min`, `clamp_max`, `round`, `sqrt`, `ln`, `log2`, `log10`, `exp`, `sgn`, `sort`, `sort_desc`, `scalar`, `vector`, `time`, `timestamp`, `histogram_*`, `holt_winters`, `predict_linear`, `label_join`, `label_replace`, `present_over_time`, `stddev_over_time`, `stdvar_over_time`, `quantile_over_time`, trigonometric functions, and date/time functions are not implemented |
| Offset modifier | The `offset` modifier is not fully supported |
| @ modifier | The `@` modifier for overriding evaluation time is not supported |
| Aggregation on name label | Using `name` in `by` or `without` clauses is not supported. |

### Troubleshooting

Here is a list of common errors.

| Error | Cause | Solution |
|---|---|---|
| "Empty or null metric name" | The query has no metric name. | Ensure your query starts with a valid metric name |
| "Unsupported function" | Using a function not implemented in VCF 9.1. | See the Limitations section documented above. |
| "Matrix selector not supported as outermost operation" | The range vector is used without a function in a range query. | Wrap in a function, such as `last_over_time(metric[5m])` |
| "Subquery not supported for nested queries" | A subquery used inside another expression. | Use the range selector with the step given in query params. |
| "Grouping operations are not supported" | Using `on`, `ignoring`, and so on. | Remove vector matching modifiers |
| "Unary operation is not supported" | Using `-metric` or `+metric`. | Use `0 - metric` or just `metric` instead. |
| "Comparisons between scalars must use BOOL modifier" | Scalar comparison without `bool`. | Add `bool` keyword: `5 > bool 3` |

## Recommended Actions Widget

The Recommended Actions widget displays recommendations to solve problems in your vCenter instances. With recommendations, you can run actions on your data centers, clusters, hosts, and virtual machines.

### How the Recommended Actions Widget and Configuration Options Work

The Recommended Actions widget appears on the Home dashboard, and displays the health status for the objects in your vCenter instance. At a glance, you can see how many objects are in a critical state, and how many objects need immediate attention.

From the Recommended Actions widget, you can focus in on problems further by, for example, clicking an object where the alerts triggered, and by clicking an individual alert.

You can edit the Recommended Actions widget on the Home dashboard, or on another dashboard where you add the widget. With the widget configuration options, you can assign a new name to the widget, set the refresh content, and set the refresh interval.

The Recommended Actions widget includes a selection bar, a summary pane, a toolbar for the data grid, and alert information for your objects in a data grid.

### Where You Find the Recommended Actions Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Recommended Actions Widget Selection Bar and Summary Pane

| Option | Description |
|---|---|
| Scope | Allows you to select an instance of vCenter, and a data center in that instance. |
| Object tabs | Displays the object types with the number of objects affected in parentheses. You can display the actions for virtual machines, host systems, clusters, vCenter instances, and datastores. |
| Badge | Select the Health, Risk, or Efficiency badge to display alerts on your objects. Health alerts require immediate attention. Risk alerts require attention in the immediate future. Efficiency alerts require your input to reclaim wasted space or to improve the performance of your objects. For each badge, you can view critical, immediate, and warning alerts.<br>• Health Status. With the Health badge selected, displays the number of affected objects and a summary of their health based on the alerts that triggered on the object. Lists the objects that have the worst health, and the number of alerts that triggered on each object.<br>• Risk Status. With the Risk badge selected, displays the number of affected objects and a summary of their risk based on the alerts that triggered on the object. Lists the objects that have the highest, and the number of alerts that triggered on each object.<br>• Efficiency Status. With the Efficiency badge selected, displays the number of affected objects. Lists the objects that have the lowest efficiency based on the alerts that triggered on the object, and the number of alerts that triggered on each object. |
| Search filter | Narrows the scope of the objects that appear. Enter a character or a number to search and display an object. When a filter is active, the name of the filter appears below the Search filter text box. |

### Recommended Actions Widget Toolbar Options

The toolbar allows you to address an alert, and to filter the alert list.

| Option | Description |
|---|---|
| Cancel Alert | Cancels the selected alert.<br>You cancel alerts when you do not need to address them. Canceling the alert does not cancel the underlying condition that generated the alert. Canceling alerts is effective if the alert is generated by triggered fault and event symptoms because these symptoms are triggered again only when subsequent faults or events occur on the monitored objects. If the alert is generated based on metric or property symptoms, the alert is canceled only until the next collection and analysis cycle. If the violating values are still present, the alert is generated again. |
| Suspend | Suspends an alert for a specified number of minutes.<br>You suspend alerts when you are investigating an alert and do not want the alert to affect the health, risk, or efficiency of the object while you are working. If the problem persists after the elapsed time, the alert is reactivated and it will again affect the health, risk, or efficiency of the object.<br>The user who suspends the alert becomes the assigned owner. |
| Quick Filter | Narrows the search to one of the available filter types. For example, you can display all alerts that are related to the Compliance Alert Subtype. |

### Recommended Actions Widget Data Grid Options

The data grid displays the alerts that triggered on your objects. To resolve the problems indicated by the alerts, you can link to the alerts and the objects on which the alerts triggered.

| Option | Description |
|---|---|
| Criticality | Criticality is the level of importance of the alert in your environment. The alert criticality appears in a tooltip when you hover the mouse over the criticality icon.<br>The level is based on the level assigned when the alert definition was created, or on the highest symptom criticality, if the assigned level was **Symptom Based**. |
| Actionable | When an alert has an associated action, you can run the action on the object to resolve the alert. |

| Option | Description |
|---|---|
| Suggested Fix | Describes the recommendation to resolve the problem. For example, for Compliance alerts, the recommendation instructs you to use the *vSphere Hardening Guide* to resolve the problem.<br>You can view other available recommendations and their associated actions, if any, to resolve the problem when you click the drop-down menu. |
| Name | Name of the object for which the alert was generated, and the object type, which appears in a tooltip when you hover the mouse over the object name.<br>Click the object name to view the object details tabs where you can begin to investigate any additional problems with the object. |
| Alert | Name of the alert definition that generated the alert.<br>Click the alert name to view the alert details tabs where you can begin troubleshooting the alert. |
| Alert Type | Describes the type of alert that triggered on the selected object, and helps you categorize the alerts so that you can assign certain types of alerts to specific system administrators. For example, Application, Virtualization/ Hypervisor, Hardware, Storage, and Network. |
| Alert Subtype | Describes additional information about the type of alert that triggered on the selected object, and helps you categorize the alerts to a more detailed level than Alert Type, so that you can assign certain types of alerts to specific system administrators. For example, Availability, Performance, Capacity, Compliance, and Configuration. |
| Time | Date and time that the alert triggered. |
| Alert ID | Unique identification for the alert. This column is hidden by default. |

### Recommended Actions Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |

## Risk Widget

The risk widget is the status of the risk-related alerts for the objects it is configured to monitor. Risk alerts in VCF Operations usually indicate that you should investigate problems in the near future. You can create one or more risk widgets for objects that you add to your custom dashboards.

### How the Risk Widget and Configuration Options Work

You can add the risk widget to one or more custom dashboards and configure it to display data that is important to the dashboard users.

The state of the badge is based on your alert definitions. Click the badge to see the **Summary** tab for objects or groups configured in the widget. From the **Summary** tab, you can begin determining what caused the current state. If the widget is configured for an object that has descendants, you should also check the state of descendants. Child objects might have alerts that do not impact the parent.

If the Badge Mode configuration option is set to Off, the badge and a chart appear. The type of chart depends on the object type that the widget is configured to monitor.

- A population criticality chart displays the percentage of group members with critical, immediate, and warning risk alerts generated over time, if the monitored object is a group.
- A trend line displays the risk status of the monitored object for all other object types.

If the Badge Mode is set to On, only the badge appears.

You edit a risk widget after you add it to a dashboard. The changes you make to the options create a custom widget that provides information about an individual object, a custom group of objects, or all the objects in your environment.

### Where You Find the Risk Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Risk Widget Display Options

The Risk Widget displays a risk badge. The widget also displays a risk trend chart when not in badge mode.

| Option | Description |
|---|---|
| Risk Badge | Status of the objects configured for this instance of the widget. Click the badge to open the **Alerts** tab for the object that provides data to the widget. |
| Risk Trend | Displays a chart, depending on the selected or configured object. The charts vary, depending on whether the monitored object is a group, a descendent object, or an object that provides resources to other objects. The chart appears only if the **Badge Mode** configuration option is off. If the **Badge Mode** is on, only the badge appears. |

### Risk Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Badge Mode | Determines whether the widget displays only the badge, or the badge and a weather map or trend chart.<br>Select one of the following options:<br>• On. Only the badge appears in the widget.<br>• Off. The badge and a chart appear in the widget. The chart provides additional information about the state of the object. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Rolling View Chart Widget

The Rolling View Chart widget cycles through selected metrics at an interval that you define and shows one metric graph at a time. Miniature graphs, which you can expand, appear for all selected metrics at the bottom of the widget.

## How the Rolling View Chart Widget and Configuration Options Work

The Rolling View Chart widget shows a full chart for one selected metric at a time. Miniature graphs for the other selected metrics appear at the bottom of the widget. You can click a miniature graph to see the full graph for that metric, or set the widget to rotate through all selected metrics at an interval that you define. The key in the graph indicates the maximum and minimum points on the line chart.

You edit a Rolling View Chart widget after you add it to a dashboard. The changes you make to the options create a custom chart to meet the needs of the dashboard users.

## Where You Find the Rolling View Chart Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Rolling View Chart Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

The toolbar contains icons that you can use to change the view of the graphs.

| Option | Description |
|---|---|
| **Trend Line** | Shows or hides the line and data points that represents the metric trend. The trend line filters out metric noise along the timeline by plotting each data point relative to the average of its adjoining data points. |
| **Dynamic Thresholds** | Shows or hides the calculated dynamic threshold values for a 24-hour period. |
| **Show Entire Period Dynamic Thresholds** | Shows or hides dynamic thresholds for the entire time period of the graph. |
| **Anomalies** | Shows or hides anomalies. Time periods when the metric violates a threshold are shaded. Anomalies are generated when a metric crosses a dynamic or static threshold, either above or below. |
| **Zoom to Fit** | Changes all graphs to show the entire time period and value range. |
| **Zoom the view** | Click this icon and drag to outline a part of the hierarchy. The display zooms to show only the outlined section. |
| **Pan** | Click this icon and click and drag the hierarchy to show different parts of the hierarchy. |
| **Show Data Values** | After you click the **Show data point tips** icon to retrieve the data, click this icon and point to a graphed data point to show its time and exact value. In non-split mode, you can hover over a metric in the legend to show the full metric name, the names of the adapter instances (if any) that provide data for the resource to which the metric belongs, the current value, and the normal range. If the metric is currently alarming, the text color in the legend changes to yellow or red, depending on your color scheme. Click a metric in the legend to highlight the metric in the display. Clicking the metric again toggles its highlighted state. |
| **Date Controls** | Use the date selector to limit the data that appears in each chart to the time period you are examining.<br>Select **Dashboard Time** to activate the dashboard time panel. The option chosen in the dashboard time panel is effective. The default time is 6 hours.<br>**Dashboard Time** is the default option. |

## Rolling View Chart Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Data** section provides options to select object types on which you are basing the widget data.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Auto Transition Interval | Time interval for a switch between charts in the widget. |
| **Input Data** | |

| Option | Description |
| --- | --- |
| Metrics | Select metrics on which you want to base the widget data. You can select an object and pick its metrics.<br>1. Click the **Add New Metrics** icon to add metrics for the widget data. Select an object to view its metric tree and pick metrics for the object. The picked metrics appear in a list in this section.<br>The metric tree shows common metrics for several objects when you click the **Show common metrics** icon.<br>While selecting objects for which you want to pick metrics, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select metrics from the list and click the **Remove Selected Metrics** icon to remove the selected metrics.<br>Click the **Select All** icon to select all the metrics in the list.<br>Click the **Clear Selection** icon to clear your selection of metrics in the list.<br>You can define measurement units for the metrics in the list. Double-click a metric box in the list, select a measurement unit in the **Unit** drop-down menu, and click **Update**. |
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |
| **Output Data** | |
| Empty drop-down menu | Specifies a list with attributes to display. |

| Option | Description |
|---|---|
| | Add metrics based on object types. The objects corresponding to the selected metrics are the basis for the widget data.<br>1. Click the **Add New Metrics** icon to add metrics based on object types. The metrics that you add appear in a list in this section.<br>While selecting object types for which you want to pick metrics, you can filter the object types by adapter type to pick an object type. On the metrics pane, click the **Select Object** icon to select an object for the object type. Pick metrics of the selected object from the metric tree.<br>For example, you can select the **Datacenter** object type, click the **Select Object** icon to display the list of data centers in your environment, and pick metrics of the selected data center.<br>2. Optionally, you can define measurement units for the metrics in the list. Double-click a metric box in the list, select a measurement unit in the **Unit** drop-down menu, and click **Update**. |
| **Output Filter** | |
| | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

## Scoreboard Widget

The Scoreboard widget shows the current value for each metric of the objects that you select.

### How the Scoreboard Widget and Configuration Options Work

Each metric appears in a separate box or as a gauge chart depending on the mode you choose. The value of the metric determines the color of the box or the gauge chart. You define the ranges for each color when you edit the widget. You can customize the widget to use a sparkline chart to show the trend of changes of each metric. If you point to a box, the widget shows the source object and metric data. Icons in the box indicate the level of criticality.

You edit a Scoreboard widget after you add it to a dashboard. The widget can display metrics of the objects selected during editing of the widget or selected on another widget. When the Scoreboard widget is not in Self Provider mode, it shows metrics defined in a configuration XML file that you select in the Metric Configuration. It shows 10 predefined metrics if you do not select an XML file or if the type of the selected object is not defined in the XML file.

For example, you can configure the Scoreboard widget to use the sample Scoreboard metric configuration and to receive objects from the Topology Graph widget. When you select a host on a Topology Graph widget, the Scoreboard widget shows the workload, memory, and CPU usage of the host.

To set a source widget that is on the same dashboard, you must use the Widget Interactions menu when you edit a dashboard. To set a source widget that is on another dashboard, you must use the Dashboard Navigation menu when you edit the source dashboard.

## Where You Find the Scoreboard Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Scoreboard Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Data** section provides options to select object types on which you are basing the widget data.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |

| Option | Description |
|---|---|
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options.<br>When the Scoreboard widget is not in self-provider mode, it shows metrics defined in a configuration XML file that you select in the Metric Configuration. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| View Mode | Select either Classic or Gauge.<br>If you choose Classic, you can view the metric in a separate box. The value of the metric determines the color of the box.<br>If you select Gauge, you can view a gauge chart of the thresholds of the metric based on the values that you set for each color.<br>You can set the color and maximum value from the datagrid. |
| Round Decimals | Select the number of decimal places to round the scores that the widget displays. |
| Box Columns | Select the number of columns that appear in the widget. |
| Layout Mode | Select a Fixed Size or Fixed View layout. |
| Fixed Size<br>Fixed View | Use these options to customize the size of the box for each object. |
| Old metric values | Select **Show** if you want the widget to show the previous value of the metric, if the current value is not available. Select **Hide** to hide the previous value of the metric, if the current value is not available. |
| Visual Theme | Select a predefined visual style for each instance of the widget. |
| Max Scores Count | Use these menus to customize the format of the scores that the widget displays. |
| Show | Select one or more of the following items to display in the widget:<br>• Select **Object Name** to display the name of the object in the widget.<br>• Select **Metric Name** to display the name of the metric in the widget.<br>• Select **Metric Unit** to display the metric unit in the widget.<br>• Select **Sparkline** to display the Sparkline chart for each metric. |
| Period Length | Select a length of time for the statistic information that the sparkline chart displays. |
| Show DT | Select an option to show or hide the dynamic threshold for the sparkline chart. |
| **Input Data** | |

| Option | Description |
| --- | --- |
| Metrics | Select metrics on which you want to base the widget data. You can select an object and pick its metrics.<br>1. Click the **Add New Metrics** icon to add metrics for the widget data. Select an object to view its metric tree and pick metrics for the object. The picked metrics appear in a list in this section.<br>The metric tree shows common metrics for several objects when you click the **Show common metrics** icon.<br>While selecting objects for which you want to pick metrics, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select metrics from the list and click the **Remove Selected Metrics** icon to remove the selected metrics.<br>Click the **Select All** icon to select all the metrics in the list.<br>Click the **Clear Selection** icon to clear your selection of metrics in the list.<br>Optionally, you can customize a metric and apply the customization to other metrics in the list.<br>1. Double-click a metric box in the list to customize the metric and click **Update**.<br>You can use the **Box Label** text box to customize the label of a metric box.<br>You can use the **Unit** text box to define a measurement unit of each metric.<br>You can use the **Color Method** option to define a coloring criteria for each metric. If this option is set to **Custom**, you can enter color values in the **Yellow**, **Orange**, and **Red** text boxes. You can also set coloring by symptom definition. If you do not want to use color, select **None**.<br>For example, to view the remaining memory capacity of a VM, select **Virtual Machine** as an object type, expand the **Memory** from the metric tree and double-click **Capacity Remaining(%)**. Define a meaningful label name and measurement unit to help you when you observe the metrics. You can select **Custom** from the **Color Method** drop-down menu and specify different values for each color, for example 50 for **Yellow**, 20 for **Orange**, and 10 for **Red**.<br>You can use the **Link to** option to add links to external and internal pages. Internal links open in the same tab. External links open in a new tab. Examples of external links are URLs whose hostname does not match with the current VCF Operations instance hostname. Internal links are URLs whose hostname matches the current VCF Operations instance hostname or starts with *index.action*.<br>2. Select a metric and click the **Apply to All** icon to apply the customization for the selected metric to all the metrics in the list. |

| Option | Description |
| --- | --- |
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |
| **Output Data** | |
| Empty drop-down menu | Specifies a list with attributes to display. |

| Option | Description |
| --- | --- |
| | Add metrics based on object types. The objects corresponding to the selected metrics are the basis for the widget data.<br>1. Click the **Add New Metrics** icon to add metrics based on object types. The metrics that you add appear in a list in this section.<br>While selecting object types for which you want to pick metrics, you can filter the object types by adapter type to pick an object type. On the metrics pane, click the **Select Object** icon to select an object for the object type. Pick metrics of the selected object from the metric tree.<br>For example, you can select the **Datacenter** object type, click the **Select Object** icon to display the list of data centers in your environment, and pick metrics of the selected data center.<br>2. Optionally, select metrics from the list and click the **Remove Selected Metrics** icon to remove the selected metrics.<br>Click the **Select All** icon to select all the metrics in the list.<br>Click the **Clear Selection** icon to clear your selection of metrics in the list.<br>Optionally, you can customize a metric and apply the customization to other metrics in the list.<br>1. Double-click a metric box in the list to customize the metric and click **Update**.<br>You can use the **Box Label** text box to customize the label of a metric box.<br>You can use the **Unit** text box to define a measurement unit of each metric.<br>You can use the **Max Value** option to define the maximum value to be displayed in the gauge chart. To set the maximum value, you can either enter an absolute max value or select a metric and the current value of the metric is considered the maximum value in the gauge chart.<br>You can use the **Color Method** option to define a coloring criteria for each metric. If this option is set to **Custom**, you can enter color values in the **Yellow**, **Orange**, and **Red** text boxes. You can also set coloring by symptom definition. If you do not want to use color, select **None**.<br>**Note:**<br>For the gauge view, you can use only the **Custom** option.<br>For example, to view the remaining memory capacity of a VM, select **Virtual Machine** as an object type, expand the **Memory** from the metric tree and double-click **Capacity Remaining(%)**. Define a meaningful label name and measurement unit to help you when you observe the metrics. You can select **Custom** from the **Color Method** drop-down menu and specify different values for each color, for example 50 for **Yellow**, 20 for **Orange**, and 10 for **Red**.<br>You can use the **Link to** option to add links to external and internal pages. Internal links open in the same tab. External links will open in a new tab. Examples of external links are URLs whose hostname does not match with the current VCF Operations instance hostname. Internal links are URLs whose hostname matches the current VCF Operations instance hostname or starts with *index.action*.<br>2. Select a metric and click the **Apply to All** icon to apply the customization for the selected metric to all the metrics in the list. |

| Option | Description |
|---|---|
| **Output Filter** | |
| | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

## Scoreboard Health Widget

The Scoreboard Health widget displays color-coded health, risk, efficiency, and custom metrics scores for objects that you select.

### How the Scoreboard Health Widget and Configuration Options Work

The icons for each object are color coded to give a quick indication of the state of the object. You can configure the widget to display the scores of common or specific metrics of the object. You can use the symptom state color code or you can define your criteria to color the images. If you configure the widget to show the metric for objects that do not have this metric, those objects have blue icons.

You can double-click an object icon to show the Object Detail page for the object. When you point to the icon, a tool tip shows the name of the object and the name of the metric.

You edit a Scoreboard Health widget after you add it to a dashboard. To configure the widget, click the pencil at the upper-right corner of the widget window. The widget can display metrics of the objects that you select when you edit the widget, or that you select on another widget. For example, you can configure the widget to show the CPU workload of an object that you select on the Topology Graph widget. To set a source widget that is on the same dashboard, you must use the Widget Interactions menu when you edit a dashboard. To set a source widget that is on another dashboard, you must use the Dashboard Navigation menu when you edit the source dashboard.

### Where You Find the Scoreboard Health Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a

widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Scoreboard Health Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The **Configuration** section provides general configuration options for the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Image Type | Select an image type for the metrics. |
| Metric | Select the default or custom metric. |
| Pick Metric | Active only when you select **Custom** from the **Metric** menu.<br>Use to select a custom metric for the objects that the widget displays. Click **Pick Metric** and select an object type from the Object Type pane.<br>Use the Metric Picker pane to select a metric from the metric tree and click **Select Object** to check the objects from the type that you select on the Object Types pane. |
| Use Symptom state to color chart | Select to use the default criteria to color the image. |
| Custom ranges | Use to define custom criteria to color the image. You can define a range for each color. |

| Option | Description |
|---|---|
| **Input Data** | |
| | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |

## Sparkline Chart Widget

The Sparkline Chart widget displays graphs that contain metrics for an object in VCF Operations. You can use VCF Operations to create one or more graphs that contain metrics for objects that you add to your custom dashboards.

### How the Sparkline Chart Widget and Configurations Options Work

If the metrics in the Sparkline Chart are for an object that another widget provides, the object name appears at the top right of the widget. If you select a metric when you edit the widget configuration, the widget uses the metric and its corresponding object as the source for dashboard interactions. The line in the graphs represents the average value of the selected metric for the specified time period. The boxed area in the graph represents the dynamic threshold of the metric.

Point to a graph in the Sparkline Chart widget to view the value of a metric in the form of a tool tip. You can also view the maximum and minimum values on a graph. The values are displayed as orange dots.

You can add the Sparkline Chart widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance.

The metrics shown in sparkline widget is the current value, to view the average value you can use transformations in list views or distribution charts to calculate an average. Another way to get to an average value is to double click on the sparkline to open the metric chart, click and drag to select a range, keep the mouse button depressed and hover for a few seconds, you should see a popup that has average value.

### Where You Find the Sparkline Chart Widget

The widget might be included on any of your custom dashboards. On the menu, click **Dashboards** to display a list of dashboards in the left pane.

### Sparkline Chart Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

The toolbar contains icons that you can use to change the view of the graphs.

| Option | Description |
|---|---|
| Dashboard Navigation | You can navigate to another dashboard when the object you select is also available in the dashboard to which you want to navigate. |
| Refresh | Refreshes the widget data. |
| Time Range | Select the range for the time period to show on the graphs. You can select a period from the default time range list or select start and end dates and times.<br>Select **Dashboard Time** to activate the dashboard time panel. The option chosen in the dashboard time panel is effective. The default time is 6 hours.<br>**Dashboard Time** is the default option. |
| Remove All | Removes all graphs. |

## Sparkline Chart Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Data** section provides options to select object types on which you are basing the widget data.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |

| Option | Description |
| --- | --- |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Show Object Name | You can view the name of the object before the metric name in the Sparkline Chart widget.<br>• **On**. Displays the name of the object before the metric name in the widget.<br>• **Off**. Does not display the name of the object in the widget. |
| Column Sequence | Select the order in which to display the information.<br>• **Graph First**. The metric graph appears in the first column in the widget display.<br>• **Label First**. The metric label appears in the first column in the widget display. |
| Show DT | Select an option to show or hide the dynamic threshold for the sparkline chart. |
| **Input Data** | |

| Option | Description |
| --- | --- |
| Metrics | Select metrics on which you want to base the widget data. You can select an object and pick its metrics.<br>1. Click the **Add New Metrics** icon to add metrics for the widget data. Select an object to view its metric tree and pick metrics for the object. The picked metrics appear in a list in this section.<br>The metric tree shows common metrics for several objects when you click the **Show common metrics** icon.<br>While selecting objects for which you want to pick metrics, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select metrics from the list and click the **Remove Selected Metrics** icon to remove the selected metrics.<br>Click the **Select All** icon to select all the metrics in the list.<br>Click the **Clear Selection** icon to clear your selection of metrics in the list.<br>Optionally, you can customize a metric and apply the customization to other metrics in the list.<br>1. Double-click a metric box in the list to customize the metric and click **Update**.<br>You can use the **Box Label** text box to customize the label of a metric box.<br>You can use the **Unit** text box to define a measurement unit of each metric.<br>You can use the **Color Method** option to define a coloring criteria for each metric. If this option is set to **Custom**, you can enter color values in the **Yellow**, **Orange**, and **Red** text boxes. You can also set coloring by symptom definition. If you do not want to use color, select **None**.<br>For example, to view the remaining memory capacity of a VM, select **Virtual Machine** as an object type, expand the **Memory** from the metric tree and double-click **Capacity Remaining(%)**. Define a meaningful label name and measurement unit to help you when you observe the metrics. You can select **Custom** from the **Color Method** drop-down menu and specify different values for each color, for example 50 for **Yellow**, 20 for **Orange**, and 10 for **Red**.<br>2. Select a metric and click the **Apply to All** icon to apply the customization for the selected metric to all the metrics in the list. |

| Option | Description |
| --- | --- |
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |
| **Output Data** | |
| Empty drop-down menu | Specifies a list with attributes to display. |

| Option | Description |
| --- | --- |
| | Add metrics based on object types. The objects corresponding to the selected metrics are the basis for the widget data.<br>Click the **Add New Metrics** icon to add metrics for the widget data. Select an object to view its metric tree and pick metrics for the object. The picked metrics appear in a list in this section.<br>The metric tree shows common metrics for several objects when you click the **Show common metrics** icon.<br>While selecting objects for which you want to pick metrics, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>Optionally, you can customize a metric and apply the customization to other metrics in the list.<br>1. Double-click a metric box in the list to customize the metric and click **Update**.<br>You can use the **Box Label** text box to customize the label of a metric box.<br>You can use the **Unit** text box to define a measurement unit of each metric.<br>You can use the **Color Method** option to define a coloring criteria for each metric. If this option is set to **Custom**, you can enter color values in the **Yellow**, **Orange**, and **Red** text boxes. You can also set coloring by symptom definition. If you do not want to use color, select **None**.<br>For example, to view the remaining memory capacity of a VM, select **Virtual Machine** as an object type, expand the **Memory** from the metric tree and double-click **Capacity Remaining(%)**. Define a meaningful label name and measurement unit to help you when you observe the metrics. You can select **Custom** from the **Color Method** drop-down menu and specify different values for each color, for example 50 for **Yellow**, 20 for **Orange**, and 10 for **Red**.<br>2. Select a metric and click the **Apply to All** icon to apply the customization for the selected metric to all the metrics in the list. |
| **Output Filter** | |
| | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

## Tag Picker Widget

The Tag Picker widget lists all available object tags.

### How the Tag Picker Widget and Configuration Options Work

With the Tag Picker widget, you can check the list of the object tags. You can use the widget to filter the information that another widget shows. You can select one or more tags from the object tree or search for tags, and the destination widget displays information about the objects with this tag. For example, you can select **Object Types** > **Virtual Machine** on the Tag Picker widget to observe statistic information about the VMs on the Environment Status widget.

You edit a Tag Picker widget after you add it to a dashboard. To configure the widget, click the pencil in the upper right of the widget window. You can configure the Tag Picker widget to send information to another widget on the same dashboard or on another dashboard. To set a receiver widget that is on the same dashboard, use the **Widget Interactions** menu when you edit a dashboard. To set a receiver widget that is on another dashboard, use the **Dashboard Navigation** menu when you edit a source dashboard. You can configure two Tag Picker widgets to interact when they are on different dashboards.

### Where You Find the Tag Picker Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Tag Picker Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Collapse All | Close all expanded tags and tag values. |
| Deselect All | Remove all filtering and view all objects in the widget. |
| Tag Picker | Select an object from your environment. |
| Dashboard Navigation | **Note:**<br>Appears on the source widget and when the destination widget is on another dashboard.<br>Use to explore the information on another dashboard. |

### Tag Picker Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |

## Text Display Widget

You can use the Text Display widget to show text in the user interface. The text appears in the Text Display widget on the dashboard.

The Text Display widget can read text from a Web page or text file. You specify the URL of the Web page or the name of the text file when you configure the Text widget. To use the Text Display widget to read text files you must set a property in the *web.properties* file to specify the root folder that contains the file.

You can enter content in the Text Display widget in plain text or rich text format based on the view mode that you configure. Configure the Text Display widget in HTML view mode to display content in rich text format. Configure the Text Display widget in Text mode to display content in plain text format.

The Text Display widget can display websites that use the HTTPS protocol. The behavior of the Text Display widget with websites that use HTTP, depends on the individual settings of the websites.

> **Note:**
> If the webpage that you are linking to has `X-Frame-Options` set to `sameorigin`, which denies rendering a page in an iframe, the Text Display widget cannot display the contents of the webpage.

### How the Text Display Widget Configuration Options Work

You can configure the widget in the Text view mode or HTML view mode. In the HTML view mode, you can click **Edit** in the widget and use the rich text editor to add content.

If you configure the widget to use Text view mode, you can specify the path to the directory that contains the files to read or you can provide a URL. The content in the URL will be shown as text. If you do not specify a URL or text file, you can add content in the widget. Double-click the widget and enter content in plain text.

You can also use command-line interface (CLI) commands to add file content to the Text Display widget.

- To view a list of parameters, run the `file -h|import|export|delete|list txtwidget` command.
- To import text or HTML content, run the `import txtwidget input-file [--title title] [--force]` command.
- To export the content to the file, run the `export txtwidget all|title[{,title}] [output-dir]` command.
- To delete imported content, run the `delete txtwidget all|title[{,title}]` command.
- To view the titles of the content, run the `list txtwidget` command.

## Where You Find the Text Display Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

## Text Display Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |

| Option | Description |
|---|---|
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| View mode | Display text in text or rich text format. You can configure the widget in HTML view mode only when the **URL** and **File** fields are blank. |
| URL | Enter the URL. |
| File | Navigate to the file that contains the source text file by clicking the **Select** button.<br>To add, edit, and remove source text files, go to the **Text Widget Content** tile in the Configuration page. From the left menu, click **Operations** > **Configurations**, and then click the **Text Widget Content**tile from the VCF Operations user interface. |
| Test | Validates the correctness of the text file or URL that you enter. |

## Time Remaining Widget

The Time Remaining widget displays how much time remains before the resources of the object are exhausted.

VCF Operations calculates the percentage by object type based on historical data for the pattern of use for the object type. You can use the time remaining percentage to plan provisioning of physical or virtual resources for the object or rebalance the workload in your virtual infrastructure.

### Where You Find the Time Remaining Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Time Remaining Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Top Alerts Widget

Top alerts are the alerts with the greatest significance on the objects it is configured to monitor in VCF Operations. These are the alerts most likely to negatively affect your environment and you should evaluate and address them.

### How the Top Alerts Widget and Configuration Options Work

You can add the top alerts widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance.

You edit a top alerts widget after you add it to a dashboard. The changes you make to the options help create a custom widget to meet the needs of the dashboard users.

### Where You Find the Top Alerts Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Top Alerts Widget Display Options

The Top Alerts widget includes the short description of alerts configured for the widget. The alert name opens a secondary window from which you can link to the alert details. In the alert details, you can begin resolving the alerts.

| Option | Description |
|---|---|
| Alert name | Name of the generated alert. Click the name to open the alert details. |
| Alert description | Number of affected objects, and the number of recommendations and the best recommendation to resolve the alert. |

### Top Alerts Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |

| Option | Description |
|---|---|
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Impact Badge | Select the badge for which you want alerts to appear.<br>The affected badge is configured when you configure the alert definition. |
| Number of Alerts | Select the maximum number of alerts to display in the widget. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |

## Top-N Widget

The Top-N widget displays the top n results from analysis of an object or objects that you select.

### How the Top-N Widget and Configuration Options Work

You can select an object when you configure the Top-N widget or you can select an object on another widget. The widget shows an analysis of the applications, alerts, and metrics of an object and its child objects depending on how you configure the widget. The widget can show an analysis of the current values or values over a period of time. You can receive detailed information about each object on the widget. When you double-click an object, the Object Detail page appears.

You can configure a widget to receive data from another widget by selecting **Off** for Self Provider. You can configure a widget to display results from analysis of an object that you select on the source widget.

For example, you can select a host on a Topology widget and observe the metric analysis of the virtual machines on the host. To set a receiver widget that is on the same dashboard, use the **Widget Interactions** menu when you edit a dashboard. To set a receiver widget that is on another dashboard, use the **Dashboard Navigation** menu when you edit a source dashboard.

### Where You Find the Top-N Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a

widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Top-N Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

The toolbar contains icons that you can use to change the view of the graphs.

| Icon | Description |
|---|---|
| Dashboard Navigation | Takes you to a predefined object. For example, when you select a datastore from the data grid and click **Dashboard Navigation**, you can open the datastore in the vSphere Web Client. |
| Select Date Range | Limits the alerts that appear in the list to the selected date range.<br>Select **Dashboard Time** to activate the dashboard time panel. The option chosen in the dashboard time panel is effective. The default time is 6 hours. |
| Object details | Select an object and click this icon to show the Object Detail page for the object. |
| Display Filtering Criteria | Shows the filtering settings for the widget in a pop-up window. |
| Percentile | Filters and displays objects based on the percentile entered while configuring the widget. You can change the percentile using the drop-down option.<br>**Note:**<br>The Percentile option is activated in the toolbar of the widget after you configure the widget with the Percentile option. To configure the widget with the Percentile option, navigate to **Configurations** > **Top-N Options** > **Metric Analysis** > **Percentile**. |

### Top-N Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

The **Input Transformation** section provides options to transform the input for the widget.

The **Output Data** section provides options to select object types on which you are basing the widget data.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

The **Additional Columns** section provides options to select metrics that are displayed as additional columns in the widget.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |

| Option | Description |
| --- | --- |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Redraw Rate | Set the redraw rate. |
| Bars Count | Select the number of top results. |
| Round Decimals | Select the number of decimals to round the scores displayed in the widget. |
| Filter old metrics | Select or deselect whether the analysis includes old metric values. |
| Application Health and Performance | • Top Least Healthy. The top n results from an analysis of the object or objects that are the least healthy.<br>• Top Most Healthy. The top n results from an analysis of the object or objects that are the most healthy.<br>• Top Most Volatile. The sorted list of values based on the standard deviation of values for several alerts over time.<br>Select the criteria for analysis of the objects. |
| Alert Analysis | Select the criteria for analysis of the alerts. |
| Metric Analysis | If you select this option, you must select a metric in the **Output Data** section.<br>• Top Highest Utilization. A list of objects with similar object types that have the highest utilization on configuring usage metrics like CPU usage and memory usage.<br>• Top Lowest Utilization. A list of objects with similar object types that have the lowest utilization on configuring usage metrics like CPU usage and memory usage.<br>• Top Abnormal States. The objects are ordered by the duration of all alarms that are triggered on the selected metric for a selected interval.<br>• Top Highest Volatility. The sorted list of values based on the standard deviation of values for several alerts over time.<br>• Percentile. Objects are filtered based on the percentile entered.<br>Select the criteria for analysis of the metric that you select from the metric tree. |
| **Input Data** | |

| Option | Description |
| --- | --- |
| Objects | Select objects on which you want to base the widget data.<br>1. Click the **Add New Objects** icon and select objects in the pop-up window. The selected objects appear in a list in this section.<br>While selecting objects, you can use the **Filter** text box to search for objects. You can also expand the **Tag Filter** pane on the left hand side to select one or more object tag values. A list of objects with the selected tag values appears. If you select more than one value for the same tag, you can choose objects that have any of the tags applied. If you select more than one value for different tags, you can choose only the objects that have all the tags applied.<br>2. Optionally, select objects from the list and click the **Remove Selected Objects** icon to remove the selected objects.<br>Click the **Select All** icon to select all the objects in the list.<br>Click the **Clear Selection** icon to clear your selection of objects in the list. |
| All | If you select this option, the widget data is based on all the objects in your environment. The following sections provide options to refine the objects for the widget data. |
| **Input Transformation** | |
| Relationship | Transform the input for the widget based on the relationship of the objects. For example, if you select the **Children** check box and a **Depth** of **1**, the child objects are the transformed inputs for the widget. |
| **Output Data** | |
| | Select an object type in your environment on which you want to base the widget data.<br>1. Click the **Add Object Type** icon to search for and add an object type.<br>When you search for object types, you can filter the types in the list by selecting a type from the **Adapter Type** drop-down menu or by using the **Filter** text box.<br>2. Optionally, select the object type from the list and click the **Delete Object Type** icon to remove the selected object type.<br>If the objects have an input transformation applied, the transformed objects are the basis for the widget data. |
| Metric | Select a common metric or a metric for the selected object type in the list. The metric is the basis for the widget data. |
| Label | Type in a name that displays as a label for the metric.<br>You can add a label if you have selected **Metric Analysis** > **Top Highest Utilization** or **Metric Analysis** > **Top Lowest Utilization** as Top-N options in the **Configuration** section. |
| Unit | You can define measurement units for the metrics. Select a measurement unit in the **Unit** drop-down menu.<br>You can add a unit if you have selected **Metric Analysis** > **Top Highest Utilization** or **Metric Analysis** > **Top Lowest Utilization** as Top-N options in the **Configuration** section. |
| Maximum | Specify the maximum value based on which the bar size is calculated.<br>You can add a maximum value if you have selected any of the options under **Metric Analysis**. |

| Option | Description |
| --- | --- |
| Color Method | You can use the **Color Method** option to define a coloring criteria for each metric. If this option is set to **Custom**, you can enter color values in the **Yellow**, **Orange**, and **Red** text boxes. If you do not want to use color, select None.<br>You can add color thresholds if you have selected **Metric Analysis** > **Top Highest Utilization**, **Metric Analysis** > **Top Lowest Utilization**, or **Metric Analysis** > **Percentile** as Top-N options in the **Configuration** section. |
| **Output Filter** | |
| Basic | Pick tags to refine the widget data. The widget data is based on the objects that have the picked tags applied. If you pick more than one value for the same tag, the widget includes objects that have any of the tags applied. If you pick more than one value for different tags, the widget includes only the objects that have all the tags applied.<br>If the objects have an input transformation applied, you select tag values for the transformed objects. |
| Advanced | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>If the objects have an input transformation applied, you define filter criteria for the object types of the transformed objects.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |
| **Additional Columns** | |
| | Add metrics based on object types. The selected metrics are displayed as additional columns in the widget.<br>1. Click the **Add New Metrics** icon to add metrics based on object types. The metrics that you add appear in a list in this section.<br>While selecting object types for which you want to pick metrics, you can filter the object types by adapter type to pick an object type. On the metrics pane, click the **Select Object** icon to select an object for the object type. Pick metrics of the selected object from the metric tree.<br>For example, you can select the **Datacenter** object type, click the **Select Object** icon to display the list of data centers in your environment, and pick metrics of the selected data center.<br>2. Optionally, you can double-click a metric box in the list to customize the label of the metric and click **Update**. |

## Topology Graph Widget

The Topology Graph widget gives a graphical presentation of objects and their relationships in the inventory. You can customize each instance of the widget in your dashboard.

### How the Topology Graph Widget and Configuration Options Work

The Topology Graph widget helps you explore all nodes and paths connected to an object from your inventory. Connection between the objects might be a logical, physical, or network connection. The widget can display a graph that shows all of the nodes in the path between two objects, or that shows the objects related to a node in your inventory. You select the type of graph in the Exploration Mode when you configure the widget. You can select the levels of exploration between nodes in the displayed graph by using **Relationship** check boxes when you edit the widget. The widget displays all object types in the inventory by default, but you can select object types to view by using the Object View list during the configuration process. Double-clicking an object on the graph takes you to a detailed page about the object.

### Where You Find the Topology Graph Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Topology Graph Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

| Option | Description |
|---|---|
| Action | Use to select from predefined actions for each object type. To see available predefined actions, select an object in the graph and click the toolbar to select an action. For example, when you select a datastore object in the graph, you can click **Delete Unused Snapshots for Datastore** to apply this action to the object. |
| Dashboard Navigation | Takes you to a predefined object. For example, when you select a datastore from the graph and click **Dashboard Navigation**, you can open the datastore in the vSphere Web Client. |
| Pan | Use to move the entire graph. |
| Show values on point | Provides a tool tip with parameters when you point to an object in the graph. |
| Zoom in | Zooms in the graph. |
| Zoom out | Zooms out the graph. |
| Hierarchical View | Use to switch to hierarchical view. Hierarchical view is activated only for Node Exploration mode and with selected inventory tree. |
| Graph View | Use to switch to graph view. |
| Object Detail | Select an object and click this icon to show the Object Detail page for the object. |

| Option | Description |
|---|---|
| Expand Node | Selects which object types related to your object to show on the graph. For example, if you select a virtual machine from the graph and click **Expand Node** toolbar icon and select **Host System**, the host on which the virtual machine is located is added to the graph. |
| Hide Node(s) | Use to remove a given object from the graph |
| Reset To Initial Object | Use to return to the initially displayed graph and configured object types. |
| Explore Node | Use to explore a node from a selected object in the graph. For example, if the graph displays a connection between a VM, a host, and a datastore, and you want to check the connection of the host with the other objects in the inventory, you can select the host and click **Explore Node**. |
| Status | Use to select objects based on their status or their state. |

### Topology Graph Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |

| Option | Description |
|---|---|
| Exploration Mode | Use **Node Exploration mode** to observe a selected object from an object list and the objects related to it. For example, if you select a virtual machine and select node exploration mode, the widget shows the host where the VM is placed and the datastore storing the files of the VM.<br>Use **Path Exploration mode** to observe the relation between two objects. You must select them from the Select First Object list and the Select Second Object list. For example, if you select to explore the path between a VM and a vCenter, the graph shows you both objects and all nodes in the path between the VM and server as datastore, datastore cluster, and data center.<br>**Important:**<br>To select object view is mandatory for the widget to start working in path exploration mode. |
| Show Paths | Use **All** to observe connections between a node and nodes related to it as well as connections between the nodes. For example, if you are using node exploration mode and you select to observe a VM and all objects types, the graph shows a VM connected to its datastore and host and the connection between the host and datastore. |
| | Use **Discovered Only** to observe directly related nodes. For example, if you are using node exploration mode and you select to observe a VM and all objects types, the graph will shows the VM connected to its datastore and to its host, but without the connection between the host and datastore. |
| Configuration File | The default configuration includes parent and child relationship. Drop-down options depend on the installed Solutions. You can add a new type of relationship to the Relationship pane. |
| Metric Configuration | Specifies a list with attributes to display. |
| Layout | Select whether you want a graph view or hierarchical view for the topology graph. |
| Tree type | For a hierarchical layout, select whether you want a tree type view. |
| **Input Data** | |
| Selected object | From the object list, select an object on which you want to base the widget data. |
| Degree of separation | Available only when node exploration mode is selected. Use to define the levels of exploration in node exploration mode. The lowest degree configuration shows only directly related nodes rather than higher degrees that show the inventory in details. |
| Select First Object | Available only in path exploration mode. Select the first object from the object list. |
| Select Second Object | Available only in path exploration mode. Select the second object from the object list. |
| Object view | Use to select which types of objects to observe in the graph. |
| Relationship | Select the type of relationship between objects to observe in the graph, respectively the details about your inventory . The common relationships for all objects are parent and child, but the list of relationships can vary depending on added solutions to VCF Operations. |

## View Widget

The View widget provides the VCF Operations view functionality into your dashboard.

### How the View Widget and Configuration Options Work

A view presents collected information for an object in a certain way depending on the view type. Each type of view helps you to interpret metrics, supermetrics, properties, alerts, policies, and data from a different perspective.

You can add the View widget to one or more custom dashboards and configure it to display data that is important to the dashboard users. List views can send interactions to other widgets.

### Where You Find the View Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

You can export the view as a CSV file for any view type.

### View Widget Toolbar Options

The View widget toolbar depends on the displayed view type.

| Option | Description |
|---|---|
| Export as CSV | You can export the view as a CSV file for any view type. |
| Open in External Application | Ability to link to another application for information about the object. For example, you have a List view with VMs. You can select any VM and select **Open in External Application** to open the VM in vSphere Web Client. |

| Option | Description |
|---|---|
| Time Settings | Use the time settings to select the time interval of data transformation. These options are available for all view types, except Image.<br>• Relative Date Range. Select a relative date range of data transformation.<br>• Specific Date Range. Select a specific date range of data transformation.<br>• Absolute Date Range. Select a date or time range to view data for a time unit such as a complete month or a week. For example, you can run a report on the third of every month for the previous month. Data from the first to the end of the previous month is displayed as against data from the third of the previous month to the third of the current month.<br>The units of time available are: Hours, Days, Weeks, Months, and Years.<br>The locale settings of the system determine the start and end of the unit. For example, weeks in most of the European countries begin on Monday while in the United States they begin on Sunday.<br>• Dashboard Time. Select this option to activate the dashboard time panel. The option chosen in the dashboard time panel is effective. The default time is 6 hours. |
| Items per page | You can set the number of results that appear in the widget. Available for **List** view only. |
| Roll up interval | The time interval at which the data is rolled up. |
| Actions | An action on the selected object. Depends on the object type. |
| Filter | Limits the list to objects for a specific host, data center, and so on. You can drill-down in the hierarchical level. Available for **List**, **Trend**, and **Distribution** types of Views. |
| Filter by name | Limits the list to objects of a specific name. Available for **List** view only. |

### View Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget.

The **Output Data** section provides options to select object types on which you are basing the widget data.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |

| Option | Description |
|---|---|
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Inventory trees | Select an existing predefined traversal spec to pick an object for the widget data. |
| Object | In self-provider mode, click the **Add Object** icon to select an object from the object list. The object list is displayed based on the inventory tree selection. You can also search for the object in this text box. |
| **Output Data** | |
| | A list of defined views available for the selected object is displayed.<br>You can create, edit, delete, clone, export, and import views directly from the View widget configuration options.<br>For more information, see Views in VCF Operations. |
| Auto Select First Row | Determines whether to start with the first row of data for list type views. |
| Show | Select one or more of the following items to display in the widget:<br>• To display the list of legends in the widget, select **Legend**.<br>• To display the name of the labels in the widget, select **Labels**. |

## Weather Map Widget

The Weather Map widget provides a graphical display of the changing values of a single metric for multiple resources over time. The widget uses colored icons to represent each value of the metric. Each icon location represents the metric value for particular resources. The color of an icon changes to show changes in the value of the metric.

### How the Weather Map Widget and Configuration Options Work

You can add the Weather Map widget to one or more custom dashboards and configure it to display data that is important to different dashboard users. The data that appears in the widget is based on the configured options for each widget instance.

Watching how the map changes can help you understand how the performance of the metric varies over time for different resources. You can start or stop the display using the **Pause** and **Play** options at the bottom of the map. You can move

the slider forwards or backwards to a specific frame in the map. If you leave the widget display and return, the slider remains in the same state.

The map does not show the real-time performance of the metrics. You select the time period, how fast the map refreshes, and the interval between readings. For example, you might have the widget play the metric values for the previous day, refreshing every half second, and have each change represent five minute's worth of metric values.

To view the object that an icon represents, click the object.

### Where You Find the Weather Map Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Weather Map Widget Toolbar Options

On the title bar of the widget, click the **Show Toolbar** icon to access the toolbar options.

The toolbar contains the icons that you can use to view the graph.

| Icon | Description |
|---|---|
| **Pause** and **Play** | Start or stop the display. The icon remains in the same state if you leave the widget display and return. |
| **Display Filtering Criteria** | View the current settings for the widget, including the current metric. |

### Weather Map Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Output Data** section provides options to select object types on which you are basing the widget data.

The **Output Filter** section provides options to restrict the widget data based on the selected filter criteria.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |

| Option | Description |
|---|---|
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Redraw Rate | An interval at which cashed data is refreshed based on newly collected data.<br>For example, if you set metric history to `Last 6 hours` and image redraw rate to `15 minutes`, and data is collected every 5 minutes, the data collected during 10 minutes will not be calculated at the 15 minutes.<br>For example, if you set metric history to `Last 6 hours` and image redraw rate to `15 minutes`, and data is collected every 5 minutes, the data collected during 10 minutes will not be calculated at the 15 minutes. |
| Metric History | Select the time period for the weather map, from the previous hour to the last 30 days. |
| Metric Sample Increment | Select the interval between metric readings. For example, if you set this option to one minute and set the Metric History to one hour, the widget has a total of 60 readings for each metric. |
| Group by | Select a tag value by which to group the objects. |
| Sort by | Select **Object name** or **Metric value** to set the way to sort the objects. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| Frame Transition Interval | Select how fast the icons change to show each new value. You can select the interval between frames and the number of frames per second (fps). |
| Start Over Delay | The number of seconds for the display to remain static when it reaches the end of the Metric History period, the most current readings, before it starts over again from the beginning. |
| Color | Shows the color range for high, intermediate, and low values. You can set each color and type minimum and maximum color values in the **Min Value** and **Max Value** text boxes.<br>If you leave the text boxes blank, VCF Operations maps the highest and lowest values for the **Color By** metric to the end colors.<br>If you set a minimum or maximum value, any metric at or beyond that value appears in the end color. |
| **Output Data** | |

| Option | Description |
|---|---|
| | Select an object type in your environment on which you want to base the widget data.<br>1. Click the **Add Object Type** icon to search for and add an object type.<br>When you search for object types, you can filter the types in the list by selecting a type from the **Adapter Type** drop-down menu or by using the **Filter** text box.<br>2. Optionally, select the object type from the list and click the **Delete Object Type** icon to remove the selected object type. |
| Metric | Select a common metric or a metric for the selected object type in the list. The metric will be the basis for the widget data. The object corresponding to the metric is the selected object for the widget. |
| **Output Filter** | |
| Basic | Pick tags to refine the widget data. The widget data is based on the objects that have the picked tags applied. If you pick more than one value for the same tag, the widget includes objects that have any of the tags applied. If you pick more than one value for different tags, the widget includes only the objects that have all the tags applied. |
| Advanced | Refine the widget data further based on the filter criteria for object types. The widget data is based on the objects for the filtered object types.<br>If the objects have a tag filter applied in the **Basic** subsection, you define filter criteria for the object types of the objects with tag filter applied. If the objects with tag filter applied do not belong to any of the object types in this filter criteria, the widget skips this filter and includes all the objects with tag filter applied.<br>1. In the first drop-down menu, select an object type.<br>2. In the second drop-down menu, select the option based on which you want to define the filter criteria. For example, if you select **Metrics** for the **Datacenter** object type, you can define a filter criteria based on the value of a specific metric for data centers.<br>3. In the drop-down menus and text boxes that appear, select or enter values to filter the objects.<br>4. To add more filter criteria, click **Add**.<br>5. To add another filter criteria set, click **Add another criteria set**. |

## Workload Widget

The Workload widget displays data indicating how hard a selected resource is working.

The Workload widget displays a graph depicting how hard the object that you selected is working. The Workload widget reports data on CPU usage, Memory usage, Disk I/O, and Network I/O.

### Where You Find the Workload Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the

left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### About Datastore Metrics for Virtual SAN

The metric named `datastore|oio|workload` is not supported on Virtual SAN datastores. This metric depends on `datastore|demand_oio`, which is supported for Virtual SAN datastores.

The metric named `datastore|demand_oio` also depends on several other metrics for Virtual SAN datastores, one of which is not supported.

- The metrics named `devices|numberReadAveraged_average` and `devices|numberWriteAveraged_average` are supported.
- The metric named `devices|totalLatency_average` is not supported.

As a result, VCF Operations does not collect the metric named `datastore|oio|workload` for Virtual SAN datastores.

### Workload Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |

| Option | Description |
|---|---|
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

## Workload Pattern Widget

The Workload Pattern widget displays a historical view of the hourly workload of an object.

### Where You Find the Workload Pattern Widget

The widget might be included on any of your custom dashboards. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All** to see your configured dashboards.

To customize the data that appears in the dashboard widget, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**. To create your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **Create**. To edit your dashboard, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the center pane click **Dashboards** > **All**. Click the dashboard that you want to edit and select **Actions** > **Edit Dashboard**. Toggle between the **Views** and **Widgets** option to view and add a widget or view to the dashboard. The widgets list panel displays a list of all the predefined widgets. Drag the widget to the dashboard workspace in the upper panel.

### Workload Pattern Widget Configuration Options

On the title bar of the widget, click the **Edit Widget** icon to configure the widget.

The configuration options are grouped into one or more sections. You can select the objects on which you want to base the widget data and refine the objects in the following sections. Each section filters the objects further and pushes the filtered objects to the next section. The widget data is based on the objects that are the output of the last section.

The **Configuration** section provides general configuration options for the widget.

The **Input Data** section provides options to specify input for the widget. This section appears when the widget is in self provider mode.

| Option | Description |
|---|---|
| Title | Enter a custom title that identifies this widget from other instances that are based on the same widget template. |
| Widget Description | Enter a custom description for the widget. The description you enter is displayed as a tooltip against the name of the widget in the dashboard. |
| **Configuration** | |
| Refresh Content | Activate or deactivate the automatic refreshing of the data in this widget.<br>If not activated, the widget is updated only when the dashboard is opened or when you click the **Refresh** button on the widget in the dashboard. |
| Refresh Interval | If you activate the **Refresh Content** option, specify how often to refresh the data in this widget. |

| Option | Description |
|---|---|
| Self Provider | Indicates whether the objects for which data appears in the widget are defined in the widget or provided by another widget.<br>• On - You define the objects for which data appears in the widget.<br>• Off - You configure other widgets to provide the objects to the widget using the dashboard widget interactions options. |
| Details URL | Enter an external URL or an internal URL. The **View Details** button that appears at the bottom of the associated dashboard, links to the URL that you enter in the **Details URL** field. For example, you can enter an external URL such as `https://google.com/` or an internal URL such as `/vcf-operations/ui/inventory` that links to the **Inventory** page in VCF Operations. |
| **Input Data** | |
| Object | Search for objects in your environment and select the object on which you are basing the widget data. You can also click the **Add Object** icon and select an object from the object list. You can use the **Filter** text box to refine the object list and the **Tag Filter** pane to select an object based on tag values. |

# Using Predefined Dashboards for Quick Insights

VCF Operations includes a broad set of simple to use, but customizable dashboards to get you started with monitoring your VMware environment. The predefined dashboards address several key questions including how you can troubleshoot your VMs, the workload distribution of your hosts, clusters, and datastores, the capacity of your data center, and information about the VMs. You can also view log details.

Each set of dashboards is complemented with a series of out-of-the-box customizable alerts and reports to assist with your operational awareness. Alerts, reports, and dashboards, each have a purpose with minimal overlap. Several activities that are carried out using alerts should be carried out using dashboards. Reports should be kept to a minimum as they are not interactive and do not provide timely information.

The following table details how alerts, dashboards, and reports are complimentary.

VCF Operations dashboards support a concept we call insight. Insight complements alerts but does not replace it. Alerts miss the larger picture and only see what is triggered. For one object that reaches the threshold, there might be many just beneath the threshold. The objects below the threshold are called insight.

Alerts might auto-close if the symptoms disappear. Managing alerts is not the same as minimizing alerts. Minimizing alerts is about preventing alerts.

**Working with Predefined Dashboards**

To access the predefined dashboards, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Dashboards** > **All**.

Any customization you make is overwritten during upgrade and as a result, it is recommended that you back up your dashboards before an upgrade.

## Application Monitoring Dashboards

Use the **Linux OS discovered by Telegraf** dashboard and the **Windows OS discovered by Telegraf** dashboard to view the Linux and Windows OS objects discovered on all types of machines such as Virtual Machines, Azure Virtual Machine, EC2 Instance, and physical servers.

### Linux OS discovered by Telegraf Dashboard

Use the **Linux OS discovered by Telegraf** dashboard to view detailed information related to Linux OS objects. You can monitor CPU, disk, and network metric usage. You can also view object relationships.

**Table 1381: Widgets in the Linux OS discovered by Telegraf Dashboard**

| Widget | Description |
|---|---|
| Linux Operating Systems | Displays a list Linux OS objects that are discovered on all types of machines. Click on the Linux OS object for which you want to view details. The other widgets are populated with relevant details. |
| Process | Displays Linux Process metrics for the selected Linux OS object. |
| CPU | Displays CPU metrics for the selected Linux OS object. |
| Memory | Displays Memory metrics for the selected Linux OS object. |
| Memory Swap File | Displays Memory Swap File metrics for the selected OS object. |
| CPU: Individual CPU Performance | Displays all CPU usage metrics for the selected Linux OS object. |
| Disk: Individual Partition Capacity | Displays the instance name, total capacity, free capacity, and percentage of capacity that is used. |
| Disk: Individual Disk Performance | Displays the Individual disk performance metrics for the selected Linux OS object. |
| Related Objects | Displays a detailed object relationship of the Linux OS objects. |

## Windows OS discovered by Telegraf Dashboard

Use the **Windows OS discovered by Telegraf** dashboard to view detailed information related to Windows OS objects. You can monitor CPU, disk, and network metric usage. You can also view object relationships.

**Table 1382: Widgets in the Windows OS discovered by Telegraf Dashboard**

| Widget | Description |
|---|---|
| Windows Operating Systems | Displays a list Windows OS objects that are discovered on all types of machines. Click on the Windows OS object for which you want to view details. The other widgets are populated with relevant details. |
| Associated VM | Displays the VM version, CPU, memory, and disk space details. |
| System | Displays System metrics for the selected Windows OS object. |
| CPU | Displays CPU metrics for the selected Windows OS object. |
| Memory | Displays Memory metrics for the selected Windows OS object. |
| Windows: Memory Rate | Displays Memory Rate metrics for the selected Windows OS object. |
| CPU: Individual CPU Usage | Displays all CPU usage metrics for the selected Windows OS object. |
| Disk: Individual Partition Capacity | Displays the instance name, total capacity, free capacity and percentage of capacity that is used. |
| Network: Individual Adapter Usage | Displays the individual network adapter usage metrics for the selected Windows OS object. |
| Related Objects | Displays a detailed object relationship of the Windows OS objects. |

# Availability Dashboards

Availability covers the uptime of the object now and the uptime trend over time. The availability of hybrid clouds should be tracked at both the provider and consumer layers to understand the availability of the environment. These dashboards show the current uptime and the uptime percentage over the past month.

## VM Availability Dashboard

Use the **VM Availability** dashboard to calculate the availability of the Guest OS. The availability of the Guest OS is calculated because the Guest OS might not be running even when the VM is powered on. There are two layers of Availability, that is, the Consumer layer and the Provider layer. This dashboard covers the Consumer layer. You can view VMs in the selected data center, uptime trend for a selected cluster, and so on.

### Design Considerations

The **VM Availability** dashboard helps you check the availability (uptime in percentage) of VMs, as availability is typically part of the services provided by the IaaS provider.

This dashboard does not check the application uptime because it is possible that the application such as, a database, or a web server, is down while the underlying Windows or Linux is up. Generally, the service provided by the IaaS team is only for Windows or Linux. For information on the application, use the network ping or application-specific agent such as application monitoring.

### How to Use the Dashboard

- In the **Datacenters** widget, click any data center from the list.
  - To view the overall information, click the **vSphere World** object.
  - The other widgets are automatically updated once you click any data center.
  - Create a filter that reflects your class of service for this widget. Group by the class of services such as gold, silver, and bronze and default the selection to Gold. In this way, the monitoring is not cluttered with less critical workloads and you can focus on the important VMs. You can achieve this by creating a VCF Operations custom group for each class of service.
- The **VMs by Uptime in the last 30 days** widget displays the average uptime of VMs grouped by their availability. The bucket distribution helps you cater to a wide array of environments. If you are monitoring only production VMs where the uptime is expected to be near 100% all the time, edit the bucket to meet your operational needs.
  - The VMs in the **Selected Datacenter** widget display all the VMs that are currently deployed to the data center. The average uptime is displayed for the last month. For a production VM, expect this number to be 100% or closer to 100%.

    **Note:**
    The Services column will be blank unless Service Discovery is activated and the services/processes are discovered on a specific virtual machine.
  - The VMs column includes all VMs including the powered off VMs.
- Click any VM in the **VMs by Uptime in the last 30 days** widget to view the details in the **VM in the Selected VM Powered On Status**, **Selected VM Uptime Trend**, and **Selected Cluster Uptime Trend** widgets.
  - The **Selected VM Uptime Trend** widget displays the selected VM's Guest Tool Uptime (%) across the last 30 days.
- The **Guest OS: Services** widget displays the service state over time and the process or services running inside the Guest OS. If Guest OS services or processes are discovered inside a VM, their availability is analyzed. This requires the Service Discovery.
- The ESX **Host(s) where the VM has run** widget displays the historical migration of the VM. This can be useful in determining the cause of a VM downtime.

### Points to Note

- The metric only tracks the availability of VMware Tools and not the entire Guest OS. If VMware Tools is not up, it assumes the Guest OS to be down. You can check that this is not a false negative by adding a few line charts that display the evidence of activity. A good counter is IO counters such as Disk IOPS, Disk Throughput, and Network Transmit Throughput, because IO requires CPU processing. CPU usage is not a reliable counter as the work by VMkernel on the VM is charged to the CPU counters.
- VCF Operations exhibits a new ping adapter. This allows you to enhance the accuracy of the uptime measurement by creating a super metric that adds the ping information or by checking the process using an agent, such as application monitoring.
- Add a property widget that lists the selected VM properties to give you more context about the VM. In a large environment, the VM name alone might not provide enough context.

## vSphere Availability Dashboard

There are two layers of Availability, that is, the Consumer layer and the Provider layer. The **vSphere Availability** dashboard covers the Provider layer. This dashboard includes a cluster and not an ESX host because the cluster is operationally a single compute provider. This dashboard considers the N+1 design, where the cluster can withstand one host failure. Logically, a cluster with fewer hosts has a higher risk.

### Design Considerations

The **vSphere Availability** dashboard helps you analyze and report the uptime, as availability is typically part of the official business SLA. It is also often required in the monthly operational summary report.

This dashboard is not designed for live monitoring of the uptime. A NOC style of dashboard is better suited for those use cases. VMware Tools such as Log management must be leveraged as the fault is typically preceded with soft errors.

### How to Use the Dashboard

- The **Clusters** widget lists all the clusters in the environment. It is sorted by the lowest uptime so that the cluster with the lowest uptime in the last one month is displayed.
  - The **Running Hosts** column is color-coded as logically a smaller cluster has a higher risk. A single host failure results in a relatively higher capacity degradation.
  - The **vSAN?** column is hyper-converged, which means both the compute and the storage part is considered.
  - The **Admission Control Policy** column is based on the Cluster Configuration \ DAS Configuration \ Active property. The mapping between the code to name is:
    - -1 : Disabled
    - 0 : Cluster Resource Percentage
    - 1 : Slot Policy (Powered-on VMs)
    - 2 : Dedicated Failover Hosts
  - In a large environment, creating a filter for the list of clusters can make it more manageable. Group by the class of services such as gold, silver, and bronze and default the selection to Gold. In this way, you can easily view your gold clusters.
- Click any cluster from the **Clusters** widget.
  - The cluster uptime is automatically plotted in the **Selected Cluster Uptime Trend** widget. It uses 99%, 99.%, and 99.99% as the threshold for red, orange, and yellow colors respectively.
  - The ESX host details in ESX **in the Selected Cluster** widget are automatically updated. For more context, you can add a property widget that lists the selected ESX host properties.
  - In the ESX **in the Selected Cluster** widget, the **Connected to vCenter** and **Maintenance State** columns are not the average values, as both are string. However, they display the last state in the selected period. This allows you to go back to a specific point in time and view availability at that point.
- The **Datastores not available** widget lists only the datastores with powered off status. This covers both local and shared datastores. To add context, consider adding an extra column such as the data center where it resides, and the datastore types such as NFS and VMFS.
- The **Port Group Availability** widget lists port groups that currently have an uptime of less than 100%. To add context, consider adding an extra column such as the data center where it resides, number of used ports, and the maximum number of ports.
- For more context, you can add a property widget that lists the selected object properties. Multiple tables can drive the same property widget, but the object type must be the same.
- In a large environment, you can create a filter for this dashboard. Group by the class of services such as gold, silver, and bronze and default the selection to Gold. In this way, the monitoring is not cluttered with less critical workloads.
- In the ESX **in the Selected Cluster** widget, the **Connected to vCenter** and **Maintenance State** columns are not the average values, as both are string. However, they display the last state in the selected period. This allows you to go back to a specific point in time and view availability at that point.

**Points to Note**

- You can add vCenter Server and NSX components availability. This requires the VMware SDDC Health Monitoring Solution.

## Ping Overview Dashboard

Use the Ping Overview dashboard to configure the ping functionality and verify the availability of end points that exist in your virtual environment. The ping functionality is configured at the adapter instance for IP addresses, group of IP addresses, and FQDN. You can view ping adapter details like, latency distribution and packet loss distribution in this dashboard.

**Customizations Available for Your Use**

For more context, you can add a property widget that lists the selected object properties. Multiple tables can drive the same property widget, but the object type must be the same.

> **Note:**
> The FQDN names are checked for validity, the FQDN validation relies on RFC1034 and RFC1123, and only top level domains of the internet are validated. The `.local` domain is not supported as it does not fall into the list of top-level domains in the Domain Name System (DNS) of the Internet.

**Widget Information**

- Latency distribution - You can use this widget to see the objects that are experiencing high latency.
- Packet Loss Distribution – You can use this widget to see the objects that are experiencing high packet loss.
- Ping Targets – You can use this widget to view the list of ping targets grouped by their FQDN. Latency and packet loss information is also displayed for the ping objects.
- Breakdown by Source Initiator – You can use this widget to view the List of ping statistics by the source (ping initiator). You can ping the target from multiple locations, to determine if the issue is network-related or server-related.

## vSAN Health Dashboard

Use the vSAN Health dashboard to monitor the health of your vSAN cluster.

You can use the vSAN Health dashboard to monitor the status of the cluster components, diagnose issues, and troubleshoot problems. The dashboard displays the critical and important alerts that need immediate attention.

**How to Use the Dashboard**

The **vSAN Clusters** widget lists all the clusters in the environment with issues if the cluster health score is below 60 or has any critical alerts.

It shows the cluster names, ESX hosts, resync, and color-coded health and risk of the cluster. vSAN resync is a utilization metric, but its presence can impact performance. If the table is all green, no need to analyze it further.

You can focus on issues that need immediate attention and resolution for your clusters to be up and running. This dashboard displays the alerts triggered in your vSAN cluster and provides insights into the cause of the alerts.

The **Red Alert** column displays the critical alerts in the cluster that need immediate attention. If there are red alerts, click the cluster. The **Alerts** tab displays all the alert lists. Click a particular alert and check the alert details, related alerts, and potential evidence related to that alert. Under **Alert Details**, you can check the recommended remediation to troubleshoot the specific issue. Click the Knowledge Base article for more details.

Click any cluster to view the properties of the selected cluster in the **Property of Selected Cluster** widget. These are the properties that helps you understand the cluster health issues. If something is not there, check the alerts in the alert lists.

Once you select any particular cluster, the alerts in that cluster are listed in the **Alert Lists** widget. Click an alert to view the alert details, related alerts, and potential evidence. It also displays the alert symptoms.

# Capacity Dashboards

Capacity quantifies the resources used, resources remaining, and opportunities to reclaim unused resources. Projections of the demand provide a proactive view of capacity. The **Capacity Dashboards** display capacity in terms of time remaining before capacity is projected to run out, the amount of capacity remaining, the number of VMs that might fit in the remaining capacity, and reclaimable resources that can increase the available capacity.

Capacity management is about balancing demand and supply. It is about meeting demand with the lowest possible cost.

For IaaS or DaaS, capacity management begins before the hardware is deployed. It begins with a business plan that defines what class of service will be provided. Each class of service, for example, gold, silver, bronze is differentiated by the quality of service and covers the availability, for example, 99.99% uptime for Gold, 99.95% uptime for Silver. It also covers performance, for example, 10 ms disk latency for Gold, 20 ms disk latency for Silver, and security or compliance.

The quality incurs cost and in turn drives price. Gold VM is higher per vCPU and per GB of RAM because it has a higher quality of service. A proper pricing model must be planned. If you want your customers to rightsize in advance, then a 64 vCPU VM has to be more than 64x the price of 1 vCPU VM. If the pricing model is a simple straight line, there is no incentive to go small and no penalty if it is over provisioned. In this case, you end up forcing rightsizing in production, which is a costly and time consuming process.

Demand is more than the active load that is consuming your capacity. Since capacity based on utilization is incomplete by itself, the principles displayed in the following figure are considered.

- Latent demand. Many critical VMs are protected with Disaster Recovery. During a Disaster Recovery drill or an actual disaster, this load is consumed.
- Potential demand. Many newly provisioned VMs take time to reach their expected demand. It takes time for the database to reach the full size, the user base to reach the target, and the functionalities to complete. When this is achieved, it results in the increase in demand.
- Unmet demand occurs when the VM or Kubernetes Pod is undersized. The load is running nearly 100% most of the time.
- Excessive demand can wreak havoc in a shared environment. A group of highly demanding VM can collectively impact overall performance of the cluster or datastore.

## Cluster Capacity Dashboard

The **Cluster Capacity** dashboard includes the ESX host and resource pools as they impact cluster capacity.

## Design Considerations

See Capacity Dashboards for common design considerations among all the dashboards for capacity management.

## How to Use the Dashboard

The **Cluster Capacity** dashboard is layered, gradually providing details as you work top-down in the dashboard.

### Overall Analysis

- The three bar charts which are **Clusters by Capacity Remaining**, **Clusters by Time Remaining**, **Clusters by VM Remaining**, summarize the overall situation. The first two charts can be used together to identify when you need to add capacity to address growth. Time remaining uses historical growth in a cluster to forecast when more capacity is needed. This allows you to operate more efficiently by making sure you have enough capacity currently and proactively plan for adding capacity. The third bar chart which is **Clusters by VM Remaining**, provides complete contexts, as different clusters can have different VM sizes.

  For a large environment, a heat map is helpful. The three heat maps are Time Remaining, Capacity Remaining, and VM Remaining. If your cluster sizes are not standardized, create another heat map, and use the number of ESX hosts to show the size difference.

### Cluster Analysis

- The **Clusters Capacity** widget provides a table with details. The number of ESX hosts are color coded as smaller clusters have a relatively higher overhead. Select a cluster from the table to view the capacity details that are automatically displayed.

  **Performance**

  Ensure that the performance of the cluster meets your SLAs.

  **Utilization**

  The next two charts are Memory Workload (%) and CPU Workload (%), that show values relative to your usable capacity. Utilization is displayed for three months and not one week. The daily average is displayed and not the hourly average, so you can focus on the overall trend. For memory, the focus is on consumed memory and not active memory.

  **Allocation**

  You can view the trend of the three which are CPU, disk, and memory components together on the **Overcommit Ratio** chart. In general, your CPU overcommit should be the highest, followed by the disk (because of thin provision). Memory overcommit tends to be near one due to its nature as cache.

  Use the line chart in the **Allocation** widget, to see the trend. The data is averaged hourly.

  In the **VM Count** widget, the trend line of the number of VMs over time is important to spot if there are many newly provisioned VM. If you see that the VMs are increasing but demand remains low, it indicates a sign of potential demand in the future.

  **Reservation**

  Reservation can impact the efficiency of your cluster. Your cluster could be low on capacity because of real workload or just reservation. If your cluster size varies, complement the reservation number by showing a relative value. Once you have a standardized number, you can visualize them on a heat map.
- **ESX Analysis**

  Good cluster capacity does not indicate that there is no issue at the ESX level. Unbalance is a common problem, especially in large clusters and stretched clusters.

  The ESX **Hosts in a Cluster** table displays all the member ESX hosts. You can see the unbalance clearly, thanks to the color code. The color code reflects the unbalance.

  The **99th percentile Performance** column takes the 99th percentile value of the ESX Performance (%) metric.

  Select an ESX host to view the details. Both the **CPU Workload (%)** and the **Memory Workload (%)** trend line charts display if there is a steady demand, cyclical demand, rising demand, or declining demand. The trend is as important as the present value. View trends over a longer time. Utilization is displayed for three months and not one week. The daily average is displayed and not the hourly average. The focus is on memory consumed and not memory active. Memory consumed includes the total memory consumed, so it includes the memory consumed by VMkernel. Both total and usable utilization in terms of memory and CPU are displayed and provides the absolute amount of capacity.
- **VM Analysis**

Use the **VMs in the selected Cluster or Host** table to analyze the cause of the low capacity remaining and which VMs are impacting the infrastructure resources, such as, CPU, memory, and disk space. The table lists either the VMs in the cluster or host. When you select one of the VMs, additional relevant information is displayed.

If there are many large VMs running low on capacity you can stop provisioning until you upsize the existing VMs first.

## Datastore Capacity Dashboard

The **Datastore Capacity** dashboard complements out of the box capacity pages and dashboards. It focuses on storage, provides an overall picture, and highlights the datastores that need attention.

### Design Considerations

See Capacity Dashboards for common design consideration among all the dashboards for capacity management.

### How to Use the Dashboard

The **Datastore Capacity** dashboard is layered, gradually providing details as you work top-down in the dashboard.

- **Overall Analysis**
  The summary banner answer basic questions such as number of datastores, the capacity, number of VMs, and the running VMs.
  The distribution charts are **Shared Datastores by Capacity Remaining** and **Shared Datastores by Time Remaining**.
  There are three heat maps, the primary being the **Remaining Capacity** heat map. The two other heat maps cover used capacity. One of them is designed for an environment that uses datastore clusters. Each box represents a datastore. If you have many datastores, the heat map will group them. You can further see the members. The larger the datastore, the larger the box.
  The **Shared Datastores** table lists the shared datastores. The table provides a summary, displaying all the datastores at a glance. They are grouped by data center. By default, the table is sorted by the least capacity remaining. There are three reclamation opportunities: powered off VM, snapshot, and orphaned VMDK.
- **Datastore Analysis**
  Select a datastore from the **Summary** table. The capacity details are automatically displayed. A snapshot that lasts beyond a few days should be investigated. Orphaned VMDK are the ones that are not associated to any VM.
  For disk space, the total capacity, allocated capacity, and the actual capacity used are displayed.
- **VM Analysis**
  To analyse at the VM level, review the **VMs in the datastore** table. Click on the VM you want to investigate further to see usage over time.
- **Local Datastores**
  The **Local Datastores Capacity** table appears at the end of the dashboard. Avoid running VMs on local data stores, unless the storage requirements can be met with a local disk and does not need vMotion.

### Points to Note

If the underlying LUN is also thin provisioned, add visibility into the physical array. The dashboard does not have datastore clusters. If your environment uses datastore clusters, modify this dashboard or create a new one. In a large environment with many datastores and datastore clusters, add a View List to list the datastore clusters, so you get summary information. Alternatively, create a heat map, listing the datastore clusters.

## ESX Capacity Dashboard

The ESX **Capacity** dashboard supports the **Cluster Capacity** dashboard and is also required for the non-clustered ESX.

### Design Considerations

See Capacity Dashboards for common design considerations among all the dashboards for capacity management.

### How to Use the Dashboard

The **Summary** heat map provides an overall view of the ESX Host capacity, grouped by their clusters.

- Each ESX host is represented by a box, displaying their capacity remaining.
- The ESX host size is made constant for ease of use. If your ESX sizes are not standardized, consider using the number of physical cores or Total CPU GHz to display the difference in sizes. Ensure that the smallest ESX is not too small.
- Wastage is displayed by a new color. Dark gray indicates wastage as capacity is not used. The performance problem due to low utilization can be caused by a bottleneck elsewhere.

The ESX **Hosts Capacity** widget lists all the ESX hosts in your environment, grouped by their parent cluster.

- The standalone ESX are displayed at the bottom under No Group.
- In a large environment with many data centers, you can zoom into a specific vCenter or data center. You can also filter or search for specific ESX hosts matching certain names.
- The **99th Percentile Performance** column takes the 99th percentile value of the ESX Performance (%) metric. To rule out the outlier, the worst performance (which is equivalent to 100th percentile) is not considered. Also, the performance threshold is set to be stringent.

Select one of the ESX hosts from the ESX **Hosts Capacity** widget. All the three line charts automatically display the trend of selected ESX host.

- Displays both total and usable utilization in terms of RAM and CPU.
- Utilization is displayed for three months and not one week. The daily average is displayed and not the hourly average and the focus is on RAM consumed and not RAM active.

### Points to Note

- Add a drill-down to the ESX **Capacity** dashboard. A logical place to initiate this drill-down is in the **Cluster Capacity List** widget. Link this widget into the table of ESX host in the destination dashboard.
- A technology refresh is often used to address the capacity shortage. Consider adding a property widget that displays the hardware model and specification to help you determine the age of the hardware.

## VM Capacity Dashboard

The **VM Capacity** dashboard helps you analyze the capacity of all the VMs with the ability to analyze each VM.

### Design Considerations

See Capacity Dashboards for common design considerations among all the dashboards for capacity management.

### How to Use the Dashboard

- **Overall Analysis**

  The **Datacenters** table lists all your data centers. vSphere World is included so you can see all the VMs from all the data centers. Unlike infrastructure objects, there are potentially tens of thousands of VMs. The charts will take longer to refresh if you select vSphere World.

  The **VMs by Capacity** widget, groups the VMs by capacity remaining, while the **VMs by Time Remaining** widget groups the VMs by time remaining. Ideally, you want all of them to be low on capacity remaining, but high on time remaining.

  The heat map provides an additional view by grouping them by cluster. The heat map helps you identify which cluster is at risk (where most of the VMs need more capacity) and which cluster provides extra resources (where most of the VMs are not using their capacity).

  Review the **VMs by Capacity Remaining** heat map. The heat map provides the next level of detail by grouping the VMs by clusters, so you can see which clusters need attention. The VM size is standardized for better visualization.
- **VM Analysis**

  Review the **VMs Capacity in the Selected Datacenter** table that lists all the VMs in the selected data center. The list is sorted by the VM with the least capacity remaining. You can also sort by Time Remaining.

Select a VM from the table. The capacity details are displayed. You can view both the CPU and memory trend over time. Three months data is displayed and is averaged to hourly so you can see the overall trend.

Disk details are displayed using the Guest OS partition. Avoid using VM virtual disk as there may not be a direct mapping to the actual partition.

The recommendation for right-sizing is displayed for both CPU and memory. Unlike a physical server, it is important to right-size a VM. For CPU, the CPU Usage counter is used instead of Demand. For disk, Guest OS partition level is displayed. There is no overall capacity at the VM level because different partitions have different capacity.

- **Relevant Configuration**
  Relevant configuration is automatically displayed to provide context to the VM. Information such as VM owner and business units can be useful in the analysis.

## Reclamation Dashboard

The **Reclamation** dashboard helps you manage various types of reclamation that can be carried out on VMs and datastore. It is designed for both the Capacity team and the Operations team.

### How to Use the Dashboard

- **Overall Analysis**
  The scoreboard provides a summary of the total reclamation.
  You can select either a data center, a cluster, or a datastore. The datastore level is required as orphaned disks do not have VM association, hence it is not related to any cluster. The **Datastore** table only drives the snapshot table.
  **Powered-off VMs Distribution Size**, **Idle VMs Distribution by Memory Footprint**, and **Snapshots Distribution by Size** charts display summary information.
  Adjust the bucket size in the charts to suit your operational requirements. The reclamation potentials are presented as three bar charts, each corresponds to an area you can reclaim:
  - Powered off VMs that are no longer needed contribute to wasted disk usage. Consider deleting them to free up space or moving them to archival storage.
  - Idle VMs are running, but not being used actively. These VMs consume memory that may be used by active VMs. Consider removing these VMs to reduce memory contention.
  - Snapshots are meant to be temporary and can cause performance issues and waste disk space if not deleted after a few days.

  When reviewing each of the three tables observe that they are sorted by the largest reclamation opportunities. This allows you to get the greatest benefit from the least amount of effort. For example, focus on snapshots first, as it does not involve changing the VM. For the powered off VMs, you may want to consider VMs that have been powered off longer and these are more likely to be unneeded. Idle VMs can be challenging to reclaim since they are still running, so you might prioritize powered off VMs before attempting to reclaim idle VMs.
  The **99P CPU Usage** column displays the CPU usage at the 99th percentile during the time period. It is an easy way to check if it is indeed idle.
- **VM Analysis**
  To analyze VMs for reclamation opportunities, select a VM from one of the three tables (Powered Off VM, Idle VMs, or VM Snapshots). The selected VM will populate the widgets with the following details:
  - Powered off over time displays the amount of time a VM has been powered off.
  - CPU Usage over time provides insights into the aggregate CPU usage, including peak usage periods. This way you can validate that an idle VM has not had any brief usage.
  - VM Snapshot over time provides you with an understanding of the age and growth of snapshots on the VM. Watch for fast growing snapshots, as these can quickly consume disk space.
  - Contexts of selected VM is a summary of the VM configuration information.

### Points to Note

To organize your reclaim efforts, it is helpful to create custom groups to make it easier to filter by department or VM owner. This can make it easier to seek approvals and communicate with anyone who may be impacted.

## vSAN Capacity Dashboard

The **vSAN Capacity** dashboard complements the vSphere **Cluster Capacity** dashboard by displaying capacity related to vSAN. To manage vSAN capacity, use both dashboards.

### Design Considerations

The dashboard focuses on vSAN specific metrics, but does not list non-vSAN clusters.

See Capacity Dashboards for common design considerations among all the dashboards for capacity management.

### How to Use the Dashboard

- **Overall Analysis**
  The **Clusters by Capacity Remaining** and **Clusters by Time Remaining** bar charts focus on vSAN disk space and not compute and network.
  Use the **vSAN Clusters** table to view vSAN specific metrics.
- **Cluster Analysis**
  Select a vSAN cluster from the **vSAN Clusters** table. The detailed capacity is automatically displayed.
  The **Utilization** widget displays the utilization for all three elements, as you need to consider all three. Network is not shown as typically it is not a problem.
  Like a physical array, there can be hot spots and imbalance. The **Is Disk Group Space Utilization Balanced** heat map displays individual disk groups.
  Reclaimable storage is a key component of proactive capacity management. You can view details for both VMs and non-VMs.
  You can view the **Dedupe and Compressed** scoreboard for more details in this area.
- **Disk Group Analysis**
  If there is imbalance, you can analyze each disk group. The **Disk Groups Selected in Selected vSAN Cluster** displays all the disk groups in the cluster. Their usage may not be similar, but should not deviate drastically. To view the disk group usage trend, click on a disk group.
- **VM Analysis**
  You can analyze individual VMs in the selected cluster from the **VMs in the selected vSAN Cluster** table and check their usage and snapshot. To view the trend in Usage, click on a VM. In addition, the relevant configurations of the VM is displayed.

## vSAN Stretched Clusters

The vSAN Stretched Clusters dashboard provides an overview of the cluster resources used across vSAN fault domains. Using the stretched clusters dashboard you can monitor the resource consumption at the site level for Preferred Sites and Secondary Sites. You can create custom dashboards for specific vSAN stretched cluster metrics.

### Where to View vSAN Stretched Cluster Objects

From the left menu, click **Operations** > **Dashboards**. From the Dashboards panel, click **All** > **Capacity** > **vSAN Stretched Clusters**.

You can also view the vSAN stretched cluster objects from **Inventory** > **vSAN** > **vSAN and Storage Devices** > **vSAN Clusters**, if the vSAN cluster is a stretched cluster.

The vSAN Stretched Clusters dashboard provides information about CPU Capacity, Cores, Memory Capacity, and Disk Capacity for the Preferred Site and the Secondary Site. You can identify the vSAN stretched clusters running out of capacity looking at the utilization metrics.

## vSAN ESA Capacity Dashboard

The vSAN ESA ( Express Architecture) Capacity dashboard provides an overview of the capacity available across all the vSAN clusters. The dashboard displays the time remaining before capacity is projected to run out, the amount of

capacity remaining, the number of vSAN clusters that might fit in the remaining capacity, and reclaimable resources that can increase the available capacity.

**How to Use the Dashboard**

- **Overall Analysis**
  The **All Clusters by Capacity Remaining** and **All Clusters by Time Remaining** bar charts focuses on the number of vSAN disk against the used disk capacity percentage across vSAN clusters.
- **Cluster Analysis**
  Select a vSAN ESA cluster from the **vSAN Clusters** table. The detailed capacity is automatically displayed.
  The **Utilization** widget displays the utilization for all three elements, as you need to consider all three. Network is not shown as typically it is not a problem.
  The **Is Storage Pool Space Utilization Balanced** heat map displays individual storage pools.
  Reclaimable storage is a key component of proactive capacity management. You can view details for both VMs and non-VMs.
- The **Storage Pools in Selected vSAN Cluster** widget displays the utilization for Disks and Disk Space.
- Like a physical array, there can be hot spots and imbalance. The **Is Physical Disk Space Utilization Balanced** heat map displays individual physical disks.
- **VM Analysis**
  You can analyze individual VMs in the selected cluster from the **VMs in the selected vSAN Cluster** table and check their usage and snapshot. To view the trend in Usage, click on a VM. In addition, the relevant configurations of the VM is displayed.

## vSAN OSA Capacity Dashboard

The vSAN OSA (Original Storage Architecture) Capacity dashboard provides an overview of the capacity available across all the vSAN clusters. The dashboard displays the time remaining before capacity is projected to run out, the amount of capacity remaining, the number of vSAN clusters that might fit in the remaining capacity, and reclaimable resources that can increase the available capacity.

**How to Use the Dashboard**

- **Overall Analysis**
  The **All Clusters by Capacity Remaining** and **All Clusters by Time Remaining** bar charts focuses on the number of vSAN disk against the used disk capacity percentage across vSAN clusters.
- **Cluster Analysis**
  Select a vSAN OSA cluster from the **vSAN Clusters** table. The detailed capacity is automatically displayed.
  The **Utilization** widget displays the utilization for all three elements, as you need to consider all three. Network is not shown as typically it is not a problem.
  Like a physical array, there can be hot spots and imbalance. The **Is Disk Group Space Utilization Balanced** heat map displays individual disk groups.
  Reclaimable storage is a key component of proactive capacity management. You can view details for both VMs and non-VMs.
- **Disk Group Analysis**
  If there is imbalance, you can analyze each disk group. The **Disk Groups Selected in Selected vSAN Cluster** displays all the disk groups in the cluster. Their usage may not be similar, but should not deviate drastically. To view the disk group usage trend, click on a disk group.
- **VM Analysis**
  You can analyze individual VMs in the selected cluster from the **VMs in the selected vSAN Cluster** table and check their usage and snapshot. To view the trend in Usage, click on a VM. In addition, the relevant configurations of the VM is displayed.

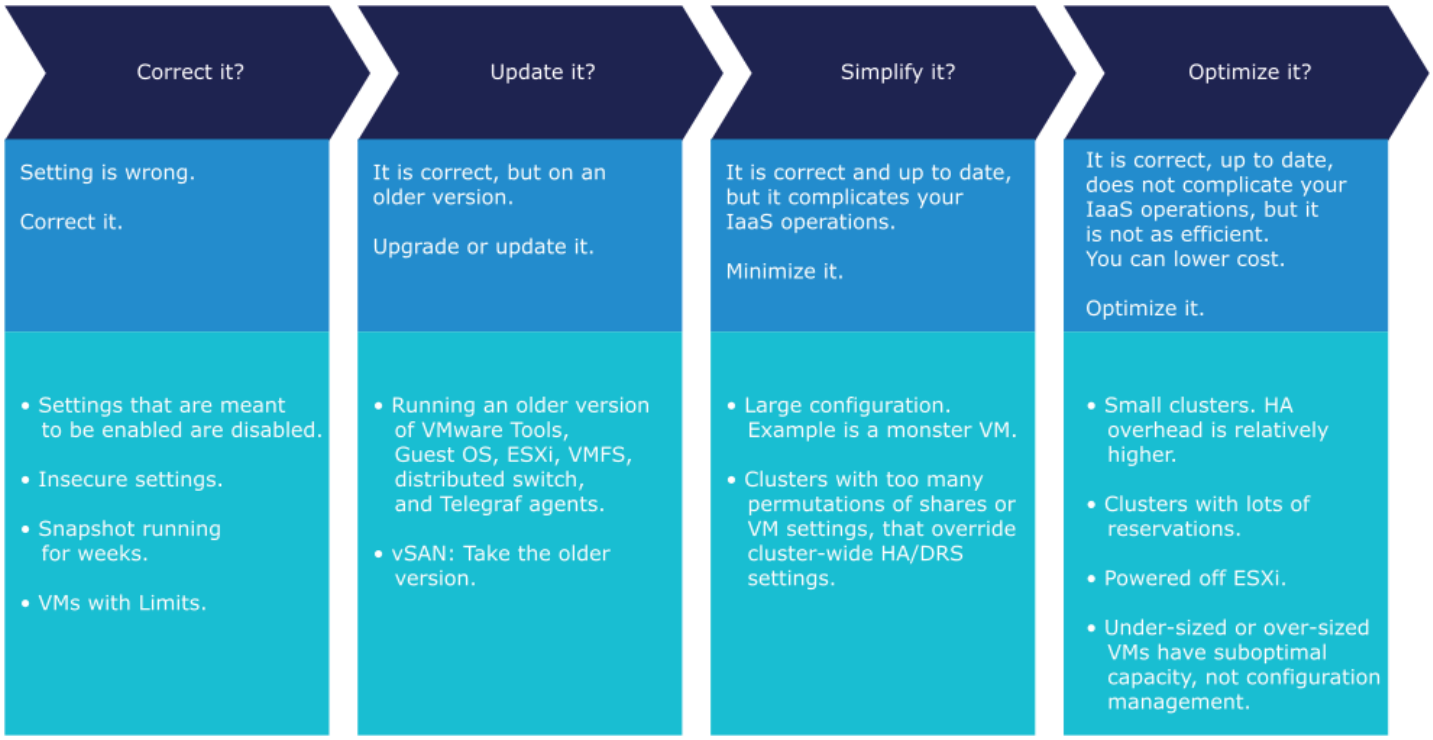
# Configuration Dashboards

As an operations management software, VCF Operations focuses on the impact to day-to-day operations a product has, rather than the feature of the product itself. Products under monitoring, such as vSphere and vSAN, can have features that are related, but have a different impact on operations. For example, vSphere provides Limits, Reservation, and Shares for the VM.

Limits, Shares, and Reservation. As a feature, they are closely related, and appear in the same dialog box and must be learned as one. However, they impact operations differently. The following table describes that in more detail.

| | | | |
|---|---|---|---|
| VM Limit | Impacts the VM | • Should not be used. Right-size instead.<br>• Results in unpredictable performance of the Guest OS. | Incorrect Configuration |
| VM Reservation | Impacts the Infrastructure | • Keep the total amount low, and relative to the total capacity of the cluster.<br>• Absolute value. A 2-GHz reservation is in fact a 2-GHz reservation.<br>• Results in suboptimal infrastructure capacity, as overcommit is not possible. | Suboptimal Configuration |
| VM Share | Impacts the Infrastructure | • Keep the number of variations to below three. One for each class of service.<br>• Relative value. 2000 worth of reservations depends on the value of other VM reservations. Be careful when you move the VM to another cluster, as the relative value changes.<br>• Results in complex operations. It is harder to troubleshoot performance when the dynamic entitlements of each VM fluctates more. | Complex Configuration |

VCF Operations follows the principle that there are different impacts on operations and applies a methodology for looking at configuration. It does not group the settings by features or objects. Rather, it begins with the impact and prioritizes what can be done.



Each operation is unique and as a result, customers run operations differently. What is right for other customers, might not be right for you. Even in the same environment, what is right for a development environment might not be appropriate for a production environment.

The following table lists some of the areas for improvement for the operations in your environment:

### Areas of Improvement

| | Correct it? | Update it? | Simplify it? | Optimize it? |
|---|---|---|---|---|
| **IaaS Consumer:**<br>• Process<br>• Applications<br>• Guest OS<br>• Container<br>• VM | • Java JVM or Database \ memory config too large relative to Guest OS<br>• Guest \ Metric not collecting<br>• Guest \ High TX Broadcast packets<br>• VM \ Tools not installed<br>• VM \ Tools not running<br>• VM \ CPU Limit<br>• VM \ Memory Limit<br>• VM \ Old Snapshot<br>• VM \ On local Datastore | • Guest OS \ Tools<br>• Guest OS \ Windows<br>• Guest OS \ Linux<br>• Guest OS \ Telegraf agent<br>• VM \ Hardware (vmx) | • VM \ Large VM (CPU, RAM, Disk)<br>• VM \ lots of disks, NIC card<br>• VM \ lots of IP address.<br>• VM \ with RDM<br>• VM \ on multiple datastores<br>• VM \ Fault Tolerant<br>• VM \ SRM protected<br>• VM \ Hot Add\|Remove \ CPU<br>• VM \ Hot Add\|Remove \ RAM | • Java JVM or Database \ memory config too small relative to Guest OS<br>• Guest OS \ no visibility<br>• Container \ smaller than the parent VM<br>• VM \ Tools unmanaged<br>• VM \ bigger than the whole ESXi cores.<br>• VM \ bigger than CPU socket.<br>• VM \ Large Snapshot<br>• VM \ Reservation. |
| **IaaS Provider:**<br>• Telegraf<br>• ESXi<br>• Cluster<br>• Datastore & Cluster<br>• Switch and Port Group<br>• Hardware<br>• NSX<br>• vSAN | • ESXi \ vMotion disabled<br>• ESXi \ Disconnected from vCenter<br>• ESXi \ Maintenance Mode<br>• ESXi \ NTP disabled<br>• ESXi \ Standalone<br>• Cluster \ Admission Control disabled<br>• Cluster \ HA disabled<br>• Cluster \ HA Failover %<br>• Cluster \ DRS disabled<br>• Cluster \ DRS manual<br>• Cluster Inconsistency<br>  • BIOS, ESXi: version<br>  • BIOS, ESXi: Power Management<br>  • ESXi Storage Path<br>  • ESXi Hardware<br>• Datastore Cluster inconsistency<br>  • Capacity<br>  • Performance<br>• Datastore \ single path<br>• Datastore \ no path. This is unlikely.<br>• NSX \ no redundancy for Controller, Manager | • ARC \ server<br>• ARC \ agent<br>• ESXi \ hardware<br>• ESXi \ vSphere<br>• ESXi \ 1 Gb NIC.<br>• Server \ not on warranty<br>• vCenter \ version<br>• Datastore \ VMFS version<br>• vSAN \ version<br>• Switch \ version<br>• NSX \ version | • ESXi \ Too many variations. No standard<br>• Cluster \ Many VM Shares (CPU)<br>• Cluster \ Many VM Shares (RAM)<br>• Cluster \ Resource Pools<br>• Cluster \ Stretched compute + storage<br>• Cluster \ 32 nodes or more<br>• Cluster \ VM to Host affinity<br>• Cluster \ Too many storage paths<br>• Datastore \ Shared by >1 cluster WLP uses this<br>• Datastore \ Many paths<br>• Network \ LBT?<br>• Network \ MAC Address change | • ESXi \ low CPU cores count<br>• ESXi \ low RAM size<br>• ESXi \ Powered Off<br>• ESXi \ HT Disabled<br>• ESXi \ 4 socket or higher.<br>• Cluster \ small clusters \ host especially for vSAN<br>• Cluster \ small clusters \ CPU<br>• Cluster \ small clusters \ RAM<br>• Cluster \ EVC Mode<br>• Cluster \ High Reservation<br>• Cluster \ DRS Automation Level<br>• Cluster \ DPM disabled<br>• vSAN \ All Flash: Dedupe disabled<br>• vSAN \ All Flash: Compressed disabled<br>• Datastore \ small<br>• Datastore \ low VM count<br>• Datastore \ no ESXi<br>• Distributed Switch \ unused |

### Design Considerations

The dashboards display configurations that need immediate attention, before displaying the overall configuration. This helps you take measures toward optimizing configuration.

Operations vary among customers, and as a result, it is not possible to design one dashboard to meet every customer's operational needs. A configuration that is important for one customer might not be relevant for another customer. Tailor the dashboard to your unique environment. You can collapse or expand the widgets to allow relevant data to be displayed.

The overall layout is designed to balance ease of use, performance (loading time of the dashboard page), and completeness of configuration check. As a result, not all configuration settings are displayed. Lack of screen real estate is another consideration behind the design.

## Cluster Configuration Dashboard

Use the **Cluster Configuration** dashboard to view the overall configuration of vSphere clusters in your environment, especially configurations that need attention.

### Design Considerations

See the Configuration Dashboards page for common design considerations among all the dashboards for configuration management.

As there are many configurations to be verified, if you have a larger screen, add additional checks as you deem fit, or add legends to the pie-charts.

### How to Use the Dashboard

The **Cluster Configuration** dashboard is organized into sections for ease of use.

- The first section of the dashboard consists of three bar-charts. They correspond to the three main features of vSphere clusters, namely High Availability (HA), Dynamic Resource Scheduler (DRS), and Distributed Power Management (DPM).
  - HA: The best practice is to activate HA admission control. You can specify the admission control policy in the vCenter and the threshold for failover shares.
  - DRS: The best practice is to activate DRS. Envision the vSphere cluster as a single logical computer that balances within itself.
  - DPM: The best practice is to activate DPM in an environment where environmental concern is the top priority or the high peak rarely occurs as most of the time you run very low utilization.
- The second section of the dashboard consists of eight pie-charts. They show the relative distribution of key configurations.
  - Two of the bar-charts cover admission control. You must activate admission control. The pie-charts displays the policy code instead of the policy name, as it is based on the property: `Cluster Configuration | Das Configuration | Active Admission Control Policy`. The mapping between the code to name is:
    - -1 = Disabled
    - 0 = Cluster Resource Percentage
    - 1 = Slot Policy (Powered-on VMs)
    - 2 = Dedicated Failover Hosts
  - There are two bar-charts that cover the HA Failover Share. One for CPU, and one for memory.
  - The next two bar-charts cover DRS settings. You might want to fully automate DRS, which means that there is no operator intervention required for both initial VM placement and subsequent load balancing, but with a moderate migration threshold (value = 3.0). The value ranges from 1.0 to 5.0.
  - There are two pie-charts that show reservation. One for CPU and one for memory. Minimize the total reservation value as it prevents overcommit of resources and hence results in less optimal utilization. Memory reservation can remain and occupy the memory space of the ESX host, even though the VM does not use the memory anymore. Consider the analogy of unused files that you have not opened for months in the c:\ drive of your laptop. They still take up space on the hard disk. Keep the number of distinct shares to below three (or at a minimum), matching the distinct classes of service.
- The third section of the dashboard consists of two bar-charts. They show the absolute distribution of the clusters.
  - The first bar-chart displays the cluster grouped by the number of ESX hosts. Small clusters, defined as having a lower number of ESX hosts, have a higher overhead while large clusters have a higher risk if there are cluster-wide outages. Performance risk is lower, because there are more nodes that DRS can tap on, but if there is an actual problem, troubleshooting can be tougher, because there are more nodes to analyze. For large clusters, have a disaster recovery plan as an unexpected cluster-wide outage can impact many VMs.
- The fourth section of the dashboard lets you drill-down to an individual cluster.
  - A table lists all the clusters with their key configuration. You can export this list as a spreadsheet for further analysis or reporting.
  - Select a cluster. The list of ESX hosts under the cluster, with shares and resource pool information, is automatically filled up.
  - Keep the number of distinct shares to below three (or at a minimum), matching the distinct classes of service. Avoid providing different services to individual VMs as that increases the complexity of the cluster performance.
  - Keep the number of resource pools minimal.
  - Some of the columns are color coded to facilitate quick reviews. Adjust their threshold to either reflect your current situation or your desired ideal state.

**Points to Note**

- The number of buckets in the pie-chart or bar-chart are balanced between the available screen estate, ease of use, and functionality. Modify the buckets to either reflect your current situation or your desired ideal state.
- `No data to display` does not imply that there is something wrong with data collection by VCF Operations. It might signify that none of the objects meet the filtering criteria of the widget, and as a result there is nothing to display.
- In a large environment, create a filter for this dashboard. Group by the class of services such as, gold, silver, and bronze. Default the selection to gold. In this way, your monitoring is not cluttered with less critical workloads.

- To view the content of a slice in a pie-chart or a bucket in a bar-chart, click on it. The list cannot be exported. Clicking an object name, takes you to the object summary page. The page provides key configuration information, with other summary information.

## ESX Configuration Dashboard

Use the ESX **Configuration** dashboard to view the overall configuration of the ESX hosts in your environment, especially the configurations that need attention.

### Design Considerations

See the Configuration Dashboards page for common design considerations among all the dashboards for configuration management.

As there are many configurations to be verified, if you have a larger screen, add additional checks as you deem fit, or add legends to the pie-charts.

### How to Use the Dashboard

The ESX **Configuration** dashboard is organized into sections for ease of use.

- The upper section of the dashboard displays basic ESX configurations that should be standardized for ease of operations.
  - There are six pie-charts that are displayed as one set because there is a relationship between their values. There should be a correlation between them. Ideally, the ESX version, the ESX build, and the BIOS must be identical across all ESX hosts in a cluster. Keep the variations of the hardware model, NIC speed, and storage path minimal. The more complex the pie-chart, the more variants you have. This results in complex operations, that potentially results in higher operating expenses.
  - The configurations should reflect your current architecture standard. Each pie-chart counts the occurrences of a particular value. A large slice signifies that the value is the most common value, and if that is not your current standard, then you must address it.
- The second section of the dashboard displays configurations that are potentially suboptimal.
  - The three bar-charts display various size dimensions of the ESX hosts. The bar-charts are designed to be seen as one set. Ensure that there are a minimal number of variations to reduce complexity.
  - Smaller ESX hosts have a relatively higher overhead, and are limited in running larger VMs. If they have a low core count, they might be using an outdated CPU. Small ESX hosts are more expensive on a per core, per GB, per rack unit basis than larger ones if they occupy the same space. However, a 4-CPU socket ESX host is likely to be too large, resulting in a concentration risk (too many VMs in a single ESX host). Maintain a good balance that balances your budget and risk constraints.
  - Adjust the distribution chart bucket size to fit your environment.
- The third section of the dashboard displays configurations that you might want to avoid.
  - The six bar-charts focus on security, availability, and capacity settings that you can set as a standard. For example, you should consider activating the NTP daemon for a consistent time, which is critical for logging and troubleshooting.
  - The three tables list the actual ESX hosts that are in a non-productive state. They can be on maintenance mode, powered off, or in a disconnected state.
- The last section of the dashboard displays all the ESX hosts in your environment.
  - You can sort the columns and export the results into a spreadsheet for further analysis.
  - Some of the columns are color-coded to facilitate quick reviews. Adjust their threshold to either reflect your current situation or your desired ideal state.

### Points to Note

- The number of buckets in the pie-chart or bar-chart are balanced between the available screen estate, ease of use, and functionality. Modify the buckets to either reflect your current situation or your desired ideal state.

- `No data to display` does not imply that there is something wrong with data collection by VCF Operations. It might signify that none of the objects meet the filtering criteria of the widget, and as a result, there is nothing to display.
- In a large environment, create a filter for this dashboard. Group by the class of services such as, gold, silver, and bronze. Default the selection to gold. In this way, your monitoring is not cluttered with less critical workloads.
- For complete visibility, consider adding physical server monitoring by using the appropriate management pack. For more information, see the following page.

## Network Configuration Dashboard

Use the **Network Configuration** dashboard to view the overall configuration of vSphere distributed switches in your environment, especially for the areas that need your attention.

### Design Considerations

See the Configuration Dashboards page for common design considerations among all the dashboards for configuration management.

### How to Use the Dashboard

The dashboard is organized into two sections for ease of use.

- The first section displays network configurations that need your attention.
  - There are five bar-charts that focus on critical security settings.
  - The last bar-chart displays the version of the vSphere Distribution Switch. Aim to keep the version current, or match your vSphere version.
- The second section provides overall configuration information, with the ability to drill down to a specific switch.
  - Click the row to select a switch from the list.
  - The ESX hosts, port groups, and the VMs on the switch are displayed.
  - Review each of the tables. For the ESX host table, ensure that the settings are consistent.
  - Some of the columns are color-coded to facilitate quick reviews. Adjust their threshold to either reflect your current situation or your desired ideal state.
  - You can sort the columns and export the result into a spreadsheet for further analysis.

### Points to Note

- `No data to display` does not imply that there is something wrong with data collection by VCF Operations. It might signify that none of the objects meet the filtering criteria of the widget, and as a result there is nothing to display.
- For complete visibility, consider adding physical network device monitoring by using the appropriate management pack. For more information, see the following page.
- To view the content of a slice in a pie-chart or a bucket in a bar-chart, click on it. The list cannot be exported. Clicking an object name, takes you to the object summary page. The page provides key configuration information, with other summary information.

## VM Configuration Dashboard

Use the **VM Configuration** dashboard to view the overall configuration of virtual machines in your environment, especially for the areas that need attention.

### Design Considerations

See the Configuration Dashboards page for common design considerations among all the dashboards for configuration management.

As there are many configurations to be verified, if you have a larger screen, add additional checks as you deem fit, or add legends to the pie-charts.

### How to Use the Dashboard

- Click the row to select a data center from the data center table.
  - In a large environment, loading thousands of VMs increases the web page loading time. As a result, the VM is grouped by data center. In addition, it might make sense to review the VM configuration per data center.
  - For a small environment, vSphere World is provided, so you can view all the VMs in the environment.

  The **VM Configuration** dashboard is organized into three sections for ease of use. All the three sections display the VM configuration for the selected data center.
- The first section covers limits, shares, and reservations.
  - Their values can easily become inconsistent among VMs, especially in an environment with multiple vCenter instances.
  - Shares should be mapped to a service level, to provide a larger proportion of shared resources to those VMs who pay more. This means that you should only have as many shares as your service levels. If your IaaS provides gold, silver, and bronze, then you should have only three types of shares.
  - Value of the shares and reservation is relative. If you move a VM from one cluster to another (in the same or different vCenter), you might have to adjust the shares.
  - Reservation impacts your capacity. Memory reservation works differently from CPU reservation, and it is more permanent.
- The second section covers VMware Tools.
  - VMware Tools is a key component of any VM, and should be kept running and up to date.
- The third section covers other key VM configurations.
  - Keep the configurations consistent by minimizing the variants. This helps to reduce complexity.
  - **VM Network Cards** widget. If you suspect that your environment might have a VM with no NIC, consider adding it as a dedicated bucket.
- The last section of the dashboard is collapsed by default.
  - You can view all the VMs with their key configurations.
  - You can sort the columns and export the results into a spreadsheet for further analysis.

### Points to Note

- The number of buckets in the pie-chart or bar-chart are balanced between the available screen estate, ease of use, and functionality. Modify the buckets to either reflect your current situation or your desired ideal state.
- `No data to display` does not imply that there is something wrong with data collection by VCF Operations. It might signify that none of the objects meet the filtering criteria of the widget, and as a result there is nothing to display.
- To view the content of a slice in a pie-chart or a bucket in a bar-chart, click on it. The list cannot be exported. Clicking an object name, takes you to the object summary page. The page provides key configuration information, with other summary information.
- The pie-chart and bar-chart cannot drive other widgets. For example, you cannot select one of the pie-slices or buckets, and expect it to act as a filter to a list or a table.
- You can apply a specific color in a pie-chart or distribution chart for a specific numeric value, but not string value. For example, you cannot apply the color red to the value `Not Installed`.

## vSAN Configuration Dashboard

The **vSAN Configuration** dashboard provides overall configuration details and is useful in large clusters with many vSANs, where you have to follow a certain standard configuration.

### Design Considerations

See Configuration Dashboards for common design considerations among all the dashboards for configuration management.

### How to Use the Dashboard

The **vSAN Configuration** dashboard is organized into three sections for ease of use.

- The first section displays six pie-charts.
  - There are five bar-charts that focus on critical security settings.
  - The last bar-chart shows the version of the vSphere Distribution Switch. Aim to keep the version current, or match your vSphere version.
- The second section displays three bar-charts.
  - The three bar-charts together provide a good overview of the vSAN key capacity configuration. By analyzing the distribution, you can identify if you have capacity configuration that is outside your expectation.
- The last section of the dashboard displays all the vSAN clusters with their key configuration.
  - Some of the columns are color-coded to facilitate quick reviews. Adjust their threshold to either reflect your current situation or your desired ideal state.
  - You can sort the columns and export the result into a spreadsheet for further analysis.

**Points to Note**

- The number of buckets in the pie-chart or bar-chart are balanced between the available screen estate, ease of use, and functionality. Modify the buckets to either reflect your current situation or your desired ideal state.
- To view the content of a slice in a pie-chart or a bucket in a bar-chart, click on it. The list cannot be exported. Clicking an object name, takes you to the object summary page. The page provides key configuration information, with other summary information.

## Workload Management Configuration Dashboard

This dashboard provides a quick configuration summary of all the key objects associated with workload management such as Supervisor Clusters, Namespaces, vSphere Pods and Tanzu Kubernetes clusters. It is essential that the configuration is consistent across all the objects. Configuration drifts may result in inconsistent performance or availability of the applications leveraging workload management Kubernetes constructs.

Use the dashboard to ensure that the configuration is consistent across all objects.

You can view the following widgets in the dashboard.

- **Environment Summary**
- **Supervisor Cluster Versions**
- **Cluster Status**
- **Pod Data**
- **Supervisor Cluster Configuration Summary**
- **Pod Configuration Summary**
- **Kubernetes cluster Configuration Summary**
- **Namespace Configuration Summary**

## Consumer \ Correct it? Dashboard

The **Consumer \ Correct it?** dashboard complements the main VM configuration dashboards by displaying the actual VMs, with their relevant information. The dashboard is designed for vSphere administrators and the platform team, to facilitate follow-up action with the VM owners. The **Consumer \ Correct it?** dashboard is one of the eight dashboards that check the environment for optimization opportunities.

**Design Considerations**

The dashboard is designed to focus on VMs that need attention. Lists are used to keep it simple, and show actual objects. The lists can be tailored using the filter and the custom group. The lists can also be exported for an offline discussion.

The dashboard is extendable, reflecting the reality that different customers have a different set of settings to verify. Since the dashboard layout is a collection of tables (List View), you can extend it by adding more tables. You can add more List View widgets to verify the VM configurations that your operations require.

**How to Use the Dashboard**

The **Consumer\Correct it?** dashboard is a collection of tables (List View), which can be reviewed independently. Click the object name to navigate to the Object Summary page to view more configurations. There can be valid reasons why specific configurations are not followed. It is recommended that you discuss best practices with VMware.

- Tools Widgets:
  - Using VMware Tools has multiple benefits.
  - VCF Operations uses VMware Tools to retrieve Guest OS metrics. Without this, right-sizing VM memory can be inaccurate, because the hypervisor metrics (VM Memory Consumed and VM Memory Active) are not designed to measure Windows or Linux memory utilization. ESX VMkernel does not have visibility into the Guest OS for security reasons.
  - Independent software vendor (ISV) support is the most common reason that VMware Tools is not installed. The ISV vendor might claim that no additional software is installed in their appliance unless they have certified it.
  - If VMware Tools is installed, there might be reasons why the application team deactivates it. The Infrastructure team should inform and educate their application team, and document the technical recommendations about why VMware Tools is recommended to be running all the time.
- CPU Limits and Memory Widgets:
  - It is recommended that you do not use memory and CPU limits as it can result in an unpredictable performance. The Guest OS is not aware of this restriction as it is at the hypervisor level. It is recommended that you shrink the VM instead.
- Guest OS Counters Missing Widget:
  - There is no visibility into the Guest OS performance counters because the requirements are not met. The memory counter is especially important as VM Consumed and VM Active are not replacements for Guest OS counters. See KB 55675 for more details.
- Old Snapshot Widget:
  - Ensure that the snapshot is removed within one day after the change request. If not, it might result in a large snapshot and impact the performance of the VM.

**Points to Note**

- Add a banner summary to the top of this dashboard so that you can verify if there is an incorrect confirmation. Add a scoreboard and select the World object and then collapse all the tables below. Create a super metric for each summary and apply it to the World object.
- In a large environment, create a filter for this dashboard to help you to focus on a segment of the environment. Group it by a class of service such as, gold, silver, and bronze. Default the selection to gold, your most important environment. In this way, your monitoring is not cluttered with less critical workloads.
- There are other VM configurations that maybe relevant to your environment. Review the list of VM settings that you might want to add to this dashboard.
- For context, add a property widget that lists the selected VM properties. In this way, you can check the property of your interest without leaving the screen. Multiple List View widgets can drive the same property widget, so you do not have to create one property widget for each List View.
- If your operations require it, add a list of VMs that do not have these three key performance counters: CPU Run Queue, CPU Context Switch, and Disk Queue Length.

## Consumer \ Optimize it? Dashboard

The **Consumer \ Optimize it?** dashboard complements the main VM configuration dashboard by displaying the actual VMs, with their relevant information. The dashboard is designed for vSphere administrators and the platform team, to facilitate follow-up action with the VM owners. The **Consumer \ Optimize it?** dashboard is one of the eight dashboards that check the environment for optimization opportunities. A suboptimal configuration might not impact performance or increase complexity, but it can be more expensive.

### Design Considerations

The **Consumer \ Optimize it?** dashboard follows the same design considerations specified for the Consumer \ Correct it? Dashboard. The eight Configuration > Review dashboards form an optimization flow and are designed as a set. Use them together, as you go through the optimization review process.

### How To Use the Dashboard

The **Consumer \ Optimize it?** dashboard is a collection of tables (List View), that can be reviewed independently. Click the object name to navigate to the Object Summary page to view more configurations. There can be valid reasons why specific configurations are not followed. It is recommended that you discuss best practices with VMware.

- VM Reservation:
  - VM reservation causes a positive impact on the VM, but a negative impact on the cluster. Total reservation cannot exceed cluster capacity. This creates a suboptimal cluster as VMs do not use the entire assigned memory at the same time.
  - VM reservation places a constraint on the DRS placement and HA calculation. Avoid using reservation as a means to differentiate performance SLA among all the VMs in the same cluster. It is difficult to correlate CPU Ready with CPU Reservation. A VM CPU Ready does not improve two times because you increase its CPU reservation by two times. There is no direct correlation.
- Guest OS visibility:
  - Since your workloads are sharing resources and are over-committed, your operations are easier if you know what is running inside. This helps with monitoring and troubleshooting, resulting in optimal operations.
  - For critical VMs, consider logging the Guest OS, such as Windows and Linux, to capture errors that do not surface as metrics. These errors typically appear as events in the log files or in the event database in the case of Windows. Use Log management to parse Windows events into log entries that can be analyzed.
- Snapshot:
  - Old snapshots tend to be larger. They consume more space and have a higher chance of impacting performance.

### Points to Note

See the **Points to Note** section as specified in the Consumer \ Correct it? Dashboard. This dashboard follows the same design considerations, and as a result shares limitations and customization ideas.

## Consumer \ Simplify it?

The **Consumer \ Simplify it?** dashboard complements the main VM configuration dashboard by displaying the actual VMs, with their relevant information. The dashboard is designed for vSphere administrators and the platform team, to facilitate follow-up action with the VM owners. The **Consumer \ Simplify it?** dashboard is one of the eight dashboards that check the environment for optimization opportunities.

### Design Considerations

The **Consumer \ Simplify it?** dashboard follows the same design considerations specified for the Consumer \ Correct it? Dashboard. The eight Configuration > Review dashboards form an optimization flow and are designed as a set. Use them together, as you go through the optimization review process.

### How to Use the Dashboard

The **Consumer \ Simplify it?** dashboard is a collection of tables (List View), that can be reviewed independently. Click the object name to navigate to the Object Summary page to view more configurations. There can be valid reasons why specific configurations are not followed. It is recommended that you discuss best practices with VMware.

- Large VMs (CPU, Memory, and Disk):
  - A large VM, relative to the underlying ESX host and datastore, requires more careful planning (Day 0) and monitoring (Day 2).

  - Ensure that the VM size does not exceed the size of the underlying ESX host. If your ESX host has CPU hyper-threading, do not count the logical processor. Instead, count the physical core. For best performance, keep it within a (non-uniform memory access) NUMA boundary.
  - During monitoring, verify if the VM is highly utilized. If the VM vCPU count is equal to the ESX cores, and the VM is running at almost full capacity, you might not be able to run other VMs. Large VMs can impact the performance of other VMs, especially if it is given higher shares. Only when the large VM is under-utilized, can the ESX hosts run other VMs.
  - If the number of configured vCPUs on a VM is higher than the number of cores per socket on the ESX, the VM can experience the NUMA effect. If the ESX has more than one physical CPU (socket), cross-NUMA access negatively impacts performance.
  - The larger the VM, the longer the time required to vMotion, Storage vMotion, and backup.
  - For disk space, if the disk is thin-provisioned and under-utilized, you can deploy other VMs in the same datastore. Ensure that the snapshot is tracked closely, as the risk of capacity running out is higher for a large virtual disk.
- VMs with many virtual disks:
  - It is simpler to have a 1:1 mapping between Guest OS partitions and the underlying virtual disk (VMDK or RDM).
  - For performance and capacity, evaluate the disks and partitions. Each virtual disk must be monitored in terms of IOPS, throughput, and latency. Having multiple virtual disks increases the monitoring and troubleshooting need.
  - If the reason for having many virtual disks is performance, identify which counter serves as proof that multiple virtual disks are required. It is possible that the performance required is met by a single virtual disk.
- VM with many IP addresses or NICs:
  - A VM might need multiple networks, such as production, back up, and management. It is recommended that you route the network interfaces through the NSX-Edge VM. A VM that has multiple network interfaces can bridge the network, causing security risks or network problems.
  - A VM that is part of multiple networks can do so with just a single NIC. A single NIC can be configured to access multiple networks, with each interface having their own IP configuration.

#### Points to Note

See the **Points to Note** section as specified in the Consumer \ Correct it? Dashboard. This dashboard follows the same design considerations, and hence shares limitations and customization ideas.

## Consumer \ Update it? Dashboard

The **Consumer \ Update it?** dashboard complements the main VM configuration dashboard by displaying the actual VMs, with their relevant information. The dashboard is designed for vSphere administrators and the platform team, to facilitate follow-up action with the VM owners. The **Consumer \ Update it?** dashboard is one of the eight dashboards that check the environment for optimization opportunities.

#### Design Considerations

The **Consumer \ Update it?** dashboard follows the same design considerations specified for the Consumer \ Correct it? Dashboard. The eight Configuration > Review dashboards form an optimization flow and are designed as a set. Use them together, as you go through the optimization review process.

#### How to Use the Dashboard

The **Consumer \ Update it?** dashboard is a collection of tables (List View), which can be reviewed independently. Click the object name to navigate to the Object Summary page to view more configurations. There can be valid reasons why specific configurations are not followed. It is recommended that you discuss best practices with VMware.

- Outdated Tools Widget:
  - Lists all the VMware Tools versions that are still supported. Tailor the filter to fit your operational needs.
- Outdated VM Hardware Widget:
  - Lists all the VM vmx versions that are not 13, 14, 15, or 16. Tailor the filter to fit your operational needs.
- Outdated Windows and Red Hat Widgets:
  - Lists all the Windows client versions that are not version 10.

  - Lists all the Windows server versions that are not versions 2016 and 2019.
  - Lists all the RHEL versions that are not version 7 or 8.
  - If you run other operating systems like Ubuntu, clone the widget. You can also repurpose the widget if you do not run RHEL and Windows.

#### Points to Note

See the **Points to Note** section as specified in the Consumer \ Correct it? Dashboard. This dashboard follows the same design considerations, and hence shares limitations and customization ideas.

## Provider \ Correct it? Dashboard

The **Provider \ Correct it?** dashboard complements the main vSphere configuration dashboards by displaying the actual vSphere objects, with their relevant information. The dashboard is designed for vSphere administrators and the platform team. The **Provider \ Correct it?** dashboard is one of the eight dashboards that check the environment for optimization opportunities.

#### Design Considerations

The **Provider \ Correct it?** dashboard follows the same design considerations specified in the Consumer \ Correct it? Dashboard. The eight Configuration > Review dashboards form an optimization flow and are designed as a set. Use them together, as you go through the optimization review process.

#### How to Use the Dashboard

The dashboard is organized into three sections for ease of use.

- The first section covers vSphere cluster configurations.
  - A cluster is the smallest logical building block for compute. Consider it as a single computer with physically independent components. As a result, consistency matters.
  - Clusters with DRS set to manual. This means that DRS initiated vMotion does not take place unless the administrator manually approves it. Since DRS calculates every five minutes, your quick approval is required to prevent a change of condition.
  - Clusters with HA disabled. Without high availability provided by the infrastructure, each application must protect itself from an infrastructure failure.
  - Clusters with DRS disabled. DRS focuses on performance and capacity, while HA focuses on availability. Without DRS, you must build a buffer on every ESX host to cope with peak demand.
  - Clusters with Admission Control disabled. Reservation is respected only when Admission Control is activated.
- The second section covers the ESX host configurations.
  - ESX with Network Time Protocol disabled. Logs are a critical component of operations, and are the main source of information in troubleshooting. While troubleshooting performance across objects, the sequence of logs determines which event is the likely root cause, as the oldest event starts the chain of events.
  - A disconnected ESX host indicates that the ESX host is not participating in HA and you cannot migrate any VM on it.
  - An ESX host that is in maintenance mode does not contribute resources to the cluster or the data center if there is a standalone ESX.
- The third section covers ESX host configurations that must be consistent within a cluster.
  - BIOS version and ESX versions.
  - BIOS Power Management, ESX: Power Management. Ideally, should be set to OS controlled. The ESX level should be set to balance level.
  - ESX Storage Path. Ensure that the number of paths and the path policies are identical.
  - ESX hardware specifications. Different specifications can result in inconsistent performances experienced by the VM.

#### Points to Note

- See the **Points to Note** section as specified in the Consumer \ Correct it? Dashboard. This dashboard follows the same design considerations, and as a result, shares limitations and customization ideas.
- If you have a standalone ESX, and you plan to replace it with a clustered ESX host, add a table to list them.
- Based on your security settings, add a table to check the Distributed Switch and Port Group to ensure that security settings such as promiscuous mode, are used correctly.

## Provider \ Optimize it? Dashboard

The **Provider \ Optimize it?** dashboard complements vSphere configuration dashboards by displaying the actual vSphere objects, with their relevant information. The dashboard is designed for vSphere administrators and the platform team. The **Provider \ Optimize it?** dashboard is one of the eight dashboards that checks the environment for optimization opportunities.

#### Design Considerations

The **Provider \ Optimize it?** dashboard follows the same design considerations specified in the Consumer \ Correct it? Dashboard. The eight Configuration > Review dashboards form an optimization flow and are designed as a set. Use them together, as you go through the optimization review process.

#### How to Use the Dashboard

The dashboard is organized into three sections for ease of use.

- The first section covers vSphere cluster configurations:
  - A small cluster has a higher HA overhead when compared to a large one. For example, a three-node cluster has 33% overhead while a 10-node cluster has 10%. For vSAN, a low number of hosts limits the availability option. Your choice of FTT is relatively more limited.
  - Many small clusters result in silos of resources. As a cluster behaves like a single computer, ensure that it has enough CPU cores, CPU GHz, and Memory. For ESX in 2020, it is typical to have 512 GB of RAM. This results in 12 TB of RAM for a 12-node cluster, which is enough for DRS to place many VMs as it balances them.
  - If there is a lot of reservation, add a list for clusters with a relatively high reservation. If your clusters are of different sizes, use a super metric to convert the reservation value to a percentage.
- The second section covers ESX host configurations.
  - Small ESX. A small host faces scalability limits in running a larger VM. While a 2-socket, 32-cores, 128 GB memory ESX can run 30 vCPU, 100 GB RAM VMs, the VM experiences a non-uniform memory access (NUMA) effect.
  - ESX powered off. You can mark the ESX hosts for decommissioning using the custom property feature of VCF Operations. You can then create a separate list, so they are not overlooked.
- The third section cover storage and network.
- Unused network (distributed port group). This is a potential security risk as you might not monitor it.

#### Points to Note

- See the **Points to Note** section as specified in the Consumer \ Correct it? Dashboard. This dashboard follows the same design considerations, and as a result, shares limitations and customization ideas.
- For CPU cores, a change in vSphere licensing means that the ideal core is 32-cores per CPU socket. This maximizes the software license.

## Provider \ Simplify it? Dashboard

The **Provider \ Simplify it?** dashboard complements vSphere configuration dashboards by displaying the actual vSphere objects, with their relevant information. The dashboard is designed for vSphere administrators and the platform team. The **Provider \ Simplify it?** dashboard is one of the eight dashboards that checks the environment for optimization opportunities.

### Design Considerations

The **Provider \ Simplify it?** dashboard follows the same design considerations specified in the Consumer \ Correct it? Dashboard. The eight Configuration > Review dashboards form an optimization flow and are designed as a set. Use them together, as you go through the optimization review process.

### How to Use the Dashboard

- Click the row in the **Clusters** widget to select one of the clusters from the table.
  - A cluster is more complex to operate when it has resource pools, shares, and limits.
- Review the list of resource pools:
  - Ensure that the number of VMs in each resource pool reflects the intended settings for the VM. The resource pool value is divided and shared among the VMs. The more the VMs, the lesser the resources allotted to each VM.
  - Verify if there are VMs who are siblings to the resource pools.
  - Verify if the resource pools are further split into subresource pools.
- Review the CPU Share and Memory Shares pie-charts:
  - Multiple combinations of shares, especially both CPU and memory, makes troubleshooting difficult.
  - Each share must map to exactly one class of service, such as one for gold and one for silver as the shares define the class of service. Shares are also relative, meaning the value depends on the value of sibling objects, such as, resource pool or VM. Ensure that the values are consistent across clusters to avoid unintended consequences while moving the VM to another cluster.
- Review the CPU Reservation and Memory Reservation tables:
  - High total reservation, especially both CPU and memory, complicates the cluster operations as it impacts the HA slot calculation, and limits the DRS choice of placement.
- Click the object name to navigate to the Object Summary page to view more configurations. There can be valid reasons why specific configurations are not followed. It is recommended that you discuss best practices with VMware.

### Points to Note

See the **Points to Note** section as specified in the Consumer \ Correct it? Dashboard. This dashboard follows the same design considerations, and as a result, shares limitations and customization ideas.

## Provider \ Update it? Dashboard

The **Provider \ Update it?** dashboard complements the main vSphere configuration dashboards by displaying the actual vSphere objects, with their relevant information. The dashboard is designed for vSphere administrators and the platform team. The **Provider \ Update it?** dashboard is one of the eight dashboards that checks the environment for optimization opportunities.

As part of operations best practices, keep the infrastructure up to date. Running outdated components that are too far behind the latest version, can cause support problems or upgrade problems. It is common that the fix for the problem is only available in the later versions. Outdated hardware can also result in higher operating costs. Outdated hardware might cost more data center footprint, such as rack space, cooling, and UPS. Refreshing your technology and consolidation are two common techniques to optimize cost.

### Design Considerations

The **Provider \ Update it?** dashboard follows the same design considerations specified in the Consumer \ Correct it? Dashboard. The eight Configuration > Review dashboards form an optimization flow and are designed as a set. Use them together, as you go through the optimization review process.

### How to Use the Dashboards

The **Consumer \ Update it?** dashboard is a collection of tables (List View) that can be reviewed independently. Click the object name to navigate to the Object Summary page to view more configurations. There can be valid reasons why specific configurations are not followed. It is recommended that you discuss best practices with VMware.

- Outdated vSphere Components Widgets:

  - Lists all the vCenter Servers versions that are not 6.7 or 7.0.
  - Lists all the ESX host versions that are not 6.5, 6.7, or 7.0.
  - Lists all the vSAN ESX host versions that are not 6.7 or 7.0. A more stringent filter is applied for vSAN because of a relatively higher maturity in the latest release. From VCF Operations and Log management, there are more counters, properties, and events that improve monitoring and troubleshooting.
  - Lists all the vSphere distributed switches, regardless of the version.
  - You should tailor the filter to fit your operational needs.
- Outdated Server BIOS Widget:
  - Lists all the ESX hosts regardless of the BIOS version. Edit the widget and tailor the filter to fit your operational needs.
- Other than customizing the existing widgets, consider adding the following checks:
  - ESX hosts with outdated hardware, using a filter based on your environment.
  - ESX hosts that are no longer on warranty. Create a custom property to capture the end of warranty.
  - Physical storage arrays with outdated firmware, model, and an expiring warranty.
  - Physical network switch with an outdated OS version and hardware model

    **Note:**
    Install the relevant management pack for the last two points.

**Points to Note**

See the **Points to Note** section as specified in the Consumer \ Correct it? Dashboard. This dashboard follows the same design considerations, and as a result, shares limitations and customization ideas.

# Cost Dashboards

The dashboards in the cost category cater to cloud administrators who are responsible for managing the expenses related to your cloud infrastructure. Using Cost dashboards, you can compare the cost of VMware cloud infrastructure with other cloud platforms. You can analyze the cloud comparison results and identify the opportunities to manage your cloud resources efficiently.

## Consumer Layer

The consumer layer dashboards of VCF Operations helps you to know how a customer can do a deeper analysis of the Return on Investment from the consumer perspective.

The available dashboards for consumers are:

- Chargeback VM Price Dashboard
- Showback VM Cost Dashboard
- Showback vSphere Pod Cost Dashboard

### Chargeback (Business Application Price)

In VCF Operations VMs are analyzed financially from the perspective of cost and price.

| | |
|---|---|
| **Cost** | Cost represents your expenditure to operate the VM for your customer. In VCF Operations, configure Cost Drivers to automatically calculate VM costs based on infrastructure expenses. Cost Drivers encompass server hardware, storage, licenses, applications, maintenance, labor, network, facilities, and additional costs set within VCF Operations. |
| **Price** | Price is what you charge your customer for using the VM. It can be based on the VM's cost or a predefined rate card, including upcharges, profit, and service charges. |

For configuring pricing cards for VCF Automation managed VMs, see the topic, What is Cloud Assembly. For other VMs, the information about configuring pricing cards is in the topic, Add New Pricing Card.

#### How to Use the Dashboard

Select an object in the **Select a Group** widget to view the price of the group. **Price Summary of Selected Group** shows the month to date price of the group. **VM Price Distribution (Top 100)** shows the most expensive VMs in the group. **Powered Off VMs** shows reclaimable VMs and their potential savings. **Idle VMs** shows reclaimable VMs and their potential savings. **VMs with Snapshots** shows reclaimable snapshots and their age. **Price of VMs in the Selected Group** shows the price and configuration of each VM in the selected group.

#### Customizing the Dashboard

The definition of a group is based on several constructs such as Virtual Machine Folder, Custom Groups, VMware Aria Automation Projects, and more. To add more objects for chargeback reporting, edit the **Select a Group** widget and select desired object types under **Output Filter** > **Basic** > **Object Types**.

> **Note:**
> Objects are not displayed correctly if the widget configuration is not complete. You must complete the object list widget configuration before you can edit the widget.

### Chargeback VM Price Dashboard

The chargeback VM price dashboard lets you know how much you must spend to run a VM on behalf of your customer. In VCF Operations, you can configure the cost drivers and let the system automatically determine how much a VM costs based on your infrastructure requirement. Cost Drivers cover server hardware, storage, licenses, application, maintenance, labor, network, facilities, and additional costs configured within VCF Operations.

Price is what you charge your customer for running their VM. The price of a VM can be based on the cost of the VM or based on a rate card that you define. Prices can include up charges, service charges, and others.

#### How to Use the Dashboard

- Select a Group widget displays the price of the group.
- Price Summary of Selected Group shows the month to date price of the group.
- VM Price Distribution (Top 100) shows the most expensive VMs in the group.
- Powered Off VMs shows reclaimable VMs and their potential savings.
- Idle VMs shows reclaimable VMs and their potential savings.
- VMs with Snapshots shows reclaimable snapshots and their age.
- Price of VMs in the Selected Group shows the price and configuration of each VM in the selected group.

### Showback (Business Application Cost)

This dashboard enables showback of VM cost based on groups.

Improve the accuracy of these costs by editing Cost Drivers. To edit Cost Drivers, see the topic, Editing Cost Drivers. Refer to Overview of Cost Drivers if you are not customizing Cost Drivers.

#### How to Use the Dashboard

Select an object in the **Select a Group** widget to view the cost of the group. **Cost Summary (This Month)** shows the month to date cost, potential savings, and projected cost of the group. **VM Cost Distribution (Top 100)** shows the most expensive VMs in the group. **Potential Savings (Top 10)** shows the VMs ranked by their potential savings. **Members of the Group (Select to View Trend)** shows the cost and configuration of each VM in the selected group. **Cost Trend of Selected VM** shows the trend of the VMs cost over time.

#### How to Customize the Dashboard

The definition of a group is based on several constructs such as Virtual Machine Folder, Custom Groups, VMware Aria Automation Projects, and more. To add more objects for showback reporting, edit the **Select a Group** widget and select desired object types under **Output Filter** > **Basic** > **Object Types**.

**Note:**
Objects are not displayed correctly if the widget configuration is not complete. You must complete the object list widget configuration before you can edit the widget.

### Showback VM Cost Dashboard

The Showback VM Cost dashboard provides a quick Showback of the cost associated with the VMs in a group. Based on the Showback you can improve the accuracy of the costs by editing the cost drivers. Cost drivers that are not customized use reference cost, cost driver customization is available only in Advanced or Enterprise edition of VCF Operations.

**How to Use the Dashboard**

- Select an object in the Select a Group widget to view the cost of the group.
- Cost Summary (This Month) shows the month to date cost, potential savings, and projected cost of the group.
- VM Cost Distribution (Top 100) shows the most expensive VMs in the group.
- Potential Savings (Top 10) shows the VMs ranked by their potential savings.
- Members of the Group (Select to View Trend) shows the cost and configuration of each VM in the selected group.
- Cost Trend of Selected VM shows the trend of the VMs cost over time.

### Showback vSphere Pod Cost Dashboard

The Showback vSphere Pod Cost Dashboard provides a quick Showback of the cost associated with the vSphere Pods in a group. Based on the Showback you can improve the accuracy of the costs by editing the cost drivers. Cost Drivers that are not customized use reference cost, cost driver customization is available only in Advanced or Enterprise edition of VCF Operations.

**How to Use the Dashboard**

- Select an object in the Select a Group widget to view the cost of the group.
- Cost Summary (This Month) shows the month to date cost and projected cost of the group.
- vSphere Pod Cost Distribution (Top 100) shows the most expensive vSphere Pods in the group.
- Idle vSphere Pods shows the vSphere Pods that have been identified as potentially idle.
- Members of the Group (Select to View Trend) shows the cost and configuration of each vSphere Pod in the selected group.
- Cost Trend of Selected vSphere Pod shows the trend of the vSphere Pod's cost over time.

## Provider Layer

The provider layer dashboards of VCF Operations, helps you to know how a customer can analyze the Return on Investment for the virtual infrastructure used in the customer’s environment.

The available dashboards for providers are:

- Assess Cost Dashboard
- Datacenter Cost Drivers Dashboard
- Server Hardware Depreciation Dashboard
- Base Rate Analysis Dashboard
- VM Cost versus Price Dashboard
- Reclaimable Hosts Dashboard

### Assess Cost Dashboards

The **Assess Cost** dashboard provides an overview of the scale of your infrastructure in terms of physical capacity available.

**Customizations Available for Your Use**

Certain data centers can be excluded, such as the development data centers that do not have to be expensed, by customizing the views in the widget.

**Widget Information**

- You can view the total cost of ownership per month for the infrastructure and the savings opportunities details, if any, for the infrastructure.
- You can view the details of the division of infrastructure investments across all data centers. The dashboard provides the magnitude of each data center in terms of the number of physical servers and virtual machines. It also provides details about the amount of savings that can be achieved from each of these data centers.
- The dashboard displays data about how you invest across clusters of different quality offered across all vCenter Servers.

## Base Rate Analysis Dashboard

The **Base Rate Analysis** dashboard helps you analyze the cost efficiency of your data center.

**Customizations Available for Your Use**

Certain data centers can be excluded, such as the development data centers that do not have to be expensed, by customizing the views in the widget.

**Widget Information**

- The total cost of ownership is the cost required to run your data center per month. This is derived from the cost drivers.
- The average cost per VM is derived by considering the cost of all the VMs in your environment. The cost of each VM depends on the base rate of the cluster the VM is placed on and its utilization. The base rate of the cluster is computed based on the total cost of ownership and the expected utilization levels of the cluster. Storage base rates are directly obtained from cost drivers.
- If the cluster is running on an allocation-based capacity model, the base rate is derived from the total cost of the cluster and the over-commit ratio. The base rate is indicative of how costly a resource is, on a given cluster.
- A base rate is derived from the total cost and the expected utilization of the cluster.
- A deeper analysis of the base rates can be performed using the CPU, memory, or storage-related widgets, which help rank clusters and datastores relative to their base rates.

## Business Applications Cost vs. Price

The Business Applications showback, chargeback, and cost vs. price dashboard helps analyze the relationship between the cost and pricing of VMs. Use this dashboard to ensure that the chargeback prices for VMs are adequate to cover their operational costs.

**How to Use the Dashboard**

- The **Select a Group** widget lets you select a group of VMs to analyze.
- The **Summary (Month to Date)** widget shows the month to date price and cost.
- The **Members of the Group (Select to View Trend)** shows all VMs in the selected group with their Month to Date Cost, Today's Cost, Month to Date Price, and Today's Price.
- The **Daily Cost and Daily Price** trend chart shows both cost and price over time.

> **Note:**
> Objects are not displayed correctly if the widget configuration is not complete. You must complete the object list widget configuration before you can edit the widget.

## Datacenter Cost Drivers Dashboard

The **Datacenter Cost Drivers** dashboard provides the cost of different data centers in a private cloud.

### Customizations Available for Your Use

Certain data centers can be excluded, such as the development data centers that do not have to be expensed, by customizing the views in the widget.

### Widget Information

- You can select individual data centers to view summary and trends. The summary of the data center costs is grouped into two:
  - Compute. Covers all the costs that are spent on compute related hardware, software, and services.
  - Non-Compute. Covers storage and network.
- Expense trends provide cost variations over a period which indicate infrastructure additions or removal to the data center.
- Cluster expenses indicate the component clusters of a data center that consume the costs. Datastores that represent the storage part of the data center cost are listed alongside.

  **Note:**
  Network costs are mapped directly to ESX hosts and hence are costed under compute as well, as of today. This might change in the future.
- When you select a cluster, you can view the component hosts that the cluster is made up of and their monthly depreciated costs. It also provides details on the purchase cost of the server and how many months until it depreciates completely.

  **Note:**
  Server costs can be suggested out-of-the-box by the system, or can be customized by the user. Depreciation information is not available for servers when the server costs are suggested out-of-the-box by the system. Depreciation information is available for those servers when the server cost is customized by the user.

## Reclaimable Hosts Dashboard

The Reclaimable Hosts dashboard helps you to identify clusters with reclaimable hosts and the potential cost savings from reclaiming the hosts. Reclaimable hosts are identified from the Total Recommended Capacity generated by the AI powered capacity engine in VCF Operations.

### Widget Information

- The Reclaimable Hosts Cost Pie Chart displays the reclaimable host cost distribution for individual clusters in your virtual environment.
- Potential Savings graph depicts the total cost savings (potential) for all the clusters in your virtual environment for a given period.
- The Top 10 Clusters with Reclaimable Hosts displays the number of reclaimable hosts.
- The Top 10 Clusters with Reclaimable Hosts by Cost displays the top 10 reclaimable hosts by cost.

## Server Hardware Depreciation Dashboard

The Server Hardware Depreciation Dashboard helps you to calculate the depreciation value for server hardware which is marked as owned in Cost Drivers. You can configure the depreciation cost settings as per your business requirement.

### Widget Information

- The Server Purchase Cost is the total purchase price of all servers as entered in Cost Drivers.

- Accumulated Depreciation is the amount of server purchase costs that have been depreciated according to purchase date and depreciation settings.
- Remaining Depreciation is the amount of server purchase costs left to be depreciated.
- Number of Fully Depreciated Servers identifies servers that have been fully depreciated. These servers may exhibit higher failure rates or have lower capacity. Use What-If scenarios to model the cost and capacity impact of replacing these servers.

### VM Cost vs. Price Dashboard

The VM Cost vs. Price Dashboard helps you to analyze the relationship between cost and price for virtual machines. You can use this dashboard to ensure the price of VMs for chargeback is sufficient to cover the cost of running virtual machines.

#### How to Use the Dashboard

- Select a Group allows selection of a group of VMs to analyze.
- Summary (Month to Date) shows the month to date price and cost.
- Members of the Group (Select to View Trend) shows all VMs in the selected group with their Month to Date Cost, Today's Cost, Month to Date Price, and Today's Price.
- Daily Cost and Daily Price trend chart shows both cost and price over time.

## Cost Optimization

The cost optimization dashboards are as follows:

- Cost Optimization Dashboard
- Potential Cost Savings Dashboard
- Realized Cost Savings Dashboard
- Total Cost of Ownership Dashboard
- VM Rightsizing Details Dashboard

### Cost Optimization Dashboard

The Cost Optimization dashboard helps you to measure the return on investment if you use VCF Operations to manage your virtual infrastructure. You can track the total cost of ownership of the entire environment along with potential savings and realized savings from recommendations provided, the dashboard helps you quantify the cost efficiency and cost savings over time.

Potential Savings is a summary of all cost savings opportunities identified by VCF Operations. Realized Savings is a summary of cost savings from actions performed that are related to recommendations provided by VCF Operations.

#### Widget Information

- Total Cost of Ownership provides details of the monthly cost of server hardware, licenses, maintenance, facilities, labor, network, storage, and additional costs.
- Average Cost per VM is a good indicator of cost efficiency over time. It is natural for the cost per VM to go up when new capacity is added and trend downwards as additional capacity is consumed. The goal is to reduce the average cost per VM over time.
- Realize Savings Breakdown shows the cost of reclaimed resources from the VM identified by VCF Operations.
- Potential Savings covers the cost savings opportunities identified by VCF Operations.

### Potential Cost Savings Dashboard

The Potential Cost Savings Dashboard helps you to measure the cost saving as reported by VCF Operations. You can evaluate the potential savings to track recommendations and improve cost efficiency over time. The dashboard shows

both cost savings and capacity savings for idle VMs, powered off VMs, VM snapshots, orphaned disks, oversized VMs, and reclaimable hosts.

**Widget Information**

- The Cost Savings Breakdown widget displays potential savings and reclaimable capacity for idle VMs, powered off VMs, VM snapshots, orphaned disks, oversized VMs, and reclaimable hosts. You can also view the allocation changes for the oversized VMs.
- Reclaimable widget provides the metric details for the reclaimable vCPU, reclaimable memory, and reclaimable disk space.
- The Optimization Opportunities Breakdown widget covers the projected costs to improve performance as identified by VCF Operations.
- Allocation Changes for Undersized VMs shows the number of vCPUs and GB of memory to add to undersized VMs.

## Realized Cost Savings Dashboard

The Realized Cost Savings Dashboard helps you to quantify the realized cost savings from actions performed that are related to recommendations provided by VCF Operations. You can analyze the realized savings to track improvements to cost efficiency over time. Realized savings covers powered off VMs that were flagged as idle, deleted VMs that were flagged as idle or powered off, deleted snapshots that were flagged as reclaimable, deleted disks that were flagged as orphaned, oversized VMs that were rightsized, and deleted hosts that were flagged as reclaimable.

**Widget Information**

- Realized Savings covers the cost savings from reclamation opportunities recommended by VCF Operations.
- The Reclaimed Capacity shows the amount of capacity that was reclaimed based on recommendations from VCF Operations.
- Allocation Changes for Oversized VMs shows the number of vCPUs and GB of memory removed from formerly oversized VMs.
- Cost of Deleted VMS shows the cost of all deleted VMs in the past 30 days, shows the cost of all deleted VMs (by cluster) for the past 30 days, and shows the year-to-date cost of all deleted VMs.

## Total Cost of Ownership Dashboard

The Total Cost of Ownership dashboard helps you to understand the total cost of ownership of your environment from multiple perspectives. You can use this dashboard to learn how cost drivers, capacity, and data centers affect the total cost of ownership.

**Widget Information**

- Cost Driver Breakdown widget shows how cost drivers affect the total cost of ownership.
- Cost of Capacity Used and Capacity Remaining widgets shows cost breakdown by the cost of capacity used and the cost of capacity remaining.
- Cost per Datacenter widget shows how the costs broken down per data center.

## VM Rightsizing Details Dashboard

The VM Rightsizing Details dashboard provides an overview of the rightsizing recommendations for Undersized VMs and Oversized VMs. Rightsizing is defined as changing the amount of resources allocated to a VM based on the Recommended Size for a VM. Recommended Size is the maximum projected utilization for the projection period from the current time to 30 days after the warning threshold value for time remaining.

**How to Use the Dashboard**

- Select a Cluster, Datacenter, or World Object.

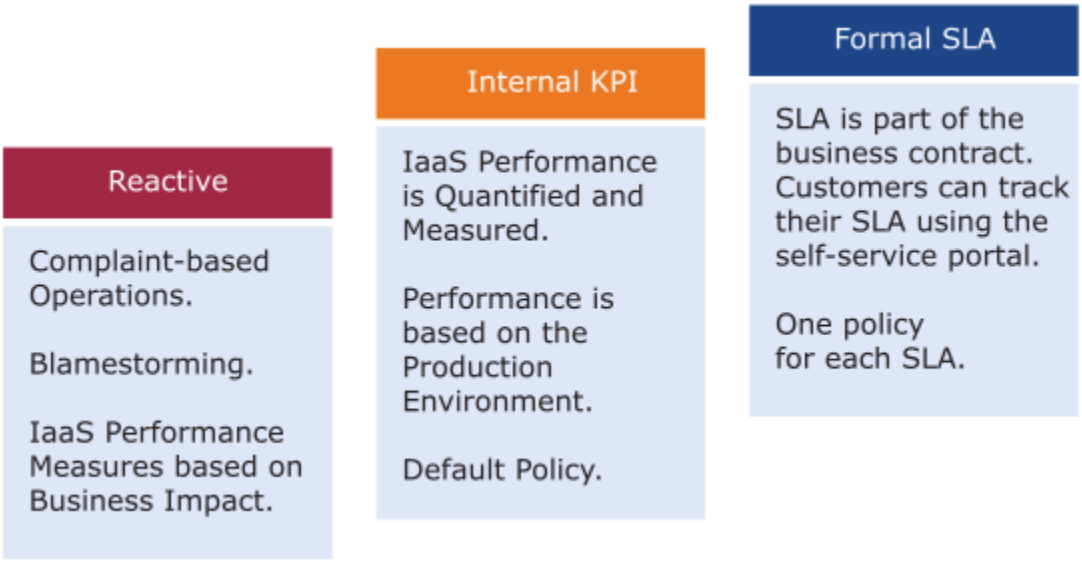
- Select an Undersized VM to view the recommendations.
- Select an Oversized VM to view the recommendations.
- Search for a VM to view the recommendations.

## Performance Dashboards

Performance is about ensuring workloads get the necessary resources. Key Performance Indicators (KPI) can be used to identify performance problems related to workloads. Use these KPIs to define SLAs associated with tiers of service. These dashboards use KPIs to display the performance of workloads at the consumer layer and the aggregate performance of workloads at the provider layer.

SLA is the formal business contract that you have with your customers. Typically, SLA is between the IaaS provider (the infrastructure team) and the IaaS customer (the application team or business unit). Formal SLA needs operational transformation, for example, it requires more than technical changes and you might need to look at the contract, price (not cost), process, and people. KPI covers SLA metrics and additional metrics that provide early warning. If you do not have an SLA, then start with Internal KPI. You must understand and profile the actual performance of your IaaS. Use the default settings in VCF Operations if you do not have your own threshold, as those thresholds have been selected to support proactive operations.

The following graphics depict the above relationship.



### The Three Processes of Performance Management

In performance management, there are three distinct processes.

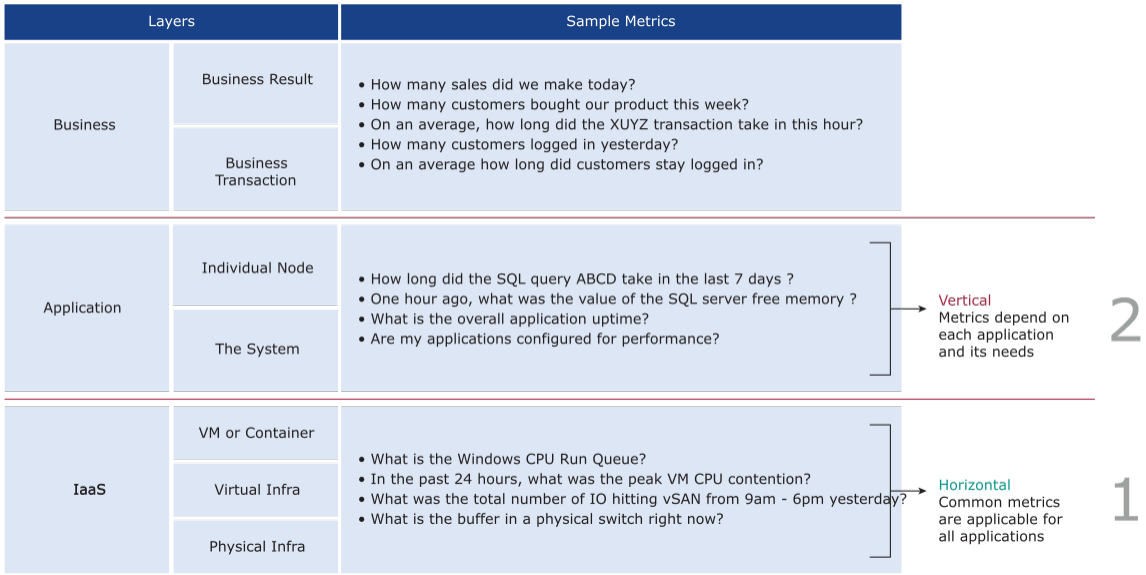
- Planning. Set your performance goals. When you architect a vSAN, you must know how many milliseconds of disk latency you want. 10 milliseconds measured at the VM level (not the vSAN level) is a good start.
- Monitoring. Compare the plan with the actual. Does the reality match what your architecture was supposed to deliver? If not, you must fix it.
- Troubleshooting. When the reality is not according to the plan, you must fix it proactively and not wait for issues and complaints.

To understand what is not healthy for performance management consider the following areas in the given order.

1. Contention: This is the primary indicator.
2. Configuration: Check the version incompatibilities.
3. Availability: Check for soft errors. vMotion stun time, lock up. This requires Log Insight.
4. Utilization: Check this in the end. If the first three parameters are good, you can skip this.

## The Three Layers of Performance Management

There are three main realms of enterprise applications. Each of these realms has its own set of teams. Each team has a set of unique responsibilities and requires the associated skill set. The three realms comprise of Business, Application, and IaaS. Refer to the graphic below to understand the three layers and the typical questions asked on each layer.



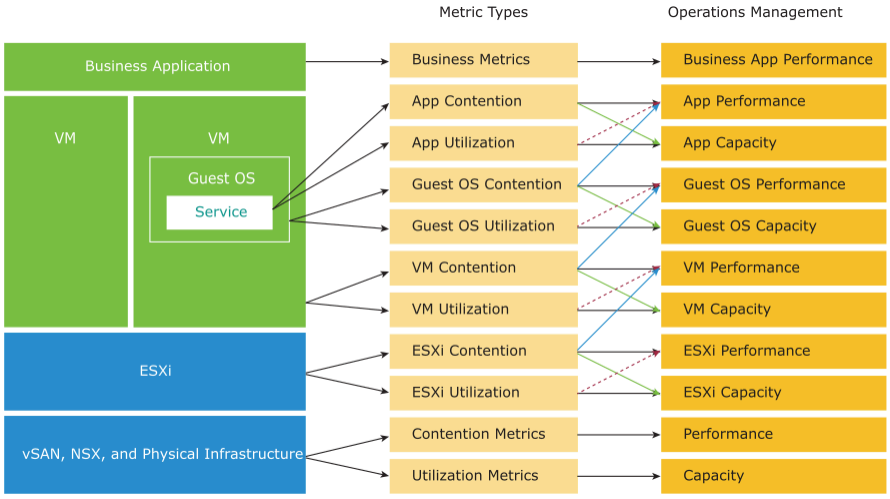
Performance Management is largely an exercise in elimination. The methodology slices each layer and determines if that layer is causing the performance problem. Hence it is imperative to have a single metric to indicate if a particular layer is performing or not. This primary metric is aptly named Key Performance Indicator (KPI).

The upper layer depends on the layer below it, and hence the infrastructure layer is typically the source of contention. As a result, focus on the bottom layer first, as it serves as the foundation for the layer above it. The good part is this layer is typically a horizontal layer, providing a set of generic infrastructure services, regardless of what business applications are running on it.

## The Two Metrics of Performance Management

The primary counter for performance is contention. Most look at utilization, because they fear something wrong might happen if utilization is high. That something is contention. Contention manifests in different forms like, queue, latency, dropped, canceled, and context switch.

However, do not confuse ultra-high utilization indicators as a performance problem. If your ESX host experiences ballooning, compression, and swapping, it does not mean that your VM has a performance problem. You measure the performance of the host by how well it serves its VMs. While performance is related to the ESX host utilization, the performance metric is not based on the utilization, instead it is based on contention metrics.



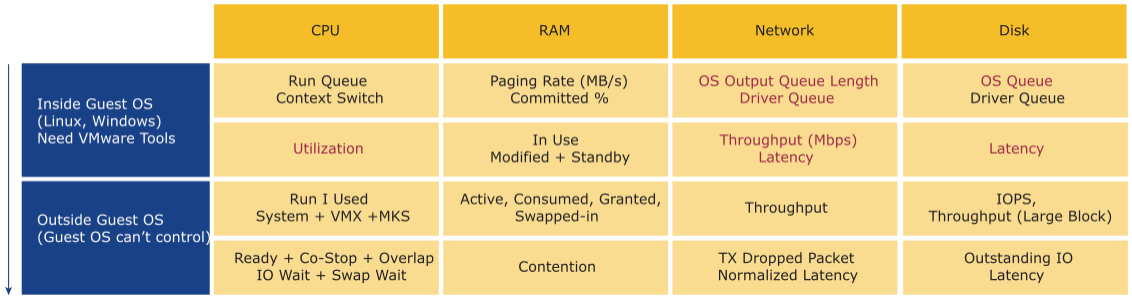
It is possible for VMs in the cluster get affected from poor performance, while the cluster utilization is low. One main reason is cluster utilization looks at the provider layer (ESX), while performance looks at an individual consumer (VM). The following table shows various possible reasons.

| Infra Configuration | VM and Guest OS Configuration |
|---|---|
| ESX Settings<br>• Host and BIOS power management causes Frequency to drop.<br>• HT enabled. It looks like twice the capacity, but it is actually 1.25 X throughput.<br>• ESX - HW compatibility. Driver and firmware are two areas that can impact the performance.<br>• Mismatch of queue depths along the various storage stacks. Must calibrate all the way to the physical array.<br>• vMotion too slow or high stunned time. | VM: Limit, Share, and Reservation<br>• Make sure that no limit is set. CPU ready includes limit.<br>• Make sure that the shares are consistent (as per what the VMs want or you agree to.)<br>• Avoid reservation if possible. This impacts the net available resources for the other VMs. |
| Network<br>• MTU mismatch.<br>• Hops. Especially horse-shoe, or going through multiple ESX. | Size: NUMA effect. VM spanning NUMA nodes. |
| Cluster Settings<br>• Inconsistent configuration among hosts in a cluster. EVC Mode can play a part if the hosts are from different generations.<br>• Resource Pool<br>– Make sure the shares match the number of VMs.<br>– Make sure that no VM is siblings to RP.<br>• VM- Host Affinity.<br>• DRS Setting. | Snapshot. IO is processes 2x.<br>VM drivers. |
| vSAN<br>• The host where the storage was having performance issues. | Windows or Linux process ping pong, process runaway, and OS level queue. |

From the performance management point of view, the vSphere cluster is the smallest logical building block of the resources. While the resource pool and VM Host affinity can provide a smaller slice, they are operationally complex, and they cannot deliver the promised quality of IaaS service. Resource pool cannot provide a differentiated class of service. For example, your SLA states that gold is two times faster than silver because it is charged at 200% more. The resource pool can give gold two times more shares. Whether those extra shares translate into half the CPU readiness cannot be determined up front.

## VM Performance

Since VM is the most important object in vSphere, it warrants an extra explanation. The graphic below lists the counters you should look at.?



| | CPU | RAM | Network | Disk |
|---|---|---|---|---|
| Inside Guest OS (Linux, Windows) Need VMware Tools | Run Queue<br>Context Switch | Paging Rate (MB/s)<br>Committed % | OS Output Queue Length<br>Driver Queue | OS Queue<br>Driver Queue |
| | Utilization | In Use<br>Modified + Standby | Throughput (Mbps)<br>Latency | Latency |
| Outside Guest OS (Guest OS can't control) | Run I Used<br>System + VMX +MKS | Active, Consumed, Granted, Swapped-in | Throughput | IOPS,<br>Throughput (Large Block) |
| | Ready + Co-Stop + Overlap<br>IO Wait + Swap Wait | Contention | TX Dropped Packet<br>Normalized Latency | Outstanding IO<br>Latency |

The KPI counters can get technical for some users, so VCF Operations includeS a starting line to get them started. You can adjust the threshold, once you profile your environment. This profiling is a good exercise, as most customers do not have a baseline.The profiling requires an advanced edition.

| | Metric | Green | Yellow | Orange | Red |
|---|---|---|---|---|---|
| Guest OS Contention | Total CPU Run Queue | 0-5 | > 5 | > 10 | > 20 |
| | CPU Context Switch Rate | 0 - 5K | < 25K | < 100K | > 100K |
| | Total Disk Queue Length | 0 - 25 | > 25 | > 50 | > 100 |
| Guest OS Usage | RAM Free (MB) | > 512 MB | > 256 | > 128 | ≤ 128 |
| | RAM Page-in Rate (KB/s) | 0 - 25K | > 25 K | > 50 K | > 100K |
| VM Contention | CPU Co-Stop (%) | 0 - 2.5% | > 1 | > 3 | > 5 |
| | [SLA] CPU Ready (%) | 0 - 2.5% | > 2.5 | > 5 | > 7.5 |
| | Total CPU Overlap (ms) at VM level | 0 - 1000 | > 1000 | > 2500 | > 5000 |
| | CPU IO Wait | 0 - 1000 | > 1000 | > 2500 | > 5000 |
| | [SLA] RAM Contention (%) | 0 - 1% | > 1 | > 2 | > 4 |
| | [SLA] Disk Latency (ms) | 0 - 10 ms | > 10 | > 20 | > 40 |
| | [SLA] Network TX Dropped Packet | 0 | > 0 | > 1 | > 2 |
| VM Usage | CPU Usage (%) | 0 - 85% | > 85 | > 90 | > 95 |

## Performance Metrics

VCF Operations uses the following threshold for internal KPI.

| IaaS | VM Counter | Threshold |
|---|---|---|
| CPU | Ready | 2.5% |
| RAM | Contention | 1% |
| Disk | Latency | 10 ms |
| Network | TX Dropped Packet | 0 |

The table is an example of a stringent threshold. A high standard for performance is used because it is an internal KPI for the consumption of the infrastructure team. It is not an external formal SLA that is confirmed with the customers. There must be a buffer between the internal KPI and the external SLA so that the operations team receive early warnings and has the time to react before the external SLA is breached. A high standard also works from the mission critical point to view to the development environment. If the standard is set to the least performing environment, then it cannot be applied to the more critical development.

A single threshold is used to keep the operations simple. This means that the performance in production is expected to have a higher score than the development environment. The development environment performance is expected to be worse than the production environment, while everything else is equal. A single threshold helps to explain the difference in Quality of Service (QoS) provided by a different class of service. For example, if you pay less, you get a poor performance and if you pay half the price, expect to get half the performance.

The four elements of IaaS (CPU, RAM, Disk, and Network) as mentioned in the table, are evaluated on every collection cycle. The collection time is set at five minutes as it is an appropriate balance for monitoring. If SLA is based on one minute, it is too close and results in either cost increase or reduction in threshold.

#### Design Considerations

All the performance dashboards share the same design principles. They are intentionally designed to be similar, as it is confusing if each dashboard looks different from one another, considering they have the same objective.

The dashboards are designed with separate two sections: summary and detail.

- The summary section is typically placed at the top of the dashboard to provide the overall picture.
- The detail section is placed below the summary section. It lets you drill down into a specific object. For example, you can get the detailed performance report of any specific VM.

In the detail section, use the quick context switch to check the performance of multiple objects during performance troubleshooting. For example, if you are looking at the VM performance, you can view the VM-specific information and the KPIs without changing screens. You can move from one VM to another and view the details without opening multiple windows.

The dashboard uses progressive disclosure to minimize information overload and ensure the webpage loads fast. Also, if your browser session remains, the interface remembers your last selections.

Many of the performance and capacity dashboards share a similar layout since there is a shared commonality between these pillars of operations.

## Guest OS Performance Profiling Dashboard

Use the **Guest OS Performance Profiling** dashboard to know the actual performance of your environment.

Some counters directly impact the performance of Windows or Linux, the operating systems running inside the VM. These KPIs are outside the control of the hypervisor.

Modern operating systems such as Linux and Windows use memory as cache, since it is faster than a disk. Some counters directly impact the performance of Windows or Linux. These KPIs are outside the control of a hypervisor, which means that the ESX VMkernel cannot control the increase or decrease of the KPI values. The KPI visibility also requires an agent, such as VMware Tools. As a result, they are typically excluded in performance monitoring.

Since they are closer to the applications, it is critical to know their values and establish an acceptable range. The acceptable level of these KPIs among all the VMs in your environment varies. By profiling the actual performance across time and from all VMs, you can establish a threshold that is supported by facts. Since there are 8766 instances of 5 minutes in a month, profiling 1000 VM over a month means you are analyzing 8.8 million datapoints.

#### Design Considerations

The dashboard uses progressive disclosure to minimize information overload and ensures that the webpage loads fast.

In a large environment, loading thousands of VMs increases the loading time of VCF Operations. As a result, the VM is grouped by data center. For a small environment, vSphere World is provided so you can see all the VMs in the environment.

#### How to Use the Dashboard

Select data center from the data centers list. The three tables listing CPU, memory, and disk will show the VMs in the selected data center or vSphere world. Each table shows the highest value in the last one week (2016 datapoints based on five minutes collection cycles), and hence uses the term max as a prefix, for example Max Page-Out/sec or Max Guest OS Disk Queue.

Select any of the VMs in any of the tables. The three line charts are displayed. They are showing data from the same VM to facilitate correlation.

- CPU table widget:
  - The Max CPU Queue column shows the highest number of processes in the queue during the given period. As a best practice, keep the queue below three for each queue. A VM with eight CPUs has eight queues, hence keep this number below 24.

  - The CPU Hyperthreading gives twice the queue as it should as both threads are interspersed in the core pipeline.
  - CPU Context Switch. There is a cost associated with the context switch. There is no guidance for this number, and it varies widely.
- Memory list widget:
  - In memory paging, the modern operating systems (Linux and Windows) use memory as cache, it is much faster than a disk. It proactively pre-fetches pages and anticipates future needs (Windows calls this Superfetch). The rate pages that are being brought in and out can reveal memory performance abnormalities. A sudden change, or one that has sustained over time, can indicate page faults. Page faults indicate that pages are not readily available and must be brought in. If a page fault occurs too frequently, it can impact application performance. While there is no concrete guidance, as it varies by application, you can view a relative size. operating systems typically use 4 KB or 2 MB page sizes.
- Disk list widget:
  - Disk queues are queued IO commands that are not sent to the VM. They have been retained inside the Guest OS (either at a kernel level or a driver level). A high disk queue in the guest OS, accompanied by low IOPS at the VM, can indicate that the IO commands are stuck waiting on processing by Windows/Linux. There is no concrete guidance regarding these IO commands threshold as it varies for different applications. You should view this with the Outstanding Disk IO at the VM layer.

#### Points to Note

- These Guest OS widgets do not appear unless the vSphere pre-requisites are met.
- Once you determine an acceptable threshold for your environment, consider adding thresholds to the table so you can easily view the VMs that exceed a threshold.
- The CPU queue is the sum from all virtual CPUs. A larger VM can tolerate a higher queue as it has more processors. If you want to compare VMs of different sizes, create a super metric that calculates the queue per vCPU. For more information, see Create a Super Metric.
- Group the VM by clusters of the same class (for example, Gold), so you can see the profile for each environment.
- For a smaller environment, consider changing the table from listing data centers to listing clusters.

## Network Top Talkers Dashboard

Use the **Network Top Talkers** dashboard to monitor network demand in your IaaS. In a shared environment, a few VMs generating excessive activity can impact the entire data center. While a single VM might not cause a serious problem, a few of them can.

#### Design Considerations

The **Network Top Talkers** dashboard helps you analyze how hard these VMs hit your IaaS. It classifies the workload into two: short bursts and sustained hits. A short burst lasts for a short period, maybe for a few minutes. A sustained hit can last for an hour and cause serious problems.

The **Network Top Talker** dashboard forms a pair with the **Storage Heavy Hitter** dashboard. To understand the IO demand in your environment, use both of them concurrently.

The **Network Top Talkers** dashboard displays sustained hits that last for an hour, as they can cause serious problems in a shared IaaS environment. You can identify the villain VMs and compare their demands with the capabilities of the underlying IaaS.

#### How to Use the Dashboard

The dashboard shows the current workload. This is the total network load (received and transmitted) from all the vSphere environments monitored by VCF Operations. The idea is to give you an indicator on how hard the overall load is.

- Select a data center from the data centers list.
  - The columns show the number of clusters, ESX hosts, and VMs for each data center. The VM count includes the powered off VM. To only see the running VM count, edit the widget.
  - If you want to see information from all the data centers, select the vSphere world row.
  - Upon selection, the Total Demand Line chart and the Top Talkers tables fill up.

- Total Demand Line Chart
  - The total throughput (received and transmitted) in the selected data center.
  - Displays both, the five minute peak and the hourly average in one line chart. You can click the metric name to hide it.
- Top Talkers Table
  - The table shows the most demanding VM. You can identify the villain VM and compare their demands with the capabilities of the underlying IaaS. Knowing the infrastructure capability is important. For example, an ESX with 2 x10 GB port can theoretically handle 20 GB TX + 20 GB RX as its full duplex.

#### Points to Note

- Understanding high demand helps you monitor IaaS and plan your capacity. IaaS provides four services, CPU, memory, disk, and network. While CPU, memory, and disk are bound, an active VM can consume all your network bandwidth, packet per second capacity, and the storage IOPS capcity. A VM with 4 vCPU and 16 GB memory cannot consume more than this amount, the same applies to disk space. A VM configured with 100 GB disk space cannot consume more than that.
- Network throughput, disk throughput, and disk IOPS can spike as their physical limits are very high per VM. This means that IaaS has enough capacity for all workloads and performs well until the VMs start consuming abnormally high amounts of network and disk bandwidth.

## Storage Heavy Hitters Dashboard

The **Storage Heavy Hitters** dashboard forms a pair with the **Network Top Talkers** dashboard. To understand the IO demands in your environment, use both of them together. If you are using ethernet-based storage, storage traffic runs over the same physical network as your ethernet-based network traffic.

#### Design Considerations

The **Storage Heavy Hitters** dashboard forms a pair with the **Network Top Talkers** dashboard, so they share a consideration behind their design. For more information, see Network Top Talkers Dashboard.

#### How to Use the Dashboard

- See the **Network Top Talkers** dashboard as they have the same design.
  - The main difference between **Storage Heavy Hitters** and **Network Top Talkers** is that the storage IO has two dimensions: IOPS and throughput.
  - Network IO does not have the IOPS dimension as the packet size is identical (1500 bytes being the standard packet, and 9000 bytes being the jumbo frames).
  - Storage IOPs and throughput are related, so use both to gain insight, they should display a similar pattern. If not, that indicates varying block sizes. For example, a throughput spike without an accompanying IOPs spike indicates large block sizes.
- Which VMs hit the storage the hardest.
  - The table shows the most demanding VM. You can identify the villain VM and compare their demands with the capabilities of the underlying IaaS. Knowing the infrastructure capability is important, because different classes of SSD have different IOPS and throughput capabilities.

    After identifying the villain VM, talk to the VM owners if the numbers are excessive during peak hours and identify the reasons behind the excessive usage. You must ensure that they do not create a hot spot. For example, vSAN cluster with > 100 disk can handle numerous IOPS but if the VM objects are only on a few disks, those disks can become a hot spot.

#### Points to Note

- Interpreting IOPs and throughput metrics depends on your underlying physical storage. For visibility into this hardware layer, add physical storage metrics to the dashboard.

# VM Contention Dashboard

The **VM Contention** dashboard is the primary dashboard for VM performance. It is designed for VMware administrators or architects. It can be used for both, monitoring, and troubleshooting. Once you determine that there is a performance issue, use the **VM Utilization** dashboard to see if the contention is caused by high utilization.

## Design Considerations

This dashboard is used as part of your Standard Operating Procedure (SOP). It is designed for daily use, hence the views are set to show data for the last 24 hours. The dashboard provides performance metrics for virtual machines in the selected data center.

To view the common design considerations among all performance management dashboards, see the Performance Dashboards.

For understanding the performance concept of the selected counters and their thresholds, see the Performance Dashboards

## How to Use the Dashboard

- Select a data center from the data center table.
  - For a smaller environment, select vSphere World to see all the VMs from all the data centers.

    **Note:**
    The count of VMs includes the powered off VMs too. To exclude powered off VMs, modify the widget and select the running VM metric.
- The two bar charts are automatically shown.
  - Use them together to get an insight about your CPU readiness and your Memory contention analysis. Analyze how the cluster serves the VMs. For each VM, it picks the worst metric in the last 24 hours. By default, VCF Operations collects data every 5 minutes, so this is the highest value among 288 datapoints. Once it has the value from each VM, the bar charts puts each VM in the respective performance buckets. The threshold in the buckets considers best practices, hence they are color coded.
  - For any critical environment, expect that all the VMs are served well by the IaaS. You must see green on both distribution charts. For development purposes, you can tolerate a small amount of contention in both CPU and Memory.
- VM Performance in selected Data Center.
  - Analyze by data center as performance problems tend to be isolated in a single physical environment. For example, a performance problem in country A typically does not cause a performance problem in country B.
  - The table is sorted by KPI Breach columns, directing your attention to the VMs that are not served well by the IaaS.
  - The table shows the hostnames known by Windows or Linux. This is the name that the application team or VM owner knows, as they might not be familiar with the VM name.
  - The rest of the columns show performance counters. Because the goal is proactive monitoring, the counters are the worst and not the average, during the monitoring period. Because the operations context here is performance, not capacity, the table considers the last 24 hours only. Daily use is encouraged as any activity older than 24 hours is considered irrelevant from a performance troubleshooting viewpoint.
  - The column KPI Breach counts the number of SLA breaches in any given 5 minutes. As a VM consumes four resources of IaaS (CPU, memory, disk, and network), the counter varies from 0–4, with 0 being the ideal. The value 4 indicates that all 4 IaaS services are not delivered. The same threshold is used regardless of class of service, as this is an internal KPI, not an external SLA. Your internal threshold should be more stringent, so that you have a reaction time.
- Select a VM from the table.
  - All the health charts show the KPI of that VM.
  - The health charts display the last value, lowest value, and the peak value. Expect that the peak is within your threshold.

**Points to Note**

- This dashboard uses Guest OS counters and VM counters appropriately. The two layers are distinct layers, and they each provide a unique visibility that the other layers might not give. For example, when the VMkernel de-schedules a VM as it has to process something else (for example, other VM, kernel interrupt). The Guest OS does not know the reason. In fact, it experiences frozen time for that particular vCPU running on the physical core and experiences time jumps when it is scheduled again.
- Guest OS counters logically require VMware Tools.
- The health chart is color coded. Change the settings if it does not suit your environment. If you are unsure of what suitable numbers to set for your environment, profile the metrics. The Guest OS Performance Profiling Dashboard provides an example of how to profile metrics.
- For a smaller environment with one or two data centers, change the filter from data center to cluster. Once you are list a cluster, you can then add the cluster performance (%) metric and sort them in an ascending order. This way the cluster that needs immediate attention is on the top.
- If you have a screen real estate, group the VMs by cluster or by ESX host. This way, you can quickly see if the problem is in a particular cluster or ESX host.
- Change the default timeline from one week to one day as and when required to suit your operations.
- If you navigate a lot to the **VM Utilization** dashboard from this dashboard, add a connection using the dashboard to dashboard navigation feature. For more details, see Dashboard Navigation Details.

## VM Performance Dashboard

Use the **VM Performance** dashboard to find out if a VM has a performance problem. As a first step, when a VM has a problem, verify if other VMs have the same problem. If the problem is widespread the root cause is not with the VM.

**How to Use the Dashboard**

The **VM Performance** dashboard is organized into sections for ease of use.

- Select a data center from the **Datacenters** widget. To find out if there is a performance problem, what the problem is, and the extent of the problem, use the following three bar charts together: **Are VMs facing CPU Ready**, **Are VMs facing Memory Contention**, **Are VMs facing Disk Latency**. Each bar chart analyzes how the VMs are served by the cluster. These bar charts indicate if the VMs are waiting for CPU resources, facing memory contention, or disk latency. For each VM, it picks the worst metric in the last 24 hours. By default, VCF Operations collects data every 5 minutes, so this is the highest value among 288 datapoints (12 x 24 = 288). Once it has the value from each VM, the bar charts put each VM in the respective performance buckets. The threshold in the buckets considers best practices, and hence they are color coded. For each bar chart, you can change the time period to the period of your interest. The maximum number is then displayed. The value is the worst 20-seconds, within the 5-minute collection time period. For your mission-critical environment, you must expect that all the VMs are being served well by the IaaS. If you see green on the distribution charts, you do not have to analyze further.

  For development, you may tolerate a small amount of contention in both CPU and Memory as you need to balance cost.

  You can also change the filter from data center to cluster. If you are listing clusters, you can then add the cluster performance (%) metric and sort them in ascending order. This way the cluster that needs immediate attention is on top.

  You can click on the bar to see the list of VMs under that performance bucket. From there, you can select a VM, and it's KPI is automatically displayed on the lower section of the dashboard.
- **Multiple VM Analysis**

  When you select a data center from the **VMs Performance in selected Datacenter** widget, the table listing all the VMs in the data center is displayed.

  The table is sorted by the KPI Breached column, directing your attention to the VMs that are not served well by the IaaS. The column counts the number of SLA breaches in any given 5-minute period. It is based on the counter `Performance \ Number of KPIs Breached`. As a VM consumes four resources of IaaS (CPU, memory, disk, and network), the counter varies from zero through four, with zero being the ideal. The value four indicates that all four IaaS services are not delivered. The same threshold is used regardless of class of service, as this is an internal KPI, and not an external SLA.

Because the goal is proactive monitoring, as opposed to reactive troubleshooting, the counters show the worst value instead of the average of the monitoring period.

- **Per VM Analysis**
  When you select a VM from the table, the CPU, memory, disk, and network performance charts are automatically displayed, each widget showing the KPIs of that VM.
- **Alerts**
  The relevant alerts are displayed automatically. You can view the settings by editing the widget, and adjust them accordingly to fit your operational needs.
- **Virtual Disks**
  A VM can have many disks, and it is possible that these disks may have different performance levels. The table lists the individual virtual disks and their contention and utilization metrics.
- **Configuration**
  The relevant configuration of the selected VM is displayed. You can customize as appropriate.
- **Relationship**
  From the VM, you can navigate to the parent cluster or datastore. Use the **Relationship** widget to navigate and auto select the associated cluster or datastore.

## VM Utilization Dashboard

The VMware administrator uses the **VM Utilization** dashboard with the **VM Contention** dashboard for managing performance.

### Design Considerations

Use the **VM Utilization** dashboard to identify virtual machines with a high utilization in a selected data center. When utilization exceeds 100%, performance can be negatively impacted especially when a queue develops inside the Windows or Linux operating systems. By default, VCF Operations has a 5-minute collection interval. For 5 minutes, there might be 300 seconds worth of data points. If a spike is experienced for a few seconds, it might not be visible if the remaining 300 seconds is low utilization.

To view the common design considerations among all performance management dashboards, see the Performance Dashboards.

### How to Use the Dashboard

- Select a data center from the data center table.
  - For a smaller environment, select vSphere World to see all the VMs from all the data centers.

    **Note:**
    The count of VMs includes the powered off VMs too. To exclude powered off VMs, modify the widget and select the running VM metric.
- VM Peak CPU Usage (%).
  - There is no peak memory use as it is not applicable. Memory is a form of storage, for example consider a hard disk occupied space. A 90% utilization of the total space is not slower than 10%. This means that the issue is related to capacity issue and not performance.
  - The bar chart is color coded using five colors instead of four. The color gray is introduced to convey any wastage. Resources that are hardly utilized do not signify that the performance is at its peak. It can also mean the opposite. For example, if a VM needs 1+ vCPU, configuring it with 2 CPUs results in better performance instead of configuring it with 128 CPUs.
- VM Peak Utilization.
  - Analyze by data center as performance problems tend to be isolated in a single physical environment. For example, a performance problem in country A typically does not cause a performance problem in country B.
  - The table focuses on peak utilization, because the context is performance and not capacity.
- Select a VM from the table.
  - All the health charts show the KPI of that VM.

  - Compliment the free memory with the memory IOPS or the memory throughput metric. The metrics in a gigabyte measure the space, and not the speed. Memory is a form of storage, so what you must measure is the rate, for example, read-write per second.

#### Points to Note

- The **VM Utilization** dashboard complements the **VM Contention** dashboard. For more information, see the points to note in the VM Contention Dashboard.

## Troubleshoot an Application Dashboard

The VMware Cloud Foundation Operations Application Management Pack provides discovered applications to be managed in VCF Operations. Using the **Troubleshoot an Application** dashboard, users can see the applications and the relevant metrics and alerts for the selected application. The dashboard also displays its relationship to the infrastructure. In the list of metrics, select a metric to see its trend over time.

## Cluster Contention Dashboard

The **Cluster Contention** dashboard is the primary dashboard for vSphere cluster performance. It is designed for VMware administrators or architects. It can be used for both, monitoring and troubleshooting. Once you determine that there is a performance issue, use the **Cluster Utilization** dashboard to see if the contention is caused by high utilization.

#### Design Considerations

This dashboard is used as part of your Standard Operating Procedure (SOP). It is designed for daily use, hence the views are set to show data for the last 24 hours. The dashboard provides performance metrics for virtual machines in the selected data center.

Utilization of the cluster is not shown in the **Cluster Contention** dashboard. You must separate the two concepts: utilization and contention. Performance and capacity are different concepts managed by two separate teams. Both CPU and memory are also shown separately. You can have a problem with one, without any issue in the other. CPU is more common as memory tends to have a lower overcommit ratio.

To view the common design considerations among all performance management dashboards, see the Performance Dashboards.

#### How to Use the Dashboard

- Average Cluster Performance (%).
  - This is the primary KPI for your entire IaaS. It plots how your IaaS is performing every 5 minutes, giving you the trend view of the overall performance.
  - The metric itself is simply the average of the Cluster KPI / Performance (%) metric. This performance metric in turn averages the VM Performance / Number of KPIs Breached metric from all the running VMs in the cluster. Hence a value of 100% indicates that every running VM in the cluster is served well.
  - As this KPI takes into account every running VM in your environment, the number should be steady. The analogy in real life is the stock market index. While individual stocks can be volatile, overall the index should be relatively steady on a 5 minutes by 5 minutes basis.
  - The relative movement of the metric is as important as the absolute value of the metric. Your absolute number might not be as high you want it to be, but if there are no complaints for a long time, then there is no urgent business justification to improve it.
- Clusters Performance.
  - It lists all the clusters, sorted by the least performing cluster in the last one week. You can change this time period.
  - The worst performance shows the lowest number in the time period. As VCF Operations collects data every 5 minutes, there are 12 x 24 x 7 = 2016 data points in a week. This column shows the worst point among these 2016 datapoints.
  - A single number among 2016 datapoints can be an outlier that needs to be complemented with another number sometimes. A logical choice is the average of these numbers. For the average performance to be low, a lot of

criterias have to be low. Waiting for the average causes a delay in your operations, and rise in complaints. For performance monitoring, the 95th percentile is a better summary than the average.
  - Your cluster should function at a 100% and perform its fuctions as planned.
- Select a cluster from the table.
  - All the health charts show the KPI of the selected cluster.
  - For performance, it is important to show both the depth and breadth of the performance problems. A problem that impacts one or two VMs requires a different troubleshooting than a problem that impacts all the VMs in the cluster.
  - The depth is shown by reporting the worst among any VM counter. So the highest value of VM CPU Ready, VM Memory contention, and VM Disk Latency among all the running VMs are shown. If the worst number is good, then you do not need to look at the rest of the VMs.
  - A large cluster with thousands of VMs can have a single VM experiencing poor performance while 99.9% of the VM population is fine. The depth counter might not report that most VMs are fine. It only reports the worst. This is where the breadth counters come in.
  - The breadth counters report the percentage of the VM population that is experiencing performance problem. The threshold is set to be stringent, as the goal is to provide early warning and activate proactive operations.

**Points to Note**

It is possible for VMs in the cluster to suffer from poor performance, while the cluster utilization is low. One main reason is cluster utilization looks at the provider layer (ESX), while performance looks at individual consumer (VM). The following table shows various possible reasons.

| Event | Aware? |
|---|---|
| Power Management | No |
| HT | No |
| Ready | No |
| Co-Stop | No |
| System | No |
| Steal | No |
| IO Wait | No |
| Memory Wait | No |

From the performance management point of view, the vSphere cluster is the smallest logical building block of the resources. While the resource pool and VM Host affinity can provide a smaller slice, they are operationally complex, and they cannot deliver the promised quality of IaaS service. Resource pool cannot provide a differentiated class of service. For example, your SLA states that gold is two times faster than silver because it is charged at 200% more. The resource pool can give gold two times more shares. Whether those extra shares translate into half the CPU readiness cannot be determined up front.

Certain settings such as DRS automation level and the presence of many resource pools can impact performance. Consider adding a property widget to show the relevant property of a selected cluster, and a relationship widget to show resource pools.

For a large environment with many clusters, add a grouping to make the list more manageable. Group it by class of service, so you can focus more on the critical clusters.

## Cluster Performance Dashboard

The **Cluster Performance** dashboard combines the functionality of the **Cluster Contention**, **Cluster Utilization**, ESX **Contention**, and ESX **Utilization** dashboards.

**How to Use the Dashboard**

The **Cluster Performance** dashboard is organized into sections for ease of use.

- **Overall Analysis**
  The **Average Cluster Performance** health chart is green when all the clusters are performing well. If the clusters are unable to serve the VMs well, all the clusters are no longer green, with a few occurrences of red.
  As the chart displays all the clusters, it uses the vSphere World object. This object is the parent of the vCenter object, and so it displays all the clusters from all the vCenter Servers.
  The metric used is `Performance \ Clusters Performance (%)` and is the primary KPI for your entire IaaS. It plots how your IaaS is performing every five minutes, giving you the trend view of overall performance.
- **Multi-Cloud Analysis**
  If the health chart is not green, and you want to find out which clusters are not performing, use the **vSphere Clusters** widget. The table lists all the clusters, starting with the cluster with the lowest performance. By default, the data displayed is from the last 24 hours. The **Worst Performance** column displays the lowest number in the time period. By default, VCF Operations collects data every 5 minutes, so this is the lowest point among 288 datapoints (12 x 24 = 288).
  The **Worst Performance** column displays the lowest performance in the last period, specified under **Time Settings**.
- **Per-Cluster Analysis**
  Select a cluster from the **vSphere Clusters** widget to see the trend over time. After you determine the cluster you want to investigate, review the five scoreboards: CPU, memory, disk, network, and others.
- **VM Shares**
  A common root cause for uneven performance problems is uneven shares. Each slice in the pie chart must correspond to a class of service. If the entire cluster is serving one class, then you should see a simple circle with no slices.
- **Resource Pool Analysis**
  Resource pool is another common reason behind uneven VM performances. A cluster with too many resource pools makes performance management difficult.
  The **Resource Pools in the cluster** provides a table listing all the resource pools.
- **ESX Analysis**
  A cluster is a collection of ESX hosts and the performance can be affected by uneven performance among the member hosts. You can drill down from a cluster to the ESX hosts. The ESX **Hosts in the Selected Cluster** widget lists all the ESX hosts in the cluster, sorted by the worst performance in the last 24 hours. If the table displays values in green, you do not have to analyze further.
  You can change the time period to the period of your interest. The maximum number will be reflected accordingly.
  The table helps you quickly compare the performance of each ESX. You can also see the performance over time, to see a trend.
  Certain settings such as power management and hyper threading can impact performance. The ESX **Hosts in the Selected Cluster** widget displays the relevant property of a selected ESX Host.
- **VM Analysis**
  When you select a cluster or ESX from the **Running VMs in the selected Cluster or ESX widget** the VMs that are running are automatically listed. Use this table to verify if the cluster or host performance problems were caused by VM configuration and usage. It is possible that the VM was not on the same host at the time of problem, due to vMotion. To drill down into a particular VM, select it and click the double arrow before the widget title.
- **Datastore Analysis**
  Use the **Shared datastores in the Cluster** widget to see a list of shared datastores accessible by hosts in the cluster. You can also drill down to the selected datastore.

## Cluster Utilization Dashboard

The VMware administrator uses the **Cluster Utilization** dashboard with the **Cluster Contention** dashboard for performance management.

## Design Considerations

This dashboard supports the **Cluster Contention** dashboard. Use it to identify vSphere clusters with high utilization in a selected data center. When utilization exceeds 100%, performance can be negatively impacted especially when VMs experience a contention. By default, VCF Operations has a 5-minutes collection interval. For five minutes, there may be 300 seconds worth of data points. If a spike is experienced for a few seconds, it may not be visible if the remaining of the 300 seconds is low utilization.

To view the common design considerations among all performance management dashboards, see the Performance Dashboards.

## How to Use the Dashboard

- CPU(%) and Memory (%).
  - Review the CPU and Memory distribution charts for an overview of the CPU and memory utilization of the clusters.
  - The highest metric in the last one week is used. Average or 95th percentile is not used as this is utilization and not contention. High utilization does not mean bad performance.
  - One week is used instead of one day to give you a longer time horizon and covers the weekend. Adjust the timeline as you deem fit for your operations.
  - Expect memory to be higher than CPU, as it is a form of cache. The Memory Consumed counter is used as it is more appropriate than the Memory Active counter.
  - Low utilization can actually indicate bad performance, as not much of real work gets done. The chart uses the dark gray color for low utilization.
- Clusters Utilization.
  - The cluster utilization table lists all the clusters, sorted by the highest utilization in the last one week. If the table displays the green color, then there is no need to analyze further.
  - You can change the time period to the period of your interest. The maximum number is reflected accordingly.
- Select a cluster from the table.
  - All the utilization charts show the key utilization metrics of the selected cluster.
  - For memory, the high utilization counters are explicitly shown, Balloon, Compressed, and Swapped. Notice they exist even though utilization is not even at 90%, indicating high pressure in the past. If you look only at utilization, you might think you are safe.
  - The line charts show both average and highest among ESX hosts in the cluster. The reason is unbalanced and it is not rare. There are many settings that can contribute to it (for example, DRS settings, VM Reservation, VM – Host Affinity, Resource Pool, Stretched Cluster, and Large VMs).
  - The disk IOPS is split into read and write to gain insight into the behavior. Some workload is read oriented, while others are write oriented.
  - The disk throughput is not shown as it sums all the traffic. In reality, each ESX host has its own limit.
  - The vMotion line chart is added, as a high number of vMotion can indicate that the cluster load is volatile, assuming the DRS Automation level is not set to the most sensitive setting.

## Points to Note

- If your operations team have some forms of standardization that utilization should not exceed a certain threshold, you can add the threshold into the line chart. The threshold line helps less technical teams as they can see how the real value compares with the threshold.
- Consider adding a third distribution chart. Show the balloon counter in this third chart, as it complements the consumed counter. If there is no ballooning, a high consumed value is in fact better than a lower value.
- The workload metric can exceed a 100% because it is demand / usable capacity * 100. This can happen if you have four hosts in a cluster with each host running at 100% demand and admission control is set to 50%.
- The **VM Utilization** dashboard complements the **VM Contention** dashboard. For more information, see the points to note in the Cluster Contention Dashboard.

## VM Rightsizing Dashboard

The **VM Rightsizing** dashboard helps you adjust the VM size for optimal performance at the lowest cost. It covers both undersized and oversized scenarios. The dashboard looks at the long term trend and covers both undersized and oversized scenarios. This dashboard is designed for the Capacity and the Operations teams, as rightsizing a VM helps in the day-to-day performance.

### How to Use the Dashboard

- **Overall Analysis**
  The scoreboard provides a summary of the total undersized and oversized CPU and memory.
  You can select either a data center or a cluster. In most cases, rightsizing analysis should be done at the cluster level as VMs typically do not move inter-cluster. The counters are displayed to provide better context. Focus on reclaiming VM capacity in a cluster that is low on capacity remaining.
  The distribution charts that display rightsizing are automatically displayed. Other than the bar charts, the **Undersized VM** and **Oversized VM** tables list the actual VMs.
- **VM Analysis**
  Select a VM to investigate further. The utilization is automatically displayed. VM usage reflects the amount of capacity consumed. This is based on the aggregate vCPU usage at five minute granularity, which provides a clear understanding of capacity used.
  Rightsizing a VM can help improve performance for the VM as well as the cluster. Because of this, metrics that show performance bottlenecks, such as CPU Ready and CPU Run Queue, are provided to help you confirm how rightsizing may result in less contention and better performance.
  Memory utilization is collected from the guest OS via VMTools. If guest OS metrics are not available, then the memory configured value is used instead. Rightsizing memory improves performance by reducing memory ballooning and contention. For example, VMs with over-provisioned memory are more likely to experience ballooning.

## Datastore Performance Dashboard

Use the **Datastore Performance** dashboard to view performance problems related to storage such as high latency, high outstanding IO, and low utilization. This dashboard is designed for both the VMware administrator and the Storage administrator, to foster a closer collaboration between the two teams. Local datastores are treated separately.

### Design Considerations

To view the common design considerations among all performance management dashboards, see the Performance Dashboards.

### How to Use the Dashboard

The **Datastore Capacity** dashboard is layered, gradually providing details as you work top-down in the dashboard.

- **Overall Analysis**
  Select a data center from the **Datacenters** table. The three bar charts which are, **VM Performance**, **Read Performance**, and **Write Performance** provide an overall analysis of the datastore performance in a given vCenter data center or vSphere World. They work together to provide better insight. Just like other performance charts, the value displayed is the worst value during the time period. After you select a data center, if the Worst VM Disk Latency displays `No data to display`, it means that you have no observed latency issues for VM disk performance.
  The **VM Performance** chart displays the kind of latency and how many VMs experience that kind of latency. The **VM Performance** chart is your primary chart as it measures latency at the VM level. The **Read Performance** and **Write Performance** charts measure latency at the datastore level, which means they are the normalized average of all VMs in that datastore. Expect the **VM Performance** chart to be higher than the **Read Performance** and **Write Performance** charts. Read and write latency are displayed separately for better insight.
- **Datastore Analysis**
  The **Datastores Performance** table automatically lists all the shared datastores in the data center or vSphere World. Both the worst (peak) performance and the 95th percentile are displayed. If the latter is close to the peak and it is

also high, then it is a sustained problem. If the latter is low, then the problem is for a short duration. The table is color coded. Select a datastore that you want to troubleshoot. The relevant metrics and configuration are displayed.

- **VM Analysis**
  The list of VMs running in the selected datastore is displayed, with the relevant contention and utilization counters. Select the VM that you want to troubleshoot. The contention and utilization of the VM are automatically displayed. The number is at the VM level. If you suspect one of the virtual disks has high latency, use the counter Peak Virtual Disk Read Latency (ms) and Peak Virtual Disk Write Latency (ms).
- **Relationship**
  From the **Related Clusters and Hosts to selected Datastores** widget, select either an ESX host, a vSphere cluster, or a vSAN cluster. The relevant contention and utilization counters are displayed.

## ESX Contention Dashboard

The ESX **Contention** dashboard is the primary dashboard for managing ESX host performance. The VMware administrator or architect can use it to monitor and troubleshoot any performance issue. If you determine that there is a performance issue, use the **ESX Utilization** dashboard to see if the cause for the contention is high utilization.

### Design Consideration

The ESX **Contention** dashboard complements the Cluster Contention Dashboard, and shares the same design consideration.

This dashboard is used as part of your Standard Operating Procedure (SOP). It is designed to be used daily, hence the views are set to show data in the last 24 hours. The dashboard provides performance metrics for virtual machines in the selected data center.

To view the common design considerations among all performance management dashboards, see the Performance Dashboards.

### How to Use the Dashboard

- ESX CPU Performance and ESX Memory Performance.
  - Review the two distribution charts for an overview of all the ESX host's utilization and memory performance.
  - Both charts are using the percentage of VM facing performance counter and not the worst performance among VM counter because you are looking at the ESX performance and not at the single VM performance. See how it handles all the VMs.
  - The bar chart is color coded. Keep the percentage of the VM population not being served under 10%.
- ESX Hosts Performance.
  - The ESX hosts performance table lists all the ESX hosts, sorted by the worst performance in the last 24 hours. If the table is displays the green color, then there is no need to analyze further. The reason 24 hours is selected instead of one week is that the performance greater than 24 hours are likely to be irrelevant.
  - You can change the time period to the period of your interest. The maximum number is reflected accordingly.
- Select an ESX host from the table.
  - All the health charts show the KPI of the selected cluster.
  - For performance, it is important to show both depth and breadth of a performance problem. A problem that impacts one or two VMs require a different troubleshooting than a problem that impacts all VMs in the cluster.
  - Worst CPU overlap among VMs in the host is included as it indicates a lot of interruptions. A running VM might get interrupted because the VMkernel needs the physical core to run something else. High and frequent numbers of interruptions are not healthy and can impact the VM performance.
  - Expect the network error to be 1% and dropped packet to be 0 most of the times, if not always. If it is not zero, analyze it to see if there are any patterns across all ESX hosts, and bring it up with your network team.

### Points to Note

- Consider adding a third distribution chart and display the CPU co-stop counter in this third chart, as it complements the CPU ready counter. If your environment has relatively slow network and storage IO, you can add IO wait too.

- Unlike the **Cluster Performance** dashboard, there is no average ESX hosts performance (%) at the vSphere World level. The reason is most ESX hosts are part of a cluster and monitoring should be done at the cluster level.
- Certain settings such as power management and hyper threading can impact the performance. Consider adding a property widget to show relevant properties of a selected ESX host.

## ESX Utilization Dashboard

The VMware administrator uses the ESX **Utilization** dashboard with the ESX **Contention** dashboard to manage performance.

### Design Considerations

The ESX **Utilization** dashboard supports the ESX **Contention** dashboard. Use it to identify vSphere clusters with high utilization in a selected data center. When utilization exceeds 100%, performance can be negatively impacted, especially when a VM experiences contention. By default, VCF Operations has a 5-minute collection interval. For 5 minutes, there might be 300 seconds worth of data points. If a spike is experienced for a few seconds, it might not be visible if the remaining 300 seconds is low utilization.

The dashboard complements the Cluster Utilization Dashboard dashboard, by providing the extra details. Hence it has a similar layout.

To view the common design considerations among all performance management dashboards, see the Performance Dashboards.

### How to Use the Dashboard

- ESX Hosts Utilization.
  - It lists all the ESX hosts, sorted by the highest utilization in the last one week. If the table is all displaying the green color, then there is no need to analyze further.
  - You can change the time period to the period of your interest. The maximum number is reflected accordingly.
- Select an ESX host from the table.
  - All the utilization charts display the key utilization metrics of the selected cluster.
  - For memory, the high utilization counters are explicitly shown, for example balloon, compressed, or swapped. You might notice they exist even though utilization is not even at 90%, indicating that there was a high pressure in the past. If you look at only utilization, you might think you are safe.
  - The disk IOPS and the disk throughput are split into read and write to gain an insight into the behavior. Some workload is read oriented, while others are write oriented.
  - The network throughput is split into sent (transmit) and received to gain insight into the behavior. The total usage can be misleading because it sums up the send and receive traffic. In reality the network pipe is one for each direction (due to the full duplex nature of Ethernet), and not shared.

### Points to Note

If your operations team have some forms of standardization that the utilization should not exceed a certain threshold, you can add the threshold into the line chart. The threshold line helps less technical teams as they can see how the real value compares with the threshold. For more information, see the points to note in the ESX Contention Dashboard.

## Network Performance Dashboard

Use the **Network Performance** dashboard to view performance problems related to network such as high latency, frequent retransmit, and many dropped packets. This dashboard is designed for both the VMware administrator and the Network administrator, to foster a closer collaboration between the two teams.

### Design Considerations

To view the common design considerations among all performance management dashboards, see the Performance Dashboards.

The dashboard activates you to drill down from the distributed switch to the ESX host and port groups in the switch, and then to the VM.

### How to Use the Dashboard

- Distributed Switches.
  - The distributed switches table lists all the switches, sorted by the highest packet dropped. The table splits the incoming traffic and the outgoing traffic for better analysis.
  - As the focus is on performance and not capacity, the throughput counters are not shown.
- Select a switch from the distributed switches table.
  - The health chart shows the dropped packet trend over time.
  - It does not narrow down the list of port groups automatically, as the list of port groups are always showing all the port groups in your environment.
  - If necessary, expand the two collapsed widgets. They show the network throughput and broadcast packets. Utilization is also shown so that you can correlate and understand whether the dropped packets are due to higher utilization.
- Port Groups and ESX Hosts in the selected switch.
  - They get listed when you select a switch from the distributed switches table.
  - Just like the distributed switch, you can also see their relevant counts.
- If your environment has unused network switches, you can filter them out from this list, as this dashboard focuses only on performance.

### Points to Note

- vSphere network is by nature distributed. Each ESX contributes to the physical NIC. This represents the physical capacity. Distributed switch and its port groups span across these independent network cards. This makes it harder to define and measure its performance. An unbalance can happen among ESX hosts or physical NIC. In a sense, it is like distributed storage ( vSAN). Capacity management does not apply to a port group, since its upper limit (also known as the physical capacity) can vary by even a minute.
- Latency within a data center should be below 1 millisecond. Use VMware Aria Network Insight to study the latency or the retransmitting problems, caused by moving into the lateral traffic.
- Add a physical network using the appropriate management pack.

Most packets are unicast, between a pair of sender and receiver. If your environment has many VMs sending broadcast packets to everyone and multicast packets to many targets, add a Top-N widget to find out which VMs are sending these packets.

## vSAN Contention Dashboard

The **vSAN Contention** dashboard is the primary dashboard for managing vSAN performance. The VMware administrator or architect can use it to monitor and troubleshoot the vSAN cluster performance. If you determine that there is a performance issue, use the **vSAN Utilization** dashboard to see if the cause for the contention is high utilization.

### Design Considerations

To view the common design considerations among all performance management dashboards, see the Performance Dashboards.

The **vSAN Contention** dashboard complements the ESX Contention Dashboard, and shares the same design consideration. It focuses on the storage and vSAN specific metrics, and does not repeat what is already covered. It does not list any non vSAN cluster.

### How to Use the Dashboard

- vSAN Peak VM Latency, vSAN Peak CPU Ready, vSAN Peak Dropped Packet.
  - Review the three distribution charts for an overview of all the vSAN clusters performance.

  - The vSAN peak VM latency chart shows the distribution of disk latency experienced by all the VMs in the cluster. You should expect most of the VMs to experience latency that matches your expectation. For example, in an all flash systems, the VMs should not have >20 ms disk latency. If your vSAN environment is all flash, you must adjust the distribution bucket to a more stringent set.
  - The vSAN peak CPU ready chart shows if any of the vSAN kernel modules has to wait for CPU. Expect this number to be near 0% and below 1%, as vSAN should not wait for CPU time. vSAN gets higher priority than VM World as it lives in the kernel space.
  - The vSAN peak dropped packet chart shows if any of the vSAN clusters are dropping packet in the vSAN network (not the VM network). vSAN relies on the network to keep the cluster in-sync. This number should be near 0% and less than 1%.
- vSAN Clusters.
  - It lists all the vSAN clusters, sorted by the least performing.
  - It lists all the ESX hosts, sorted by the worst performance in the last 24 hours. If the table is showing all green, then there is no need to analyze further. The reason 24 hours is selected instead of one week is that the performance issues greater than 24 hours are likely to be irrelevant.
  - You can change the time period to the period of your interest. The maximum number is reflected accordingly.
- Select a vSAN cluster from the vSAN clusters table.
  - All the health charts show the KPI of the selected cluster.
  - If you are using SMART, the two heat maps at the bottom of the dashboard provide early warning.

**Points to Note**

- A large vSAN cluster can have many components. Each of these components can have multiple performance metrics. The total number of KPI can reach hundreds of metrics. For example, take a 10 node cluster. It can have 530 counters to check. VCF Operations aggregates them by introducing a set of KPIs. This analysis reduces the number to a more manageable number. The following table shows the KPIs and their formula.

| Name | What it is |
|---|---|
| Max Capacity Disk Latency (ms) | Highest latency among all capacity disks take the worst, not average, as the latency in a single capacity disk is already an average of all its VMs. If there are 50 VMs on the disk and 30 are issuing IO on it, then its average is among 30. |
| Min Disk Group Write Buffer Free (%) | Lowest free capacity among all the disk group write buffers. If this number is low, one of your buffers is not enough. While you want to maximize your cache, a low number is an early warning for capacity management. |
| Max Disk Group Read Cache/Write Buffer Latency (ms) | Each disk has a Read Cache Read Latency, Read Cache Write Latency (for writing into cache), Write Buffer Write Latency, and Write Buffer Read Latency (for de-staging purpose). This takes the highest among all these four numbers and the highest among all disk groups. It is the max of the max because each of the four datapoints is an average of all the VMs on it. |
| Sum Disk Group Errors | Sum of the bus reset + sum of commands canceled among all the disk groups. You must use sum and not get the max as each member should return zero. |
| Count Disk Group Congestion Above 60 | The number of disk groups congestion greater than 60. 60 is hardcoded in the vSAN Management Pack as it is a good starting point. As any congestion above 60 serves an early warning, count how many of such occurrences happen. |
| Max Disk Group Congestion | The highest congestion among all disk groups. A high number indicates that at least one disk group is not performing. |
| Min Disk Group Capacity Free (%) | The lowest free capacity among all disk groups. A low space triggers rebalance. |

| Name | What it is |
|---|---|
| Min Disk Group Read Cache Hit Rate (%) | The lowest hit rate among the disk group read cache. Ensure that this number is high as it indicates that the read is served by cache. |
| Sum vSAN PortGroup Packets Dropped (%) | Sum of all vSAN VMkernel port RX dropped packet + TX dropped packet. You should expect no dropped packet in your vSAN network. |

## vSAN File Services

The VMware administrator uses the **vSAN File Services** dashboard to monitor the file services running in their vSAN environment.

### Design Considerations

This dashboard is designed to complement the vSAN file services management provided by the vCenter. The vCenter is more of an administrative tool, while VCF Operations is more of an operations tool. Each tool performs their specific functions and does not duplicate information.

### How to Use the Dashboard

- File Shares by Used Space and Latency.
  - Review the file shares by used space and latency heat map.
  - It shows all the file shares in your environment.
  - The greater the use (consumption), the greater the box, so you can easily see the most consumed ones.
  - The file shares are colored by latency. You must watch out for boxes with red color.
- vSAN Clusters with File Services activated.
  - It lists all the vSAN clusters with file services activated, giving a convenient view to see which clusters have these settings turned on.
- Select a vSAN cluster from the vSAN clusters with file services activated table.
  - The file servers in the selected vSAN cluster are shown. When you select a file server, it filters the file shares list to show the file shares in the selected file server.
  - The file shares in the selected vSAN cluster are shown. Selecting a file share displays all the relevant KPI on the file share.

### Points to Note

vSAN File Servers and vSAN File Shares are two new objects in Management Pack for vSAN.

## vSAN Performance Dashboard

Use the **vSAN Performance** dashboard along with the **Cluster Capacity** dashboard.

### How to Use the Dashboard

The **vSAN Performance** dashboard is organized into sections for ease of use.

- **Cluster Analysis**

  The **vSAN Clusters** widget lists all the vSAN clusters, starting with cluster with the highest VM disk latency. By default, the widget displays data from the last 24 hours.

  The first column displays if the distribution of disk latency is experienced by all the VMs in the cluster. You can expect a majority of the VMs to experience latency that matches your expectation.

  The second column displays if any of the vSAN kernel modules have to wait for CPU. Expect this number to be near 0% and below 1%, as vSAN should not be waiting for CPU time.

  The third column displays if any of the vSAN clusters are dropping packets in the vSAN network (not the VM network). vSAN relies on the network to keep the cluster in-sync. This number should be near 0% and less than 1%.

Select a cluster to investigate further. The VM latency distribution is automatically displayed.

- **Contention**
  You can view various disk-related contention counters of the cluster from the **Contention** widget.
- **Utilization**
  Contention metrics are complemented by utilization metrics. A large block size can result in high throughput in a relatively low IOPS. If you see a large block size when you are not expecting it, investigate which applications are using it.
- **Disk Groups**
  You can drill down to the disk group level. All the counters are the worst value among the disk groups.
- **Read Cache**
  All the values displayed are the worst values among the read cache of the disk group.
- **Other KPIs**
  A problem in performance can also be caused by non-storage. vSAN resync is a type of utilization metric, but its presence can impact performance.
- **Disk Group Analysis**
  You can drill down to individual disk groups from the **Disk Groups** widget. Ensure that the disk groups are fairly balanced. Select the disk group that you want to analyze. Both the contention and utilization metrics are automatically displayed.
- **Cache Disks**
  You can drill down to cache disks from the **Cache Disks** widget. Ensure that the configuration is consistent. Select the cache disk you want to analyze. Both the contention and utilization metrics are automatically displayed.
- **Capacity Disks**
  You can drill down to capacity disks from the **Capacity Disks** widget. Ensure that the configuration is consistent. Select the capacity disk you want to analyze. Both the contention and utilization metrics are automatically displayed.

## vSAN Utilization Dashboard

The VMware administrator uses the **vSAN Utilization** dashboard with the **vSAN Contention** dashboard to manage performance.

### Design Consideration

The **vSAN Utilization** dashboard supports the **vSAN Contention** dashboard. Use it to identify vSAN clusters with high utilization in a selected data center. When utilization exceeds 100%, performance can be negatively impacted, especially when a VM experiences contention. By default, VCF Operations has a 5-minute collection interval. For 5 minutes, there might be 300 seconds worth of data points. If a spike is experienced for a few seconds, it might not be visible if the remaining 300 seconds is low utilization.

To view the common design considerations among all performance management dashboards, see the Performance Dashboards.

### How to Use the Dashboard

- Clusters Utilization.
  - It lists all the vSAN clusters, sorted by the least performing.
- Select a vSAN cluster from the clusters utilization table.
  - All the health charts show the KPI of selected cluster.
- Disk Groups
  - It lists all the vSAN clusters, sorted by the least performing.
- Select a Disk Group from the disk groups table.
  - All the health charts show the KPI of selected cluster.

**Points to Note**

- The **vSAN Utilization** dashboard complements the **vSAN Contention**. For more information, see the points to note in the vSAN Contention Dashboard.

## vSAN ESA Performance Dashboard

The vSAN ESA (Express Storage Architecture) Performance dashboard provides an overview of the performance issues related to your vSAN clusters. The dashboard displays the read and write latency issues that affect the vSAN clusters present in your environment. You can use this dashboard to identify and troubleshoot performance issues related to Contention and Utilization across VMs that are part of the vSAN cluster.

**How to Use the Dashboard**

The **vSAN ESA Performance** dashboard is organized into sections for ease of use.

- **Cluster Analysis**
  The **vSAN ESA Clusters** widget lists all the vSAN clusters, starting with cluster with the highest VM disk latency. By default, the widget displays data from the last 24 hours.
  The first column displays if the distribution of disk latency is experienced by all the VMs in the cluster. You can expect a majority of the VMs to experience latency that matches your expectation.
  The second column displays if any of the vSAN kernel modules have to wait for CPU. Expect this number to be near 0% and below 1%, as vSAN should not be waiting for CPU time.
  The third column displays if any of the vSAN clusters are dropping packets in the vSAN network (not the VM network). vSAN relies on the network to keep the cluster in-sync. This number should be near 0% and less than 1%.
  Select a cluster to investigate further. The VM latency distribution is automatically displayed.
- **Contention**
  You can view various disk-related contention counters of the cluster from the **Contention** widget.
- **Utilization**
  Contention metrics are complemented by utilization metrics. A large block size can result in high throughput in a relatively low IOPS. If you see a large block size when you are not expecting it, investigate which applications are using it.
- **Configuration**
  You can view the configuration details such as storage type, number of VMs, ESX, Storage Pools, Physical Disks of the selected vSAN cluster.
- **Storage Pools**
  You can view the configuration, contention, and utilization details of the Storage Pool for the selected vSAN cluster.
- **Physical Disks**
  You can view the configuration, contention, and utilization details of the Physical Disks for the selected vSAN cluster.
- **Related Objects to Selected vSAN Cluster**
  You can view the details of the related objects for the selected vSAN cluster.

## vSAN OSA Performance Dashboard

The vSAN OSA (Original Storage Architecture) Performance dashboard provides an overview of the performance issues related to your vSAN clusters. The dashboard displays the read and write latency issues that affect the vSAN clusters present in your environment. You can use this dashboard to identify and troubleshoot performance issues related to Contention and Utilization across VMs that are part of the vSAN cluster.

**How to Use the Dashboard**

The **vSAN Performance** dashboard is organized into sections for ease of use.

- **Cluster Analysis**
  The **vSAN Clusters** widget lists all the vSAN clusters, starting with cluster with the highest VM disk latency. By default, the widget displays data from the last 24 hours.

The first column displays if the distribution of disk latency is experienced by all the VMs in the cluster. You can expect a majority of the VMs to experience latency that matches your expectation.

The second column displays if any of the vSAN kernel modules have to wait for CPU. Expect this number to be near 0% and below 1%, as vSAN should not be waiting for CPU time.

The third column displays if any of the vSAN clusters are dropping packets in the vSAN network (not the VM network). vSAN relies on the network to keep the cluster in-sync. This number should be near 0% and less than 1%.

Select a cluster to investigate further. The VM latency distribution is automatically displayed.

- **Contention**
  You can view various disk-related contention counters of the cluster from the **Contention** widget.
- **Disk Group Analysis**
  You can drill down to individual disk groups from the **Disk Groups** widget. Ensure that the disk groups are fairly balanced. Select the disk group that you want to analyze. Both the contention and utilization metrics are automatically displayed.
- **Utilization**
  Contention metrics are complemented by utilization metrics. A large block size can result in high throughput in a relatively low IOPS. If you see a large block size when you are not expecting it, investigate which applications are using it.
- **Configuration**
  You can view the configuration details such as storage type, number of VMs, ESX, Storage Pools, Physical Disks of the selected vSAN cluster.
- **Compute and Network**
  You can view the compute and network metrics for the selected vSAN cluster.
- **Cache Disks**
  You can drill down to cache disks from the **Cache Disks** widget. Ensure that the configuration is consistent. Select the cache disk you want to analyze. Both the contention and utilization metrics are automatically displayed.
- **Capacity Disks**
  You can drill down to capacity disks from the **Capacity Disks** widget. Ensure that the configuration is consistent. Select the capacity disk you want to analyze. Both the contention and utilization metrics are automatically displayed.
- **Related Objects to Selected vSAN Cluster**
  You can view the details of the related objects for the selected vSAN cluster.

### vSphere Performance Profiling Dashboard

Use the vSphere Performance Profiling dashboard to determine a suitable Service Level Agreement (SLA).

This dashboard displays the performance of all vSphere clusters and their shared datastores. For each VM, the dashboard displays the performance metric at the 99th percentile. For each SLA (CPU, Memory, Disk), the dashboard shows the worst and the average performing VM.

> **Note:**
> Avoid setting the SLAs at a 100th percentile, as the 100th percentile usually indicates an outlier.

## Private AI (GPU) Dashboards

Use the Private AI (GPU) dashboards to monitor and troubleshoot GPU issues in VCF Operations.

To access the dashboards, from the left menu, click **Infrastructure Operations** > **Dashboards and Reports**. Click **Dashboards** and then navigate to **All** > **Private AI**.

The following dashboards are available:

| Dashboard Name | Purpose |
|---|---|
| GPU Equipped Clusters | Use this dashboard for the details related to GPU compute utilization and GPU memory usage at the cluster level, host level, and GPU level. |
| GPU Overview | Use this dashboard to view if any GPUs have high-temperature. This dashboard also highlights GPUs with low to zero usage by analyzing their capacity based on compute and memory utilization. |

### GPU Equipped Clusters Dashboard

Use the GPU Equipped Clusters dashboard to view the the clusters that have GPU activated devices. You can view the GPU device information at the cluster, host, and GPU level.

This dashboard displays the total number of GPU devices, GPU compute usage, memory usage, and memory at the cluster and host level. You can select a GPU to view the cluster level GPU utilization and the host level GPU utilization. You can also view the GPU metrics and properties at the GPU level, and further drill down to get an overview of the GPU temperature and GPU instance metric chart.

### GPU Overview Dashboard

Use the GPU Overview dashboard to view the GPU summary of all the GPUs present in your environment.

This dashboard displays the total number of GPUs and highlights GPUs as per heat map, memory usage (%) and compute utilization (%). You can select a GPU to view its relationship topology, the GPU instance name and properties, and the GPU instance metric chart at the GPU level.

## Service Discovery Dashboards

Using the service discovery dashboards, you can determine the inter-dependencies of virtual machines and the dependencies of each service in the respective virtual machines.

The following service discovery dashboards are added to the predefined VCF Operations dashboards:

- Service Distribution
- Service Relationships
- Service Visibility
- Virtual Machine Relationships

### Service Distribution Dashboard

You can use the dashboard to view the distribution of different services in the selected data center, cluster, or a host system. You can also view known and unknown services including the category and distribution percentage across a vSphere resource.

You can use the dashboard widgets in several ways:

- **Inventory Item**: Use this widget to view a hierarchical representation of objects in the form of badges.
- **Known Services Distribution**: Use this widget to view different services discovered from a selected object.
- **Service Categories**: Use this widget to view the service categories that are discovered by selecting an object from the resource widget.
- **User Defined Services Distribution**: Use this widget to view a list of user-defined services.

### Service Relationships Dashboard

You can use the dashboard to view properties of the service such as the install path, the ports used, and the version. You can also view the relationship between the services that run on other VMs.

You can use the dashboard widgets in several ways:

- **List of Services Discovered**: Use this widget to view the services that have been discovered.
- **Connections from the Selected Services**: Use this widget to view the relationship between the services and the other services running on the VMs.
- **Properties of the Selected Service**: Use this widget to view the properties of the selected services.

### Service Visibility Dashboard

You can use the dashboard to view a list of VMs without service visibility and VMs with user-defined services after you select a vSphere object.

You can use the dashboard widgets in several ways:

- **Inventory Tree**: Use this widget to view a hierarchical representation of objects in the form of badges.
- **Virtual Machines without Service Visibility**: Use this widget to view information about services where discovery has failed.
- **Virtual Machines with User-Defined Services**: Use this widget to view a list of VMs where the user has defined such services.

### Virtual Machine Relationships Dashboard

You can use the dashboard to view a list of VMs with service discovery details such as, status, method, incoming/outgoing connections, and protection groups. When you select a VM, the dashboard displays a list of discovered services on the VM, the relationships of the VMs with other VMs based on the relationships of the discovered service.

You can use the dashboard widgets in several ways:

- **List of virtual machines**: Use this widget to view all the VMs discovered by the vCenter.
- **Node relationship of the selected VM**: Use this widget to view the relationship between the objects.
- **List of Services running in the selected VM**: Use this widget to view all the properties of the selected VM.
- **Connections of Virtual Machines**: Use this widget to view the relationship between one or more VMs

## Skyline Operational Overview Dashboard

The Skyline Operational Overview dashboard displays your inventory summary, high level configuration data organizing by attributes such as vCenter instances, ESX hosts, virtual machines, and VM Guest Tools configurations.

#### Cluster Configuration

Use this dashboard to view the cluster configurations and settings related to VMware Distributed Resource Scheduler (DRS), VMware High Availability (HA), and HA Admission Control Enabled. For example, to view how many hosts have HA or DRS configured, you can click the pie chart to view the cluster information. Click a cluster to view the cluster summary, alerts, and other information.

#### ESX Host Configuration

You can view your ESX host configuration organized by hardware model, BIOS version, and host version. Click the pie chart to view the host information. Click any host to view the cluster summary, alerts, and other information.

#### Virtual Machine Configuration

You can view your virtual machine capacity in terms of CPU, RAM, and disk size. Clicking the pie chart displays the VM information. Click any VM to view the cluster summary, alerts, and other information.

#### VM Guest OS Distribution

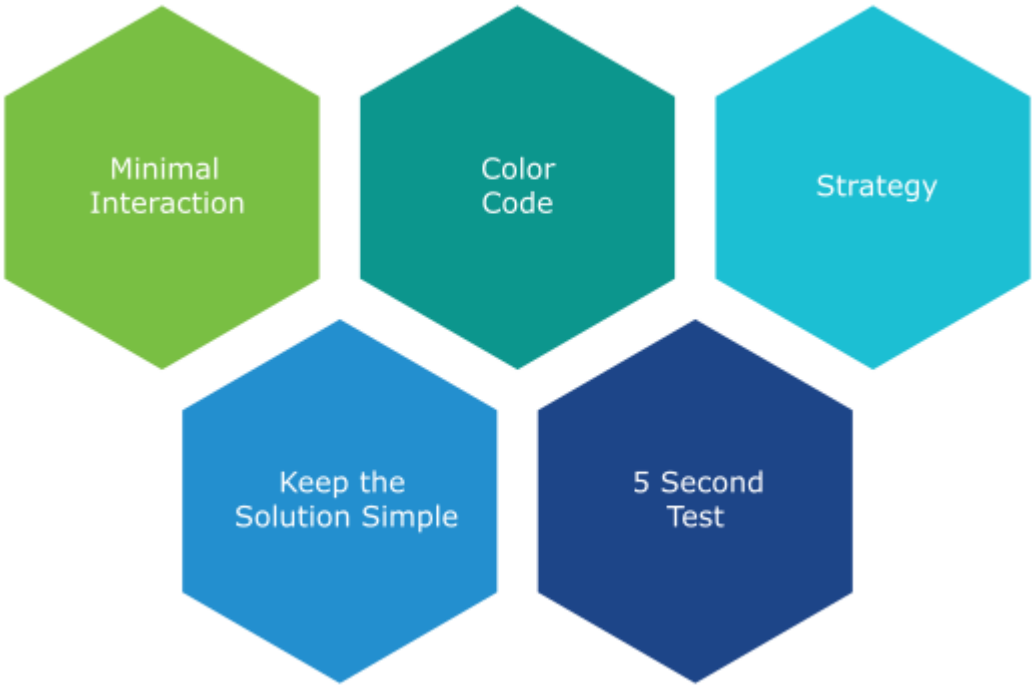
Monitor your guest tool information such as OS distribution, tool version, and tool status. Clicking the pie chart displays the tools information. Click any tool to view the summary, alerts, and other information.

## Dashboard Library

## Executive Summary Dashboards

The requirements of the CIO, Head of Global Infrastructure, and IT Senior Management vary from the requirements of the technical teams. The **Executive Summary** dashboards provide an overall information on capacity and inventory in business terms.

These dashboards allow you to display problems related to budget and resource, and provide visibility to the senior management into the live environment. By doing this, you can prove the need for additional hardware. If there is wastage that has to be reclaimed, you can display where and how large the wastage is using these dashboards. VCF Operations provides two example dashboards to get you started. As each executive might have a unique requirement or preference, the dashboards can be customized accordingly. The five principles displayed in the following figure are used to design the **Executive Summary** dashboards.



- Keeping the interaction, such as clicking, zooming, and sorting to a minimal.
- Use of color codes to have a user interface that is easy to understand.
- Each dashboard answers a specific question and the information is presented in business terms.
- Keep the solution simple and have a portal that is easy to access.
- Ensure that the dashboards are understood within five seconds.

### Capacity Summary Dashboard

The **Capacity Summary** dashboard is used by the Ops team to explain capacity to IT Management. This dashboard works together with the **Inventory Summary** dashboard. The inventory provides details on available resources and what is running on these resources. The capacity provides details on the remaining capacity and time.

#### Design Considerations

See Executive Summary Dashboards for common design considerations among all the dashboards for the IT senior management.

#### How to Use the Dashboard

The **Capacity Summary** dashboard has two sections:

- The top section of the dashboard provides a summary at the vSphere World level.

  - The **VM Growth** widget displays the weekly average of the VM growth and provides holistic visibility of overall growth across all data centers for both running and powered off workloads. If an increase in the VM count is not accompanied by a corresponding increase in utilization, these newly provisioned VMs are likely not yet used.
  - The **Overcommit Ratio** widget highlights the efficiency gained by vSphere virtualization running multiple workloads on a shared infrastructure. Overcommitment has to be further reviewed along with elevated resource contention to understand the impact of performance on VMs competing for resources. In general, Overcommit is required to be financially more economical than the public cloud.

    **Note:**
    VCF Operations uses physical CPU Cores not Logical Cores (Hyper-threading) for all CPU-based capacity calculations.
- The bottom section of the dashboard activates drill down into individual compute or storage capacity.
  - Capacity is split into Compute (vSphere Clusters) and Storage (Data stores) views. The heat map displays capacity by size and color by time remaining. By selecting either Clusters or Data stores, you can further drill down understand the remaining capacity and time (in days).

**Points to Note**

- Capacity remaining is not displayed at the vSphere World level as it can be misleading, especially in a global, or large infrastructure. Clusters also tend to serve a different purpose and they are not interchangeable.
- If you are using both on-prem and external cloud, for example, VMware on AWS, consider splitting the dashboard into two columns.

## Inventory Summary Dashboard

The **Inventory Summary** dashboard is used by the Ops team to explain capacity to IT Management. This dashboard works together with the **Capacity Summary** dashboard. The inventory provides details on available resources and what is running on these resources. The capacity provides details on the remaining capacity and time.

**Design Considerations**

See Executive Summary Dashboards for common design considerations among all the dashboards for the IT senior management.

**How to Use the Dashboard**

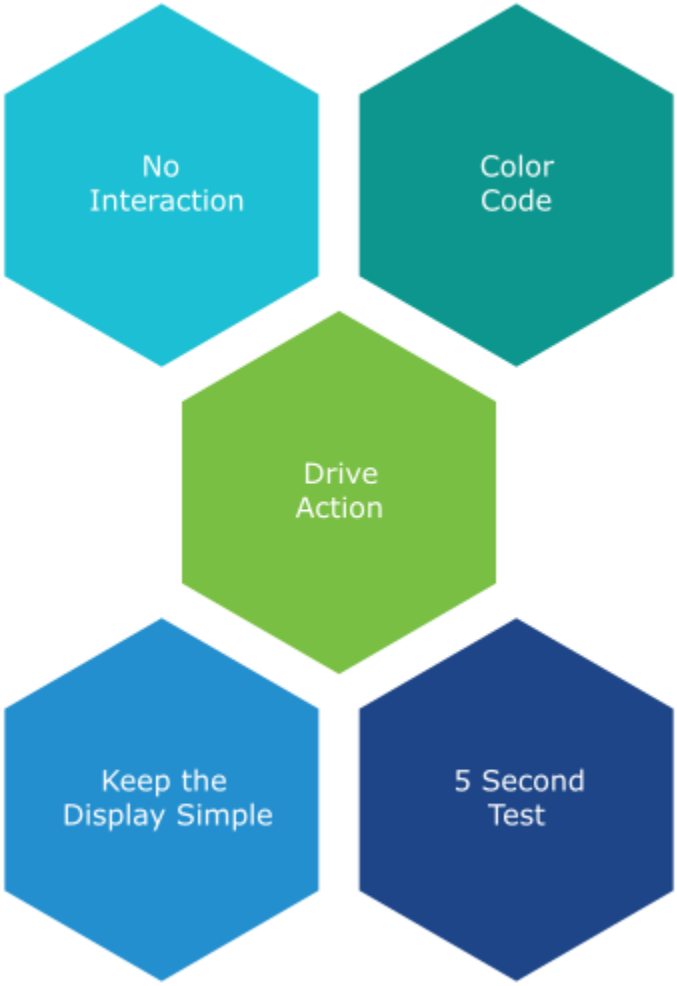
- The **Summary** widget provides a quick view of the key inventory number.
  - The scoreboard is interactive. This widget drives the eight pie charts that are placed at the bottom of the dashboard. Since all the information is at the vSphere World level, clicking any of them will display details of the total inventory.
- Select any data center from the **Datacenters** widget.
  - This widget drives Clusters and Datastores so that you can quickly view what you have in a given data center and related capacity.
  - For a small environment, the vSphere World is displayed so you can view all the VMs in the environment.
  - To sort by any of the columns in the table, click the column title.
- The eight charts in the dashboard provide details of the inventory. They are driven by **Datacenters**, **Compute**, **Storage**, and **Summary** widgets.

**Points to Note**

- Understand the relationship hierarchy in vSphere. For example, Compute (cluster) is not a parent of Storage (datastore), so logically it is not possible to display datastores in a cluster. Data center consists of compute (cluster), network (distributed switch), and storage (datastore).
- Datastores do not drive the pie chart. This is a known limitation in the View widget.
- If your senior management wants to view the largest VM in a given environment, add a Top-N widget to list the top 10 largest consumers so that CPU, memory, and the disk details are highlighted.

## Network Operation Center

A dashboard projected on the large screen serves a different business purpose than a dashboard on your laptop or desktop. It is placed strategically because it displays a time sensitive information. Dashboards complement alerts and cannot replace it. The five principles displayed in the following figure are used to design the predefined **Network Operation Center** dashboards.



- Keeping the interaction, such as clicking, zooming, and sorting to a minimal. Avoid having buttons, use of mouse or keyboard to view data.
- Use of color codes to have a user interface that is easy to understand.
- Displaying content that drives action. Display of live information as the focus is on immediate remediation. Problems that need immediate actions are displayed, for example, stop provisioning of new VM or take action on VMs that abuse the shared infrastructure.
- Display of problems that do not require immediate attention are avoided, for example, increase supply of infrastructure, such as adding hardware.
- Keep the display simple and have a portal that is easy to access.
- Dashboards are designed to display minimal and critical information only.
- Displays of numbers in percentage, with 0% being poor and 100% being perfect. To display utilisation, you can use the following markers:
  - 50% indicates good and balanced utilization. However, the ideal value is 75%
  - 0% indicates wastage
  - 100% indicates high utilization
- Ensure that the dashboards are understood within five seconds.

## Live! Cluster Performance Dashboard

The **Live! Cluster Performance** dashboard provides live information on whether the requests of the VMs are met by their underlying compute clusters. This dashboard focuses on CPU, Memory, and the performance of the clusters. Use this dashboard to view if there is any problem in meeting the demands of the VMs and if there is any unbalance within a cluster. The **Live! Cluster Performance** dashboard is the primary dashboard and it complements the **Live! Cluster Performance** dashboard which is the secondary dashboard. This secondary dashboard displays if the performance problem is caused by high utilization. The primary dashboard answers the question 'Is our IaaS performing?', while the secondary dashboard answers the question 'Is our IaaS working hard?'.

### Design Consideration

The **Live! Cluster Performance** dashboard displays three heat maps. The heat maps complement each other and must be used together. The location of each cluster and ESX hosts within those clusters is identical in all heat maps. The fixed positioning allows you to compare if the problem is caused by memory contention, CPU ready, or CPU co-stop.

The sizes of each cluster and ESX hosts are constant. Variable sizing creates a distraction and can result in small boxes, making it difficult to read.

The focus of the performance is on the population and not on a single VM. This is not a single VM troubleshooting dashboard but a dashboard focusing on infra problem. As the infra counter is mathematically an aggregation of VM counters, you must have a right roll-up strategy. As the goal is to provide an early warning, do not use the average as a roll-up technique. Use the percentage of the population exceeding a threshold. The threshold is set to be stringent to receive an early warning.

### How to Use the Dashboard

Review the heat maps, **Memory Contention**, **CPU Ready**, and **CPU Co-Stop** and see if there is any color other than green.

- Green indicates that almost 100% of the VMs have received the CPU and memory that was requested. The threshold is set such that if the 10% of the VM population does not receive the requested resources, then the heat map turns red.
- Red indicates an early warning. Stringent thresholds are used to activate proactive attention and remediation operations. The heat map can turn red because of the high standard that is applied even when there is no complaint from the VM owner yet.
- The light gray indicates that there is no VM running on the host and the metric is not computing.

View if there is any unbalance.

- There are two types of unbalance, cluster unbalance, and resource type unbalance.
- The ESX hosts are grouped by the cluster, so that the unbalance within a cluster can be easily viewed. Cluster unbalance is a real possibility and it is best monitored and not just assumed.
- If the three heat maps are different, then there is a resource unbalance. For example, if the memory contention is mostly red, but the two CPU heat maps are green, it means you have an unbalance between memory and CPU.
- If a single ESX host displays different color across the three heat maps, it indicates that there is an unbalance between the CPU and memory resources in the host.

For NOC Operator, drill-down by selecting one of the VMs on the heat map.

- The **Trends of Selected ESX Host** widget will automatically display the performance counters. To hide any metric, click the name in the legend.

As part of the deployment, configure auto-rotate among the NOC dashboards. If you want to view one dashboard, then you can remove the VCF Operations menu by using the URL sharing feature. This makes the overall user interface presentable and allows you to focus on the dashboard.

**Points to Note**

- You can add Disk Latency if you have the screen real estate. Use the counter 'Percentage of Consumers facing Disk Latency (%)'. It is a part of a datastore object, not a cluster, as a VM in a cluster can have disks across multiple datastores. Organize this storage performance by data center and not by the cluster.

## Live! Cluster Utilization Dashboard

The **Live! Cluster Utilization** dashboard complements the **Cluster Performance** dashboard. Use this dashboard to view the clusters that are working excessively and are close to their physical limit. This dashboard displays ESX hosts that have CPU or memory saturation that can lead to performance issues for the VMs running on the host.

**Design Considerations**

This dashboard is designed to complement the **Live! Cluster Performance** dashboard and it shares design considerations.

**How to Use the Dashboard**

As this dashboard has an identical design with the **Live! Cluster Performance** dashboard, it has the same usage procedure. Unlike the heat maps in the **Live! Cluster Performance** dashboard, the three heat maps in this dashboard have a different scale, reflecting the different nature of the counters.

Logically, memory is a form of storage. It acts as a cache to disk as it is much faster. A high utilization is better, as it indicates that more data is being cached. The ideal situation is when ESX host Consumed metric is red but ESX host Ballooned metric is green. When Ballooned is red and Consumed is gray, it means that there was high pressure in the past but it is not there anymore. The reason the ballooned stays red is because the ballooned pages were never requested back.

The ballooned memory counter was selected over the swapped or compressed memory counters as it is a better leading indicator. Since all three can co-exist at the same time, they are displayed in the line chart. Ballooned is displayed in absolute amount and not as a percentage, because the higher the size, higher are the chances for it to impact a VM. If you feel using percentage is easier for your operations, create a super metric to translate the value.

The heat map displays Wastage by a new color. The dark gray color indicates that wastage as capacity is not used. The performance problem due to low utilization can be caused by a bottleneck elsewhere.

Analyze if the ESX host is contributing. A light gray box indicates that the host is a part of the cluster but there is no utilization. It is possible for the host to be in the maintenance mode or is powered off.

**Points to Note**

- ESX host chooses to swap over compression if the compression ratio is less than 4x.
- If the ESX host's physical NIC is saturated in your environment, then you can add a Network Throughput heat map.

## Live! Heavy Hitters Dashboard

The **Live! Heavy Hitters** dashboard helps you analyze the misuse of the shared infrastructure. This dashboard displays details of VMs misusing shared infrastructure and if that has caused performance problems to the other VMs. The shared infrastructure includes risks. The cause for excessive load might be attacks, for example, the denial of service, process runaway, or a mass activation of agents. The most demanding VM is the largest. If a handful of VMs is dominating the shared infrastructure, their collective size is displayed on the dashboard.

**Design Considerations**

See the Performance Dashboards page for common design considerations among all the dashboards for performance management.

In a shared environment, it is possible to have a victim-villain problem. In the heat map, the villain VM is the one with the largest box size, while the victim VM is the one with the red box. If a handful of VMs is dominating the shared infrastructure, their collective size will be highly visible on the dashboard.

**How to Use the Dashboard**

- The heat maps, Disk IOPS, Disk Throughput, Network Throughput, and CPU Demand displays the four different loads that can be excessive. The heat maps display the relative value and not the absolute value. A VM does not generate a high load in the absolute term just because it has a large configuration.
- Each heat map has its color threshold, reflecting the nature of the contention metrics used in each of them.
- For NOC Operator, drill-down by selecting one of the VMs on the heat map. All the four line charts are automatically displayed, enabling you to get a complete picture of the selected VM.

**Points to Note**

- Memory is not displayed as it is a form of storage. The memory counters are space utilization and not speed. Think of disk space instead of IOPS. It can cause a capacity problem on the shared ESX host, but not performance problems to other VMs.
- In a large environment, it might be difficult to view a small victim VM. Consider having multiple dashboards and use them interchangeably.

## Live! vSphere VM Changes Dashboard

The **Live! vSphere VM Changes** dashboard displays changes to vSphere VMs as they happen. You can use the dashboard to ensure both the numbers and patterns are as per your expectation.

**How to Use the Dashboard**

The **Overview** widget at the top of the dashboard provides summary and overall high level vSphere VM numbers. Ensure that the numbers match your expectation. You can set thresholds so that it is easier to see if the values change (drop or increase) to a level that you are comfortable with. By default, you can view details of the last 6 hours. This allows you to view trends and patterns in the changes.

There are 3 types of detailed information covering different types of changes. This covers all the possible changes that could happen to a VM, hence providing real time visibility into the movement or volatility. The changes are categorized into three groups for ease of understanding: Inventory, State, and Location. The changes in each widget are displayed in order of importance.

- **Inventory Changes:** The sum of the changes in VM inventory over the last 24 hours. Information is displayed about whether VMs are added or removed as per your expectation, if they are added or removed the right way (cloning vs free style creation vs template based deployment), and why there is a high count of VMs being unregistered or deleted.
- **Location Changes:** Refers to VMs that are moved to another host or datastore. This can be hot or cold migration. Hot migration is displayed first as it might impact performance because it changes both compute and storage. Pay attention to the storage migrations as they take the longest amount of time. If it takes longer than expected, something could be wrong. On the other hand, cold migration is typically an activity that should match the change request as the VMs are shutdown.
- **State Changes:** As reset is the least desired it is displayed first. It is used as the last resort. Suspend and Power Off are least preferred as these actions should be done from within the Guest OS. Expect these numbers to be low. A high number of powered on VMs could lead to high demand.

There are two types of widgets for each of the 3 types of changes:

- The first type of widget is a trend line. In this case the widgets are **Changes in VM Inventory**, **Changes in VM Location**, and **Changes in VM State**. Ensure that both the absolute amount and the pattern match your expectation.
- The second type of widget is a scoreboard showing the present number for each of the changes. In this case the widgets are **Details of VM Inventory Changes**, **Details of VM Location Changes**, and **Details of VM State Changes**. The change is sorted from the least desired (most impact to operations) to the least important.

**Points to Note**

The changes are color coded. You can adjust the thresholds for each change, however it is recommended that you avoid too many variations as it can get confusing. You can also adjust the widget size as required for large displays.

# Software Defined Wide Area Network Dashboard

The Software-Defined Wide Area Network (SD-WAN) dashboard allows you to configure and monitor the services related to VeloCloud and SD-WAN using VCF Operations. Using the SD-WAN dashboard, you can also collect the metrics for VeloCloud Orchestrator and VeloCloud Gateway.

By default the SD-WAN dashboards are deactivated, if you want to know how to activate them, see Manage Dashboards. The following services are discovered using the VeloCloud Orchestrator:

- Java Application
- VeloCloud Orchestrator
- Nginx
- ClickHouse
- MySQL
- Redis
- Network Time Protocol

The following services are discovered using VeloCloud Gateway:

- Network Time Protocol
- VeloCloud Gateway

## Troubleshoot SD-WAN Dashboard

You can use the widgets in Troubleshoot SD-WAN dashboard to monitor and troubleshoot the services and applications associated with the SD-WAN.

You can use the dashboard widget in several ways:

- **Troubleshoot Virtual Machine (VM)**: Use this widget to navigate to a specific VM and troubleshoot the issues.
- **Troubleshoot Orchestrator**: Use this widget to navigate to a specific orchestrator and troubleshoot the issues.
- **Troubleshoot Gateway**: Use this widget to navigate to a specific gateway and troubleshoot the issues.
- **Troubleshoot Application**: Use this widget to navigate to a specific application and troubleshoot the issues.
- **Relationship**: Use this widget to view the services and operating system associated with the VeloCloud Orchestrator.
- **Top Alerts**: Use this widget to view the top alerts associated with the SD-WAN.

## Troubleshoot SD-WAN Gateway Dashboard

You can use the widgets in Troubleshoot SD-WAN Gateway dashboard to monitor and troubleshoot all the services and applications associated with the SD-WAN gateway.

You can use the dashboard widget in several ways:

- **Active Alerts on the Gateway**: Use this widget to view the active alerts for the gateway.
- **Health of Gateway Applications**: Use this widget to view the health status of the applications in the gateway.
- **Examine Operating System**: Use this widget to examine the operating system status.
- **Gateway Summary Status**: Use this widget to view the summary information for the gateway.
- **Gateway Process Status**: Use this widget to view the process information for the gateway.
- **Gateway Resource Metrics**: Use this widget to view the resource metrics associated with the gateway.
- **Parent Host**: Use this widget to view the parent host information.
- **Parent Cluster**: Use this widget to view the parent cluster information.

## Troubleshoot SD-WAN Orchestrator Dashboard

You can use the widgets in Troubleshoot SD-WAN Orchestrator dashboard to monitor and troubleshoot the services and applications associated with the SD-WAN Orchestrator.

You can use the dashboard widget in several ways:

- **Active Alerts on the Orchestrator**: Use this widget to view the active alerts for the Orchestrator.
- **Health of Orchestrator Applications**: Use this widget to view the health status of the applications in the gateway.
- **Examine Operating System**: Use this widget to examine the operating system status.
- **Examing MySQL**: Use this widget to examine the MySQL application.
- **Orchestrator Service Status**: Use this widget to view the service status of the Orchestrator.
- **Redis Status**: Use this widget to view the status of the Redis application.
- **API Check Status**: Use this widget to check the API status.
- **Nginx Status**: Use this widget to check the Nginx status.
- **Parent Host**: Use this widget to view the parent host information.
- **Parent Cluster**: Use this widget to view the parent cluster information.

# VCF Automation Dashboards

The VCF Automation dashboards allow you to track performance, health, utilization, and availability attributes of deployments made to SDDC clouds and public cloud end points. You can also monitor the virtual machines and track the utilization and performance of the VMs in your SDDCs and public cloud accounts..

### VCF Automation Predefined Dashboards

The following VCF Automation dashboards are added to the predefined VCF Operations dashboards:

- Cloud Automation Environment Overview
- Cloud Automation Project Cost Overview
- Cloud Automation Resource Consumption Overview
- Cloud Automation Deployment Overview
- Cloud Automation Top-N Dashboard

## Automation Environment Overview

You can use the widgets in the Cloud Automation Environment Overview dashboard to view the environment details for the vCenter Cloud Zone objects. You can use the Cloud Automation Environment Overview dashboard to view the projects, deployments associated with the vCenter Cloud accounts.

You can use the dashboard widgets in several ways.

- **Environment Summary**: Use this widget to view the SDDC cloud zones, public cloud zones, projects, deployments, blueprints, SDDC VMs and public cloud VM details for the cloud accounts present in your environment.
- **SDDC Cloud Zones**: Use this widget to view the CPU, Disk, Memory, health, risk, and efficiency details for the SDDC cloud zone objects present in your environment.
- **Public Cloud Zones**: Use this widget to view the CPU, Disk, Memory, health, risk, and efficiency details for the public cloud zone objects present in your environment.
- **Project List**: Use this widget to view the total blueprints, cloud zones, deployments, virtual machines, health, risk, efficiency details in your environment.
- **Top Alerts**: Use this widget to view the top alerts in your environment.
- **VM List**: Use this widget to view all the VM details in your environment.
- **Blueprint List**: Use this widget to view the blueprint objects in your environment.
- **Deployment List**: Use this widget to view the blueprint objects deployed in your environment.
- **SDDC Virtual Machines**: Use this widget to view the SDDC VM's resource details.
- **Public Cloud Resources**: Use this widget to view the public cloud resource details.

## Automation SDDC Project Price Overview

You can use the cloud automation SDDC project price overview dashboard to view the project price details associated with each of VMware Cloud on AWS SDDC and public cloud accounts. With the project price overview dashboard, you can view price details for individual projects and find out deployments with the highest cost. .

You can use the dashboard widgets in several ways.

- **Project Cost**: Use this widget to view the project wise cost for compute, storage, and additional resources associated with your cloud environment.
- **Daily Price Over Time**: Use this widget to view the price of individual projects on a day to day basis.
- **Relationship**: Use this widget to view the relationship between the objects and the projects present in your cloud environment.
- **Deployment Price by Selected Project**: Use this widget to view the deployment cost for the selected project in your cloud environment.
- **Deployment With Highest Cost**: Use this widget to view the highest cost associated with projects that are present in your cloud environment.

## Automation SDDC Resource Consumption Overview

You can use the widgets in the Cloud Automation SDDC Resource Consumption Overview dashboard to view the resources consumed by VCF Automation on Cloud Accounts.

You can use the Cloud Automation Resource Consumption Overview dashboard widgets in several ways.

- **Cloud Account**: Use this widget to view all the attributes related to the cloud account.
- **SDDC Cloud Zone**: Use this widget to view all the attributes related to the SDDC cloud zones.
- **Project**: Use this widget to view all the project details associated with your cloud account.
- **Cluster List**: Use this widget to view all the details associated with the clusters in your account.
- **Cluster Utilization**: Use this widget to view the cluster utilization details for the cloud accounts.
- **Deployment Heat Map by Project**: Use this widget to view the heat map for each deployed project in your cloud environment.
- **SDDC Cloud Zone Capacity**: Use this widget to view the memory and storage capacity that is allocated, reserved, and free for each cloud zone object.
- **SDDC Cloud Zone Memory Trend**: Use this widget to view and analyze a seven-day trend for the memory allocated, reserved, and free for the cloud zone.
- **SDDC Cloud Zone Storage Trend**: Use this widget to view and analyze a seven-day trend for the storage allocated, reserved, and free for the cloud zone.

## Automation Deployment Overview

You can use the cloud automation deployment overview dashboard to view the deployment details associated with your cloud environment. You can view details about cloud accounts, cloud zones, projects, and deployments. The dashboard also provides details about the deployment resources and the relationship between deployments and their objects.

You can use the dashboard widgets in several ways.

- **Cloud Account**: Use this widget to know the cloud account details of the selected account.
- **Cloud Zone**: Use this widget to know the cloud zone details like adapter, collection state, policy and object type of the selected account.
- **Project**: Use this widget to know the project details of the selected project.
- **Deployments**: Use this widget to know the deployment details of the cloud accounts in your environment.
- **Deployment Resources**: Use this widget to know the deployment resource details across the cloud accounts in your environment.
- **Object Relationship (Advanced)**: Use this widget to view the relationship between the objects and deployments present in your cloud environment.
- **Deployment Heat Map by Project**: Use this widget to view the heat map for each deployed project in your cloud environment.

- **Deployment Heat Map by Blueprint**: Use this widget to view the heat map for each deployed blueprint in your cloud environment.

## Automation Top-N Dashboard

You can use the widgets in the Cloud Automation Top-N dashboard to view the projects with most critical alerts, to view the blueprint with most deployments, and to view the deployments with the highest cost.

You can use the dashboard widgets in several ways.

- **Project with Most Critical Alerts**: Use this widget to view the projects which has most critical alerts.
- **Top Alerts**: Use this widget to view the top alerts for the projects in your cloud account.
- **Blueprints with Most Deployment**: Use this widget to view the blueprint which has maximum deployments for the cloud account.
- **Relationship**: Use this widget to analyze the relationship between blueprints and deployments, and deployment and cost.

## Project Chargeback

The Project Chargeback dashboard lets you know how much you must spend to run an VCF Automation managed VM on behalf of your customer. In VCF Operations, you can configure the cost drivers and let the system automatically determine how much a VM costs based on your infrastructure requirement. Cost Drivers cover server hardware, storage, licenses, application, maintenance, labor, network, facilities, and additional costs configured within VCF Operations.

Price is what you charge your customer for running their VM. The price of a VM can be based on the cost of the project or based on a rate card that you define. Prices can include up charges, service charges, and others.

### How to Use the Dashboard

- Select a Project widget displays the price of the group. The Select a Deployument widget lets you select deployments under the project, followed by the chargeback metrics.
- Price Summary of Selected Project shows the month to date price of the group.
- VM Price Distribution (Top 100) shows the most expensive VMs in the group.
- Powered Off VMs shows reclaimable VMs and their potential savings.
- Idle VMs shows reclaimable VMs and their potential savings.
- Reclaimable VMs with Snapshots shows reclaimable snapshots and their age.
- Price of VMs in the Selected Deployment shows the price and configuration of each VM in the selected group.

## Project Cost vs. Price

The VM Cost vs. Price Dashboard helps you to analyze the relationship between cost and price for VMs managed by VCF Automation. You can use this dashboard to ensure the price of VMs for chargeback is sufficient to cover the cost of running virtual machines.

### How to Use the Dashboard

- Select a Project allows selection of a group of VMs to analyze. The Select a Deployment widget allows you to select deployments under the project, followed by the price/cost metrics.
- Summary (Month to Date) shows the month to date price and cost.
- VMs of the Selected Deployment (Select to View Trend) shows all VMs in the selected group with their Month to Date Cost, Today's Cost, Month to Date Price, and Today's Price.
- Daily Cost and Daily Price trend chart shows both cost and price over time.

## Project Showback

The Showback VM Cost dashboard provides a quick Showback of the cost associated with the VCF Automation managed VMs in a group. The definition of a group is based on several constructs such as Virtual Machine Folder, Custom Groups,

VMware Aria Automation Projects, and more. Based on the Showback you can improve the accuracy of the costs by editing the cost drivers. Cost drivers that are not customized use reference cost, cost driver customization is available only in Advanced or Enterprise edition of VCF Operations .

**How to Use the Dashboard**

- Select a Project widget displays the price of the group. The Select a Deployument widget lets you select deployments under the project, followed by the showback metrics.
- Cost Summary (This Month) shows the month to date cost, potential savings, and projected cost of the group.
- VM Cost Distribution (Top 100) shows the most expensive VMs in the group.
- Potential Savings (Top 10) shows the VMs ranked by their potential savings.
- VMs of the Selected Deployment (Select to View Trend) shows the cost and configuration of each VM in the selected group.
- Cost Trend of Selected VM shows the trend of the VMs cost over time.

# VCF Operations Dashboards

With VCF Operations dashboards you can monitor and troubleshoot objects in your cloud infrastructure.

The following v VCF Operations dashboards are added to the predefined VCF Operations dashboards:

- VCF Operations Cloud Billing
- VCF Operations Cloud Universal Billing

## VCF Operations Cloud Billing

The VCF Operations Cloud Billing dashboard provides you object billing details of Operating System Instance (OSI) used in your cloud environment.

**How to Use the Dashboard**

- OSIs and Billable Objects widget provides the total count of OSIs and billable objects. You have to update these widgets depending on your subscription limits.
- OSIs Across Object Types widget provides distribution of OSIs across different object types.
- Billable Object Types List widget provides a list of all the object types which are managed by VCF Operations and consume license unit(s).
- OSIs Consumption Across Object Types displays a heat map and maps the magnitude of OSIs consumption for different object types with the relevant heat map colors. The widget also interacts with OSIs Consumption Over Time and displays how OSIs count have been changing for a given object type over a period of time.
- List of Objects widget displays the object details like name, adapter type, object type, policy, creation time, collection state, and collection status. Use the filter option to filter different objects from the list of objects.

**How to Edit OSIs and Billable Objects Widget To Set Correct Color Codes**

1. Click the Edit icon at the top right corner of the widget.
2. Go to **Output Data** section.
3. Double click the row which has column heading Yellow, Orange, or Red.
4. Set the **Color Method** to custom.
5. Enter appropriate values as per your subscription limits.

## VCF Operations Cloud Universal Billing

The VCF Operations Cloud Universal Billing dashboard provides the object billing details based on CPU usage.

#### How to Use the Dashboard

- CPUs and Billable Objects widgets provides the total count of CPUs and Billable Objects. You have to update these widgets based upon your subscription limits.
- CPUs Across Object Types widget provides distribution of CPUs across different object types.
- Billable Object Types List widget provides a list of all the object types which are actively managed by VCF Operations and consume license unit(s).
- CPUs Consumption Across Object Types displays a heatmap and maps the magnitude of CPUs consumption for different object types with heatmap colors. The widget also interacts with CPUs Consumption Over Time and displays how CPUs count has been changing for a given object type over a period of time.

#### How to Edit CPUs and Billable Objects Widget To Set Correct Color Codes

1. Click the Edit icon at the top right corner of the widget.
2. Go to **Output Data** section.
3. Double click the row which has column heading Yellow, Orange, or Red.
4. Set the **Color Method** to custom.
5. Enter appropriate values as per your subscription limits.

# Inventory Dashboards

The three vSphere Inventory dashboards and workload management inventory dashboards cater to the compute, network, and storage aspects of your SDDC. Using these dashboards, you can navigate through the environment and view your inventory and their key metrics at a glance. The Network and Storage dashboards can be shared with the network and storage teams respectively, giving them the necessary visibility, and increasing the collaboration between teams.

#### vSphere inventory dashboards

The vSphere inventory dashboards are built specifically for each role, but they share a common design. They have a similar layout and are used in the same manner. This makes learning easier, especially in smaller environments where the same team manages the full environment.

These dashboards help you answer several key questions:

- What is the topology of your vSphere compute inventory?
- What is the topology of your vSphere storage inventory?
- What is the topology of your vSphere network inventory?

#### Workload Management Inventory Dashboard

This is a unified dashboard for the new workload management objects. It shows the relationships and KPIs for the workload management objects. For example, you can see the topology view from the Tanzu Kubernetes clusters to the physical infrastructure.

## vSphere Compute Inventory Dashboard

You can use the vSphere Compute Inventory Dashboard to browse through the topology of your vSphere compute inventory which includes information related to vSphere world, vCenter, data center, clusters, hosts, virtual machines, properties, and metrics.

You can select an object type to view the properties and metrics related to it. You can also view the clusters, ESX hosts, and virtual machines associated with the object.

You can use the dashboard widgets in several ways.

- **Properties**: View the properties related to an object in the environment.
- **Metrics**: View the metrics related to the object.
- **Clusters**: View the cluster functionality.

- **ESX Hosts**: View the data related to the hosts.
- **Virtual Machines**: View VMs that belong to the object.

## vSphere Network Inventory Dashboard

The vSphere Network Inventory Dashboard allows you to browse through the topology of your vSphere network inventory which includes information related to vSphere world, vCenter, data center, distributed vSwitches, distributed port groups, virtual machines, properties, and metrics.

You can select an object type to view the properties and metrics related to it. You can also view the distributed vSwitches, distributed port groups, virtual machines associated with it.

You can use the dashboard widgets in several ways.

- **Properties**: View the properties related to the object in the environment.
- **Metrics**: View the metrics of the object.
- **Distributed vSwitches**: View details related to the distributed vSwitches.
- **Distributed Port Groups**: View data relevant to distributed port groups.
- **Virtual Machines**: View VMs that belong to the object.

## vSphere Storage Inventory Dashboard

The vSphere Storage Inventory dashboard allows you to browse through the topology of your vSphere storage inventory which includes information related to vSphere world, vCenter, data center, datastore clusters, datastores, virtual machines, properties, and metrics.

You can select an object type to view the properties and metrics related to it. You can also view the datastore clusters, datastores, and virtual machines associated with it.

You can use the dashboard widgets in several ways.

- **Properties**: View the properties related to the object in the environment.
- **Metrics**: View the metrics of the object.
- **Datastore Clusters**: View the datastore cluster functionality.
- **Datastores**: View the datastore functionality.
- **Virtual Machines**: View VMs that belong to the object.

## Workload Management Inventory Dashboard

?The Workload Management Inventory dashboards curates the Kubernetes inventory across all the Workload Management activated vSphere environments and displays it here. This includes an end to end topology map showcasing the health of all the objectes along with upstream and downstream dependencies. Upon clicking any object in the relationship tree, the related inventorty of Supervisor Clusters, Namespaces, Pods, Developer Managed VMs and Tanzu Kubernetes clusters can be viewed and exported from this dashboard.

You can select an object type to view the properties and key metrics related to it.

You can use the dashboard widgets in several ways.

- **Environment Summary**: Provides a summary of the supervisor cluster and the child objects.
- **Relationships**: An interactive canvas where you can view the relationship between the different objects in the workload management inventory.
- **Properties**: View the properties related to the object in the environment.
- **Metrics**: View the metrics of the object.
- **Supervisor Clusters**: View the supervisor cluster functionality.
- **Tanzu Kubernetes cluster**: View the Tanzu Kubernetes cluster functionality.
- **Virtual Machines**: View VMs that belong to the object.
- **vSphere Pods**: View information about vSphere Pods.

## vSphere VM Inventory Dashboard

The vSphere VM Inventory dashboard provides real-time updates on changes to virtual machines, allowing users to monitor both the quantity and patterns of these changes to ensure they align with expectations. To facilitate understanding, the 20 types of changes are categorized into three groups, with changes within each group ordered by importance. For instance, deletions are prioritized over deployments. This tool is specifically designed for the Network Operations Center support team to help them efficiently track and manage VM modifications.

### The vSphere VM Inventory Dashboard Display

The Overview widget provides high-level metrics, displaying data from the last six hours by default to help identify patterns. The Changes in VM Location section tracks movements across ESX hosts and datastores, including vSAN. The Changes in VM States section monitors changes in power or running states, detailing how these changes were executed.

### Customizing the vSphere VM Inventory Dashboard

Adjust the threshold settings to suit your specific needs, but be cautious of setting too many variations as it can become confusing. If you operate with two physical data centers, consider splitting the dashboard into two columns, one for each data center. For those using the dashboard on a desktop, adding a navigation link to the vSphere VM Inventory dashboard can enhance convenience.

# Dashboards in NSX Management Pack

The **NSX Main** dashboard provides an overview of the network objects. It displays the topology of a selected object, how it connects to the elements in the network, and a view of related alerts.

**Table 1383: Widgets in NSX Main Dashboard**

| Widget | Description |
|---|---|
| NSX Instances | Displays the list of environments that are being monitored. When you select an environment in this widget, the other widgets in the **NSX Main** dashboard display data for the selected adapter. |
| Environment Overview | Displays a top-level view of the selected environment and following key components.<br>• NSX Manager<br>• Controller Node<br>• Logical Router<br>• Logical Switch<br>• Load Balancer Virtual Server<br>• Transport Zone |
| Top Alerts | Displays all the open alerts for the selected object in the **Environment Overview** widget. |
| Topology Graph | Displays the topology of the selected object in the **Environment Overview** widget. |

## NSX Inventory Dashboard

The **NSX Inventory** dashboard in VCF Operations provides a holistic view of NSX environment topology. It offers an graphical representation of the interconnections between various NSX components.

This dashboard helps administrators with essential insights into the following components:

- NSX Management Nodes: Displays information related to the status and configuration of NSX management nodes.
- T0 and T1 Routers: Displays details of the t0 and t1 routers including their configurations and associations.
- NSX Load Balancers (LBs) and LB Pools: Displays information about NSX Load Balancers, virtual servers, pool members, and health checks.
- Edge Clusters: Displays data on Edge Clusters including cluster membership and resource consumption.

- Transport Zones: Displays insights into transport zones, offering visibility into network segmentation and connectivity options.
- Edge Nodes and Host Nodes: Monitors Edge Nodes and Host Nodes that are crucial components of the NSX infrastructure.

## Dashboards in VMware Infrastructure Health

Use the VMware Infrastructure Health dashboards to view data related to its certificates, historic trend, health, VM, and versions of all products under the VCF management domain.

**Table 1384: VMware Infrastructure Health Dashboards**

| Dashboard | Description |
|---|---|
| VMware Infrastructure Health Certificate Overview Dashboard | The VMware Infrastructure Health dashboard provides certificate information related to vCenter , NSX Manager nodes, ESX, and Adapter certificate alerts. |
| VMware Infrastructure Health Historic Trend | Use VMware Infrastructure Health health trend dashboard to view the health trend for each component in the cloud management applications.<br>The dashboard provides an overall trend of the health components of the cloud management applications, that are monitored for the last seven days. |
| VMware Infrastructure Health Health Overview | You can use VMware Infrastructure Health dashboard to view and analyze the application-specific problems in the accounts in the VMware Cloud Management Plane. This Dashboard provides the health information for each of the accounts. You can select the component in the cloud management applications from the widgets available in the dashboard. The widgets help in rendering the infrastructure health of that component with its service health and associated configuration alerts, if any. |
| VMware Infrastructure Health VM Optimizer | The VMware Infrastructure Management VM Optimizer dashboard helps you to know how you can reclaim capacity from oversized, idle, powered off VMs and optimize these VMs for performance. |
| VMware Infra VCF BOM Version | The VMware Infra VCF BOM Version dashboard displays all the versions of all products under the VCF management domain. |
| VCF HRM Host Systems | The VCF HRM Host System dashboard displays the health, reports health issues, and allows you to manage the health of the VCF host systems. |
| VCF HRM | The VCF HRM dashboard displays the health, reports health issues, and allows you to manage the health of each application in each VCF management domain. |

## vSphere Dashboards

The vSphere dashboard provides an overview of ESX hosts availability, vCenter appliance availability, and vSphere daily check of the vSphere clusters in your VCF Operations environment. The following vSphere dashboards are added to the predefined VCF Operations dashboards:

- ESX Host Availability
- vCenter Appliance Availability
- vSphere Daily Check

## ESX Host Availability

ESX Host Availability dashboard displays the list of unresponsive ESX hosts, list of hosts in maintainance mode, and list of powered on or unknown power state of the ESX hosts.

Hosts in maintainance mode and power state is an user initiated action. A host becomes becomes unresponsive because of an external factor that vCenter Server is unaware of. This can happen due to several reasons such as a network connectivity issue between the host and vCenter Server.

On the ESX Hosts Availability dashboard, the Unresponsive ESX widget displays the **Power State** as **Unknown** and **Maintainance State** as **notIn Maintainance**.

**How to Use the Dashboard**

- In the Unresponsive ESX widget, click any ESX host from the list.
  - The **Parent Cluster of selected ESX** widget is automatically displayed once you click any host. This widget displays the cluster properties of the selected ESX hosts such as HA enabled, DRS enabled.
  - The ESX **Hosts in the selected cluster** widget is automatically displayed once you click any cluster property tab. This widget displays the number of unresponsive and running hosts. You can identify which hosts has issues and try resolving the issues by accessing the hosts.
- Click any host in the ESX **on Maintenance Mode** or **Power on or Unknown Power State ESX** widget to view the details in the **Parent Cluster of selected ESX** widget.
- Click any cluster property tab in the **Parent Cluster of selected ESX** widget to view the details in the ESX **Hosts in the selected cluster**.

## vCenter Appliance Availability

vCenter Appliance Availability dashboard displays the list of vCenter instances with reachability and availability issues.

If you have hundreds of vCenter instances and need to check their availability and the status of their services, it can be tedious to log in to each vCenter individually to gather this information. This dashboard helps you identify reachability issues and services that are encountering problems.

**How to Use the Dashboard**

The **vCenter Appliance** widget displays the instance name, total ESX hosts, VMs, reachability of each vCenter. To check if there are any issues in the vCenter services, click a vCenter instance in the vCenter Appliance widget. The **Services in the selected vCenter** widget is automatically displayed once you click a vCenter instance. This widget displays the health status of the vCenter services. You can sort the services based on health status according to the following status: Started, Stopped, or Unknown.

Clicking an instance shows you the summary of the instance with metrics, logs, alerts, and other details.

## vSphere Daily Check Dashboard

Use the vSphere daily check dashboard to monitor the live operations of the vSphere clusters in your VCF Operations environment.

Use the vSphere Daily Check dashboard to review the health and performance of the vSphere clusters in your VCF Operations environment. The dashboard displays the critical and important alerts that need immediate attention. You can use this dashboard to prevent or minimize alerts for the next 12 to 24 hours. This dashboard focuses on the daily activities of the environment and provides updates based on changes or alerts in the clusters. The dashboard reflects the following changes in your environment:

- Configuration changes
- Consumption changes: Any unexpected increase or sudden decrease in consumption.
- Supply changes. Any unexpected decrease in supply.
- Dynamic changes: Any VM state, VM location, or VM inventory changes.

Use the dashboard to focus on issues that need immediate attention and resolution for proper functioning of your environment. You can adjust the thresholds and parameters to suit your need and add metrics like error logs to customize the dashboard.

This dashboard complements the alerts triggered in your environment and provides insights into the cause of the alerts and also shows the overall picture. This helps troubleshoot the specific issue without disrupting the whole environment. As part of the daily checks, the following areas are covered:

- Availability: Daily checks cover the availability of powered on VMs and ESX hosts. The numbers reflected should be within the expected range. For example, if a new cluster is added or if several new VMs have been provisioned the day before, the dashboard should reflect the revised available of the VMs and ESX hosts.
- Performance: Daily checks cover the average performance of consumers (VMs) and providers (compute, network, storage). For example, the dashboard monitors the total CPU, memory, disk, and network utilization as any sudden increase or decrease in performance can cause issues.
- Compliance: Daily checks cover the compliance status and focuses on the present status. The present status covers the past 12 to 24 hours.
- Configuration: Daily checks cover the changes in settings and make sure that the settings match the authorized changes executed during the change window.

# Configuring Reports and Views

A report is a scheduled snapshot of views and dashboards. A view helps you to interpret metrics, properties, policies of various monitored objects including alerts, symptoms, and so on

## Reports in VCF Operations

A report is a scheduled snapshot of views and dashboards. You can create reports in VCF Operations to represent objects and metrics. The report can contain a table of contents, cover page, and footer.

With the VCF Operations reporting functions, you can generate a report to capture details related to current or predicted resource needs. You can download the report in a PDF or CSV file format for future and offline needs.

#### Types of Report Templates

There are two types of report templates in VCF Operations.

- Predefined report templates that are out of the box with VCF Operations. For more information, see Accessing Report Templates .
- Custom report templates that you create based on your requirement. For more information, see Create a Report Template.

### Create a Report Template

You create a report to generate a scheduled snapshot of views and dashboards. You can track current resources and predict potential risks to the environment. You can schedule automated reports at regular intervals. The name and description of the report template as they appear in the list of templates on the **Report Templates** tab.

1. To create report templates, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Reports** > **Create**.
2. From the **Create Report Template** page, complete the options in each tab.
3. At the end of each tab, you can go to the previous or next tab. You can also cancel the creation of the report template.
4. After you have added all the details, click **Create** to create the report template.

### Name and Description Tab

**Table 1385: Name and Description Options in the Create Report Template Page**

| Option | Description |
|---|---|
| Name | Name of the template as it appears on the **Report Templates** tab. |
| Description | Description of the template. |

### Report Content Tab

The report template contains views and dashboards. Views present collected information for an object. Dashboards give a visual overview of the performance and state of objects in your virtual infrastructure. You can combine different views and dashboards and order them to suit your needs. The report template contains images of the views/dashboards that are added.

**Table 1386: Views and Dashboards Options and Sections in the Create Report Template Page**

| Option | Description |
|---|---|
| Report Template Structure | To add a view or a dashboard to your report template, select it from the **Views and Dashboards** list in the right pane and drag it to the **Report Template Structure** pane. |
| View and Dashboards | Select **Views** or **Dashboards** to display a list of available views or dashboards that you can add to the template. |
| Filter | Search for views or dashboards based on the following filter criteria.<br>Views: name, type, description, subject, metric, and modified by.<br>Dashboards: name and shared.<br>To see the complete list of views or dashboards, delete the search box contents and press Enter. |
| Vertical Ellipsis > Portrait/Landscape | You can select a portrait or landscape orientation for each view or dashboard from the vertical ellipsis next to the title of the view/dashboard after you drag and drop the view/dashboard to the left pane. |
| Vertical Ellipsis > Colorization | You can activate or deactivate a colorized PDF output for each list view from the vertical ellipsis next to the title of a list view after you drag and drop the list view to the left pane.<br>Available only for list views. |

### Layout and Format Tab

The report template can contain layout options such as a cover page, table of contents, and footer. Formats are the outputs in which you can generate the report.

**Table 1387: Layout and Format Options in the Create Report Template Page**

| Option | Description |
|---|---|
| Cover Page | Can contain an image up to 5 MB.<br>The default report size is 8.5 inches by 11 inches. The image is resized to fit the report front page. |
| Table of contents | Provides a list of the template parts, organized in the order of their appearance in the report. |

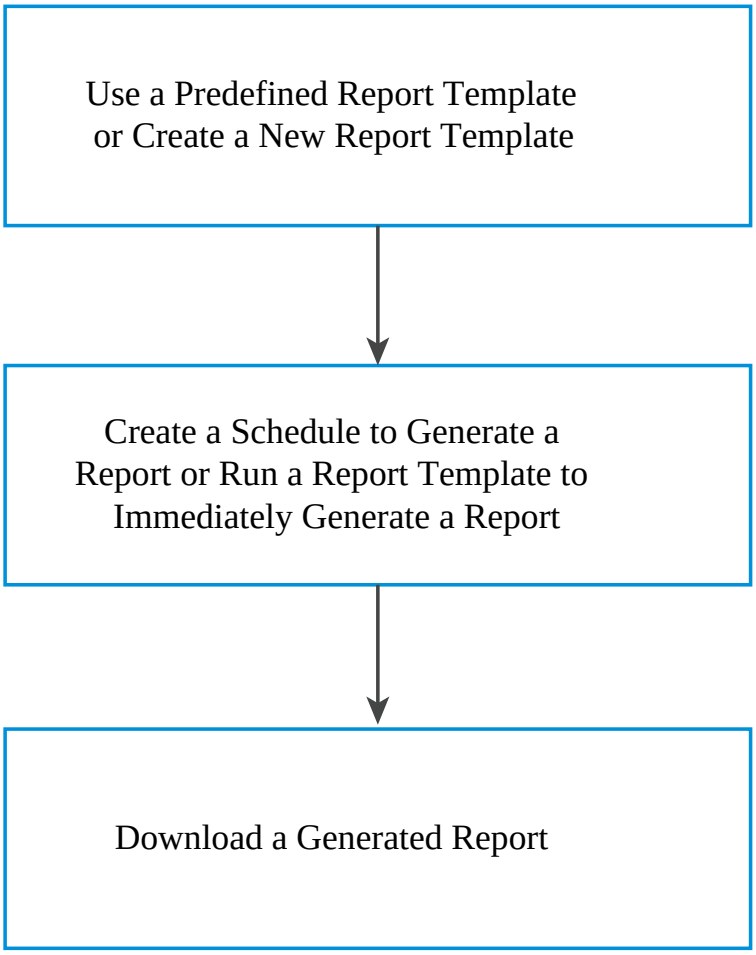
| Option | Description |
|---|---|
| Footer | Includes the date when the report is created, a note that the report is created by VCF Operations, and page number. |
| PDF | With the PDF format, you can read the reports, either on or off line. This format provides a page-by-page view of the reports, as they appear in printed form. |
| CSV | In the CSV format, the data is in a structured table of lists. |

## Manage Report Templates

Using VCF Operations you can manage report templates by running, scheduling, and generating report templates. Additionally, you can create custom report templates, edit existing report templates, download report templates, and so on.

### Reports Workflow

The following flowchart describes a simple workflow for reports in VCF Operations.



## Accessing Report Templates

A report template contains views and dashboards. Views present collected information for an object. Dashboards give a visual overview of the performance and state of objects in your virtual infrastructure. VCF Operations offers several predefined report templates that you can use based on your requirement.

### Where You Can Access Report Templates From

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Reports**. The **Report Templates** tab is displayed on the right.

The listed report templates are user-defined and predefined by VCF Operations. You can order them by template name, description, subject, date they were modified, last run report, or the user who modified them. For each template, you can see the number of generated reports and schedules.

You can filter the reports based on the name of the report template, the subject, and the owner. You can click **Add** to create a report template. For information about creating a report template, see Create a Report Template.

You can select a report template from the list, click the vertical ellipsis against each report template, and select options such as run, edit, schedule, delete, clone, and export a report.

**Table 1388: Predefined Filter Groups**

| Filter Group | Description |
|---|---|
| Name | Filter by the template name. For example, type `my template` to list all reports that contain the `my template` phrase in their name. |
| Subject | Filter by another object. If the report contains more than one view applicable for another type of object, you can filter by the other objects. |
| Owner | Filter by the owner of the report template. |

The maximum number of reports per template is 10. After the tenth report is generated, VCF Operations deletes the oldest report. vSphere users must be logged in until the report generation is complete. If you log out or your session expires, the report generation fails.

### Report Template Actions

You can select more than one report template and perform a set of actions by clicking the horizontal ellipsis next to the **Add** option.

| Option | Description |
|---|---|
| Delete | Deletes the report template. |
| Export | Downloads the report template. |
| Import | Allows you to import a report template by selecting a report template in XML or zip file format.<br>To import a report template:<br>• Click the **Import** option from the horizontal ellipsis.<br>• Click **Browse** and select a report template ZIP or XML file to import.<br>• Select if you want to Overwrite or Skip the file in case of a conflict.<br>• Click **Import** to import the report template, and click **Done**. |
| Change default cover image | Allows you to change the default cover image of the report template. For more information, see Upload a Default Cover Page Image for Reports. |

## Schedule a Report

In VCF Operations, the schedule of a report is the time and recurrence of report generation. To generate a report on a selected date, time, and recurrence, you create a schedule for the report template. You set the email options to send the generated report to your team.

- Download the generated report to verify the output.
- To activate sending email reports, you must have configured Outbound Alert Settings. See Notifications in VCF Operations.

The date range for the generated report is based on the time when the report is generated and not on the time when you schedule the report or when VCF Operations places the report in the queue.

**Note:**
Only users created in VCF Operations can add and edit report schedules.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Reports**.
2. From the **Report Templates** tab, select the relevant report template from the list.
3. Click the vertical ellipsis and select **Schedule**.

   To schedule a report for tenants, click the vertical ellipsis, and select **Schedule for Tenants**.

   **Note:**

   - To view the **Schedule for Tenants** option, click the filter option and select **Yes** against the option **For Tenants**.
   - Scheduled reports are always published to tenants.
4. Select an object and click **Next**.
5. Select the time zone, date, hour, and minutes (in the range of 0, 15, 30, and 45 minutes) to start the report generation.

   VCF Operations generates the scheduled reports in sequential order. Generating a report can take several hours. This process might delay the start time of a report when the previous report takes an extended period of time.
6. From the **Recurrence** drop-down menu, select one of the following options for report generation:

| Option | Description |
|---|---|
| **Daily** | You can set the periodicity in days. For example, you can set report generation to every two days. |
| **Weekly** | You can set the periodicity in weeks. For example, you can set report generation to every two weeks on Monday. |
| **Monthly** | You can set the periodicity in months. |

7. Select the **Email report** check box to send an email with the generated report.

   Email a generated report to a predefined email group or to a network shared location. For more information about how to set up and configure the email options, see Add a Standard Email Plug-In for VCF Operations Outbound Alerts.

   a) In the **Email addresses** text box, enter the email addresses that must receive the report. You can also add email addresses in the CC list and BCC list.
   b) Select an outbound rule.

   An email is sent according to this schedule every time a report is generated.
8. Save a generated report to an external location.

### Editing a Report Schedule

To edit the schedule of a report, click the link in the **Schedules** column against the report template from the **Report Templates** tab, and then from the **Scheduled Reports** dialog box, click **Edit Schedule**. You see the **Scheduled Reports** page.

**Table 1389: Scheduled Reports Toolbar Options**

| Options | Description |
|---|---|
| New Schedule | You can create a schedule for the report. |
| Edit Schedule | You can edit an existing report schedule. |
| Delete Schedule | You can delete an existing report schedule. |
| Transport Report Schedule | You can assign a new owner for the selected report schedule. You can select a target user from the **Transfer Report Schedules** dialog box. |

**Note:**
You can edit, clone, and delete report templates. Before you do, familiarize yourself with the consequences of these actions. When you edit a report template and delete it, all reports generated from the original and the edited templates are deleted. When you clone a report template, the changes that you make to the clone do not affect the source template. When you delete a report template, all generated reports are also deleted.

## Generate and Regenerate a Report

To generate a report, use a predefined or custom report template.

Create a report template.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Reports**.
2. From the **Report Templates** tab on the right, navigate to the relevant report template, click the vertical ellipsis, and select **Run**.

   To generate a report for tenants, click the vertical ellipsis, and select **Run for Tenants**.
3. Select an associated object from the **Select Object** dialog box and click **OK**.

   **Note:**

   To publish the report to tenants, click the the **Publish to Tenants** option.

The report is generated and listed on the **Generated Reports** tab.

**Note:**
To regenerate the selected report, from the **Generated Reports** tab, click the vertical ellipsis against the generated report and select **Run**.

Download the generated report and verify the output.

## Accessing Generated Reports

You can view a list of report templates that have been generated in VCF Operations.

**Where You Can Access Generated Reports From**

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Reports**. The **Generated Reports** tab on the right pane contains all the generated reports. If the report is generated through a schedule, the owner is the user who created the schedule.

**Note:**
The maximum number of reports per template is 10. After the tenth report is generated, VCF Operations deletes the oldest report.

To select a generated report from the list, click the vertical ellipsis against each generated report and select options such as run and delete. You can also select more than one generated report and select the **Delete** button above the data grid to delete a generated report.

You can filter the reports list by adding a filter from the upper-right corner of the panel.

**Table 1390: Predefined Filter Groups**

| Filter Group | Description |
|---|---|
| Report Name | Filter by the report template name. For example, type `my template` to list all reports that contain the `my template` phrase in their name. |
| Template | Filter by the report template. You can select a template from a list of templates applicable for this object. |
| Completion Date/Time | Filter by the date, time, or time range. |
| Subject | Filter by another object. If the report contains more than one view applicable for another type of object, you can filter by that second object. |
| Status | Filter by the status of the report. |

You can download a report in a PDF or CSV format. You define the format that a report is generated in the report template.

If you log in to VCF Operations with vCenter credentials and generate a report, the generated report is always blank.

## Download a Report

To verify that the information appears as expected, you download the generated report.

Generate a report.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Reports**.
2. From the **Generated Reports** tab on the right, click the PDF or the CSV icon in the **Download** column to download the report.

VCF Operations saves the report file.

Schedule a report generation and set the email options, so your team receives the report.

## Publish a Report to Tenants

You can publish a report to the tenant.

**Prerequisites**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards**, and then in the pane in the centre, click **Reports**.
2. From the **Reports** page, click the **Generated Reports** tab.
3. Click the the generated report and then click the **Publish** button.

The report is published to the tenant in VCF Automation.

## Upload a Default Cover Page Image for Reports

You can upload a common default image for the cover page of reports. You do not have to upload a cover page for each report. The cover pages of predefined reports are modified when you use this option. The cover pages of user-defined reports do not change.

### Where Do You Upload a Default Cover Page Image for Reports

To upload a default cover page for reports, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Reports**. From the **Report Templates** tab on the right side, click the horizontal ellipsis next to the **Add** option and click the **Change default cover image** option.

### How Do You Upload a Default Cover Page Image for Reports

Browse for the image that you want to add to the cover page and click **Save**. You can also use the default product image that is available.

## Views in VCF Operations

VCF Operations provides several types of views. Each type of view helps you to interpret metrics, properties, policies of various monitored objects including alerts, symptoms, and so on, from a different perspective. Views also show information that the adapters in your environment provide.

You can configure VCF Operations views to show transformation, forecast, and trend calculations.

- The transformation type determines how the values are aggregated.
- The trend option shows how the values tend to change, based on the historical, raw data. The trend calculations depend on the transformation type and roll up interval.
- The forecast option shows what the future values can be, based on the trend calculations of the historical data.

You can use VCF Operations views in different areas of VCF Operations.

- To manage all views, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Views** > **Manage**.
- To see the data that a view provides in your dashboard, add the View widget to the dashboard. For more information, see View Widget.

**Table 1391: Views Options**

| Options | Description |
|---|---|
| Manage | You can manage views by navigating to **Home** and in the left navigation pane, click **Views** > **Manage**. |
| Add | Use this option to create a view. See Creating and Configure a View. |
| Search | You can search for a view across the **Recents** and **All** folders in the **Views** panel. |
| Recent | The views are listed in the order in which you select them, with the most recent view that you selected, appearing at the top. Up to ten views can be displayed as Recent views.<br>If you do not pin the view and log out of the user interface, on logging back in, the view is removed from the Recents folder |
| All | Lists the views based on their type. You can use this menu for quick navigation through your views. When you navigate to a view, the views are listed in the **Views** panel under **All**. You can also search for views using keywords and letters. |

### Views and Reports Ownership

The default owner of all predefined views and templates is System. If you edit them, you become the owner. If you want to keep the original predefined view or template, you have to clone it. After you clone it, you become the owner of the clone.

The last user who edited a view, template, or schedule is the owner. For example, if you create a view you are listed as its owner. If another user edits your view, that user becomes the owner listed in the Owner column.

The user who imports the view or template is its owner, even if the view is initially created by someone else. For example, *User 1* creates a template and exports it. *User 2* imports it in back, the owner of the template becomes *User 2*.

The user who generated the report is its owner, regardless of who owns the template. If a report is generated from a schedule, the user who created the schedule is the owner of the generated report. For example, if *User 1* creates a template and *User 2* creates a schedule for this template, the generated report owner is *User 2*.

## Accessing Predefined Views

You can access some of the useful, predefined views from the **Views** home page.

To access these views, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Views**.

The views are categorized as follows: Availability, Capacity, Configuration, Inventory, Performance, and Compliance. To easily access some of the useful, predefined dashboards under these categories, click on the drop-down button against the selected category and click on the specific dashboard.

## Views Overview

A view presents collected information for an object in a certain way depending on the view type. Each type of view helps you to interpret metrics, properties, policies of various monitored objects including alerts, symptoms, and so on, from a different perspective.

### How You Access the Views Page

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Manage**.

### Manage and Preview Views

You can preview a view by clicking a view from the **Views** page. Click on a view and add an object if necessary by clicking **Preview source** from the upper-right corner of the specific view.

From the **Views** page you can select a view from the list, click the vertical ellipsis against each view, and select the various options such as edit, delete, clone, and export a view.

You can filter the views based on the name, type, description, subject, metric, and owner. You can click the **Add** option to create a view. For information about creating a view, see Creating and Configure a View.

Views are also categorized and listed in the **Views** panel based on the type of view and subject.

**Table 1392: Filter Groups**

| Filter Group | Description |
|---|---|
| Name | Filter by the view name. For example, type `my view` to list all views that contain the `my view` phrase in their name. |
| Type | Filter by the view type. |
| Description | Filter by the view description. For example, type `my view` to list all views that contain the `my view` phrase in their description. |
| Subject | Filter by the subject. |
| Metric | Filter by a metric. All views using the metric specified will be displayed.<br>You must first select a subject and then select a metric. |
| Modified By | Filter by the user who modified the view. |

**Datagrid Options**

| Column Names | Description |
|---|---|
| Name | Displays the name of the view. |
| Type | Displays the type of view: list, summary, trend, distribution, text, or image. |
| Description | Displays the description of the dashboard. |
| Subject | Displays the base object type for which the view shows information. |
| Dashboard Usage | Displays the number of dashboards where the view is used. Click the number in the column to view the name of the dashboard/s. Click the dashboard name to navigate to the dashboard. |
| Report Usage | Displays the number of reports where the view is used. Click the number in the column to view the name of the report/s. Click the report name to navigate to the report template in edit mode. |
| Last Modified | Displays the date the view was last modified. |
| Modified By | Displays the user who last modified the view. |

### Views Actions

You can select more than one view and perform a set of actions by clicking the horizontal ellipsis next to the **Add** option.

| Option | Description |
|---|---|
| Delete | Deletes the view. |
| Export | Downloads the view. |
| Import | Allows you to import a view by selecting a view in XML or zip file format.<br>To import a view:<br>• Click the **Import** option from the horizontal ellipsis.<br>• Click **Browse** and select a view XML or ZIP file to import.<br>• Select if you want to Overwrite or Skip the file in case of a conflict.<br>• Click **Import** to import the view, and click **Done**. |

## Views and Reports Ownership

The owner of views, reports, or templates might change over time.

The default owner of all predefined views and templates is System. If you edit them, you become the owner. If you want to keep the original predefined view or template, you have to clone it. After you clone it, you become the owner of the clone.

The last user who edited a view, template, or schedule is the owner. For example, if you create a view you are listed as its owner. If another user edits your view, that user becomes the owner listed in the Owner column.

The user who imports the view or template is its owner, even if the view is initially created by someone else. For example, *User 1* creates a template and exports it. *User 2* imports it in back, the owner of the template becomes *User 2*.

The user who generated the report is its owner, regardless of who owns the template. If a report is generated from a schedule, the user who created the schedule is the owner of the generated report. For example, if *User 1* creates a template and *User 2* creates a schedule for this template, the generated report owner is *User 2*.

## Creating and Configure a View

To collect and display information for a specific object, you can create a custom view.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Create**.
2. Select one of the following views from the right panel.
   - List View
   - Summary View
   - Trend View
   - Distribution View
   - Text View
   - Image View
3. At the end of each tab in the selected view, you can go to the previous or next tab. You can also cancel the creation of the view.
4. After you have added all the details, click **Create** to create the view.

### List View

List views provide tabular data about specific objects in the monitored environment that correspond to the selected view.

#### Where You Find the List View

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Create**. Click **List** from the right page.

#### Name and Configuration Tab

| Option | Description |
|---|---|
| Name | Name of the view as it appears on the Views page. |
| Description | Description of the view. |
| **Settings** | |
| Items per page | Select the number of items per page. Each item is one row and its metrics and properties are the columns. |
| Top result count | Select the top results. Restricts the number of results. For example, if you list all the clusters in a View, selecting 10 in this option displays the top 10 clusters with the relevant information. You can reduce the number of rows for the purposes of reporting. |
| Include Deleted Objects | Select to add deleted objects. |
| Show Objects | Select the type of object you want displayed in the view. You can select **Existing**, **Deleted**, or **All** objects. |
| Show Object Creation Date | Select to display the date the object was created. |
| Make the view available at > Dashboards through the View widget | Select if you want to make the view available in a dashboard. |
| Make the view available at > Report template creation and modification | Select if you want to make the view available in a report template. |
| Hide the view for the selected object types | Select an object type for which you do not want to see this view. For example, you have a list view with the subject <virtual machines>. It is visible when you select any of its parent objects. You add a data center from the list. The view is not visible anymore on the data center level. |

## Data Tab

The data definition process includes adding properties, metrics, policies, or data that adapters provide to a view. These are the items by which VCF Operations collects, calculates, and presents the information for the view.

### How to Add Data to a View

If you selected more than one subject, click the subject for which you add data. Double-click either a metric or a property from the tree in the left panel to add it to the view. For each subject that you select, the data available to add might be different. The Data, Transformation, and Configuration details are displayed.

You can see a live preview of the view type when you select a subject and associated data, and then click **Preview Source**.

| Option | Description |
|---|---|
| Add Subject | Select the base object type for which the view shows information. The subject you specify determines where the view is applicable. If you select more than one subject, the view is applicable for each of them. |
| Group By | You can group the results based on a parent object, by making a selection in the Group By drop-down option. If you generate a report based on the list view for which a group has been specified, the report displays group-based information for the selected object. You can also view summary calculations for the group of objects in the report, along with the total summary results for all the objects. |
| **Breakdown By** | |
| Add interval breakdown | Select this check box to see the data for the selected resources broken down in time intervals.<br>After you select this check box, you can enter a label, specify whether the values have to be sorted in ascending or descending order, and select a breakdown interval for the time range. |
| Add Instance breakdown | Select this check box to see the data for all instances of the selected resources.<br>After you select this check box, you can enter a label and select a metric group to break down all the instances in that group. Deselect **Show non-instance aggregate metric** to display only the separate instances. Deselect **Show only instance name** to display the metric group name and instance name in the instance breakdown column.<br>For example, you can create a view to display CPU usage by selecting the metric **CPU:0\|Usage**. If you add an instance breakdown column, the column **CPU:0\|Usage** displays the usage of all CPU instances on separate rows (0, 1, and so on). To avoid ambiguity, you can change the metric label of **CPU:0\|Usage** to **Usage**. |
| **Data Grid options** | |

| Option | Description |
|---|---|
| **Self** drop down option | Click the drop down button to select an ancestor or descendant of the selected subject. You can select metrics and properties from the data selection tree and then configure them.<br>**Note:**<br>Error messages are displayed in the following cases:<br>• If the same object type is used as an ancestor/ descendant and as the primary object type.<br>• If you do not select a metric for the primary object type. You must select at least one metric.<br>• If the number of related ancestor/descendant object types used in the configuration exceeds a maximum of 3. |
| Add Object Name | If you have selected an ancestor or descendant from the **Self** drop down option, click **Add Object Name** to add the name of the selected descendant or ancestor as a column name in the **Preview Source** pane. |
| Data selection tree (Metrics and Properties) | Select a metric or a property.<br>**Note:**<br>The metrics presented by default are a subset of available metrics. If the desired metric is not represented, use the **Select Object** button in the title bar of the data selection tree to re-filter the displayed list. |
| Data column | Click the metric or property to enter configuration details in the configuration column. |
| Transformation column | Displays the type of transformation applied to the data. |
| Configuration column | |
| Metric name | Default metric name. |
| Metric label | Customizable label as it appears in the view or report. |
| Units | Depends on the added metric or property. You can select in what unit to display the values. For example, for CPU\|Demand (MHz) from the **Units** drop-down menu, you can change the value to Hz, kHz, or GHz. If you select **Auto**, the scaling is set to a meaningful unit. |
| Sort order | Orders the values in ascending or descending order<br>**Note:**<br>Sort order is not activated for ancestor or descendant objects. |

| Option | Description |
| --- | --- |
| Transformation | Determines what calculation method is applied on the raw data. You can select the type of transformation:<br>• Minimum. The minimum value of the metric over the selected time range.<br>• Maximum. The maximum value of the metric over the selected time range.<br>• Average. The mean of all the metric values over the selected time range.<br>• Sum. The sum of the metric values over the selected time range.<br>• First. The first metric value for the selected time range.<br>• Last. The last value of a metric within the selected time range.<br>If you have selected **Last** as the transformation in versions before vRealize Operations 6.7, and the end of specified time range is not before the last five minutes, use the **Current** transformation.<br>• Current. The last available value of a metric if it was last updated not before five collection cycles were complete, otherwise it is null.<br>• Standard Deviation. The standard deviation of the metric values.<br>• Metric Correlation. Displays the value when another metric is at the minimum or maximum. For example, displays the value for memory.usage when cpu.usage is at a maximum.<br>• Forecast. Performs a regressive analysis and predicts future values. Displays the last metric value of the selected range.<br>• Percentile. Calculates the specified percentile for the data range. For example, you can view the 95th percentile, 99th percentile, and so on.<br>• Expression. Allows you to construct a mathematical expression over existing transformations using minus, plus, multiplication, division, unary minus, unary plus, and round brackets. For example, `sum/((max + min)/2)`. You can use the operands of some of the existing transformations such as, max, min, avg, sum, first, last, current. You cannot use standard deviation, forecast, metric correlation, and percentile.<br>You can customize the metric unit label when you select the Expression transformation. For example, some of the metric units available are, vCPUs, Bps, KBps, Mbps, and MBps.<br>• Timestamp: You can choose between Absolute Timestamp or Relative Timestamp.<br>– If applied to a numeric metric/property defined with a time-unit definition, the actual value is converted to a human readable timestamp. The metric value is rounded-off to an hour.<br>– In the remaining cases, a timestamp is displayed when metrics and properties are added or modified. In this case, the behavior is the same as the Timestamp option selected for a non-Timestamp transformation. Applicable for Absolute Timestamp and Relative Timestamp.<br>Available for List view and Minimum, Maximum, Current, First, and Last transformation. |
| Ranges for metric coloring | You can associate colors to metrics by entering a percentage, range, or specific state. For example, you can enter Powered Off in the **Red Bound** field when you select virtual machine as an object. You can set the colors only for views and not for csv or pdf formats. |

| Option | Description |
|---|---|
| Series Roll up | The time interval at which the data is rolled up. You can select one of the available options. For example, if you select Sum as a Transformation and 5 minutes as the roll-up interval, then the system selects 5-minute interval values and adds them.<br>This option is applicable to the Transformation configuration option. |

### Time Settings Tab

Use the time settings to select the time interval of data transformation. These options are available for all view types, except Image.

You can set a time range for a past period or set a future date for the end of the time period. When you select a future end date and no data is available, the view is populated by forecast data. Data is collected based on the browser time.

**Table 1393: Time Settings Options**

| Configuration Option | Description |
|---|---|
| Time Range Mode | In Basic mode, you can select date ranges.<br>In Advanced mode, you can select any combination of relative or specific start and end dates.<br>You can also activate the **Business Hour** option and select business hours/days for weekdays. |
| Relative Date Range | Select a relative date range of data transformation.<br>Available in Basic mode. |
| Specific Date Range | Select a specific date range of data transformation.<br>Available in Basic mode. |
| Absolute Date Range | Select a date or time range to view data for a time unit such as a complete month or a week. For example, you can run a report on the third of every month for the previous month. Data from the first to the end of the previous month is displayed as against data from the third of the previous month to the third of the current month.<br>The units of time available are: **Hours**, **Days**, **Weeks**, **Months**, and **Years**.<br>The locale settings of the system determine the start and end of the unit. For example, weeks in most of the European countries begin on Monday while in the United States they begin on Sunday.<br>Available in Basic mode. |
| Relative Start Date | Select a relative start date of data transformation.<br>Available in Advanced mode. |
| Relative End Date | Select a relative end date of data transformation.<br>Available in Advanced mode. |
| Specific Start Date | Select a specific start date of data transformation.<br>Available in Advanced mode. |
| Specific End Date | Select a specific end date of data transformation.<br>Available in Advanced mode. |
| Currently selected date range | Displays the date or time range you selected. For example, if you select a specific date range from 5/01/2016 to 5/18/2016, the following information is displayed: `May 1, 2016 12:00:00 AM to May 18, 2016 11:55:00 PM`. |

| Configuration Option | Description |
|---|---|
| Business Hours | Select business hours from Monday to Sunday by moving the sliders on the left and right sides to set the start and end time for each day of the week.<br>For example, as a VM owner, you can track the average utilization of VMs over a week (business days), during specified hours of the day (business hours).<br>This option is available for Minimum, Maximum, Average, Sum, and Percentile transformations<br>Available in Advanced mode for List Views.<br>**Note:**<br>Business Hours is not supported for the **Interval Breakdown** option. |

## Filter Tab

The filter option allows you to add additional criteria when the view displays too much information. For example, a List view shows information about the health of virtual machines. From the **Filter** tab, you add a risk metric less than 50%. The view displays the health of all virtual machines with risk less than 50%. For selected criteria you can also apply Business Hours, if the selected transformation type you add as a filter is supported by the business hours functionality.

To add a filter to a view, from an existing or new view dialog box, click the **Filter** tab. Fill in the details for each row and click **Add**. You can activate Business Hours for the metric selected.

Each subject has a separate filter box. For Alerts Roll up, Alert, and Symptom subjects not all applicable metrics are supported for filtering.

**Note:**
For Symptom based views, in the filter, if you select either **Symptom Definition Name**, **Alert Definition Name**, or **Alert Type**, it is recommended that you select a preview source that has a smaller number of objects.

**Table 1394: Filter Add Options**

| Option | Description |
|---|---|
| Add | Adds another criteria to the criteria set. The filter returns results that match all the specified criteria.<br>If you add a filter for an instance metric or property, all the instances of the object for which the criteria is met, will be displayed in the preview screen.<br>For instance metrics or properties, you can filter based on transformations such as, Current, Average, First, Last, Maximum, Minimum, Sum, and Timestamp. |
| Add another criteria set | Adds another criteria set. The filter returns results that match one criteria set or another. |

## Summary Tab

You can add more than one summary row or column and configure each to show different aggregations. In the summary configuration panel, you select the aggregation method and what data to include or exclude from the calculations.

To add a summary row or column to a view, from an existing or new view dialog box, click the **Summary** tab in the right pane. Click the plus sign to add a summary row.

For the Summary view, the summary column shows aggregated information by the items provided on the **Data** tab.

### Previous, Next, Create, and Cancel Options

At the end of each tab, you can go to the previous or next tab. You can also cancel the creation of the view. After you have added all the details, click **Create** to create the view.

## Summary View

Summary views provide tabular data about the use of resources in the monitored environment.

### Where You Find the Summary View

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Create**. Click **Summary** from the right page.

### Name and Configuration Tab

| Option | Description |
|---|---|
| Name | Name of the view as it appears on the Views page. |
| Description | Description of the view. |
| **Settings** | |
| Items per page | Select the number of items per page. Each item is one row and its metrics and properties are the columns. |
| Make the view available for > Dashboards through the View widget | Select if you want to make the view available in a dashboard. |
| Make the view available for > Report template creation and modification | Select if you want to make the view available in a report template. |
| Hide the view for the selected object types | Select an object type for which you do not want to see this view. For example, you have a list view with the subject <virtual machines>. It is visible when you select any of its parent objects. You add a data center from the list. The view is not visible anymore on the data center level. |

### Data Tab

The data definition process includes adding properties, metrics, policies, or data that adapters provide to a view. These are the items by which VCF Operations collects, calculates, and presents the information for the view.

### How to Add Data to a View

If you selected more than one subject, click on the subject for which you want to add data. Double-click either a metric or a property from the tree in the left panel to add it to the view. For each subject that you select, the data available to add might be different. The Data, Transformation, and Configuration details are displayed.

You can see a preview of the view type when you select a subject and associated data, and then click **Select preview source**.

| Option | Description |
|---|---|
| Add Subject | Select the base object type for which the view shows information. The subject you specify determines where the view is applicable. If you select more than one subject, the view is applicable for each of them. |
| **Data Grid options** | |
| Data selection tree | Select a metric or property |

| Option | Description |
|---|---|
| Data column | Click the metric or property to enter configuration details in the configuration column. |
| Transformation column | |
| Configuration column | |
| Metric name | Default metric name. |
| Metric label | Customizable label as it appears in the view or report. |
| Units | Depends on the added metric or property. You can select in what unit to display the values. For example, for CPU\|Demand(MHz) from the **Units** drop-down menu, you can change the value to Hz, KHz, or GHz. If you select **Auto**, the scaling is set to a meaningful unit. |
| Sort order | Orders the values in ascending or descending order. |
| Transformation | Determines what calculation method is applied on the raw data. You can select the type of transformation:<br>• Minimum. The minimum value of the metric over the selected time range.<br>• Maximum. The maximum value of the metric over the selected time range.<br>• Average. The mean of all the metric values over the selected time range.<br>• Sum. The sum of the metric values over the selected time range.<br>• First. The first metric value for the selected time range.<br>• Last. The last value of a metric within the selected time range. If you have selected **Last** as the transformation in versions before vRealize Operations 6.7, and the end of specified time range is not before the last five minutes, use the **Current** transformation.<br>• Current. The last available value of a metric if it was last updated not before five collection cycles were complete, otherwise it is null.<br>• Standard Deviation. The standard deviation of the metric values.<br>• Metric Correlation. Displays the value when another metric is at the minimum or maximum. For example, displays the value for memory.usage when cpu.usage is at a maximum.<br>• Forecast. Performs a regressive analysis and predicts future values. Displays the last metric value of the selected range.<br>• Percentile. Calculates the specified percentile for the data range. For example, you can view the 95th percentile, 99th percentile, and so on.<br>• Expression. Allows you to construct a mathematical expression over existing transformations using minus, plus, multiplication, division, unary minus, unary plus, and round brackets. For example, `sum/((max + min)/2)`. You can use the operands of some of the existing transformations such as, max, min, avg, sum, first, last, current. You cannot use standard deviation, forecast, metric correlation, and percentile. You can customize the metric unit label when you select the Expression transformation. For example, some of the metric units available are, vCPUs, Bps, KBps, Mbps, and MBps. |

| Option | Description |
|---|---|
| Series Roll up | The time interval at which the data is rolled up. You can select one of the available options. For example, if you select Sum as a Transformation and 5 minutes as the roll-up interval, then the system selects 5-minute interval values and adds them.<br>This option is applicable to the Transformation configuration option. |

### Time Settings Tab

Use the time settings to select the time interval of data transformation. These options are available for all view types, except Image.

You can set a time range for a past period or set a future date for the end of the time period. When you select a future end date and no data is available, the view is populated by forecast data. Data is calculated based on the browser time.

**Table 1395: Time Settings Options**

| Configuration Option | Description |
|---|---|
| Time Range Mode | In Basic mode, you can select date ranges.<br>In Advanced mode, you can select any combination of relative or specific start and end dates. |
| Relative Date Range | Select a relative date range of data transformation.<br>Available in Basic mode. |
| Specific Date Range | Select a specific date range of data transformation.<br>Available in Basic mode. |
| Absolute Date Range | Select a date or time range to view data for a time unit such as a complete month or a week. For example, you can run a report on the third of every month for the previous month. Data from the first to the end of the previous month is displayed as against data from the third of the previous month to the third of the current month.<br>The units of time available are: **Hours**, **Days**, **Weeks**, **Months**, and **Years**.<br>The locale settings of the system determine the start and end of the unit. For example, weeks in most of the European countries begin on Monday while in the United States they begin on Sunday.<br>Available in Basic mode. |
| Relative Start Date | Select a relative start date of data transformation.<br>Available in Advanced mode. |
| Relative End Date | Select a relative end date of data transformation.<br>Available in Advanced mode. |
| Specific Start Date | Select a specific start date of data transformation.<br>Available in Advanced mode. |
| Specific End Date | Select a specific end date of data transformation.<br>Available in Advanced mode. |
| Currently selected date range | Displays the date or time range you selected. For example, if you select a specific date range from 5/01/2016 to 5/18/2016, the following information is displayed: `May 1, 2016 12:00:00 AM to May 18, 2016 11:55:00 PM`. |

### Filter Tab

The filter option allows you to add additional criteria when the view displays too much information. For example, a view shows information about the health of virtual machines. From the **Filter** tab, you add a risk metric less than 50%. The view displays the health of all virtual machines with risk less than 50%.

To add a filter to a view, from an existing or new view dialog box, click the **Filter** tab. Fill in the details for each row and click **Add**.

Each subject has a separate filter box. For Alerts Roll up, Alert, and Symptom subjects not all applicable metrics are supported for filtering.

**Table 1396: Filter Add Options**

| Option | Description |
|---|---|
| Add | Adds another criteria to the criteria set. The filter returns results that match all the specified criteria.<br>If you add a filter for an instance metric or property, all the instances of the object for which the criteria is met, will be displayed in the preview screen.<br>For instance metrics or properties, you can filter based on transformations such as, Current, Average, First, Last, Maximum, Minimum, Sum, and Timestamp. |
| Add another criteria set | Adds another criteria set. The filter returns results that match one criteria set or another. |

#### Summary Tab

You can add more than one summary row or column and configure each to show different aggregations. In the summary configuration panel, you select the aggregation method and what data to include or exclude from the calculations.

To add a summary row or column to a view, from an existing or new view dialog box, click the **Summary** tab in the right pane. Click the plus sign to add a summary row.

For the Summary view, the summary column shows aggregated information by the items provided on the **Data** tab.

#### Previous, Next, Create, and Cancel Options

At the end of each tab, you can go to the previous or next tab. You can also cancel the creation of the view. After you have added all the details, click **Create** to create the view.

### Trend View

Trend views use historic data to generate trends and forecasts for resource use and availability in the monitored environment.

#### Where You Find the Trend View

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Create**. Click **Trend** from the right page.

#### Name and Configuration Tab

| Option | Description |
|---|---|
| Name | Name of the view as it appears on the Views page. |
| Description | Description of the view. |
| **Settings** | |

| Option | Description |
|---|---|
| The maximum plot lines | Enter the maximum number of plot lines. Limits the output in terms of the objects displayed in the live preview of the view type on the left upper pane. The number you set as the maximum number of plot lines determines the plot lines.<br>For example, if you plot historical data and set the maximum at 30 plot lines, then 30 objects are displayed. If you plot historical, trend, and forecast lines, and set the maximum to 30 plot lines, then only 10 objects are displayed as each object has three plot lines. |
| Make the view available for > Dashboards through the View widget | Select if you want to make the view available in a dashboard. |
| Make the view available for > Report template creation and modification | Select if you want to make the view available in a report template. |
| Hide the view for the selected object types | Select an object type for which you do not want to see this view. For example, you have a list view with the subject <virtual machines>. It is visible when you select any of its parent objects. You add a data center from the list. The view is not visible anymore on the data center level. |

## Data Tab

The data definition process includes adding properties, metrics, policies, or data that adapters provide to a view. These are the items by which VCF Operations collects, calculates, and presents the information for the view.

### How to Add Data to a View

If you selected more than one subject, click on the subject for which you want to add data. Double-click the data from the tree in the left panel to add it to the view. For each subject the data available to add, might be different.

You can see a live preview of the view type when you select a subject and associated data, and then click **Select preview source**.

| Option | Description |
|---|---|
| Add Subject | Select the base object type for which the view shows information. The subject you specify determines where the view is applicable. If you select more than one subject, the view is applicable for each of them. |
| **Data Grid options** | |
| Data selection tree | Select a metric or a property. |
| Data column | Click the metric or property to enter configuration details in the configuration column. |
| Transformation column | Displays the type of transformation applied to the data. |
| Configuration column | |
| Metric name | Default metric name. |
| Metric label | Customizable label as it appears in the view or report. |
| Units | Depends on the added metric or property. You can select in what unit to display the values. For example, for CPU\|Demand (MHz) from the Units drop-down menu, you can change the value to Hz, KHz, or GHz. If you select Auto, the scaling is set to a meaningful unit. |

| Option | Description |
|---|---|
| Sort order | Select whether you want to sort data in either ascending or descending order.<br>**Note:**<br>Null values are included. To exclude them, you can apply a filter. |
| Data Series | Select whether to include historical data, trend of historical data, and forecast for future time in the trend view calculations. |
| Ranges for metric coloring | You can associate colors to metrics by entering a percentage, range, or specific state. For example, you can enter Powered Off in the **Red Bound** field when you select virtual machine as an object. You can set the colors only for views and not for csv or pdf formats. |
| Series Roll up | The time interval at which the data is rolled up. You can select one of the available options. For example, if you select Sum as a Transformation and 5 minutes as the roll-up interval, then the system selects 5-minute interval values and adds them.<br>This option is applicable to the Transformation configuration option.<br>Available for all views. |
| Threshold Lines | You can set a threshold for a single metric:<br>• None. You have not set a threshold.<br>• By Symptom Definition. You can set a threshold value based on a symptom definition.<br>• Custom. You can set the threshold value as **Warning**, **Critical**, or **Immediate**. These options are available only for the **Custom** option. |

## Time Settings Tab

Use the time settings to select the time interval of data transformation.

You can set a time range for a past period or set a future date for the end of the time period. When you select a future end date and no data is available, the view is populated by forecast data. Data is calculated based on the browser time.

**Note:**

Trend and forecast calculations in Views are based solely on historical data for the selected resource–metric pair. By default, only the most recent 90 days of historical data are used for these calculations, even if the time range configured in the View is longer. The time range selected in the View controls only the data displayed, not the data used for trend or forecast calculations. Capacity-related settings do not affect trend or forecast calculations in Views and are not configurable for this feature.

**Table 1397: Time Settings Options**

| Configuration Option | Description |
|---|---|
| Time Range Mode | In Basic mode, you can select date ranges.<br>In Advanced mode, you can select any combination of relative or specific start and end dates. |
| Relative Date Range | Select a relative date range of data transformation.<br>Available in Basic mode. |
| Specific Date Range | Select a specific date range of data transformation.<br>Available in Basic mode. |

| Configuration Option | Description |
|---|---|
| Absolute Date Range | Select a date or time range to view data for a time unit such as a complete month or a week. For example, you can run a report on the third of every month for the previous month. Data from the first to the end of the previous month is displayed as against data from the third of the previous month to the third of the current month.<br>The units of time available are: **Hours**, **Days**, **Weeks**, **Months**, and **Years**.<br>The locale settings of the system determine the start and end of the unit. For example, weeks in most of the European countries begin on Monday while in the United States they begin on Sunday.<br>Available in Basic mode. |
| Relative Start Date | Select a relative start date of data transformation.<br>Available in Advanced mode. |
| Relative End Date | Select a relative end date of data transformation.<br>Available in Advanced mode. |
| Specific Start Date | Select a specific start date of data transformation.<br>Available in Advanced mode. |
| Specific End Date | Select a specific end date of data transformation.<br>Available in Advanced mode. |
| Currently selected date range | Displays the date or time range you selected. For example, if you select a specific date range from 5/01/2016 to 5/18/2016, the following information is displayed: `May 1, 2016 12:00:00 AM to May 18, 2016 11:55:00 PM`. |

## Filter

The filter option allows you to add additional criteria when the view displays too much information.

To add a filter to a view, from an existing or new view dialog box, click the **Filter** tab. Fill in the details for each row and click **Add**.

Each subject has a separate filter box. For Alerts Roll up, Alert, and Symptom subjects not all applicable metrics are supported for filtering.

**Table 1398: Filter Add Options**

| Option | Description |
|---|---|
| Add | Adds another criteria to the criteria set. The filter returns results that match all the specified criteria.<br>If you add a filter for an instance metric or property, all the instances of the object for which the criteria is met, will be displayed in the preview screen.<br>For instance metrics or properties, you can filter based on transformations such as, Current, Average, First, Last, Maximum, Minimum, Sum, and Timestamp. |
| Add another criteria set | Adds another criteria set. The filter returns results that match one criteria set or another. |

## Previous, Next, Create, and Cancel Options

At the end of each tab, you can go to the previous or next tab. You can also cancel the creation of the view. After you have added all the details, click **Create** to create the view.

## Distribution View

Distribution views provide aggregated data about resource distribution in the monitored environment. When you add a distribution type of View to a dashboard, you can click a section of the pie chart or on one of the bars in the bar chart to view the list of objects filtered by the selected segment.

### Where You Find the Distribution View

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Create**. Click **Distribution** from the right page.

### Name and Configuration Tab

| Option | Description |
|---|---|
| Name | Name of the view as it appears on the Views page. |
| Description | Description of the view. |
| **Configuration** | |
| Visualization | You can view the data as a pie chart, a bar chart, or a donut chart. When you add a distribution type of View to a dashboard, you can click a section of the pie chart, or on one of the bars in the bar chart, or a section of the donut chart to view the list of objects filtered by the selected segment. You can select the display colors for single or multi-colored charts. |
| Coloring | |
| Colorize | The colors of the slices in the pie chart are displayed in the order of the colors in the color palette. |
| Select Color | Select the color that you want the chart to appear in. If there is more than one slice in a pie chart, the colors are chosen sequentially from the color palette. In a bar chart, the bars are all the same color. |
| Distribution Type > Dynamic Distribution | |
| Buckets Count | The number of buckets to use in the data distribution. |
| Buckets Size Interval | The bucket size is determined by the defined interval divided by the specified number of buckets. |
| Buckets > Size > Logarithmic bucketing | The bucket size is calculated to logarithmically increasing sizes. This provides a continuous coverage of the whole range with the specified number of buckets. The base of the logarithmic sizing is determined by the given data. |
| Buckets > Size > Simple Max/Min bucketing | The bucket size is divided equally between the measured min and max values. This provides a continuous coverage of the whole range with the specified number of buckets. |
| Distribution Type > Manual Distribution | Specify the number of buckets and the minimum and maximum values of each bucket.<br>You can also select a color for each defined bucket that you specify. |
| Distribution Type > Discrete Distribution | Specify the number of buckets in which VCF Operations distributes the data.<br>If you increase the number of buckets, you can see more detailed data. |
| Distribution Type > Summary | |
| **Settings** | |

| Option | Description |
|---|---|
| Make the view available for > Dashboards through the View widget | Select if you want to make the view available in a dashboard. |
| Make the view available for > Report template creation and modification | Select if you want to make the view available in a report template. |
| Hide the view for the selected object types | Select an object type for which you do not want to see this view. For example, you have a trend view with the subject <virtual machines>. It is visible when you select any of its parent objects. You add a data center from the list. The view is not visible anymore on the data center level. |

## Data Tab

The data definition process includes adding properties, metrics, policies, or data that adapters provide to a view. These are the items by which VCF Operations collects, calculates, and presents the information for the view.

## How to Add Data to a View

If you selected more than one subject, click the subject for which you add data. Double-click either a metric or a property from the tree in the left panel to add it to the view. For each subject that you select, the data available to add might be different. The Data, Transformation, and Configuration details are displayed.

You can see a live preview of the view type when you select a subject and associated data, and then click **Select preview source**.

| Option | Description |
|---|---|
| Add Subject | Select the base object type for which the view shows information. The subject you specify determines where the view is applicable. If you select more than one subject, the view is applicable for each of them. |
| **Data Grid options** | |
| Data selection tree | Double-click to select a metric or a property. |
| Data column | Click the metric or property to enter configuration details in the Configuration column. |
| Transformation column | Displays the type of transformation applied to the data. |
| Configuration column | |
| Metric name | Default metric name. |
| Metric label | Customizable label as it appears in the view or report. |
| Units | Depends on the added metric or property. You can select in what unit to display the values. For example, for CPU\|Demand (MHz) from the **Units** drop-down menu, you can change the value to Hz, KHz, or GHz. If you select **Auto**, the scaling is set to a meaningful unit. |
| Sort order | Orders the values in ascending or descending order. |

| Option | Description |
| --- | --- |
| Transformation | Determines what calculation method is applied on the raw data. You can select the type of transformation:<br>• Minimum. The minimum value of the metric over the selected time range.<br>• Maximum. The maximum value of the metric over the selected time range.<br>• Average. The mean of all the metric values over the selected time range.<br>• Sum. The sum of the metric values over the selected time range.<br>• First. The first metric value for the selected time range.<br>• Last. The last value of a metric within the selected time range. If you have selected **Last** as the transformation in versions before vRealize Operations 6.7, and the end of specified time range is not before the last five minutes, use the **Current** transformation.<br>• Current. The last available value of a metric if it was last updated not before five collection cycles were complete, otherwise it is null.<br>• Standard Deviation. The standard deviation of the metric values.<br>• Metric Correlation. Displays the value when another metric is at the minimum or maximum. For example, displays the value for memory.usage when cpu.usage is at a maximum.<br>• Forecast. Performs a regressive analysis and predicts future values. Displays the last metric value of the selected range.<br>• Percentile. Calculates the specified percentile for the data range. For example, you can view the 95th percentile, 99th percentile, and so on.<br>• Expression. Allows you to construct a mathematical expression over existing transformations using minus, plus, multiplication, division, unary minus, unary plus, and round brackets. For example, `sum/((max + min)/2)`. You can use the operands of some of the existing transformations such as, max, min, avg, sum, first, last, current. You cannot use standard deviation, forecast, metric correlation, and percentile. You can customize the metric unit label when you select the Expression transformation. For example, some of the metric units available are, vCPUs, Bps, KBps, Mbps, and MBps. |
| Series Roll up | The time interval at which the data is rolled up. You can select one of the available options. For example, if you select Sum as a Transformation and 5 minutes as the roll-up interval, then the system selects 5-minute interval values and adds them.<br>This option is applicable to the Transformation configuration option. |

## Time Settings Tab

Use the time settings to select the time interval of data transformation.

You can set a time range for a past period or set a future date for the end of the time period. When you select a future end date and no data is available, the view is populated by forecast data. Data is calculated based on the browser time

**Table 1399: Time Settings Options**

| Configuration Option | Description |
|---|---|
| Time Range Mode | In Basic mode, you can select date ranges.<br>In Advanced mode, you can select any combination of relative or specific start and end dates. |
| Relative Date Range | Select a relative date range of data transformation.<br>Available in Basic mode. |
| Specific Date Range | Select a specific date range of data transformation.<br>Available in Basic mode. |
| Absolute Date Range | Select a date or time range to view data for a time unit such as a complete month or a week. For example, you can run a report on the third of every month for the previous month. Data from the first to the end of the previous month is displayed as against data from the third of the previous month to the third of the current month.<br>The units of time available are: **Hours**, **Days**, **Weeks**, **Months**, and **Years**.<br>The locale settings of the system determine the start and end of the unit. For example, weeks in most of the European countries begin on Monday while in the United States they begin on Sunday.<br>Available in Basic mode. |
| Relative Start Date | Select a relative start date of data transformation.<br>Available in Advanced mode. |
| Relative End Date | Select a relative end date of data transformation.<br>Available in Advanced mode. |
| Specific Start Date | Select a specific start date of data transformation.<br>Available in Advanced mode. |
| Specific End Date | Select a specific end date of data transformation.<br>Available in Advanced mode. |
| Currently selected date range | Displays the date or time range you selected. For example, if you select a specific date range from 5/01/2016 to 5/18/2016, the following information is displayed: `May 1, 2016 12:00:00 AM to May 18, 2016 11:55:00 PM`. |

## Filter Tab

The filter option allows you to add additional criteria when the view displays too much information.

To add a filter to a view, from an existing or new view dialog box, click the **Filter** tab. Fill in the details for each row and click **Add**.

Each subject has a separate filter box. For Alerts Roll up, Alert, and Symptom subjects not all applicable metrics are supported for filtering.

**Table 1400: Filter Add Options**

| Option | Description |
|---|---|
| Add | Adds another criteria to the criteria set. The filter returns results that match all the specified criteria.<br>If you add a filter for an instance metric or property, all the instances of the object for which the criteria is met, will be displayed in the preview screen.<br>For instance metrics or properties, you can filter based on transformations such as, Current, Average, First, Last, Maximum, Minimum, Sum, and Timestamp. |
| Add another criteria set | Adds another criteria set. The filter returns results that match one criteria set or another. |

#### Previous, Next, Create, and Cancel Options

At the end of each tab, you can go to the previous or next tab. You can also cancel the creation of the view. After you have added all the details, click **Create** to create the view.

### Text View

Text views allows you to insert provided text. The text can be dynamic and contain metrics and properties. You can format text to increase or decrease the font size, change the font color, highlight text, and align text to the left, right, or center. You can also make the selected text appear bold, in italics, or underlined. By default the text view is available only for report template creation and modification. You can change this in the **Visibility** option in the **Name and Configuration** tab.

#### Where You Find the Text View

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Create**. Click **Text** from the right page.

#### Name and Configuration Tab

| Option | Description |
|---|---|
| Name | Name of the view as it appears on the Views page. |
| Description | Description of the view. |
| **Settings** | |
| Make the view available for > Dashboards through the View widget | Select if you want to make the view available in a dashboard. |
| Make the view available for > Report template creation and modification | Select if you want to make the view available in a report template. This is the default option. |
| Hide the view for the selected object types | Select an object type for which you do not want to see this view. For example, you have a list view with the subject <virtual machines>. It is visible when you select any of its parent objects. You add a data center from the list. The view is not visible anymore on the data center level. |

#### Data Tab

The data definition process includes adding properties, metrics, policies, or data that adapters provide to a view. These are the items by which VCF Operations collects, calculates, and presents the information for the view.

## How to Add Data to a View

If you selected more than one subject, click the subject for which you add data. Double-click the data from the tree in the left panel to add it to the view. For each subject, the data available to add might be different. The data and configuration details are displayed.

You can see a live preview of the view type when you select a subject and associated data, and then click **Select preview source**.

| Option | Description |
|---|---|
| Add Subject | Select the base object type for which the view shows information. The subject you specify determines where the view is applicable. If you select more than one subject, the view is applicable for each of them. |
| **Data Grid options** | |
| Data selection tree | Select a metric or property. |
| Data column | Click the metric or property to enter configuration details in the Configuration column.<br>You can also enter text to display in the view. |
| **Configuration column** | |
| Metric name | Default metric name. |
| Metric label | Customizable label as it appears in the view or report. |
| Units | Depends on the added metric or property. You can select in what unit to display the values. For example, for CPU\|Demand(MHz) from the **Units** drop-down menu, you can change the value to Hz, KHz, or GHz. If you select **Auto**, the scaling is set to a meaningful unit. |

| Option | Description |
|---|---|
| Transformation | Determines what calculation method is applied on the raw data. You can select the type of transformation:<br>• Minimum. The minimum value of the metric over the selected time range.<br>• Maximum. The maximum value of the metric over the selected time range.<br>• Average. The mean of all the metric values over the selected time range.<br>• Sum. The sum of the metric values over the selected time range.<br>• First. The first metric value for the selected time range.<br>• Last. The last value of a metric within the selected time range. If you have selected **Last** as the transformation in versions before vRealize Operations 6.7, and the end of specified time range is not before the last five minutes, use the **Current** transformation.<br>• Current. The last available value of a metric if it was last updated not before five collection cycles were complete, otherwise it is null.<br>• Standard Deviation. The standard deviation of the metric values.<br>• Metric Correlation. Displays the value when another metric is at the minimum or maximum. For example, displays the value for memory.usage when cpu.usage is at a maximum.<br>• Forecast. Performs a regressive analysis and predicts future values. Displays the last metric value of the selected range.<br>• Percentile. Calculates the specified percentile for the data range. For example, you can view the 95th percentile, 99th percentile, and so on.<br>• Expression. Allows you to construct a mathematical expression over existing transformations using minus, plus, multiplication, division, unary minus, unary plus, and round brackets. For example, `sum/((max + min)/2)`. You can use the operands of some of the existing transformations such as, max, min, avg, sum, first, last, current. You cannot use standard deviation, forecast, metric correlation, and percentile. You can customize the metric unit label when you select the Expression transformation. For example, some of the metric units available are, vCPUs, Bps, KBps, Mbps, and MBps. |
| Series Roll up | The time interval at which the data is rolled up. You can select one of the available options. For example, if you select Sum as a Transformation and 5 minutes as the roll-up interval, then the system selects 5-minute interval values and adds them.<br>This option is applicable to the Transformation configuration option. |

## Time Settings

Use the time settings to select the time interval of data transformation. These options are available for all view types, except Image.

You can set a time range for a past period or set a future date for the end of the time period. When you select a future end date and no data is available, the view is populated by forecast data. Data is calculated based on the browser time.

**Table 1401: Time Settings Options**

| Configuration Option | Description |
|---|---|
| Time Range Mode | In Basic mode, you can select date ranges.<br>In Advanced mode, you can select any combination of relative or specific start and end dates. |
| Relative Date Range | Select a relative date range of data transformation.<br>Available in Basic mode. |
| Specific Date Range | Select a specific date range of data transformation.<br>Available in Basic mode. |
| Absolute Date Range | Select a date or time range to view data for a time unit such as a complete month or a week. For example, you can run a report on the third of every month for the previous month. Data from the first to the end of the previous month is displayed as against data from the third of the previous month to the third of the current month.<br>The units of time available are: **Hours**, **Days**, **Weeks**, **Months**, and **Years**.<br>The locale settings of the system determine the start and end of the unit. For example, weeks in most of the European countries begin on Monday while in the United States they begin on Sunday.<br>Available in Basic mode. |
| Relative Start Date | Select a relative start date of data transformation.<br>Available in Advanced mode. |
| Relative End Date | Select a relative end date of data transformation.<br>Available in Advanced mode. |
| Specific Start Date | Select a specific start date of data transformation.<br>Available in Advanced mode. |
| Specific End Date | Select a specific end date of data transformation.<br>Available in Advanced mode. |
| Currently selected date range | Displays the date or time range you selected. For example, if you select a specific date range from 5/01/2016 to 5/18/2016, the following information is displayed: `May 1, 2016 12:00:00 AM to May 18, 2016 11:55:00 PM`. |

## Filter

The filter option allows you to add additional criteria when the view displays too much information.

To add a filter to a view, from an existing or new view dialog box, click the **Filter** tab. Fill in the details for each row and click **Add**.

Each subject has a separate filter box. For Alerts Roll up, Alert, and Symptom subjects not all applicable metrics are supported for filtering.

**Table 1402: Filter Add Options**

| Option | Description |
|---|---|
| Add | Adds another criteria to the criteria set. The filter returns results that match all the specified criteria.<br>If you add a filter for an instance metric or property, all the instances of the object for which the criteria is met, will be displayed in the preview screen.<br>For instance metrics or properties, you can filter based on transformations such as, Current, Average, First, Last, Maximum, Minimum, Sum, and Timestamp. |
| Add another criteria set | Adds another criteria set. The filter returns results that match one criteria set or another. |

#### Previous, Next, Create, and Cancel Options

At the end of each tab, you can go to the previous or next tab. You can also cancel the creation of the view. After you have added all the details, click **Create** to create the view.

## Image View

Image views allow you to insert a static image. By default the image view is available only for report template creation and modification.

#### Where You Find the Image View

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Create**. Click **Image** from the right page.

#### Name and Configuration Tab

| Option | Description |
|---|---|
| Name | Name of the view as it appears on the Views page. |
| Description | Description of the view. |
| **Settings** | |
| Make the view available for > Dashboards through the View widget | Select if you want to make the view available in a dashboard. |
| Make the view available for > Report template creation and modification | Select if you want to make the view available in a report template. This is the default option. |
| Hide the view for the selected object types | Select an object type for which you do not want to see this view. For example, you have a list view with the subject <virtual machines>. It is visible when you select any of its parent objects. You add a data center from the list. The view is not visible anymore on the data center level. |

#### Data Tab

#### How to Add Data to a View

From the **Data** tab, browse and select an image from the left panel to add it to the view.

You can see a live preview of the view type when you select an image and then click **Preview source**.

#### Previous, Next, Create, and Cancel Options

At the end of each tab, you can go to the previous or next tab. You can also cancel the creation of the view. After you have added all the details, click **Create** to create the view.

## Editing, Cloning, and Deleting a View

You can edit, clone, and delete a view. Before you do, familiarize yourself with the consequences of these actions.

#### Edit a View

When you edit a view, all changes are applied to the report templates that contain the view. To edit a view, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Manage**. From the **Views** page on the right, select a view, click the vertical ellipsis against the view, and select **Edit**.

#### Clone a View

When you clone a view, the changes that you make to the clone do not affect the source view. To clone a view, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Manage**. From the **Views** page on the right, select a view, click the vertical ellipsis against the view, and select **Clone**.

#### Delete a View

When you delete a view, it is removed from all the report templates that contain it. To delete a view, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Manage**. From the **Views** page on the right, select a view, click the vertical ellipsis against the view, and select **Delete**.

## Share a View

You might want to present insights into your application or infrastructure performance to a wider audience, using tools such as Microsoft Power BI. By using the view share functionality, you can export a view to an external tool to ensure relevant stakeholders have the latest insights. You can use the provided API end point URL to import view data in a reporting tool. You can also export the configuration details of the view.

#### Where You Can Access the Option to Share Views

From the left menu, in the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Dashboards** and then in the centre pane click **Views** > **Manage**. From the **Views** page on the right, click an existing view, select a preview source, and then click the **Share View** icon in the top-right corner.

**Table 1403: Options in the Share View Dialog Box**

| Option | Description |
|---|---|
| URL Tab | You can export view data using a URL. The resulting view data includes view configuration data, objects, and metrics metadata, per object metric data, summary and calculated data, and other view specific data. View data usually corresponds to the data shown in the View UI for the specified view configuration. You can copy and paste the URL in other reporting tools for integration with VCF Operations.<br>• Preview Source: You can select the last previewed source.<br>• URL: You can copy the URL for the selected configured view. To use the URL as an authorized user, you need an authorization token.<br>**Note:**<br>The URL provided is the required REST call for fetching data. See the API Programming Guide for details.<br>• Authorization: The authorization token is generated. To generate the authorization token, enter the **Username** and **Password** and click **Generate**. |
| Export Tab | You can download and export the view configuration details. |

# Extensions Management

**Important:**

Extensions is available ONLY for select customers. Reach out to your account team to work with the VCF Operations product team to enable the capabilities.

**Note:** Do NOT directly enable the features as it is not supported.

The following capabilities are part of Extensions:

- **Platform Observability**
  Kubernetes Observability for the Platform Engineering team.
- **VMware Intelligent Assist**
  AI assisted chatbot to help troubleshoot VCF software (ESX, vCenter, and Management Services).
- **Content Builder**
  AI assisted mechanism to build management packs.

# Configuring Super Metrics

The super metric is a mathematical formula that contains one or more metrics or properties. It is a custom metric that you design to help track combinations of metrics or properties, either from a single object or from multiple objects. If a single metric does not inform you about the behavior of your environment, you can define a super metric.

After you define it, you assign the super metric to one or more object types. This action calculates the super metric for the objects in that object type and simplifies the metrics display. For example, you define a super metric that calculates the average CPU usage on all virtual machines, and you assign it to a cluster. The average CPU usage on all virtual machines in that cluster is reported as a super metric for the cluster.

When the super metric attribute is activated in a policy, you can also collect super metrics from a group of objects associated with a policy.

Because super metric formulas can be complex, plan your super metric before you build it. The key to creating a super metric that alerts you to the expected behavior of your objects is knowing your own enterprise and data. Use this checklist to help identify the most important aspects of your environment before you begin to configure a super metric.

**Table 1404: Designing a Super Metric Checklist**

| | |
|---|---|
| Determine the objects that are involved in the behavior to track. | When you define the metrics to use, you can select either specific objects or object types. For example, you can select the specific objects VM001 and VM002, or you can select the object type virtual machine. |
| Determine the metrics to include in the super metric. | If you are tracking the transfer of packets along a network, use metrics that refer to packets in and packets out. In another common use of super metrics, the metrics might be the average CPU usage or average memory usage of the object type you select. |
| Decide how to combine or compare the metrics. | For example, to find the ratio of packets in to packets out, you must divide the two metrics. If you are tracking CPU usage for an object type, you might want to determine the average use. You might also want to determine what the highest or lowest use is for any object of that type. In more complex scenarios, you might need a formula that uses constants or trigonometric functions. |
| Decide where to assign the super metric. | You define the objects to track in the super metric, then assign the super metric to the object type that contains the objects being tracked. To monitor all the objects in a group, activate the super metric in the policy, and apply the policy to the object group. |
| Determine the policy to which you add the super metric. | After you create the super metric, you add it to a policy. For more information, refer to Policy Workspace in VCF Operations. |

**What Else Can You Do with Super Metrics**

- To see the super metrics in your environment, generate a system audit report. For more information, refer to System Audit for VCF Operations.
- To create alert definitions to notify you of the performance of objects in your environment, define symptoms based on super metrics. For more information, refer to Symptom Definitions in VCF Operations.
- Learn about the use of super metrics in policies. For more information, refer to Policy Workspace in VCF Operations.
- Use OPS CLI commands to import, export, configure, and delete super metrics. For more information, refer to the OPS CLI documentation.
- To display metric-related widgets, create a custom set of metrics. You can configure one or more files that define different sets of metrics for a particular adapter and object types. This ensures that the supported widgets are populated based on the configured metrics and selected object type.

## Create a Super Metric

Create a super metric when you want to check the health of your environment, but you cannot find a suitable metric to perform the analysis.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Configuration**, and then click the **Super Metrics** tile.
2. Click **Add** .

   The **Create Super Metric** wizard opens.
3. Optional: To edit a super metric, click the vertical ellipsis next to the super metric and select **Edit**. You can also edit the super metric using the **EDIT** option in super metrics page.
4. Enter a meaningful name for the super metric such as `Worst VM CPU Usage (%)` in the **Name** text box.

   **Note:**
   It is important that you have an intuitive name as it appears in dashboards, alerts, and reports. For meaningful names, always use space between words so that it is easier to read. Use title case for consistency with the out of the box metrics and add the unit at the end.

5. Provide a brief summary of the super metric in the **Description** text box.

   **Note:**
   Information regarding the super metric, like why it was created and by whom can provide clarity and help you track your super metrics with ease.

6. From the **Object Types** drop-down list, select the object to associate with the super metric and click **Next**.
7. Create the formula for the super metric.

   For example, to add a super metric that captures the average CPU usage across all virtual machines in a cluster, perform the following steps.

   a) Select the function or operator. This selection helps combine the metric expression with operators and/or functions. In the super metric editor, enter `avg` and select the **avg** function.

      You can manually enter functions, operators, objects, object types, metrics, metrics types, property, and properties types in the text box and use the suggestive text to complete your super metric formula.

      Alternatively, select the function or operator from the **Functions** drop-down menu.

   b) To create a metric expression, enter `Virtual` and select **Virtual Machine** from the object type list.

   c) Add the metric type, enter `usage`, and select the **CPU|Usage (%)** metric from the metric type list.

      **Note:**
      The expression ends with depth=1 by default. If the expression ends with depth=1, that means that the metric is assigned to an object that is one level above virtual machines in the relationship chain. However, since this super metric is for a cluster which is two levels above virtual machine in the relationship chain, change the depth to 2.

      The depth can also be negative, this happens when you need to aggregate the parents of a child object. For example, when aggregating all the VMs in a datastore, the metric expression ends with depth=-1, because VM is a parent object of datastore. But, if you want to aggregate all the VMs at a Datastore Cluster level, you need to implement 2 super metrics. You cannot directly aggregate from VM to Datastore Cluster, because both are parents of a datastore. For a super metric to be valid, depth cannot be 0 (-1+1=0). Hence, you need to create the first super metric (with depth=-1) for the aggregate at the datastore level, and then build the second super metric based on the first (with depth = 1).

      The metric expression is created.

   d) To calculate the average CPU usage of powered on virtual machines in a cluster, you can add the `where` clause. Enter `where=""`.

      **Note:**
      The `where` clause cannot point to another object, but can point to a different metric in the same object. For example, you cannot count the number of VMs in a cluster with the CPU contention metric > SLA of that cluster. The phrase "SLA of that cluster " belongs to the cluster object, and not to the VM object. The right operand must also be a number and cannot be another super metric or variable.

   e) Position the pointer between the quotation marks, enter **Virtual**, and select the **Virtual Machine** object type and the **System|Powered ON** metric type.

   f) To add the numeric value for the metric, enter `==1`.

   g) To view hints and suggestions, click **ctrl+space** and select the objects, object types, metrics, metrics types, property, and properties types to build your super metric formula.

   h) Select **This** option from the drop-down menu.

      If **This** option is selected during the creation of a metric expression, it means that the metric expression is associated to the object for which the super metric is created.

8. Select the unit of the super metrics from the **Unit** drop-down.

   **Note:**
   The super metrics unit configured here can be changed in the metrics charts, widgets, and views.

9. Click **Validate** to verify that the super metric formula has been created correctly.

   After you click the **Preview** button the system selects a random object and displays a metric graph showing values for the current super metric. For example, if you have selected `Host System` in the **Object Types** tab, after you click the **Preview** button it will randomly select a host system object from the list of the available objects and displays the graph

for the selected host. Alternatively, you can also type in the object name in the **Object** text box, and the result will also depend on the pre-selected object type.

a) Expand the **Preview** section.

A metric graph is displayed showing values of the metric collected for the object. Verify that the graph shows values over time.

b) Click **Next**.

The Policies page is displayed.

10. Select the policy which you want to associate with super metric and click **Update**.

The selected policy is applied to the super metric. You can view the super metric you created, the associated object type, and policy on the **Super Metrics** page.

# Enhancing Your Super Metrics

You can enhance your super metrics by using clauses and resource entry aliasing.

### Where Clause

The `where` clause verifies whether a particular metric value can be used in the super metric. Use this clause to point to a different metric of the same object, such as `where=(${metric=metric_group|my_metric} > 0)`.

For example: `count(${objecttype = ExampleAdapter, adaptertype = ExampleObject, metric = ExampleGroup|Rating, depth=2, where =($value==1})`

### IsFresh Function

Use the `isFresh` function in the `where` clause to check if the last value of the metrics is fresh or not.

For every metric published in VCF Operations, the point with the latest publishing time is called as the last point of that metric. The value of that metric's last point is called the last value of that metric. A metric's last point is considered fresh when the time elapsed after the metric's last point is lesser than the estimated publishing interval of that metric.

The `isFresh` function returns true if the last value of the metrics is fresh. For example, in the following scenarios, the function:

- `${this, metric=a|b, where=($value.isFresh())}`, returns the last value of the metric a|b if the last value is fresh.
- `${this, metric=a|b, where=($value == 7 && $value.isFresh())}`, returns the last value of the metric a|b if it is equal to seven and is fresh.
- `${this, metric=a|b, where=(${metric=c|d} == 7 && ${metric=c|d}.isFresh())}`, returns the last value of the metric a|b only if the last value of the metric c|d is equal to seven and is fresh.

### Resource Entry Aliasing

Resource entries are used to retrieve metric data from VCF Operations for computing super metrics. A resource entry is the part of an expression which begins with `$` followed by a `{..} block`. When computing a super metric, you might have to use the same resource entry multiple times. If you have to change your computation, you must change every resource entry, which might lead to errors. You can use resource entry aliasing to rewrite the expression.

The following example, shows a resource entry that has been used twice.

```
(min(${adaptertype=VMWARE, objecttype=HostSystem, attribute= cpu|demand|
active_longterm_load, depth=5, where=($value>=0)}) + 0.0001)/(max(${adaptertype=VMWARE,
objecttype=HostSystem, attribute=cpu|demand|active_longterm_load, depth=5,
where=($value>=0)}) + 0.0001)"
```

The following example shows how to write the expressing using resource entry aliasing. The output of both expressions is the same.

```
(min(${adaptertype=VMWARE, objecttype=HostSystem, attribute= cpu|demand|
active_longterm_load, depth=5, where=($value>=0)} as cpuload) + 0.0001)/(max(cpuload) +
0.0001)"
```

Follow these guidelines when you use resource entry aliasing:

- When you create an alias, make sure that after the resource entry you write `as` and then `alias:name`. For example: **${…} as alias_name**.
- The alias cannot contain the ()[]+-*/%|&!=<>,.?:$ special characters, and cannot begin with a digit.
- An alias name, like all names in super metric expressions, is case-insensitive.
- Use of an alias name is optional. You can define the alias, and not use it in an expression.
- Each alias name can be used only once. For example: `${resource1,…} as r1 + ${resource2,…} as R1`.
- You can specify multiple aliases for the same resource entry. For example: **${…} as a1 as a2**.

#### Conditional Expression ?: Ternary Operators

You can use a ternary operator in an expression to run conditional expressions.

For example: `expression_condition ? expression_if_true : expression_if_false`.

The result of the conditional expression is converted to a number. If the value is not 0, then the condition is assumed as true.

For example: `-0.7 ? 10 : 20` equals 10. `2 + 2 / 2 - 3 ? 4 + 5 / 6 : 7 + 8` equals 15 (7 + 8).

Depending on the condition, either `expression_if_true` or `expression_if_false` is run, but not both of them. In this way, you can write expressions such as, `${this, metric=cpu|demandmhz} as a != 0 ? 1/a : -1`. A ternary operator can contain other operators in all its expressions, including other ternary operators.

For example: `!1 ? 2 ? 3 : 4 : 5` equals 5.

## Exporting and Importing a Super Metric

You can export a super metric from one VCF Operations instance and import it to another VCF Operations instance. For example, after developing a super metric in a test environment, you can export it from the test environment and import it use in a production environment.

If the super metric to import contains a reference to an object that does not exist in the target instance, the import fails. VCF Operations returns a brief error message and writes detailed information to the log file.

1. Export a super metric.
   a) In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Configuration**, and then click the **Super Metrics** tile.
   b) Select the super metric to export, click the horizontal ellipsis and then click **Export**.

      VCF Operations creates a super metric file, for example, `SuperMetric.json`.
   c) Download the super metric file to your computer.
2. Import a super metric.
   a) From the left menu, select **Configure** and then click **Super Metrics**.
   b) Click the horizontal ellipsis and then click **Import**.
   c) (Optional). If the target instance has a super metric with the same name as the super metric you are importing, you can either overwrite the existing super metric or skip the import, which is the default.

## Super Metrics Tab

A super metric is a mathematical formula that contains a combination of one or more metrics for one or more objects. With super metrics you can assess information more quickly when you are observing fewer metrics.

#### Where You Configure Super Metrics

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Configuration**, and then click the **Super Metrics** tile.

To view the details for a specific super metric, click the super metric from the list. The super metric details are displayed in the right-side panel. The super metric details include the assigned object types, formula and policies activated for the selected super metric.

**Table 1405: Configuration Options for Super Metrics**

| Option | Description |
|---|---|
| Toolbar | Use the toolbar selections to manage super metric options.<br>• Add New Super Metric. Starts the Create Super Metric workspace.<br>• Edit Selected Super Metric. Starts the Create Super Metric workspace.<br>• Clone Selected Super Metric. Duplicates the super metric. Edit the clone or associate it with a different object type.<br>• Delete Selected Super Metric.<br>• Export Selected Super Metric. Exports a super metric to use in another VCF Operations instance. See Exporting and Importing a Super Metric.<br>• Import Super Metric. Imports a super metric to this VCF Operations instance. See Exporting and Importing a Super Metric. |
| Super Metrics list | Configured super metrics listed by name and formula description. |

### Enhancements to the Super Metric Functions

In the earlier implementation of aggregate functions in super metrics, you had to explicitly specify the Adapter Kind and Resource Kind in the formula.

Old Formula

```
count(${adaptertype=VMWARE, objecttype=HostSystem,attribute=badge|health, depth=1})
```

The new implementation of aggregate function provides a way to define a super-metric without explicitly specifying the Resource Kind. You can use "objecttype=*" in the super-metric formula which indicates you to consider all Resource Kinds having the specified attribute.

New Formula

```
count(${adaptertype=VMWARE, objecttype=*,attribute=badge|health, depth=1})
```

**Note:**

The explicit specification of "adaptertype" remains mandatory. However, "*" can be used only to select all Resource Kinds for the given Adapter Kind.

## Manage Super Metric Workspace

You use the Manage Super Metric workspace to create or edit a super metric. The toolbar helps you to build the mathematical formula with the objects and metrics you select.

### Where You Configure Super Metrics

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Configuration**, and then click the **Super Metrics** tile.

**Table 1406: Super Metrics Workspace Options**

| Option | Description |
|---|---|
| Super Metric | • Name. The name you give to the super metric.<br>• Description. The textual description you give about the super metric. |
| Object Types Pane | Use this page to associate the super metric with an object type. You can use this list to select the object type with the metrics to measure. The object type selection affects the list of objects, metrics, and attribute types displayed. |
| Formula | Define the formula you want to associate with the super metric. You can preview and validate the formula before you create it. Use drop-down menu to select the metrics to add to the formula.<br>• Functions. Mathematical functions that operate on a single object or group of objects. See Super Metric Functions and Operators.<br>• Operators. Mathematical symbols to enclose or insert between functions. See Enhancing Your Super Metrics.<br>• This Object. Assigns the super metric to the object selected in the Object pane and displays `this` in the formula instead of a long description for the object.<br>• Unformatted. Slide the toggle button to the right to view the unformatted version of the formula, slide the button to the left to view the formula in textual format.<br>• Preview. Shows the super metric in a graph. Look at the graph so that you can verify that VCF Operations is calculating the super metric for the target objects that you selected. |
| Policies | Displays the policies related to the object types you assigned your super metric to. |

## Super Metric Functions and Operators

VCF Operations includes functions and operators that you can use in super metric formulas. The functions are either looping functions or single functions.

### Looping Functions

Looping functions work on more than one value.

**Table 1407: Looping Functions**

| Function | Description |
|---|---|
| avg | Average of the collected values. |
| combine | Combines all the values of the metrics of the included objects in a single metric timeline. |
| count | Number of values collected. |
| max | Maximum value of the collected values. |
| min | Minimum value of the collected values. |
| sum | Total of the collected values. |

**Note:**
VCF Operations 5.x included two sum functions: `sum (expr)` and `sumN (expr, depth)`. VCF Operations 6.x includes one sum function: `sum (expr)`. Depth is set at depth=1 by default. For more information about setting depth, refer to Create a Super Metric.

## Looping Function Arguments

The looping function returns an attribute or metric value for an object or object type. An attribute is metadata that describes the metric for the adapter to collect from the object. A metric is an instance of an attribute. The argument syntax defines the desired result.

For example, CPU usage is an attribute of a virtual machine object. If a virtual machine has multiple CPUs, the CPU usage for each CPU is a metric instance. If a virtual machine has one CPU, then the function for the attribute or the metric return the same result.

**Table 1408: Looping Function Formats**

| Argument syntax example | Description |
|---|---|
| *funct*(${this, metric =*a\|b:optional_instance\|c*}) | Returns a single data point of a particular metric for the object to which the super metric is assigned. This super metric does not take values from the children or parents of the object. |
| *funct*(${this, attribute=*a\|b:optional_instance\|c*}) | Returns a set of data points for attributes of the object to which the super metric is assigned. This super metric does not take values from the child or parent of the object. |
| *funct*(${adaptertype=*adaptkind*, objecttype=*reskind*, resourcename=*resname*, identifiers={id1=*val1*id2=*val2*,…}, metric=*a\|b:instance\|c*}) | Returns a single data point of a particular metric for the *resname* specified in the argument. This super metric does not take values from the children or parents of the object. |
| *funct*(${adaptertype=*adaptkind*, objecttype=*reskind*, resourcename=*resname*, identifiers={*id1=val1, id2=val2,…*}, attribute=*a\|b:optional_instance\|c*}) | Returns a set of data points. This function iterates attributes of the *resname* specified in the argument. This super metric does not take values from the child or parent of the object. |
| *funct*(${adaptertype=*adaptkind*, objecttype=*reskind*, depth=*dep*}, metric=*a\|b:optional_instance\|c*}) | Returns a set of data points. This function iterates metrics of the *reskind* specified in the argument. This super metric takes values from the child (depth > 0) or parent (depth < 0) objects, where *depth* describes the object location in the relationship chain.<br>For example, a typical relationship chain includes a data center, cluster, host, and virtual machines. The data center is at the top and the virtual machines at the bottom. If the super metric is assigned to the cluster and the function definition includes depth = 2, the super metric takes values from the virtual machines. If the function definition includes depth = -1, the super metric takes values from the data center. |
| *funct*(${adaptertype=*adaptkind*, objecttype=*reskind*, depth=*dep*}, attribute=*a\|b:optional_instance\|c*}) | Returns a set of data points. This function iterates attributes of the *reskind* specified in the argument. This super metric takes values from the child (depth > 0) or parent (depth < 0) objects. |

For example, `avg(${adaptertype=VMWARE, objecttype=VirtualMachine, attribute=cpu|usage_average, depth=1})` averages the value of all metric instances with the cpu|usage_average attribute for all objects of type `VirtualMachine` that the vCenter adapter finds. VCF Operations searches for objects one level below the object type where you assign the super metric.

## Single Functions

Single functions work on only a single value or a single pair of values.

**Table 1409: Single Functions**

| Function | Format | Description |
|---|---|---|
| *abs* | abs(x) | Absolute value of x. x can be any floating point number. |
| *acos* | acos(x) | Arccosine of x. |
| *asin* | asin(x) | Arcsine of x. |
| *atan* | atan(x) | Arctangent of x. |
| *ceil* | ceil(x) | The smallest integer that is greater than or equal to x. |
| *cos* | cos(x) | Cosine of x. |
| *cosh* | cosh(x) | Hyperbolic cosine of x. |
| *exp* | exp(x) | e raised to the power of x. |
| *floor* | floor(x) | The largest integer that is less than or equal to x. |
| *log* | log(x) | Natural logarithm (base *x*) of x. |
| *log10* | log10(x) | Common logarithm (base 10) of x. |
| *pow* | pow(x,y) | Raises x to the y power. |
| *rand* | rand() | Generates a pseudo random floating number greater than or equal to 0.0 and less than 1.0. |
| *sin* | sin(x) | Sine of x. |
| *sinh* | sinh(x) | Hyperbolic sine of x. |
| *sqrt* | sqrt(x) | Square root of x. |
| *tan* | tan(x) | Tangent of x. |
| *tanh* | tanh(x) | Hyperbolic tangent of x. |

## Operators

Operators are mathematical symbols and text to enclose or insert between functions.

**Table 1410: Numeric Operators**

| Operators | Description |
|---|---|
| + | Plus |
| - | Subtract |
| * | Multiply |
| / | Divide |
| % | Modulo |
| == | Equal |
| != | Not equal |
| < | Less than |
| <= | Less than, or equal |
| > | Greater than |
| >= | Greater than, or equal |
\|\| | Or |
&& | And |
! | Not |

| Operators | Description |
|---|---|
| ? : | Ternary operator. If/then/else<br>For example: `conditional_expression ? expression_if_condition_is_true : expression_if_condition_is_false`<br>For more information about ternary operators, see Enhancing Your Super Metrics. |
| ( ) | Parentheses |
| [ ] | Use in an array of expressions |
| [x, y, z] | An array containing x, y, z. For example, min([x, y, z]) |

**Table 1411: String Operators**

| String Operators | Description |
|---|---|
| equals | Returns true if metric/property string value is equal to specified string. |
| contains | Returns true if metric/property string value contains specified string. |
| startsWith | Returns true if metric/property string value starts with the specified prefix. |
| endsWith | Returns true if metric/property string value ends with the specified suffix. |
| !equals | Returns true if metric/property string value is not equal to specified string. |
| !contains | Returns true if metric/property string value does not contain specified string. |
| !startsWith | Returns true if metric/property string value does not start with the specified prefix. |
| !endsWith | Returns true if metric/property string value does not end with the specified suffix. |

**Note:**
String operators are valid in 'where' condition only. For example: `${this, metric=summary|runtime|isIdle, where = "System Properties|resource_kind_type !contains GENERAL"}`

# Configuring Administration Settings

After VCF Operations is installed and configured, you can use administration settings to manage your environment. You find most administration settings under the Administration selection of the VCF Operations user interface.

## Modifying Global Settings

The global settings control the system settings for VCF Operations, including data retention and system timeout settings. You set times to delete objects, set timeouts, store historical data, use dynamic threshold and capacity calculations, and determine how vCenter users log in. For automated actions, you can select whether to allow actions to be triggered from alert recommendations automatically. You can modify one or more of the settings to monitor your environment better. These settings affect all your users.

The global settings do not affect metric interactions, color indicators, or other object management behaviors. These behaviors are configured in your policies.

Settings related to managing objects with VCF Operations are available on the **Inventory** page.

### Access Global Settings

From the left menu, click **Administration** > **Global Settings**. The global settings are categorised into Data Retention, Cost/Price, User Access, System Settings, and Network Settings. Select one of the categories to edit the global settings. If you cannot find a settings, type the name of the setting in the search bar. When you edit a setting, the **Save** and **Cancel** buttons appear. Save the setting after your selection to complete the editing process.

### Global Settings Best Practices

Most of the settings pertain to how long VCF Operations retains the collected and processed data. The default values are common retention periods. You might need to adjust the time periods based on your local policies or disk space.

## List of Global Settings

The global settings determine how VCF Operations retains data, keeps connection sessions open, and other settings. These are system settings that affect all users. Some of these settings are not editable. The global settings are grouped into four types.

### Settings in the Data Retention Category

**Table 1412: Global Setting Default Values and Descriptions**

| Setting | Default Value | Description |
|---|---|---|
| Action History | 14 days | Number of days to retain the historical record of remediation actions. The data is purged from the system after the specified number of days. |
| Deleted Objects | 168 hours | This setting determines the number of hours for which objects in the inventory must be retained when:<br>• The objects are deleted from an adapter data source or server before deleting them from VCF Operations<br>• A cloud account is deleted from VCF Operations but the check box to delete related objects is not selected in the **Delete All Accounts** dialog box.<br>An object deleted from an adapter data source is identified by VCF Operations as not existing and VCF Operations can no longer collect data about the object. Whether VCF Operations identifies deleted objects as not existing depends on the adapter. This feature is not implemented in some adapters.<br>For example, if the retention time is 360 hours and a virtual machine is deleted from a vCenter instance, the virtual machine remains as an object in VCF Operations for 15 days before it is deleted.<br>This setting applies to objects deleted from the data source or server, not to any objects you delete from VCF Operations on the Inventory page.<br>You can define the number of hours per object type to retain objects that no longer exist and check for object type overrides. To add individual object types and set up their values, click the **Object Retention Period** icon. You can also edit or delete these object types. |
| Deletion Scheduling Interval | 24 hours | Determines the frequency to schedule deletion of resources. This setting works with the Deleted Objects setting to remove objects that no longer exist in the environment. VCF Operations transparently marks objects for removal that have not existed for the length of time specified under Deleted Objects. VCF Operations then removes the marked objects at the frequency specified under Deletion Scheduling Interval. |

| Setting | Default Value | Description |
|---|---|---|
| Object History | 90 days | Number of days to retain the history of the object configuration, relationship, and property data.<br><br>**Note:**<br><br>The retention decision for each property value is based on the end date of that value instead of the start date. So any property value with an end date within the last 90 days interval (default setting) is retained. For example, if property value A was first published 1 year ago (which is long before the object history retention interval of 90 days) and property value B was published 3 days ago, and if no more points for that property exists, then the end date for the value A will be 3 days ago and for value B now. So both end dates will be within the recent 90 day limit and both values will be retained.<br><br>The configuration data is the collected data from the monitored objects on which the metrics are based. The collected data includes changes to the configuration of the object.<br>The data is purged from the system after the specified number of days. |
| Generated Reports Retention | Deactivated | Number of days to retain generated reports. If deactivated, all the generated reports will be retained.<br>The minimum number of days you can set is one and the maximum number of days you can set is 3600. |
| Generated Tenant Report Retention | Deactivated | Number of days to retain generated tenant reports.<br>The minimum number of days you can set is 30 and the maximum number of days you can set is 90. If deactivated, the generated tenant reports will be retained as per the setting in the **Generated Reports Retention** field.<br>This option is visible only if you have deployed VCF Automation using the VCF Installer Deployment Wizard. |
| Symptoms/Alerts | 45 days | Number of days to retain canceled alerts and symptoms.<br>The alerts and symptoms are either canceled by the system or by a user. |
| Time Series Data Retention | 6 months | Number of months that you want to retain the collected and calculated metric data for the monitored objects. This setting is set to 6 months by default for 5-minutes interval data retention. |
| Additional Time Series Retention | 36 months | The number of months that the roll-up data extends beyond the regular period. The roll-up data is available starting from the end of the regular period and until the end of the roll-up data retention period. If you specify 0 as the value, then this will effectively deactivate the Additional Time Series Data Retention time and only data specified in Time Series Retention is stored. This setting ensures that after 6 months of normal retention for 5 minutes, the seventh month data is rolled up into a one hour roll up. You can set up this option up to 120 months for data roll ups. |
| Deleted Users | 100 days | You can specify the number of days to keep custom content created by a user who has been removed from VCF Operations or by the automatic synchronization of LDAP. For example, the custom dashboards created by a user. |
| Configuration management drift history Data retention | 7 days | The number of days to retain historical data for the configuration drift report. |

| Setting | Default Value | Description |
|---|---|---|
| External Event Based Active Symptoms | Deactivated | The number of days to retain the external event-based active symptoms.<br>**Note:**<br>Before modifying the retention period, ensure that the potential impact on existing alerting workflows has been thoroughly evaluated. If you activate **External Event Based Active Symptoms**, it automatically remediates the associated diagnostic findings and cancels any alerts that rely on those symptoms. This applies to symptoms that are active and unresolved during the configured retention period. |
| Generated Bills | 1440 days | Enter the number of days for which you want to retain the generated bills.<br>You can retain the generated bills to a maximum of 1440 days.<br>You must deploy VCF Automation to view this setting. |
| Real-time metrics Data Retention | 15 days | Duration for which the real-time metrics are retained. |

## Settings in the Cost/Price Category

### Table 1413: Global Setting Default Values and Descriptions

| Setting | Default Value | Description |
|---|---|---|
| Currency | | You can specify the currency unit that is used for cost calculation. Click **Set Currency** and select the currency from the list of currency types. Click the check box to confirm your selection and then click **Set Currency**.<br>You can edit the currency to update the currency for cost calculation.<br>**Note:**<br>Editing the currency has the following effects:<br>• Views, dashboards, and reports display data with the old and new currency and there will be discrepancies if you compare data across a timeline that includes currency change.<br>• Billing schedules get updated if the currency is changed between billing cycles. New scheduled bills are generated with the new currency and the currency change date as the start date. You must manually generate a bill for the timeline before that for the older currency.<br>In Tenant Bills, if the provider generates the bill during the currency change period, tenants will see multiple bills.<br>• The cost and price metrics collected after the update display the new currency value. Older metrics that are already published continue to display the old currency value.<br>• The cost analysis report only displays data with the new currency if the analysis includes a time range with a currency change.<br>To view the currency change timeline, you can view the **Currency Code** property under the Universe object type. |
| Show Cost Savings | Activated | Controls whether Cost savings is displayed in all the pages under 'Optimize'. |
| Cost Calculation | Activated 9:00 PM | Host time to calculate the costs for objects. |

| Setting | Default Value | Description |
|---|---|---|
| Cluster Utilization Ceiling Factor | 5 | Ceiling for Expected Utilization when running on Actual Utilization. |
| Tag Based Costing Metrics | Deactivated | When activated, VCF Operations calculates additional cost metrics per tag. |

## Settings in the User Access Category

**Table 1414: Global Setting Default Values and Descriptions**

| Setting | Default Value | Description |
|---|---|---|
| Allow vCenter users to log in to VCF Operations | Activated | Allows vCenter users to log in to VCF Operations.<br>**Note:**<br>Disabling the VCF Operations extension in vCenter removes its authorization to connect to VCF Operations. Consequently, vCenter users cannot access the appropriate VCF Operations pages. |
| Password Policy | Activated | Allows users to manage user passwords and determine the criteria used for account lockout, password strength, and the password change policy in VCF Operations. You can edit the following settings:<br>• Account Lockout: Indicates whether the account lockout is in effect, and indicates the number of login attempts allowed before the account is locked. The account lockout policy is activated by default.<br>• Password Strength: Indicates whether the policy that requires users to strengthen their password is in effect, and the minimum number of characters required to make a strong password. The password strength policy is activated by default.<br>• Password Change: Indicates how often the password must be changed, and whether users will receive a warning. The account password change policy is activated by default.<br>For more information about VCF Fleet level password policy, see Access Control: Password Policy . |
| Concurrent UI login sessions | Activated | Allows concurrent UI login sessions per user. Once changed, this setting affects the subsequent login sessions. |
| Allow non-imported vIDM user access | Activated | Allows non-imported VMware Identity Manager users to be created automatically as read-only users upon first access. If deactivated, only VMware Identity Manager imported users or users belonging to imported VMware Identity Manager groups will be granted access. |
| Login Message | Deactivated | Allows the user to display the login message when the user launches the login page in VCF Operations. You can set a message that requires explicit consent, for example, terms and conditions or a Standard Mandatory DoD Notice.<br>You can enter the **Title** and content you want to display and enter a button label for users to click to provide their consent. You can add text and images that are copied from an external source and edit it using the formatting options available. You can preview the message before you save it. |

## Settings in the Capacity Optimization Category

Settings in the capacity optimization category display information about powered-off VMs, idle VMs, snapshots, and orphaned disks.

**Table 1415: Global Settings Default Values and Descriptions**

| Setting | Default Value | Description |
|---|---|---|
| Include Powered off VMs for Reclamation | Activated 7 Days | VMs that have been continuously powered off during the defined time period.<br>The total storage capacity used is reclaimable. Total storage reclaimable cost is computed by multiplying storage rate with storage utilization. The direct cost of VM is also attributed. |
| Idle VM Management | | |
| Include Idle VMs for Reclamation | Activated | You can configure the following parameters based on which VCF Operations calculates idle VMs:<br>• **Minimum number of days that the VM has been idle for**: The total number of days the VM has been idle to be classified as a reclaimable idle VM.<br>• **Exclude VM provisioned in last**: The number of days before which the provisioned VMs are not considered in the classification of reclaimable idle. |
| VM Idleness Criteria | 100 MHz of CPU for 100% of Time | Defines the criteria to identify VMs that remain idle during the defined time period.<br>You can set the following values:<br>• MHz of CPU consumption of VMs, and percentage of the time VMs have less than defined MHz of CPU within each day. |
| Include Snapshots for Reclamation | Activated | VM snapshots is older than the entire defined time period.<br>Snapshots of a VM use storage space and such storage is reclaimable. The reclaimable cost is computed by multiplying the storage rate with the reclaimable storage value. |
| Orphaned Disk Management | | |
| Include Orphaned Disks for Reclamation | Activated | Orphaned disks are VMDKs that are associated with a VM which are not in inventory, but still available in a data store. You can configure the minimum number of days for which VMDKs not related to any existing VM will be reported as orphaned and appear under the Orphaned Disks in the Reclaim page. |
| Orphaned Disks Collection Time | 8:00 pm | Host time to collect orphaned disks.<br>**Note:**<br>VCF Operations checks for orphaned VMDKs in the vCenter instances based on the set time. The **Orphaned Disks Collection** and the **Cost Calculation** settings are interrelated. It is recommended to schedule orphaned disks collection before cost calculation so that the cost is calculated based on the recent list of reclaimable orphaned VMDKs. The default value for Orphaned Disks Collection is set to 8:00 PM, and the default value for Cost Calculation is set to 9:00 PM.<br>You can navigate to the **Cost/Price** section under **Administ ration** > **Global Settings** and change the value of the **Cost Calculation** time. |
| Exclude Broadcom appliances from Optimization | Activated | This will exclude appliance VMs from Powered off VM, Idle VM, Oversized VM and Undersized VM. However appliance VMs will be still available in the list of Snapshot VM list |
| Exclusion settings based on time | 7 Days | Minimum number of days of data collection required before VMs can be included for rightsizing optimization |

## Settings in the System Settings Category

### Table 1416: Global Setting Default Values and Descriptions

| Setting | Default Value | Description |
|---|---|---|
| SSL Syslog | Activated | Enforce SSL for syslog ingestion. Note that SSL is supported for TCP only. |
| SSL API Ingestion | Activated | Enforce SSL for API ingestion in Log Management. |
| Enforced Authenticated Log Ingestion | Deactivated | Enforce authentication for HTTP-based log ingestion (for example Logs Agent, fluentbit, fluentd). For more information, see Agent Authentication for Log Ingestion. |
| Log Event 'Type & Trends' | Activated | Enable detailed event processing for Event Types and Event Trends. Disabling this can improve performance but these views will not display data. |
| Session Inactivity Timeout | 30 minutes | If your connection to VCF Operations is idle for the specified amount of time, you are logged out of the application.<br>You must provide credentials to log back in. |
| Dynamic Threshold Calculation | Activated | Determines when to calculate normal levels of threshold violation for all objects.<br>If the setting is deactivated, the following area of VCF Operations does not work or are not displayed:<br>• Alert symptom definitions based on dynamic thresholds will not work<br>• Metric charts that display normal behavior are not present<br>Deactivate this setting only if you have no alternative options for managing resource constraints for your VCF Operations system. |
| Compliance Assessment Schedule | 02:00 AM | Set the compliance assessment start time for all enabled compliance benchmarks. VCF Operations starts the evaluation based on the benchmark at this time everyday. |
| In Page Feedback | Activated | When activated, you can send feedback to Broadcom by using the feedback button and VCF Operations can show you optional surveys. This setting requires internet access. |
| Broadcom's Customer Experience Improvement Program ("CEIP") | Activated | Determines whether to participate in the Customer Experience Improvement Program by having VCF Operations send anonymous usage data to https://vmware.com.<br>**Note:**<br>CEIP is activated by default when you install a new VCF Operations instance or when you upgrade VCF Operations.<br>Deactivate this setting only if you want to opt out of CEIP.<br>**Note:**<br>If you deactivate this setting in version 8.14 of VCF Operations, it stays deactivated for future releases. |

| Setting | Default Value | Description |
|---|---|---|
| System access URL | | You can specify the URL that is used to access the system when a load balancer is used. The URL that you enter here is displayed in the outbound notifications and while sharing dashboards.<br>The IP /FQDN of the URL is used to register vCenter and VMware Identity Manager when you configure the vCenter cloud account and VMware Identity Manager accordingly.<br>When you use VMware Identity Manager with a load balancer for VCF Operations, the System access URL is used during the source registration authentication.<br>When you use identity broker with a load balancer for VCF Operations, the System access URL (load balancer IP/FQDN) is used as the redirect destination after authentication. If this URL is configured incorrectly, users will not be redirected back to the load balancer after successful authentication. |
| Docker image default registry URL | | You can specify the URL that is used to pull the docker images for containerized adapters. This URL can be overridden by installed management packs.<br>You can bring your own content using the containerized adapters. For more information, contact `ops-integration-sdk-beta@vmware.com` . |
| Automated Actions | Activated | Determines whether to allow VCF Operations to automate actions. When an alert triggered, the alert provides recommendations for remediation. You can automate an action to remediate an alert when the recommendation is the first priority for that alert. You activate actionable alerts in your policies. |
| Credential ownership enforcement | Activated | This setting enforces credential ownership and allows users to only access credentials they own.<br>Deactivate this option to modify credentials owned by other users. Once deactivated, you can view, or edit credentials created by other users, or delete credentials that are not in use.<br>**Note:**<br>After deactivating, if a user edits a credential owned by another user and then reactivates this option, the ownership of the credential transfers to the user who edited it last.<br>For more information on credentials, see Configuring Credentials in Integrations and Adding Credentials. |
| Activate Standard Certificate Validation | Deactivated | This option activates certificate verification to Test Connection in the Create or Modify AI screen, using a standard verification flow.<br>The option checks CA authority.<br>• Certificate Subject DN<br>• Subject alternative name<br>• Certificate validity period<br>• Revocation list<br>This option also presents dialogs to user if one of those checks fail. It is up to the adapter implementation on how the adapter checks source certificate validity during a normal collection cycle. On a usual scenario, adapters just perform a thumb-print verification. However, in case this flag is activated, Test connection validates certificates in full scale and accepts certificates that are matching all criteria without any user dialogs. |

| Setting | Default Value | Description |
|---|---|---|
| Threshold For Adapter and Outbound Plugin Certificate Expiration Alert | 5 for critical<br>14 for immediate<br>30 for warning | Set the number of days before which the system must raise certification expiration alerts.<br>Alerts related to adapter and outbound plugin certificate expiration are evaluated daily. To change the values of Critical, Immediate, and Warning alerts, click the corresponding icon and move them along the slider. Alternatively, set the values manually.<br>Click **Save** after you make your changes.<br>**Note:**<br>For critical alerts, an alert banner is displayed under **Home** > **Overview** on the day of certification expiry. For example, if the critical alert is set to 10, then on the tenth day, an alert banner is displayed in the Home page. |

### Settings in the Network Settings Category

**Table 1417: Global Setting Default Values and Descriptions**

| Setting | Default Value | Description |
|---|---|---|
| HTTP Proxy | Not Configured | As an admin, you can configure VCF Operations with a network proxy.<br>To configure a HTTP proxy, ensure that you have the IP or hostname, port, and the credentials of your proxy.<br>After you enter the details, test the connection, and save the configuration.<br>**Note:**<br>SSL termination proxy is not supported in VCF Operations. |

## Access Control: Password Policy

You can modify the user passwords and determine the criteria used for account lockout, password strength, and the password change policy in VCF Operations.

### Modify the Password Policy Settings

You can modify the existing password policy settings in VCF Operations. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Global Settings**, and then click **User Access**. In the **User Access** section, navigate to **Password Policy**.

As a best practice, manage the password settings at the fleet level to ensure compliance across all VCF components.

**Table 1418: Access Control Edit Password Policy Settings**

| Option | Description |
|---|---|
| Account Lockout | Modify the settings to lock user accounts.<br>• **Activate Account Lockout Policy**: Activate the policy to lock user accounts. For a super administrator user, the account lockout policy is activated by default and cannot be deactivated. The super administrator user account is locked for approximately one hour, and then unlocked.<br>• **Number of failed login attempts before lockout**: Indicates the number of consecutive failed logins that a user can attempt to log in to VCF Operations before their account is locked. The default number of tries is three.<br>• **Login fail eviction time**: Indicates the time available for the user to complete the login attempts. You can set fail evication time in seconds. |
| Password Strength | Modify the settings required for users to create strong passwords.<br>• **Activate Password Strength Policy**: When selected, activates the policy to require users to strengthen their password.<br>• **Minimum password length**: Indicates the number of characters required for user passwords. The default length is eight characters.<br>• **Passwords must contain numeric**: When selected, users must include a combination of numbers and letters in their passwords.<br>• **Passwords must not match user names**: To ensure security, users are not allowed to use their user name as their password.<br>• **Passwords must contain at least one uppercase and one lowercase letter**: When selected, users must include one or more uppercase and lowercase characters.<br>• **Passwords must contain special characters**: When selected, users must include one or more special characters. Special characters include: !@#$%^&*+= |
| Password Life | Modify the settings required for users to change their password.<br>• **Activate Password Change Policy**: Activate the policy to require users to change their password at specific intervals.<br>• **Passwords expire every 90 days**: Users receive notification five days before the password expires.<br>• **Warn users 5 days prior to expiration**: Indicate when to have VCF Operations notify users that their password will expire. The default is five days before their password expires. |

# Managing Users and Access Control in VCF Operations

As a system administrator you can manage all aspects of user access control. You create user accounts, assign each user to be a member of one or more user groups, and assign roles to each user or user group to set their privileges.

Users must have privileges to access specific features in the VCF Operations user interface and API. Access control is defined by assigning privileges to both users and objects. You can assign one or more roles to users, and allow them to perform a range of different actions on the same types of objects. For example, you can assign a user with the privileges to delete a virtual machine, and assign the same user with read-only privileges for another virtual machine.

### User Access Control

You can authenticate users in VCF Operations in several ways.

- Create local user accounts in VCF Operations.
- Use VMware vCenter users. After the vCenter is registered with VCF Operations, configure the vCenter user options in the VCF Operations global settings to activate a vCenter user to log in to VCF Operations. When logged into VCF Operations, vCenter users access objects according to their vCenter-assigned permissions.
- Add an authentication source to authenticate imported users and user group information from an external identity provider.t

- Use LDAP to import users or user groups from an LDAP server. LDAP users can use their LDAP credentials to log in to VCF Operations.
- Create a single sign-on source and import users and user groups from a single sign-on server. Single sign-on users can use their single sign-on credentials to log in to VCF Operations and vCenter. You can also use Active Directory through single sign-on by configuring the Active Directory through single sign-on and adding the single sign-on source to VCF Operations.

## Users of VCF Operations

Each user has an account to authenticate them when they log in to VCF Operations.

The accounts of local users and LDAP users are visible in the VCF Operations user interface when they are set up. The accounts of vCenter and single sign-on users only appear in the user interface after a user logs in for the first time. Each user can be assigned one or more roles, and can be an authenticated member of one or more user groups.

### Local Users in VCF Operations

When you create user accounts in a VCF Operations instance, VCF Operations stores the credentials for those accounts in its global database, and authenticates the account user locally.

Each user account must have a unique identity, and can include any associated user preferences.

If you are logging in to VCF Operations as a local user, and on occasion receive an `invalid password` message, try the following workaround. In the Login page, change the Authentication Source to **All vCenter**, change it back to **Local Users**, and log in again.

### vCenter Users in VCF Operations

VCF Operations supports vCenter users. To log in to VCF Operations, vCenter users must be valid users in vCenter.

#### Roles and Associations

A vCenter user must have either the vCenter Admin role or one of the VCF Operations privileges, such as PowerUser which assigned at the root level in vCenter, to log in to VCF Operations. VCF Operations uses only the vCenter privileges, meaning the VCF Operations roles, at the root level, and applies them to all the objects to which the user has access. After logging in, vCenter users can view all the objects in VCF Operations that they can already view in vCenter.

#### Logging in to vCenter Instances and Accessing Objects

vCenter users can access either a single vCenter instance or multiple vCenter instances, depending on the authentication source they select when they log in to VCF Operations.

- If users select a single vCenter instance as the authentication source, they have permission to access the objects in that vCenter instance. After the user has logged in, an account is created in VCF Operations with the specific vCenter instance serving as the authentication source.
- If users select **All vCenter Servers** as the authentication source, and they have identical credentials for each vCenter in the environment, they see all the objects in all the vCenter instances. Only users that have been authenticated by all the vCenter Servers in the environment can log in. After a user has logged in, an account is created in VCF Operations with all vCenter instances serving as the authentication source.

VCF Operations does not support linked vCenter instances. Instead, you must configure the vCenter adapter for each vCenter instance, and register each vCenter instance to VCF Operations.

Only objects from a specific vCenter instance appear in VCF Operations. If a vCenter instance has other linked vCenter instances, the data does not appear.

#### vCenter Roles and Privileges

You cannot view or edit vCenter roles or privileges in VCF Operations. VCF Operations sends roles as privileges to vCenter as part of the vCenter Global privilege group. A vCenter administrator must assign VCF Operations roles to users in vCenter.

VCF Operations privileges in vCenter have the role appended to the name. For example, VCF Operations ContentAdmin Role, or VCF Operations PowerUser Role.

#### Read-Only Principal

A vCenter user is a read-only principal in VCF Operations, which means that you cannot change the role, group, or objects associated with the role in VCF Operations. Instead, you must change them in the vCenter instance. The role applied to the root folder applies to all the objects in vCenter to which a user has privileges. VCF Operations does not apply individual roles on objects. For example, if a user has the PowerUser role to access the vCenter root folder, but has read-only access to a virtual machine, VCF Operations applies the PowerUser role to the user to access the virtual machine.

#### Refreshing Permissions

When you change permissions for a vCenter user in vCenter, the user must log out and log back in to VCF Operations to refresh the permissions and view the updated results in VCF Operations. Alternatively, the user can wait for VCF Operations to refresh. The permissions refresh at fixed intervals, as defined in the `$ALIVE_BASE/user/conf/auth.properties` file. The default refreshing interval is half an hour. If necessary, you can change this interval for all nodes in the cluster.

#### Single Sign-On and vCenter Users

When vCenter users log into VCF Operations by way of single sign-on, they are registered on the VCF Operations User Accounts page. If you delete the account of a vCenter user that has logged into VCF Operations by way of single sign-on, or remove the user from a single sign-on group, the user account entry still appears on the User Account page and you must delete it manually.

#### Generating Reports

vCenter users cannot create or schedule reports in VCF Operations.

### Backward Compatibility for vCenter Users in VCF Operations

VCF Operations provides backward compatibility for users of the earlier version of VCF Operations, so that users of vCenter who have privileges in the earlier version in vCenter can log in to VCF Operations.

When you register VCF Operations in vCenter, certain roles become available in vCenter.

- The Administrator account in the previous version of VCF Operations maps to the PowerUser role.
- The Operator account in the previous version of VCF Operations maps to the ReadOnly role.

During registration, all roles in VCF Operations, except for VCF Operations Administrator, Maintenance, and Migration, become available dynamically in vCenter. Administrators in vCenter have all of the roles in VCF Operations that map during registration, but these administrator accounts only receive a specific role on the root folder in vCenter if it is specially assigned.

Registration of VCF Operations with vCenter is optional. If users choose not to register VCF Operations with vCenter, a vCenter administrator can still use their user name and password to log in to VCF Operations, but these users cannot use the vCenter session ID to log in. In this case, typical vCenter users must have one or more VCF Operations roles to log in to VCF Operations.

When multiple instances of vCenter are added to VCF Operations, user credentials become valid for all of the vCenter instances. When a user logs in to VCF Operations, if the user selects all vCenter options during login, requires that the user's credentials are valid for all of the vCenter instances. If a user account is only valid for a single vCenter instance, that user can select the vCenter instance from the login drop-down menu to log in to VCF Operations.

vCenter users who log in to VCF Operations must have one or more of the following roles in vCenter:

- VCF Operations Content Admin Role
- VCF Operationss General User Role 1
- VCF Operations General User Role 2
- VCF Operations General User Role 3
- VCF Operations General User Role 4
- VCF Operations Power User Role
- VCF Operations Power User without Remediation Actions Role
- VCF Operations Read Only Role

For more information about vCenter users, groups, and roles, see the vCenter documentation.

### External User Sources in VCF Operations

You can import user accounts from external authentication sources so that you can use them in your VCF Operations instance.

There are a few types of external user identity sources:

- Lightweight Directory Access Protocol (LDAP): Use the LDAP source if you want to use the Active Directory or LDAP servers as authentication sources. The LDAP source does not support multi-domains even when there is a two-way trust between Domain A and Domain B.
- Single Sign-On (SSO): Use a single sign-on source to perform single sign-on with any application that supports vCenter single sign-on, including VCF Operations.

## Roles and Privileges in VCF Operations

VCF Operations provides several predefined roles to assign privileges to users. You can also create your own roles.

You must have privileges to access specific features in the VCF Operations user interface. The roles associated with your user account determine the features you can access and the actions you can perform.

Each predefined role includes a set of privileges for users to perform, create, read, update, or delete actions on components such as dashboards, reports, administration, capacity, policies, problems, symptoms, alerts, user account management, and adapters.

| | |
|---|---|
| **Administrator** | Includes privileges to all features, objects, and actions in VCF Operations . |
| **PowerUser** | Users have privileges to perform the actions of the Administrator role except for privileges to user management and cluster management. VCF Operations maps vCenter administrators to this role. |
| **PowerUserMinusRemediation** | Users have privileges to perform the actions of the Administrator role except for privileges to user management, cluster management, and remediation actions. |
| **ContentAdmin** | Users can manage all content, including views, reports, dashboards, and custom groups in VCF Operations . |
| **GeneralUser-1 through GeneralUser-4** | These predefined template roles are initially defined as ReadOnly roles. vCenter administrators can configure these roles to create combinations of roles to give users multiple types of privileges. Roles are synchronized to vCenter once during registration. |
| **ReadOnly** | Users have read-only access and can perform read operations, but cannot perform write actions such as create, update, or delete. |

## User Scenario: Manage User Access Control

As a system administrator or virtual infrastructure administrator, you manage user access control in VCF Operations so that you can ensure the security of your objects. Your company just hired a new person, and you must create a user account and assign a role to the account so that the new user has permission to access specific content and objects in VCF Operations.
Verify that the following conditions are met:

- VCF Operations is installed and operating properly, and contains objects such as clusters, hosts, and virtual machines.

- One or more user groups are defined.
- An LDAP authentication source is configured.

In this scenario you will learn how to create user accounts and roles, and assign roles to the user accounts to specify access privileges to views and objects. You will then demonstrate the intended behavior of the permissions on these accounts.

You will create a new user account, named Tom User, and a new role that grants administrative access to objects in the VCF Operations clusters. You will apply the new role to the user account.

Finally, you will import a user account from an external LDAP user database that resides on another machine to VCF Operations, and assign a role to the imported user account to configure the user's privileges.

Create a new role.

### Create a New Role

You use roles to manage access control for user accounts in VCF Operations.

Verify that you understand the context of this scenario. See User Scenario: Manage User Access Control.

In this procedure, you will add a new role and assign administrative permissions to the role.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. Click the **Roles** tab.
3. Click the **Add** icon on the toolbar to create a role.
   The **Create Role** dialog box appears.
4. For the role name, type `admin_cluster`, then type a description and click **SAVE**.
   The admin_cluster role appears in the list of roles.
5. Click the **admin_cluster** role.
6. In the Details grid below, on the Permissions pane, click the **Edit** icon.
7. Select the **Select all permissions** check box.
8. Click **Update**.
   This action gives this role administrative access to all the features in the environment.

Create a user account, and assign this role to the account.

### Create a User Account

As an administrator you assign a unique user account to each user so that they can use VCF Operations. While you set up the user account, you assign the privileges that determine what activities the user can perform in the environment, and upon what objects.

Create a new role. See Create a New Role.

In this procedure, you will create a user account, assign the `admin_cluster` role to the account, and associate the objects that the user can access while assigned this role. You will assign access to objects in the VCF Operations cluster. Then, you will test the user account to confirm that the user can access only the specified objects.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. Click the **User Accounts** tab.
3. Click the **Add** icon to create a new user account, and provide the information for this account.

| Option | Description |
|---|---|
| **User Name** | Type the user name to use to log in to VCF Operations. |
| **Password** | Type a password for the user. |

| Option | Description |
|---|---|
| **Confirm Password** | Type the password again to confirm it. |
| **First Name** | Type the user's first name. For this scenario, type `Tom`. |
| **Last Name** | Type the user's last name. For this scenario, type `User`. |
| **Email Address** | (Optional). Type the user's email address. |
| **Description** | (Optional). Type a description for this user. |
| **Deactivate this user** | Do not select this check box, because you want the user to be active for this scenario. |
| **Require password change at next login** | Do not select this check box, because you do not need to change the user's password for this scenario. |

4. Click the **Objects** tab.
5. Select the **admin_cluster** role from the drop-down menu.
6. In the Object Hierarchies list, select the **VCF Operations Cluster** check box.
7. Click **Finish**.

   You created a new user account for a user who can access all the **VCF Operations Cluster** objects. The new user now appears in the list of user accounts.
8. Log out of VCF Operations.
9. Log in to VCF Operations as Tom User, and verify that this user account can access all the objects in the VCF Operations cluster hierarchy, but not other objects in the environment.
10. Log out of VCF Operations.

You used a specific role to assign permission to access all objects in the VCF Operations Cluster to a user account named Tom User.

Import a user account from an external LDAP and assign permissions to the user account.

## Import a User Account and Assign Permissions

You can import user accounts from external sources, such as an LDAP database on another machine, or a single sign-on server, so that you can give permission to those users to access certain features and objects in VCF Operations.

- Configure an authorization source. See Authentication Sources.

1. Log out of VCF Operations, then log in as a system administrator.
2. From the navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
3. On the toolbar, click the horizontal ellipsis and then click **Import from Source** icon.
4. Specify the options to import user accounts from an authorization source.
   a) On the Import Users page, from the **Import From** drop-down menu, select an authentication source.
   b) In the **Domain Name** drop-down menu, type the domain name from which you want to import users, and click **Search**.
   c) Select the users you want to import, and click **Next**.
   d) On the **Groups** tab, select the user group to which you want to add this user account.
   e) Click the **Objects** tab, select the **admin_cluster** role, and select the **Assign this role to the user** check box.
   f) In the Object Hierarchies list, select the **VCF Operations Cluster** check box, and click **Finish**.
5. Log out of VCF Operations.
6. Log in to VCF Operations as the imported user.
7. Verify that the imported user can access only the objects in the VCF Operations Cluster.

You imported a user account from an external user database or server to VCF Operations, and assigned a role and the objects the user can access while holding this role to the user.

You have finished this scenario.

## Configure a Single Sign-On Source in VCF Operations

As a system administrator or virtual infrastructure administrator, you use single sign-on to activate SSO users to log in securely to your VCF Operations environment.

- Verify that the server system time of the single sign-on source and VCF Operations are synchronized. If you need to configure the Network Time Protocol (NTP), see Configuring the NTP Settings for VMware vSphere Foundation Components.
- Verify that you have access to a Platform Services Controller through the vCenter. See the VMware vSphere Information Center for more details.

After the single sign-on source is configured, users are redirected to an SSO identity source for authentication. When logged in, users can access other vSphere components such as the vCenter without having to log in again.

1. Log in to VCF Operations as an administrator.
2. From the navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Authentication Sources** tile.
3. Click **Add**.
4. In the Add Source for User and Group Import dialog box, provide information for the single sign-on source.

| Option | Action |
|---|---|
| **Source Display Name** | Type a name for the import source. |
| **Source Type** | Verify that SSO SAML is displayed. |
| **Host** | Enter the IP address or FQDN of the host machine where the single sign-on server resides. If you enter the FQDN of the host machine, verify that every node in the VCF Operations cluster can resolve the single sign-on host FQDN. |
| **Port** | Set the port to the single sign-on server listening port. By default, the port is set to 443. |
| **User Name** | Enter the user name that can log into the SSO server. |
| **Password** | Enter the password. |
| **Grant administrator role to VCF Operations for future configuration?** | Select **Yes** so that the SSO source is reregistered automatically if you make changes to the VCF Operations setup. If you select |

| Option | Action |
|---|---|
| | **No**, and the VCF Operations setup is changed, single sign-on users will not be able to log in until you manually re-register the single sign-on source. |
| **Automatically redirect to vRealize Operations single sign-on URL?** | Select **Yes** to direct users to the vCenter single-sign on log in page. If you select **No**, users are not redirected to SSO for authentication. |
| **Import single sign-on user groups after adding the current source?** | Select **Yes** so that the wizard directs you to the Import User Groups page when you have completed the SSO source setup. If you want to import user accounts, or user groups at a later stage, select **No**. |
| **Advanced options** | If your environment uses a load balancer, enter the IP address of the load balancer. |

5. Click **Test** to test the source connection, and then click **OK.**

   The certificate details are displayed.

6. Select the **Accept this Certificate** check box, and click **OK**.
7. In the Import User Groups dialog box, import user accounts from an SSO server on another machine.

| Option | Action |
|---|---|
| **Import From** | Select the single sign-on server you specified when you configured the single sign-on source. |
| **Domain Name** | Select the domain name from which you want to import user groups. If Active Directory is configured as the LDAP source in the PSC, you can only import universal groups and domain local groups if the vCenter resides in the same domain. |
| **Result Limit** | Enter the number of results that are displayed when the search is conducted. |
| **Search Prefix** | Enter a prefix to use when searching for user groups. |

8. In the list of user groups displayed, select at least one user group, and click **Next**.
9. In the Roles and Objects pane, select a role from the **Select Role** drop-down menu, and select the **Assign this role to the group** check box.
10. Select the objects users of the group can access when holding this role.

    To assign permissions so that users can access all the objects in VCF Operations, select the **Allow access to all objects in the system** check box.

11. Click **OK.**
12. Familiarize yourself with single-sign on and confirm that you have configured the single sign-on source correctly.
    a) Log out of VCF Operations.
    b) Log in to the vSphere Web Client as one of the users in the user group you imported from the single sign-on server.
    c) In a new browser tab, enter the IP address of your VCF Operations environment.
    d) If the single sign-on server is configured correctly, you are logged in to VCF Operations without having to enter your user credentials.

## Edit a Single Sign-On Source

Edit a single sign-on source if you need to change the administrator credentials used to manage the single sign-on source, or if you have changed the host of the source.

When you configure an SSO source, you specify either the IP address or the FQDN of the host machine where the single sign-on server resides. If you want to configure a new host, that is, if the single sign-on server resides on a different host machine than the one configured when the source was set up, VCF Operations removes the current SSO source, and creates a new source. In this case, you must reimport the users you want to associate with the new SSO source.

If you want to change the way the current host is identified in VCF Operations, for example, change the IP address to the FQDN and the reverse, or update the IP address of the PSC if the IP address of the configured PSC has changed, VCF Operations updates the current SSO source, and you are not required to reimport users.

1. Log in to VCF Operations as an administrator.
2. From the navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Authentication Sources** tile.
3. Select the single sign-on source, click the vertical ellipsis and then click **Edit**.
4. Make changes to the single sign-on source, and click **OK**.
   If you are configuring a new host, the New Single Sign-On Source Detected dialog box appears.
5. Enter the administrator credentials that were used to set up the single sign-on source, and click **OK**.
   The current SSO source is updated.
6. Click **OK** to accept the certificate.
7. Import the users you want to associate with the SSO source.

## Access Control in VCF Operations

Each user must have a unique account with one or more roles assigned to enforce a role-based security when they use VCF Operations. You create a user account, and assign the account to be a member of one or more user groups to allow the user to inherit the roles and scopes associated with the user group.

### Where You Find the Access Control Options

You can manage user accounts and their associated user groups, roles, scopes, and passwords.

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.

**Table 1419: Access Control Tabs**

| Option | Description |
|---|---|
| User Accounts | Add, edit, remove, or import VCF Operations user accounts from an LDAP database, and manage user roles, their membership in groups, and the scopes assigned for association with the user. Import user accounts from an LDAP database that resides on another machine.<br>vCenter users who are logged in to VCF Operations, either logged in directly or through the vSphere Client, appear in the list of user accounts. |
| User Groups | Add, edit, or remove, or import VCF Operations user groups, update the members in a group and the associated scopes that they can access. Import user groups from an LDAP database or a single sign-on database that resides on another machine.<br>VCF Operations continuously synchronizes the user membership of imported LDAP user groups when the autosync option is enabled in the LDAP configuration. |
| Roles | For users to perform actions in VCF Operations, they must be assigned specific roles. With role-based access, when you assign a role to a user, you are determining not only what actions the user can perform in the system, but also the objects upon which those actions can be performed while holding the role. For example, to import or export a policy, the role assigned to your user account must have the Import or Export permissions enabled for policy management. |
| Scopes | Add, edit, clone, or remove scope associated with users or groups in VCF Operations. Scope lets you limit the access of a user or a set of users to VCF Operations. You can also define the scope for all the objects managed by VCF Operations. |

## Access Control: User Accounts Tab

You can add, edit, or remove VCF Operations user accounts, and import user accounts from an external LDAP database. With access control, you manage roles, the objects a user can access while assigned a specific role, and the membership in user groups.

### Where You Manage User Accounts

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.

To view the details of the user account configured in VCF Operations, click the user account, the user account details is displayed in the right-side panel. The user account details include the user groups associated with the user account along with the roles and scope of the selected user account.

> **Note:**
> For user accounts only the exclusive roles that is associated with the user account is displayed. The roles inherited from the user groups are not displayed.

**Table 1420: Access Control User Accounts Summary Grid**

| Summary Grid Options | Description |
|---|---|
| User Accounts toolbar | To manage user accounts, use the toolbar options.<br>• Click the **Add** button to add a user account, and provide the details for the user account in the **Account Information** page.<br>• Click the **Vertical Ellipses** to perform any one of the following actions:<br>– **Edit**. Edit the selected user account, and modify the details for the user account in the **Edit User Account** dialog box.<br>– **Export**. Click **Export User Accounts** to export a user account, and provide the details to export the user account in the **Export Authentication Source** dialog box.<br>– **Delete**. Delete a user account.<br>• Click the **Horizontal Ellipses** and select **Delete**. Delete a user account.<br>– **Export**. Click export to export a user account, and provide the details to export the user account in the **Export Authentication Source** dialog box.<br>– Click **Import** to import a user account, and provide the details to import the user account in the **Import User Accounts** dialog box.<br>– Click **Import from source** to import a user account, and provide the details to import the user group in the **Import User** dialog box. |
| User Name | User name, without spaces, that you use to log in to VCF Operations. |
| First Name | User's first name, created when you create the user account. |
| Last Name | User's last name, created when you create the user account. |
| Email | User's email address, created when you create the user account. |
| Description | Description of the user account, defined when you create the user account. This information can identify the type of user and a summary of their access privileges. |
| Imported | Indicates whether the user account is imported or not. |
| Source Type | Indicates whether the user account is a local user, or an external user who is integrated through an external authentication source, such as from LDAP, SSO, AD, OpenLDAP, vCenter. |
| Activated | Indicates whether the user account is activated to use VCF Operations features. An administrator can edit a user account to manually activate it, or deactivate it to prevent user access to VCF Operations. |
| Locked | Indicates whether VCF Operations has locked the user account. For example, a user account can get locked based on the password lockout policy, or if the user enters an incorrect password three times in the span of five minutes. |
| Access All Objects | Indicates whether the user account is allowed to access all the objects that are imported into the VCF Operations instance. |

| Summary Grid Options | Description |
|---|---|
| Modified By | Indicates the last person to update the user account. |
| Last Modified | Indicates the last time the user account was updated. |
| Last Login Time | Indicates the last time the user logged in. |
| Filters | Activates you to search the list of user accounts according to the following criteria:<br>• User Name<br>• First Name<br>• Last Name<br>• Description<br>• Activated<br>• Locked<br>• Access All Objects<br>• Modified By<br>• Last Login Time |

After you add a user account, use the Details grid to view and edit which user accounts are assigned to user groups, and view the permissions assigned to the user account.

**Table 1421: Access Control User Accounts Details Grid**

| Details Grid Options | Description |
|---|---|
| First Name | User's first name, created when you create the user account. |
| Last Name | User's last name, created when you create the user account. |
| Modified By | Displays the name of the user who last updated the user account. |
| Last Modified | Displays the date and time when the user account was last updated. |
| Roles and Scope | Displays the role and scope associated with the selected user.<br>• Roles: Indicates the name of the role or roles assigned to the user.<br>• Scope : Indicates the scope associated with the user account. |
| User Groups | Assigned user groups appear when you click a user in the summary grid. You can then view and modify which user groups the user is associated with. |

### Modify User Accounts and Assign Groups and Permissions

You can add user accounts so that users can access the features of VCF Operations and certain objects in the environment. Or, modify user accounts to change their attributes, deactivate or lock the accounts, or require them to change their password. After you add user accounts, you can assign them to one or more user groups, and assign roles and scopes. Assign the administrators role only to specific users who must access objects and perform actions in the entire environment.

#### Where You Add or Edit User Accounts

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. In the **User Accounts** tab, click **Add**.
3. To edit a user account, click the vertical ellipsis and select **Edit**. You can also click the **EDIT ACCOUNT** button in the **User Details** page and edit the user account.
   - By default, the user is added to the "Everyone" group. You can add or remove users to or from the user group when you create or edit the user group, . You can assign the permissions to the users by selecting the required role-scope pairs.

- When you add users to a user group, the user inherits the permissions (role-scope pairs) from that group. You also have the option of not assigning permissions to the user, in that case the user actions are restricted, and the user cannot login to VCF Operations.
- You cannot change the user name once you create it. So, select your username appropriately.
- You have read only access for the Super Administrator account. You can change the password for the Super Administrator account from the user interface only.

**Table 1422: Add or Edit Users Accounts- User Details Page**

| User Details Options | Description |
|---|---|
| User Name | User name, without spaces to access the VCF Operations. |
| Password | User's password to access the VCF Operations instance. |
| Confirm Password | Confirmation of the user's password. |
| Require password change at next login | Users can change their password the next time they log in to the VCF Operations instance. |
| Deactivate this user | Deactivate the user account so that a user cannot access the VCF Operations instance. |
| First Name | User's first name, created when you create the user account. |
| Last Name | User's last name, created when you create the user account. |
| Email Address | User's email address, created when you create the user account. |
| Description | Description of the user account, defined when you create the user account. This information can identify the type of user and a summary of their access rights. |

**Assign Roles and Scope**

The Assign Roles and Scope option lets you select a role for each user and then assign a scope for that role.

4. From the **Select Role** drop-down menu, select a role for the user.
5. From the **Select Scope** drop-down menu, assign a scope for the selected user.

   **Note:**
   You can click the + sign to add multiple roles and then assign the required scope for each role.

**Assign User Groups**

The Assign User Group option lets you select user groups that the user will be a member of.

6. Select the user groups for which you want the user to be member of.
7. Click **Save**.

   **Note:**
   You cannot manually add users to groups imported from LDAP and SSO.

**Import User Accounts From Source**

You can import user accounts so that users can access the features of VCF Operations and the objects in the environment. After you import user accounts, you can add them to non-imported user groups, assign roles and scopes to them.

**Where You Import User Accounts**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. Click the horizontal ellipsis next to **Add** and then, click **Import from Source** to import user from another source.

**Table 1423: Import Users from a LDAP Source**

| User Details Options | Description |
|---|---|
| Import From | Select the authentication source from the drop-down menu, the options are LDAP host machine, VMware Identity Manager, Active Directory, or Other sources configured to import user accounts. To know more about authentication,see Authentication Sources. |
| User Name | Click **Use alternate credentials** to display the user name of the LDAP source credential used to import user accounts to the VCF Operations instance. |
| Password | Password for the LDAP source credential to import user accounts to the VCF Operations instance. |
| Basic | Use the basic import setting with search option to look for user accounts. |
| Advanced | Displays the advanced import settings.<br>• Group Search Criteria. Search criteria to find LDAP groups. If not included, VCF Operations uses the default search parameters: `(|(objectClass=group)(objectClass=groupOfNames))`<br>• Member Attribute. Name of the attribute for a group object that contains the list of members. If not included, VCF Operations uses member by default.<br>• User Search Criteria. Search criteria to use the member field to find and cache LDAP users. You enter sets of key=value pairs in the form `(|(key1=value1)(key2=value2))`. If not included, VCF Operations searches for each user separately. This operation might take extra time.<br>• Member Match Field. Name of the attribute for a user object to match with the member entry from a group object. If not included, VCF Operations treats the member entry as a distinguished name.<br>• LDAP Context Attributes. Attributes that VCF Operations applies to the LDAP context environment. You enter sets of key=value pairs separated by commas, such as `java.naming.referral=ignore,java.naming.ldap.deleteRDNfalse`. |
| Search String | Enter a search string, and click **Search** to start the search for user accounts. |
| User Name Summary grid | Lists the users available for import. Select the check box for each user to import, or select the **User Name** check box to import all users. User accounts that are already imported to VCF Operations do not appear in the list. |

**Table 1424: Import Users from a VMware SSO Source**

| User Details Options | Description |
|---|---|
| Import From | VMware SSO is configured as the source to import user accounts. |
| Search Prefix | Enter a search string, and click **Search** to start the search for user accounts. |
| User Name Summary grid | Lists the users available for import. Select the check box for each user to import, or select the **User Name** check box to import all users. To appear in the list, the user configuration must be set to primary group in the default domain user group. User accounts that are already imported to VCF Operations do not appear in the list.<br>**Note:**<br>After importing the user, you must edit the user information and assign a role and a scope. |

**Table 1425: Import Users from a VMware Identity Manager Source**

| User Details Options | Description |
|---|---|
| Import From | VMware Identity Manager configured as the source to import user accounts. |
| Search Option | Enter the search option, it can be a domain or search prefix. |
| Domain Name | Enter the domain name for import. |
| Search Prefix | Enter a search string, and click **Search** to start the search for user accounts. |
| User Name Summary grid | Lists the users available for import. Select the check box for each user to import, or select the **User Name** check box to import all users. To appear in the list, the user configuration must be set to primary group in the default domain user group. User accounts that are already imported to VCF Operations do not appear in the list. |

**Table 1426: Import Users from a Single Sign On Source**

| User Details Options | Description |
|---|---|
| Import From | SSO source configured as the source to import user accounts. |
| Domain Name | Select the domain name for import from the drop-down menu. |
| Result Limit | Determines the number of users displayed. |
| Search Prefix | Enter a search prefix, and click **Search** to start the search for user accounts. |
| User Name Summary grid | Lists the users available for import. Select the check box for each user to import, or select the **User Name** check box to import all users. To appear in the list, the user configuration must be set to primary group in the default domain user group. User accounts that are already imported to VCF Operations do not appear in the list. |

3. After you enter the import users details, click **Next**

**Table 1427: Import Users Accounts- Assign Groups Page**

| Assign Groups | Description |
|---|---|
| Assign Groups | Select or deselect the groups associated with the user account. To select or deselect all accounts, click the **Group Name** check box. You cannot add user accounts to groups imported from LDAP. |

4. Click **Finish**.

### Export and Import of User Accounts

You can export User account configurations from one VCF Operations and import into any VCF Operations.

#### Export User Accounts

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click **Access Control** tile.
2. In the **User Accounts** tab, select the user accounts to be exported. Click the horizontal ellipsis next to **Add** and then, click **Export**.
3. You will be prompted to enter a password when you export the user accounts. Enter the password and note it down, you have to use the same password when you import the user accounts.
4. Click **Export**.

The user accounts `.json` file is downloaded to the default download location.

**Import User Accounts**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click **Access Control** tile.
2. In the **User Accounts** tab, click the horizontal ellipsis next to **Add** and then, click **Import**.
3. Click **Browse** and select the user accounts `.json` file.
4. Enter the same password which you had used during user accounts export.
5. In case of a conflict, select either **Overwrite existing User Accounts** or **Skip User Accounts**.
6. Click **Import**.

**Important Points**

- User scopes will be matched in the target VCF Operations, which means the user scopes references are being exported, then assigned to user while importing only if those scopes exist on the target VCF Operations.
- User roles will be matched in the target VCF Operations, which means user roles references are being exported, then assigned to user while importing only if those roles exist on the target VCF Operations.
- User groups will be matched in the target VCF Operations, which means user group references are being exported, then assigned to user while importing only if those user groups exist on the target VCF Operations.
- Import of the external users fails if their authentication source is not found in the target VCF Operations.
- The traversal specifications are not imported or exported in VCF Operations.
- An error message is displayed with details for failed imports.

## Access Control: User Groups Tab

You can manage the user groups associated with the users and objects in your environment. You can import user groups from an LDAP database that resides on another machine, or from a single sign-on server or from a source in VMware Identity Manager.

**Where You Manage User Groups**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. Click the **User Groups** tab.

To view the details of the user groups configured in VCF Operations, click the user group, the user group details are displayed in the right-side panel. The user group details include the user accounts associated with the selected user group along with the roles and scope associated with the user group.

**Table 1428: Access Control User Groups Summary Grid**

| Option | Description |
|---|---|
| User Groups toolbar | To manage user groups, use the toolbar options.<br>• Click the **Add** button to add a user group, and provide the details for the user group in the **Group Information** page.<br>• Click the **Vertical Ellipses** to perform any one of the following actions:<br>– **Edit**. Edit the selected user group, and modify the details for the user group in the **Edit User Group** dialog box.<br>– **Delete**. Delete a user group.<br>– **Clone**. Clone a user group, and enter a name and description for the cloned user group.<br>– **Export**. Click export to export a user group, and provide the details to export the user group in the **Export Authentication Source** dialog box.<br>• Click the **Horizontal Ellipses** and select the available options.<br>– **Delete**. Click delete to Delete a user group.<br>– **Export**. Click export to export a user group, and provide the details to export the user group in the **Export Authentication Source** dialog box.<br>– Click **Import** to import a user group, and provide the details to import the user group in the **Import User Groups** dialog box.<br>– Click **Import from source** to import a user group, and provide the details to import the user group in the **Import User** dialog box. |
| Group Name | Name of the user group. |
| Description | Description of the group, indicating its purpose. |
| Members | Number of members in the group. |
| Group Type | Type of group, either a local user group or a group imported from LDAP. |
| Distinguished Name | Names for LDAP objects, such as domains and users. |
| Access All Objects | Indicates if the user group account is allowed to access all the objects that are imported into the VCF Operations instance. |
| Modified By | Indicates the last person to update the user group. |
| Last Modified | Indicates the last time the user group was updated. |
| Filters | Enables you to search the list of user groups according to the following criteria:<br>• Group Name<br>• Description<br>• Access All Objects<br>• Modified By |

After you select a user group in the summary grid, view details about associated users in the Details pane.

**Table 1429: Access Control User Groups Details Grid**

| Option | Description |
|---|---|
| User Group Name | User Group name, created when you create the user group. |
| Modified By | Displays the name of the user who last updated the user group. |
| Last Modified | Displays the date and time when the user group was last updated. |
| Description | Description of the group, indicating its purpose. |
| Roles and Scope | Displays the role and scope associated with the selected user.<br>• Role: Indicates the name of the role or roles assigned to the user.<br>• Scope: Indicates the scope associated with the user group. |
| User Accounts | Displays the user accounts associated with the selected user group. |

### Add User Groups and Assign Members and Roles

You can view and modify the details for user groups, including users, roles, and scope.

#### Where You Add User Groups

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. Select the **User Groups** tab and then click **Add**
3. To edit a user group, click the vertical ellipsis and select **Edit**. You can also click the **EDIT GROUP** button in the **Group Details** page and edit the user group.

**Table 1430: Add or Edit Group Information - Name and Description Page**

| Option | Description |
|---|---|
| Group Name | Name of the user group, either created manually, imported from a single sign-on server, or imported from an LDAP database that resides on another machine. |
| Description | Description of the user group, indicating its purpose. |

4. **Assign Roles and Scope**
   The Assign Roles and Scope option lets you select a role for the user group and then assign a scope for each role.
5. From the **Select Role** drop-down menu, select a role for the user group.
6. From the **Select Scope** drop-down menu, assign scope for the selected user group.

   **Note:**
   You can click the + sign to add multiple roles and then assign the required scope for each role.

   **Assign Users**
   The Assign Users option lets you add members to the group based on the membership criteria that you have defined.
7. Select the users who would be the members of this group.
8. Click **Save**.

### Import User Groups From Source

You import user groups from a single sign-on server, VMware Identity Manager, Active Directory, or an LDAP database on another machine so that you can use those groups in VCF Operations.

#### Where You Import User Groups

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. Select **User Groups** tab, click the horizontal ellipsis next to **ADD** button, and select **Import**

   **Note:**
   You can edit the imported group to assign Roles and Scopes.

   The options displayed in the Import User Groups page depend upon the authentication source you select.

**Table 1431: Import User Groups Page - LDAP, Active Directory, and Others Sources**

| Option | Description |
|---|---|
| Import From | Host machine configured as the source to import the user groups. These options are displayed when the host machine of an LDAP, Active Directory, or Other source is selected. |
| User Name | User name of the source credential to import user groups to the VCF Operations instance. |
| Password | Password for the source credential to import user groups to the VCF Operations instance. |
| Search String | Invoke the search for user groups. |
| Basic | Use the basic import setting with search option to look for user groups. |

| Option | Description |
|---|---|
| Advanced | Displays the advanced import settings.<br>• Group Search Criteria. Search criteria to find LDAP groups. If not included, VCF Operations uses the default search parameters: `(|(objectClass=group)(objectClass=groupOfNames))`<br>• Member Attribute. Name of the attribute for a group object that contains the list of members. If not included, VCF Operations uses member by default.<br>• User Search Criteria. Search criteria to use the member field to find and cache LDAP users. You enter sets of key=value pairs in the form `(|(key1=value1)(key2=value2))`. If not included, VCF Operations searches for each user separately. This operation might take extra time.<br>• Member Match Field. Name of the attribute for a user object to match with the member entry from a group object. If not included, VCF Operations treats the member entry as a distinguished name.<br>• LDAP Context Attributes. Attributes that VCF Operations applies to the LDAP context environment. You enter sets of key=value pairs separated by commas, such as `java.naming.referral=ignore,java.naming.ldap.deleteRDNfalse`. |
| Group Name | Displays a list of user groups. Select the **Group Name** check box to import all the displayed user groups, or select the check box next to each user group that you want to import. |

**Table 1432: Import User Groups Page - Single Sign On Source**

| Option | Description |
|---|---|
| Import From | Host machine configured as the source to import the user groups. |
| Domain Name | User name of the source credential to import user groups to the VCF Operations instance. |
| Result Limit | Determines the number of groups displayed. |
| Search Prefix | Enter a search prefix to narrow your search. |
| Group Name | Displays a list of user groups. Select the **Group Name** check box to import all the displayed user groups, or select the check box next to each user group that you want to import. |

**Table 1433: Import User Groups from a VMware SSO Source**

| User Detail Options | Description |
|---|---|
| Import From | VMware SSO is configured as the source to import user groups. |
| Search Prefix | Enter a search string, and click **Search** to start the search for user groups. |
| Group Name Summary grid | Lists the users available for import. Select the check box for each user group to import, or select the **Group Name** check box to import all groups. User groups that are already imported to VCF Operations do not appear in the list.<br>**Note:**<br>After importing the user group, you must edit the user group information and assign a role and a scope. |

**Table 1434: Import User Groups from a VMware Identity Manager Source**

| User Details Options | Description |
|---|---|
| Import From | VMware Identity Manager configured as the source to import user groups. |
| Domain Name | Enter the domain name for import. |
| Search Prefix | Enter a search string, and click **Search** to start the search for user groups. |

| User Details Options | Description |
|---|---|
| Group Name Summary grid | Lists the users available for import. Select the check box for each user group to import, or select the **Group Name** check box to import all groups. User groups that are already imported to VCF Operations do not appear in the list. |

3. After you enter the import user group details, click **Next**.
4. Click **Finish**.

**Export and Import of User Groups**

You can export User Group configurations from one VCF Operations and import into any VCF Operations.

**Export User Groups**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click **Access Control** tile.
2. In the **User Groups** tab, select the user groups to be exported. Click the horizontal ellipsis next to **Add** and then, click **Export**.

The user groups `.json` file is downloaded to the default download location.

**Import User Groups**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click **Access Control** tile.
2. In the **User Groups** tab, click the horizontal ellipsis next to **Add** and then, click **Import**.
3. Click **Browse** and select the user groups `.json` file.
4. In case of a conflict, select either **Overwrite existing User Groups** or **Skip User Groups**.
5. Click **Import**.

**Important Points**

- User group's scopes are matched in the target VCF Operations, which means user group's scopes references are exported, then assigned to the user group while importing only if those scopes exist on the target VCF Operations.
- User group's roles are matched in the target VCF Operations, which means user group's role references are exported, then assigned to the user group while importing only if those roles exist on the target VCF Operations.
- User group's members are matched in the target VCF Operations, which means user group's member references are exported, then assigned to the user group while importing only if those users exist on the target VCF Operations.
- Import of the external user groups fails if their authentication source is not found in the target VCF Operations.
- The traversal specifications are not imported or exported in VCF Operations.
- An error message is displayed with details for failed imports.

## Access Control: Roles Tab

You can assign users-specific roles to perform actions and view features and objects in VCF Operations. With role-based access, users can only perform the actions that their permissions allow.

**Where You Manage User Roles**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. Click the **Roles** tab.

To view the details of roles configured in VCF Operations, click the role, the role details are displayed in the right-side panel. The role details include the permissions, user accounts, and user groups associated with the selected role.

You can view and edit details about a role, by selecting a role in the summary grid, and clicking the **Edit** icon in the Roles toolbar.

**Table 1435: Access Control Roles Summary Grid**

| Option | Description |
|---|---|
| Roles toolbar | To manage roles, use the toolbar icons.<br>• Click the **Add** icon. to add a user role, provide the name and description for the role, and assign permissions in the **Role Information** page.<br>**Note:**<br>To assign all the available permissions to the selected role, select the **Select all Permissions** check box.<br>• Click the **Vertical Ellipses** to perform any one of the following actions:<br>– **Edit**. Edit the selected user role, and modify the details for the role in the **Edit Role** dialog box.<br>– **Delete**. Delete a user role.<br>– **Clone**. Clone the selected user role<br>– **Export**. Export a user role.<br>• Click the **Horizontal Ellipses** to perform any one of the following actions:<br>– **Delete**. Click delete to Delete a role.<br>– **Export**. Click export to export a role.<br>– Click **Import** to import a role from the **Import Roles** page. You can import existing roles, overwrite existing roles, and skip roles. |
| Filters | Activates you to search the list of roles according to the following criteria:<br>• Role Name<br>• Role Description<br>• Modified By |

You can view details for the user accounts and user groups associated with a selected role in the Details panes.

**Table 1436: Access Control Roles Details Panes**

| Option | Description |
|---|---|
| Role Name | Name of the role to apply to a specific level of users, such as user for base users or administrator for users with administrative permissions. |
| Description | Description of the role, indicating its purpose. |
| Modified By | Displays the name of the user who last updated the role. |
| Last Modified | Displays the date and time when the role was last updated. |
| Permissions | Displays the permissions assigned to the role according to the categories: Subscriptions, Administration, Automation Central, Configure, Data Sources, Environment, Home, Optimize, Plan, Troubleshoot, and Visualize. Expand the tree of each category to view all the assigned permissions.<br>You can edit the permissions assigned to the role by clicking the **Edit Role** icon.<br>• Click the **Expand All** button to expand the trees of all the categories, and select the check boxes to apply permissions for the selected role. |
| User Accounts | The roles are assigned to the users. You can only view users who have been assigned roles directly, the users belonging to a user group are not displayed here. The information in this pane is based on the data entered when you created the user, or imported with the user.<br>• First Name. Indicates the first name of each user who is assigned this role.<br>• Last Name. Indicates the last name of each user who is assigned this role.<br>• User name , without spaces, that will log in to VCF Operations<br>• Email. Indicates the email address for each user who is assigned this role. |

| Option | Description |
|---|---|
| User Groups | The roles are assigned to the selected user groups.<br>• Group Name: Name of each group that is associated with the selected role.<br>• Members: Number of members in each group. |

### Add or Edit Roles and Assign Permissions

You can add or edit user-specific roles to perform actions and view features and objects in VCF Operations. With role-based access, you can assign roles to users and let them only perform the actions that their permissions allow.

#### Where You Add or Edit User Roles

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**,and then click the **Access Control** tile.
2. Select the **Roles** tab and click **Add**.
3. To edit a role, select the role and then click **Edit Role**. You can also click the **EDIT ROLE** button in the **Role Details** page and edit the role.

**Table 1437: Add or Edit Role Information Page**

| Option | Description |
|---|---|
| Name | Name of the role to apply to a specific level of users, such as user for base users or administrator for users with administrative permissions. |
| Description | Description of the role, indicating its purpose. |
| **Assign Permissions**<br>**Note:**<br>You can set default permissions for the selected role using the **Apply Default Permissions** option. The Apply Default Option is available only when you edit an Out-of-the-box role. | |
| Select all Permissions | Click **Select all Permissions** to apply the permissions for the role you create or select. You can click the arrow next to the categories to set specific permissions to the roles you define. |
| Expand All | Click the **Expand All** button to expand the trees of all the categories and select the check boxes to apply or modify the permissions for the selected role. |
| Collapse All | Click the **Collapse All** button to Close the tree view and display only the high-level categories. |

4. Click **Save**.

### Export and Import of Roles

You can export User Roles configurations from one VCF Operations and import into any VCF Operations.

#### Export User Roles

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. In the **Roles** tab, select the user roles to be exported. Click the horizontal ellipsis next to **Add** and then, click **Export**.

The roles `.json` file is downloaded to the default download location.

#### Import Roles

Invalid privilege keys of a role are ignored during import.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click **Access Control** tile.
2. In the **Roles** tab, click the horizontal ellipsis next to **Add** and then, click **Import**.
3. Click **Browse** and select the roles `.json` file.

4. In case of a conflict, select either **Overwrite existing Roles** or **Skip Roles**.
5. Click **Import**.

**Important Points**

- Invalid permissions are ignored during import based on target VCF Operations.
- An error message is displayed with details for failed imports.

## Access Control: Scopes Tab

You can add, edit, or remove scope associated with users and groups in VCF Operations. Scope provides you the ability to limit access of a user or a set of users to VCF Operations. The All Objects scope is created by default. Assign the All Objects scope to the user to access all objects discovered by VCF Operations.

**Where to Manage Scope**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. Click the **Scopes** tab.

To view the details for a specific scope defined in VCF Operations, click the scope. The scope details are displayed in the right-side panel. The scope details include the user accounts and user groups associated with the scope.

**Table 1438: Access Control Scope Summary Grid**

| Option | Description |
|---|---|
| Scope Toolbar | To manage scopes, use the toolbar options.<br>• Click **Add** to add the scope and provide the name and description for the scope, and assign members to objects in the **Scope Information** page.<br>Select **Object Hierarchies** and then select the object to assign members to. You can select one or more objects.<br>**Note:**<br>For vSphere Storage object hierarchy, select the **Propagate to children** checkbox to include all future discovered objects in the scope.<br>• Click the **Vertical Ellipses** to perform any one of the following actions:<br>– **Edit**. Edit a specific scope and modify the details for the scope in the **Edit Scope Information** page.<br>– **Clone**. Clone a scope and enter a name and description for the cloned scope.<br>– **Delete**. Delete a scope.<br>• Click the **Horizontal Ellipses** and select **Delete**. Delete a scope. |
| Filters | Activates you to search the list of scopes according to the following criteria:<br>• Scope Name<br>• Description<br>• Modified By |

**Table 1439: Access Control Scope Details Grid**

| Option | Description |
|---|---|
| Scope Name | Displays the name of the selected scope. |
| Description | Displays the description of the scope, indicating its purpose. |
| Modified By | Indicates the last person to update the scope. |
| Last Modified | Indicates the time when the scope was last updated. |

| Option | Description |
|---|---|
| User Accounts | Displays the user accounts associated with the selected scope. |
| User Groups | Displays the user groups associated with the selected scope. |

### Modify Scopes and Assign Member Objects

You can add and modify the scope defined in VCF Operations. Scope lets you create a package and associate the objects and object hierarchies to the package. You can select the object hierarchy and assign the required objects to the selected object hierarchy. After you define a scope, you can associate the scope to user accounts and user groups.

#### Where You Add or Edit Scope

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Access Control** tile.
2. Click the **Scopes** tab.
3. In the **Scopes** tab, click **Add**.
4. To edit a scope, select the scope and then click **Edit Scope**. You can also click the **EDIT SCOPE** button in the **Scope Details** grid and edit the scope.

**Table 1440: Access Control Scopes Details Grid**

| Option | Description |
|---|---|
| Scope Name | Name of the scope to apply to a specific user or a set of users, such as user for base users or administrator for users with administrative permissions. |
| Description | Description of the scope, indicating its purpose. |

5. To add or edit the scope, select the required **Object Hierarchy**, and then select the **Object** to be associated.
6. Click **Save**.

After you save the scope, you can assign the scope to user accounts and user groups. You can also assign a log data set. For more information, see Defining a Dataset.

## Authentication Sources

VCF Operations uses authentication sources that activate you to import and authenticate users and user group information that reside on another machine: the Lightweight Directory Access Protocol (LDAP) platform-independent protocol, Active Directory, VMware Identity Manager, VMware SSO, Single Sign-On, and Others.

#### Where You Manage Authentication Sources

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Authentication Sources** tile.

> **Note:**
>
> Native 2FA is not currently supported for local user accounts. Customers requiring MFA on all logins should use single sign-on with an identity provider that enforces MFA for all interactive users, and should restrict local account usage to emergency/break-glass access only, protected by a strong unique password, IP allow-listing, session timeout, and audit logging of local-account logins.

**Table 1441: Authentication Sources Toolbar and Data Grid**

| Option | Description |
|---|---|
| Authentication Sources toolbar | To manage authentication sources, use the toolbar icons.<br>• **Add** icon: Add an authentication source, and provide the information for the source in the Add Source for User and Group Import dialog box.<br>• Click the **Vertical Ellipses** to perform any one of the following actions:<br>— **Edit**. Edit the selected authentication source, and modify the details in the Edit Source dialog box.<br>— **Delete**. Delete an authentication source.<br>— **Synchronize User Groups**. Synchronize users within the groups imported through the selected Active Directory or LDAP authentication source. |
| Source Display Name | Name that you assign to the authentication source. |
| Source Type | Indicates the type of directory services access technology to access the source machine where the authentication database of user accounts resides. Options include:<br>• SSO SAML: An open-standard data format that activates Web browser single sign-on.<br>• VMware Identity Manager: A platform where you can manage users and groups, manage resources and user authentication, and access policies and entitle users to resources.<br>• VMware SSO: Browser based SSO that uses an external identity provider to log into vCenter, VCF Operations, Log management, and VCF Operations Orchestrator without providing credentials again.<br>• Open LDAP: A platform-independent protocol that provides access to an LDAP database on another machine to import user accounts.<br>• Active Directory or Other: Specifies any other LDAP-based directory services, such as Novel or Open DJ, used to import user accounts from an LDAP database on a Linux Mac machine. |
| Host | Name or IP address of the host machine where the user database resides. |
| Port | Port used for the import. |
| Base DN | Base distinguished name for the user search. VCF Operations locates only the users under the Base DN. The Base DN is an elementary entry for an imported user's distinguished name (DN), which is the base entry for the user name without the need for other related information such as the full path to the user account, or the inclusion of related domain components. Although VCF Operations populates the Base DN, an Administrator must verify the Base DN before saving the LDAP configuration. |
| Auto Synchronization | When selected, activates VCF Operations to map imported LDAP users to user groups. |
| Last Synchronized | Date and time that the synchronization last occurred. |

## Configure VMware Single Sign-On for VCF Operations

After installing or upgrading to VCF Operations 8.18, you can configure VCF Operations for VMware Single Sign-On. When you configure VMware Single Sign-On, you use an external identity provider to sign into VCF Operations.

- Ensure that the associated vCenter Server host is configured for VMware Single Sign-On. For more information about configuring a vCenter Server host for VMware Single Sign-On, see *Configure VMware Single Sign-on* in the vSphere Authentication documentation.

  **Note:**

  After configuring VMware Single Sign-On configuration for VCF Operations, you can still log in to VCF Operations with a local account.

1. Log in to VCF Operations with a local account.
2. Configure VMware SSO as an authentication type. For more information, see Authentication Sources and Authentication Sources: Add Authentication Source for User and Group Import.

   **Note:**
   Only one VMware Single Sign-On configuration can exist during any period of time.
3. To allow users or groups to log in to VCF Operations using **VMware SSO** authentication source, import users or groups from the authentication source into VCF Operations. For more information, see Import User Accounts From Source and Import User Groups From Source.

   **Note:**
   You must select a role for each user and assign a scope for each role.
4. A certificate of type **VMware SSO** is created and can be viewed from **Administration** > **Control Panel** > **Certificates**.
5. Users from the VMware SSO authentication source can now log into VCF Operations using VMware SSO. When you log in to using VMware SSO, you will be redirected to an external authentication page. Enter the credentials to log in to VCF Operations.

   **Note:**

   - You can delete and unregister a VMware Single Sign-On authentication source. For more information see, Delete and Deregister a VMware Single Sign-On Authentication Source.
   - You have to re-register the VMware SSO server in certain scenarios. Navigate to the **Authentication Sources** page, click the **Re-register source** link and enter the vCenter Server credentials. Re-register the VMware SSO server in the following two scenarios:
     – If you add or remove nodes from a cluster in VCF Operations, and/or
     – If you have modified the system access URL when a load balancer is used (**Administration** > **Global Settings** > **System Settings** > **System Access URL option**).

## Authentication Sources: Add Authentication Source for User and Group Import

When you import user account information that resides on another machine, you must define the criteria used to import the user accounts from the source machine.

### Where You Add or Edit Authentication Sources

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Authentication Sources** tile.
2. Click **Add**.
3. To edit authentication sources, click **Edit**.

**Table 1442: Authentication Sources Add Source for User and Group Import**

| Option | Description |
|---|---|
| Source Display Name | Name that you assign to the authentication source. |
| Source Type<br><br>**Note:**<br>The option you select in the **Source Type** drop-down box, determines the options available in this dialog box. | Indicates the type of directory services access technology to access the source machine where the database of user accounts resides. There are two types of databases: LDAP and single sign-on. Options include:<br>• SSO SAML: An XML-based standard for a web browser single sign-on that activates users to perform single sign-on to multiple applications.<br>• VMware Identity Manager: A platform where you can manage users and groups, manage resources and user authentication, and access policies and entitle users to resources.<br>• VMware SSO: Browser based SSO that uses an external identity provider to log into vCenter, VCF Operations, Log management, and VCF Operations Orchestrator without providing credentials again.<br>• Open LDAP: A platform-independent protocol that provides access to an LDAP database on another machine to import user accounts.<br>• Other: Specifies any other LDAP-based directory services, such as Novel or OpenDJ, used to import user accounts from an LDAP database on a Linux Mac machine. |

**Table 1443: Authentication Sources Add Source for User and Group Import - Options Available When SSO SAML Is Selected.**

| Name | Description |
|---|---|
| Host | Name or IP address of the host machine where the single sign-on user server resides. |
| Port | The single sign-on listening port. By default this is set to 443. |
| User Name | Name of the user account that can log in to the single sign-on host machine. |
| Password | Password of the user account that can log in to the single sign-on host machine. |
| Grant administrator role to VCF Operations for future configuration? | When you create a single sign-on source, a new VCF Operations user account is created on the single sign-on server.<br>• Select **Yes**, to grant VCF Operations an administrative role so that it can be used to configure the SSO source if changes are made to the VCF Operations setup.<br>• If you select **No** and the VCF Operations setup is changed, SSO users will not be able to log in until you re-register the SSO source. |
| Automatically redirect to VCF Operations single sign-on URL? | After you have configured a single sign-on source, users are redirected to the vCenter SSO server.<br>• Select **Yes**, to redirect users to the single sign-on server for authentication.<br>• If you select **No** users must sign in through the VCF Operations login page. |

| Name | Description |
|---|---|
| Import single sign-on user groups after adding the current source? | When you have set up a single sign-on source, you import users and user groups into VCF Operations so that single sign-on users can access the system with their single sign-on permissions.<br>• If you select **Yes**, the wizard directs you to the Import User Groups page so that you can import user groups when you have finished setting up the SSO source.<br>• If you want to import user accounts, or user groups at a later stage, select **No**. |
| Advanced | If your system uses a load balancer, enter the IP address of the load balancer. |
| Test | Tests whether the host machine can be reached with the credentials provided. |

**Table 1444: Authentication Sources Add Source for User and Group Import - Options Available When VMware SSO  Is Selected.**

| Name | Description |
|---|---|
| Host | Name or IP address of the vCenter host machine on which VMware SSO has been configured. |
| Port | The single sign-on listening port. By default this is set to 443. |
| Tenant | |
| Username | Name of the vCenter user account that can log in to the VMware SSO host machine.<br>**Note:**<br>The user must have the *VcIdentityProviders.Manage* permission assigned. |
| Password | Password of the vCenter user account that can log in to the VMware SSO host machine. |

**Note:**
Only one VMware Single Sign-On configuration can exist during any period of time.

**Table 1445: Authentication Sources Add Source for User and Group Import - Options Available When Open LDAP, Active Directory, and Other Are Selected.**

| Option | Description |
|---|---|
| Integration Mode Basic settings | Applies basic settings to integrate the LDAP import source with the instance of VCF Operations.<br>Use Basic integration mode to have VCF Operations discover the host machine where the LDAP database resides, and set the base distinguished name (Base DN) used to search for users. You provide the name of the domain and the subdomain, which VCF Operations uses to populate the Host and Base DN details, and the name and password of the user who can log in to the LDAP host machine.<br>In Basic mode, attempts to fetch the host and port from the DNS server, and obtain the Global Catalog and domain controllers for the domain, with preference given to SSL/TLS-activated servers.<br>• Domain/Subdomain. Domain information for the LDAP user account.<br>**Note:**<br>To import users and groups from multiple subdomains, use the root domain.com instead of subdomain. Using a subdomain limits the visibility of VCF Operations to groups and users from that specific subdomain.<br>• Use SSL/TLS. When selected, VCF Operations uses the Secure Sockets Layer/Transport Layer Security (SSL/TLS) protocol to provide secure communication when you import users from an LDAP database. You do not need to install the SSL/TLS certificate. Instead, VCF Operations prompts you to view and verify the thumbprint, and accept the LDAP server certificate. After you accept the certificate, the LDAP communication proceeds.<br>• If Active Directory uses a self-signed certificate, then the certificate should contain the **Subject Alternative Name** field. VCF Operations can successfully verify the Active Directory certificate and integrate with Active Directory only if, the host name or the IP address provided in the **Subject Alternative Name** field matches the address of the domain controller on which the certificate is used.<br>• User Name. Name of the user account that can log in to the LDAP host machine.<br>• Reset Password. Reset the password of the user account that can log in to the LDAP host machine.<br>• Automatically synchronize user membership for configured groups. When selected, activates VCF Operations to map imported LDAP users to user groups.<br>• Host. Name or IP address of the host machine where the LDAP user database resides.<br>• Port. Port used for the import. Use port 389 if you are not using SSL/TLS, or port 636 if you are using SSL/TLS, or another port number of your choice. Global Catalog ports are 3268 for non-SSL/TLS, and 3269 for SSL/TLS.<br>• Base DN. Base distinguished name for the user search. VCF Operations locates only the users under the Base DN. The Base DN is an elementary entry for an imported user's distinguished name (DN), which is the base entry for the user name without the need for other related information such as the full path to the user account, or the inclusion of related domain components. Although VCF Operations populates the Base DN, an Administrator must verify the Base DN before saving the LDAP configuration.<br>• Common Name. LDAP attribute used to identify the user name. The default attribute for Active Directory is `userPrincipalName`. |
| Integration Mode Advanced settings | Applies advanced settings to integrate the LDAP import source with the instance of VCF Operations.<br>Use Advanced integration mode to manually provide the host name and base distinguished name (Base DN) to have VCF Operations import users. You provide the name and password of the user who can log in to the LDAP host machine.<br>• Host. Name or IP address of the host machine where the LDAP user database resides.<br>• Use SSL/TLS. When selected, VCF Operations uses the Secure Sockets Layer/Transport Layer Security (SSL/TLS) protocol to provide secure communication when you import users from an LDAP database. You do not need to install the SSL/TLS certificate. Instead, VCF Operations prompts you to view and verify the thumbprint, and accept the LDAP server certificate. After you accept the certificate, the LDAP communication proceeds.<br>• If Active Directory uses a self-signed certificate, then the certificate should contain the **Subject Alternative Name** field. VCF Operations can successfully verify the Active Directory certificate and integrate with Active Directory only if, the host name or the IP address provided in the **Subject Alternative Name** field matches the address of the domain controller on which the certificate is used.<br>• Base DN. Base distinguished name for the user search. VCF Operations will locate only the users under the Base DN. The Base DN is an elementary entry for an imported user's distinguished name (DN), which is the base entry for the user name without the need for other related information such as the full path to the user account, or the inclusion of related |

| Option | Description |
|---|---|
| Search Criteria | Displays the search criteria settings.<br>Although VCF Operations populates part of the search criteria, an Administrator must verify the settings to ensure that the settings are correct according to the properties of the LDAP type.<br>• Group Search Criteria. Search criteria to find LDAP groups. If not included, VCF Operations uses the default search parameters: `(|(objectClass=group)(objectClass=groupOfNames))`<br>• Member Attribute. Name of the attribute for a group object that contains the list of members. If not included, VCF Operations uses member by default.<br>• User Search Criteria. Search criteria to use the member field to find and cache LDAP users. You enter sets of key=value pairs in the form `(|(key1=value1)(key2=value2))`. If not included, VCF Operations searches for each user separately. This operation might take extra time.<br>• Member Match Field. Name of the attribute for a user object to match with the member entry from a group object. If not included, VCF Operations treats the member entry as a distinguished name.<br>• LDAP Context Attributes. Attributes that VCF Operations applies to the LDAP context environment. You enter sets of key=value pairs separated by commas, such as `java.naming.referral=ignore,java.naming.ldap.deleteRDNfalse`. |
| Test | Tests whether the host machine can be reached, with the credentials provided. Although a test of the connection is successful, users who use the search feature must have read permissions in the LDAP source.<br>This test does not verify the accuracy of the Base DN or Common Name entries. |

**Table 1446: Authentication Sources Add Source for User and Group Import - Options Available When VMware Identity Manager Is Selected.**

| Option | Description |
|---|---|
| Host | Name or IP address of the VMware Identity Manager machine where the single sign-on user server resides. |
| Port | The single sign-on listening port. By default this is set to 443. |
| Tenant | This is an optional field. |
| User name | VMware Identity Manager system-domain tenant administrator user name. |
| Password | Password of the VMware Identity Manager system-domain tenant administrator. |
| Redirect IP/ FQDN | This is the IP address of VCF Operations node where a user is redirected after a successful authentication from VMware Identity Manager. By default, this is the IP address of the VCF Operations primary node.<br>**Note:**<br>When the primary replica becomes the primary node on VCF Operations, then VCF Operations administrator has to manually edit the IP address and set it to the IP address of the current primary node. |
| Test | Tests whether the VMware Identity Manager machine can be reached, with the credentials provided. |

## Export and Import of Authentication Sources

You can export Authentication source configurations from one and import into any VCF Operations.

**Export Authentication Sources**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click **Authentication Sources** tile.
2. In the **Authentication Sources** tab, select the authentication sources to be exported. Click the horizontal ellipsis next to **Add** and then, click **Export**.
3. You are prompted to enter a password when you export authentication sources. Enter the password and note it down, you have to use the same password when you import the authentication sources.
4. Click **Export**.

The authentication sources `.json` file is downloaded to the default download location.

**Import Authentication Sources**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click **Authentication Sources** tile.
2. In the **Authentication Sources** page, click the horizontal ellipsis next to **Add** and then, click **Import**.
3. Click **Browse** and select the authentication sources `.json` file.
4. Enter the same password which you had used during authentication sources export.
5. In case of a conflict, select either **Overwrite existing Authentication Sources** or **Skip Authentication Sources**.
6. Click **Import**.
7. After the import you must re-accept all untrusted certificates manually.

**Important Points**

- An error message is displayed with details for failed imports.

## Delete and Deregister a VMware Single Sign-On Authentication Source

Deleting the VMware Single Sign-on authentication source automatically removes users and user groups that are associated with the VMware Single Sign-On authentication source.

- A VMware SSO authentication source must be configured.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Authentication Sources** tile.
2. Select the **VMware SSO** authentication source, and then click the vertical ellipsis and select **Delete**.
3. Enter the **User Name** and **Password** of the vCenter Server user account that can log in to the VMware SSO host machine.
4. Select **Force Delete** if you cannot access the single sign-on server. VCF Operations continues to attempt to clean the VMware Single Sign-On registration even when errors occur.
5. Click **OK**.

## Give Administrator Access to AD or LDAP Users

You can assign users from AD or LDAP administrator access to VCF Operations so that you can distribute the workload among domain users.

**Before You Proceed**

- Know the credentials of the AD or LDAP account.
- Create the group of users who will get administrative access in AD or LDAP.
- To assign administrator access to users from AD or LDAP in VCF Operations, you must log in as administrator in VCF Operations and import the user group to whom you would like to grant administrator access from AD or LDAP.

1. In a Web browser, navigate to the master node administration interface: `https://master-node-name-or-ip-address/admin`.

2. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click **Administrator Settings**.
3. Expand the Active Directory/Open LDAP Integration section.
4. Click the **Activate AD/Open LDAP** button to activate the setting.
5. In the Domain/Subdomain setting, provide the FQDN of the domain name, for example, mydomain.com. Do not provide an IP address. This domain name must be DNS-resolvable.
6. Expand Advanced Settings and change the default settings.

**Table 1447: Advanced Settings**

| Setting | Description |
|---|---|
| Host | The host name is populated to Auto by default. You can select a host from the drop-down list. |
| Port | The port number is populated depending on the **Use SSL/TLS** selection in the domain name. |
| Base DN | The Base Distinguished Name for users is populated based on the domain. Optionally, enter the DN from which to start user searches. For example, cn=Users,dc=myCorp,dc=com. |
| Common Name | The common name is populated to `userPrincipalName` by default. You can change this value from the drop-down menu. |

7. Expand Search Criteria and change the default settings.

**Table 1448: Search Criteria Settings**

| Setting | Description |
|---|---|
| Group Search Criteria | The group search criteria is populated to `(|(objectclass=group)(objectclass=groupofnames)(objectclass=groupOfUniqueNames))` by default. |
| User Search Criteria | The user search criteria is populated to `(|(objectclass=user)(objectclass=person)(objectclass=inetOrgPerson)(objectclass=organizationalPerson))` by default. |
| Member Attribute | The member attribute is populated to member by default. |

8. Import the SSL certificate. You can import only one SSL certificate PEM file. The imported SSL certificate PEM file can contain more than one certificate. For more details, see Broadcom knowledge base article 2046591.
9. Click **Select User Group**. A new dialog box opens.

**Table 1449: Select User Group Settings**

| Setting | Description |
|---|---|
| **Credentials** > **Username** | Enter the AD/LDAP username. |
| **Credentials** > **Password** | Enter the AD/LDAP password. |
| Search box | Search for the user group name or distinguished name. |
| Select | Select for the user group name or distinguished name to give administrative access to its users. |

10. Click **TEST** to verify that the AD or LDAP connection works.
11. Click **SAVE**.

After AD or LDAP users get administrative rights, they cannot see the local administrator password, but they can reset it. You cannot add or remove any user from the group or view the list of users from VCF Operations.

AD or LDAP integration in VCF Operations supports all three formats: `"DOMAIN\user_name"`, `"CN=username,DC=domain,DC=com"`, and `"user_name@domain.com"`. The Admin UI only supports the email format.

**Note:**

As an administrator, if you face any issues while assigning users from AD or LDAP administrator access to VCF Operations:

- Ensure that the users have "`distinguishedName`" attribute in the LDAP records.
- Ensure that the users have enough permissions to perform the following LDAP queries:
  - `(|(CN=...)(sAMAccountName=...)(userPrincipalName=...)(mail=...))`. If the user name is given in the DN format (e.g. "`CN=username,DC=domain,DC=com`"), the query is not performed.
  - `&((|(objectclass=group)(objectclass=groupofnames)(objectclass=groupOfUniqueNames))(member=...))`, or custom group search criteria if it was modified.

## Audit Users and the Environment in VCF Operations

At times, you might need to provide documentation as an evidence of the sequence of activities that took place in your VCF Operationsenvironment. Auditing allows you to view the users, objects, and information that is collected. To meet audit requirements, such as for business critical applications that contain sensitive data that must be protected, you can generate reports on the activities of your users, the privileges assigned to users to access objects, and the counts of objects and applications in your environment.

Auditing reports provide traceability of the objects and users in your environment.

| | |
|---|---|
| **User Activity Audit** | Run this report to understand the scope of user activities, such as logging in, actions on clusters and nodes, changes to system passwords, activating certificates, and logging out. |
| **User Permissions Audit** | Generate this report to understand the scope of user accounts and their roles, access groups, and access privileges. |
| **System Audit** | Run this report to understand the scale of your environment. This report displays the counts of configured and collecting objects, the types and counts of adapters, configured and collecting metrics, super metrics, applications, and existing virtual environment objects. This report can help you determine whether the number of objects in your environment exceeds a supported limit. |
| **VC Pricing Migration Audit** | Run this report to understand the details of VC pricing migration. |
| **Chargeback Migration Audit** | Run this report to understand the details of Chargeback migration. |
| **System Component Audit** | Run this report to display a version list of all the components in your environment. |

### Reasons for Auditing Your Environment

Auditing in VCF Operations helps data center administrators in the following types of situations.

- You must track each configuration change to an authenticated user who initiated the change or scheduled the job that performed the change. For example, after an adapter changes an object, which is associated with a specific object identifier at a specific time, the data center administrator can determine the principal identifier of the authenticated user who initiated the change.
- You must track who made changes to your data center during a specific range of time, to determine who changed what on a particular day. You can identify the principal identifiers of authenticated users who were logged in to VCF Operations and running jobs, and determine who initiated the change.
- You must determine which objects were affected by a particular user during a time-specific range of time.
- You must correlate events that occurred in your data center, and view these events overlayed so that you can visualize relationships and the cause of the events. Events can include login attempts, system start up and shutdown, application failures, watchdog restarts, configuration changes of applications, changes to security policy, requests, responses, and status of success.
- You must validate that the components installed in your environment are running the latest version.

## User Activity Audit

The user activity report helps you understand the scope of user activities in yourVCF Operations instance, such as when users logged in, actions they took on clusters and nodes, changes they made to system passwords, when they activated certificates, and when they logged out.

### Where You Audit User Activity

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Audit** tile. The activities that users performed in the environment appear on the page.

**Table 1450: User Activity Audit Actions**

| Option | Description |
|---|---|
| Download | Download the user activity audit information to a report in PDF or XLS format. |
| Configure | Configure the settings to send the user activity log to an external syslog server to meet security auditing requirements.<br>**Note:**<br>Audit events are only forwarded if the underlying log4j2 configuration on the node handling audit logging already defines a logger category for AuditLog with an appender reference. On a standard deployment, this is pre-configured. If enabling forwarding has no effect (no events reach the external syslog server despite this setting being enabled), verify that the node's log4j2 configuration contains the following:<br>1. logger.comintegrienalivecommonauditAuditLog.name = AuditLog<br>2. logger.comintegrienalivecommonauditAuditLog.level = INFO<br>3. logger.comintegrienalivecommonauditAuditLog.appenderRef.AuditLogAppender.ref = AuditLogAppender<br>• Output log to external syslog server: When selected, VCF Operations sends the log to a separate server machine.<br>• IP Address or Host Name: Identification for the syslog server.<br>• Port: VCF Operationsport used to send the audit information to the external server. |
| Date Range | Display the list of user activities performed in the past based on a selected number of hours, days, weeks, months, or years, or between two specific dates and times. |
| Starting Line | Indicates the starting line of the file. 0 is for the first line. -1 or no value indicates that the file has to be displayed from the end. |
| Number of Lines | Specifies the number of lines to be displayed in the search result. For example: If you want to see the first 10 occurrences of a particular chunk of text, enter the number of lines as 10 and the starting line as 0. |
| Filter | Filters the data according to User ID, Subject, Auth Source, Session, Origin, Audit ID, and Result. |

## User Permissions Audit

A user permissions audit report provides an overview of the local users and LDAP imported users in your VCF Operations instance, and a list of groups to which each user belongs. This report helps you understand the scope of the user accounts and their roles, access groups, and access privileges in your environment.
The report displays the access group associated with each local user and the access privileges granted to the user in each access group. This report does not include vCenter users, roles, or privileges.

When a user is a member of a specific user group, the associated access group could provide the user with access to configuration, dashboards, and templates, or to specific navigation areas in the user interface such as Administration. The access rights associated with the access group include actions for each access group, such as the ability to add, edit, or delete dashboards, or to view, configure, or manage objects.

**Where You Audit User Permissions**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Audit** tile.
2. Click the **User Permissions Audit** tab.

The permissions assigned to users, and their associated access groups and access privileges, appear on the page.

**Table 1451: User Permissions Audit Actions**

| Option | Description |
|---|---|
| Download | Download the user permissions audit information to a report in PDF or XLS format. |

## System Audit for VCF Operations

A system audit report provides an overview of the counts of objects, metrics, super metrics, applications, and custom groups in your VCF Operations instance. This report can help you understand the scale of your environment.

The system audit report displays the types and number of objects that VCF Operations manages. Reported objects include those that are configured and collecting data, the types of objects, object counts for adapters, the metrics that are configured and being collected, super metrics, VCF Operations generated metrics, the number of applications used, and the number of custom groups.

You can use this report to help determine whether the number of objects in your environment exceeds a supported limit.

**Where You Audit the System**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Audit** tile.
2. Click the **System Audit** tab.

The objects and their associated counts appear in the report.

**Table 1452: System Audit Actions**

| Option | Description |
|---|---|
| Download | Download the system information to a report in PDF or XLS format. |

## System Component Audit

A system component audit report provides a version list of every component installed in the system.

**Where You Audit System Components**

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Audit** tile.
2. Click the **System Component Audit** tab.

A list of components installed in the environment appears on the page.

**Table 1453: System Component Audit Actions**

| Option | Description |
|---|---|
| Download | Display the version information in a new browser window. |

## VC Pricing Migration Audit

The vCenter Pricing Migration Audit provides details of the migration of pricing cards to VCF Operations policies.

### Where You Audit vCenter Pricing Migration Components

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Audit** tile.
2. From the **Audit** page, click **Chargeback Audit tab** > **VC Pricing Migration Audit tab**.

**Table 1454: vCenter Pricing Migration Audit Actions**

| Option | Description |
|---|---|
| Download | Download the vCenter Pricing migration information to a report in PDF or XLS format. |
| Date Range | Display the list of vCenter Pricing migration activities performed in the past based on a selected number of hours, days, weeks, months, or years, or between two specific dates and times. |
| Starting Line | Indicates the starting line of the file . 0 is for the first line. -1 or no value indicates that the file has to be displayed from the end. |
| Number of Lines | Specifies the number of lines to be displayed in the search result. For example: If you want to see the first 10 occurrences of a particular chunk of text, enter the number of lines as 10 and the starting line as 0. |
| Filter | Filters the data according to User ID, User Name, Auth Source, Session, Client IP, Category, and Message. |

## Chargeback Migration Audit

The Chargeback Migration Audit provides details of the migration of VMware Chargeback configurations and content to VCF Operations.

### Where You Audit Chargeback Migration Components

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Audit** tile.
2. From the **Audit** page, click **Chargeback Audit tab** > **Chargeback Migration Audit tab**.

**Table 1455: Chargeback Migration Audit Actions**

| Option | Description |
|---|---|
| Download | Download the Chargeback migration information to a report in PDF or XLS format. |
| Date Range | Display the list of Chargeback migration activities performed in the past based on a selected number of hours, days, weeks, months, or years, or between two specific dates and times. |
| Starting Line | Indicates the starting line of the file . 0 is for the first line. -1 or no value indicates that the file has to be displayed from the end. |
| Number of Lines | Specifies the number of lines to be displayed in the search result. For example: If you want to see the first 10 occurrences of a particular chunk of text, enter the number of lines as 10 and the starting line as 0. |

| Option | Description |
|---|---|
| Filter | Filters the data according to User ID, User Name, Auth Source, Session, Client IP, Category, and Message. |

## User Preferences in VCF Operations

You can configure the user preferences to determine the VCF Operations display options, such as the number of metrics and groups to display and whether to synchronize system time with the host machine.

In the VCF Operations navigation bar at the top, click the

icon, and then click **Preferences**. The user preference settings appear in the dialog box.

**Table 1456: User Preference Settings**

| Option | Description |
|---|---|
| Display | Configure how many metrics and root cause groups to display.<br>• Color scheme: Set the user interface to display in light or dark colors. |
| Language and Time | • Language: Select the language you want VCF Operations to be displayed in. You can select the browser language or select a language from the drop-down list.<br>• Font: Select the font for reports.<br>Synchronize the time used for the VCF Operations instance, and display the updated time when VCF Operations communicates with the host machine.<br>• Browser time. All dates and times displayed in the user interface use the time zone settings of the local browser.<br>• Host time. All dates and times displayed in the user interface use the time zone of the host machine.<br>• Show update time in the application header. Displays the updated time in the top-level header of the VCF Operations user interface. The updated time-stamp appears to the left of the refresh button. Other features, such as dashboards, use the updated time to display data at specific intervals. |
| Product Survey Opt Out | Allows you to opt out of providing regular feedback from the VCF Operations UI. |
| Account | Change the password for the user account. |

# VCF Operations Support Logs for Product UI

Use the expandable tree of VCF Operations log files for troubleshooting issues in the product UI.

### How VCF Operations Support Logs Work

You can browse and load the VCF Operations log files for review and for troubleshooting issues in the product UI.. You can also edit the log file folders, limit the retained log size, and set logging levels.

VCF Operations logs are categorized by cluster node, and log type. All logs are in the UTC formatted date and time. The logging format is as follows:

```
Date/Time+0000, LEVEL, [THREAD/IP Address], [Specific Fields], CLASS - MESSAGE
```

If you have configured a timezone for the VCF Operations VM, the system logs will be in that timezone. The VCF Operations logs will remain in UTC.

### Where You Find VCF Operations Support Logs

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Support Logs** tile.

## Log Viewer Options

Use the toolbar options to control the tree of items and the viewer.

1. Click **Node** and select any component that is listed under the node.
2. Click the gear icon, enter the logging levels and log size.
3. Click **OK**.

> **Note:**
> Not all components have relevant syslog information. Therefore, not all nodes have the configuration option activated.

**Figure 474: Log Options**

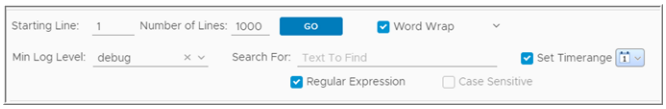


**Table 1457: Log Viewer Toolbar Options**

| Option | Description |
|---|---|
| Group By | Organizes the tree by cluster node or log type. |
| Collapse All | Closes the view of the tree to show only the high-level folders. |
| Edit Properties | For the selected folder, you can limit the log size and set logging levels. |
| Delete Selected File | Deletes the log file. |
| Starting Line | Indicates the starting line of the file .<br>0 is for the first line. -1 or no value indicates that the file has to be displayed from the end. |
| Number of Lines | Specifies the number of lines to be displayed in the search result.<br>For example:<br>If you want to see the first 10 occurrences of a particular chunk of text, enter the number of lines as 10 and the starting line as 0. |
| Min Log Level | If you specify the minimum log level, the logs for that particular log level and higher are shown.<br>For example:<br>If you select **warning**, the logs having the same log level (**warning**) and higher are shown . |
| Text to Find | Enter the specific text that you want to search in the logs. Add the following filters for search, if required:<br>• **Case Sensitive**<br>• **Regular Expression**<br>You can perform the search at various levels:<br>• On a single file: Use this option if you want to search a single log file .<br>• On all the log files of an entity: Use this option if you want to search all the log files of an entity such as a log type or folder.<br>• On all the log files of a node: Use this option if you want to search all the log files that are grouped under a node.<br>The last modified time for any file is found by placing the pointer on the file in the tree. |
| Set Timerange | If you specify a time range, the logs for that particular time range are shown in the search results. |
| Word Wrap | If you select this option, the part of the line that does not fit on the screen is moved to the next line. If you do not select this option, a scroll bar is provided to see the complete line. |

# Cluster Management

VCF Operations includes a central page where you can monitor and manage the nodes in your VCF Operations cluster and the adapters that are installed on the nodes.

## How Cluster Management Works

Cluster management lets you view and change the online or offline state of the overall VCF Operations cluster or the individual nodes. In addition, you can activate or deactivate high availability (HA) and view statistics related to the adapters that are installed on the nodes.

## Where You Find Cluster Management

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Cluster Management** tile.

## Cluster Management Options

The options include cluster-level monitoring and management features.

**Table 1458: Initial Setup Status Details**

| Option | Description |
|---|---|
| Actions | Expand Actions.<br>• Click **Network Time Protocol Settings** to set the global network time protocol settings for your cluster. For more information see Configuring the NTP Settings for VMware vSphere Foundation Components.<br>• Click **Rebalance** to rebalance the adapter, disk, memory, or network load across VCF Operations cluster nodes to increase the efficiency of your environment. |
| Cluster Status | Displays the online, offline, or unknown state of the VCF Operations cluster.<br>Once CA is activated, it displays the status of the two fault domains. |
| High Availability | Indicates whether HA is activated, deactivated, or degraded. |
| Continuous Availability | Indicates whether CA is activated, deactivated, or degraded. |

VCF Operations provides node-level information and a toolbar for taking nodes online or offline.

**Table 1459: Nodes in the VCF Operations Cluster**

| Option | Description |
|---|---|
| Node Name | Machine name of the node.<br>The node that you are logged into displays a dot next to the name. |
| Node Address | Internet protocol (IP) address of the node. Primary and replica nodes require static IP addresses. Data nodes can use DHCP or static IP. |
| Cluster Role | Type of VCF Operations node: primary, data, replica, or witness node (only applicable for CA). |
| Fault Domain | Displays the fault domain a node is associated to in a CA activated cluster.<br>**Note:**<br>This column appears only if CA is activated. |
| Node Pair | Displays which pair the node belongs to. For example, in CA, nodes are added in pairs. If there are four nodes, the column displays whether the node is part of pair one or two.<br>**Note:**<br>This column appears only if CA is activated. |

| Option | Description |
|---|---|
| State | Running, Not Running, Going Online, Going Offline, Inaccessible, Failure, Error |
| Status | Online, offline, unknown, or other condition of the node. |
| Objects in Process | Total environment objects that the node currently monitors. |
| Objects Being Collected | Total environment objects that the node collected. |
| Metrics in Process | Total metrics that the node has discovered since being added to the cluster. |
| Metrics Being Collected | Total metrics the node has collected since being added to the cluster. |
| Version | Displays the VCF Operations software version and the build number installed on the node. |

In addition, there are adapter statistics for the selected node.

**Table 1460: Adapters on Server**

| Option | Description |
|---|---|
| Name | Name that the installing user gave to the adapter. |
| Status | Indication of whether the adapter is collecting data or not. |
| Objects Being Collected | Total environment objects that the adapter currently monitors. |
| Metrics Being Collected | Total metrics that the adapter has collected since being installed on the node. |
| Last Collection Time | Date and time of the most recent data collection by the adapter. |
| Added On | Date and time when the adapter was installed on the node. |

## Cluster Management using the VCF Operations Admin UI

VCF Operations includes a central page where you can monitor and manage the nodes in your VCF Operations cluster and the adapters that are installed on the nodes.

### How Cluster Management Works

You can view and change the online or offline state of the overall VCF Operations cluster or the individual nodes. In addition, you can activate or deactivate high availability (HA) and continuous availability (CA) and view statistics related to the adapters that are installed on the nodes.

### Where You Find Cluster Management

Log in to the VCF Operations administration interface at https://*master-node-name-or-ip-address*/admin.

### Cluster Management Options

The options include cluster-level monitoring and management features.

**Table 1461: Initial Setup Status Details**

| Option | Description |
|---|---|
| Cluster Status | Displays the online, offline, or unknown state of the VCF Operations cluster and provides an option to take the cluster online or offline.<br>If a cluster fails to go offline, click the **Force Take Offline** button to take the cluster offline.<br>**Note:**<br>The Force Take Offline button appears only when the Bring Cluster offline operation fails.<br>You can select to display the reason for taking the cluster offline. Select the **Show reason on maintenance page** check box in the **Take Cluster Offline** dialog box. When you log in to VCF Operations when the cluster is offline, the reason for taking the cluster offline is displayed. |
| High Availability | Indicates whether HA is activated, deactivated, or degraded and provides an option to change that setting. |
| Continuous Availability | Indicates whether CA is activated, deactivated, or degraded and provides an option to change that setting. |

VCF Operations provides node-level information as well as a toolbar for taking nodes online or offline.

**Table 1462: Nodes in the VCF Operations Cluster**

| Option | Description |
|---|---|
| Generate Passphrase | Generate a passphrase that can be used instead of the administrator credentials to add a node to this cluster. |
| Add New Node | Add a new node to the this cluster. You cannot add a witness node. |
| Take Node Online/Offline | You can select the required node and bring it online or offline. You are required to understand the risk involved and provide a valid reason for the action performed when you bring a node online or offline. |
| Remove Node | Remove node from the cluster without any loss of collected data. Data nodes must be removed by shrinking. |
| Reload Nodes | Reload data in the screen. |

| Option | Description |
|---|---|
| Shrink Cluster | This option provides a mechanism to remove a node without having to lose any data. The shrink cluster removes nodes by migrating data from one node to any other node.<br>All the historical data is either moved to the primary node or any other node, which has sufficient disk space.<br>If HA is activated and you have selected the replica node for removal, then you are asked to select another replica node. VCF Operations provides a list of nodes that be a possible candidate to become a replica node.<br>VCF Operations stops collecting data from the removed nodes. However, the data that is available in the removed node is migrated to an existing node. Once the migration is complete, then the removed nodes are deleted with the cluster state as offline.<br>**Note:**<br>VCF Operations cannot move pinned adapters. The adapter instances which were pinned on removed nodes do not move to another collector automatically. You must change the collector before starting the shrink cluster process. |
| Replace Node | You cannot remove one node in a CA cluster, because the nodes are in pairs. Use the replace node option to replace one of the nodes in the CA cluster. The following rules apply:<br>• Replace master node - not allowed<br>• Replace data node -<br>— Single data node - allowed<br>— Data nodes from different FDs - allowed<br>— Pair of data nodes - not allowed<br>— Data nodes from the same FD - not allowed<br>• Replace witness node - allowed |

**Table 1463: Nodes in the VCF Operations Cluster**

| Option | Description |
|---|---|
| Node Name | Machine name of the node.<br>The node that you are logged into displays a dot next to the name. |
| Node Address | Internet protocol (IP) address of the node. Primary and replica nodes require static IP addresses. Data nodes may use DHCP or static IP. |
| Cluster Role | Type of VCF Operations node: primary, data, or replica. |
| State | Powered on, powered off, unknown, or other condition of the node. |
| Status | Online, offline, unknown, or other condition of the node. |
| Objects | Total environment objects that the node currently monitors. |
| Metrics | Total metrics that the node has collected since being added to the cluster. |
| Build | VCF Operations software build number installed on the node. |
| Version | VCF Operations software version installed on the node. |
| Deployment Type | Type of machine on which the node is running: vApp |
| SSH Status | Activate or deactivate the SSH Status. |

In addition, there are adapter statistics for the selected node.

**Table 1464: Adapters on Server**

| Option | Description |
|---|---|
| Name | Name that the installing user gave to the adapter. |
| Status | Indication of whether the adapter is collecting data or not. |
| Objects | Total environment objects that the adapter currently monitors. |
| Metrics | Total metrics that the adapter has collected since being installed on the node. |
| Last Collection Time | Date and time of the most recent data collection by the adapter. |
| Added On | Date and time when the adapter was installed on the node. |

## Monitoring Data Collection

The collection status page provides an overview of the data that is being collected at the cluster level in VCF Operations. You can view the details for each collector and you can also view the adapter instance within the collector. The collection status page also provides recommendations in case of any issues caused by the collection mechanism.

The collection status page summarizes the number of objects and metrics that are getting collected by the VCF Operations collectors and adapter instances. You can view the status of each collector and adapter instance and find issues, if any. If there are anomalies, the collection status page provides recommendations to resolve those issues.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Collection Status** tile.

**Table 1465: Collection Status Overview Options**

| Option | Description |
|---|---|
| Overview | You can view the overall number of objects and metrics that is collected by your cluster. The charts underneath the numbers represent the graphical view of the collected data. Hover over the charts to view their values. |
| Collectors | You can view the total number of collectors, including data collectors in your cluster. If any of the collectors stop working, it is reported here. |
| Adapter Instances | You can view the total number of adapter instances that are receiving data. If any of the adapter instances do not receive data, it is reported here. |

2. Click the **Show Issues Only** check box to filter collectors and adapter instances that have issues.
3. By default, the collection cycle is displayed in the **Topology** structure. Using the topology view, you can clearly view the flow of data from the adapter instances to the collectors, and from the collectors into the cluster.
   Alternatively, you can click the **List View** icon to view the collection cycle in a tabular structure.

**Table 1466: Collection Status Topology View**

| Option | Description |
|---|---|
| Cluster | The VCF Operations cluster collects data using its collectors. Hover over the cluster to view the name and type of the cluster. |
| Collectors | All the collectors that are part of a cluster are listed. You can view the number of objects and metrics being collected. Hover over the collector to view the name and type of the collector. Click the **Expand** icon to view the adapter instances. |

| Option | Description |
|---|---|
| Adapter Instances | All the adapter instances that are part of a collector are listed. You can view the number of objects and metrics that are being collected. Hover over the adapter instance to view the name and type of the adapter. |

4. The collection status of each of the instances are colour coded.

**Table 1467: Collection Status of Adapter Instances**

| Colour | Status | Description |
|---|---|---|
| Green | Collecting. | Resource is receiving data. |
| Grey | Stopped | Resource manually stopped by user. |
| Yellow | Warning | Resource is receiving data but has a problem. You can view the warning message and recommendation on how to resolve it. |
| Red | Failed | Resource fails to collect data due to some problem. |

5. Click the collector to view the details.

| Option | Description |
|---|---|
| Details | |
| Name | Name of the collector. |
| IP Address | Internet protocol (IP) address of the collector. |
| Status | Status of the collector.<br>**Note:**<br>If any of the adapter instances within the collector has an anomaly, the status will reflect as warning. |
| Uptime | Total time elapsed since the collector started receiving data. |
| Creation Date | The day the collector was created. |
| Last HeartBeat | The last heart beat from the collector in the defined interval. |
| Version | The version of the collector. |
| Adapters | Total number of adapter instances in the collector. |
| Performance Details | |
| CPU | The average percentage of CPU used by the collector. |
| Memory | The percentage of memory used by the collector. |
| Data Collection Details | |
| Objects | Number of objects collected. |
| Metrics | Number of metrics collected. |
| Started Adapters | Number of adapter instances receiving data. |
| Threads | Number of threads collector service that is being used. |

6. Click the adapter instance to view its details.

| Option | Description |
|---|---|
| Details | |
| Name | Name of the adapter instance. |

| Option | Description |
|---|---|
| Status | Status of the adapter instance.<br>**Note:**<br>If the adapter instance has a problem, the status will reflect as warning and also display the recommendation to resolve it. |
| Data Collection Details | |
| Objects | Number of objects collected. |
| Metrics | Number of metrics collected. |
| Events | Number of events collected. |
| New Objects | Determines whether new objects are collected. |
| New Metrics | Determines whether new metrics are collected. |
| New Properties | Determines whether new properties are collected. |
| Property Value Changes | Determines if the property values have changed. |
| Relationship Updates | Determines if there are any changes in the relationship. |
| Elapsed Collection Time | Duration of the last collection cycle. |

# Managing Content

As a VCF Operations administrator, you can take regular backups of your custom and the out-of-the-box content to manage your operational or regulatory needs. If there is a wrong edit or if the need to recover data arises, then you can use the recent backup to restore the content or import the content to a different setup. By taking regular backups, you can also upgrade the VCF Operations to the latest build without losing or overriding the custom content.

**Note:**
Any user with the "Content Management" permission can export the content. However, only a admin user or the user assigned to the Administrator role has the privilege to export all the content, including the content owned by other users, for example, custom dashboards.

When you use a VCF single sign-on (SSO) account that has a VCF administrator role, you should assign the correct role for exporting and importing content within the VCF Operations component. To assign the VCF Operations component role to a VCF SSO account, navigate to **Operate** > **Administration** > **Control Panel** > **Access Control**, and then choose the VCF SSO account to assign the appropriate group or role.

## Creating a Backup

You can create regular backups of your custom and the out-of-the-box content in VCF Operations. You can use this backup to restore your content or export the content while setting up another environment.

You can either import content or export content at a given point in time. You can select the content or the configuration type that you want to export. When you export, ensure you export Configuration and Content separately. Some content types have dependencies on other types. The dependencies, when not selected, will not be exported. When you import, you must import the Configuration before you import the Content so that all user related information is imported first. Select all the required types to ensure that are no missing items when importing.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Content Management** tile.
2. In the **Export** tab, select the content and configurations that you want to export. You can take a backup of the following content types and configurations available in VCF Operations.

   **Note:**
   Click **Include out-of-the-box content** under the Content section to include the out-of-the-box content while exporting. Click **Select All** under both Content and Configuration sections to select all the content and configurations respectively, while exporting.

| Content | |
|---|---|
| • Dashboards<br>• Views<br>• Reports<br>• Report Schedules<br>• Configuration Files<br>• Alert Definitions<br>• Symptom Definitions<br>• Log Query Configuration<br>• Log Extracted Fields<br>• Log Agent Groups<br>• Log Templates | • Recommendations<br>• Notifications<br>• Payload Templates<br>• Policies<br>• Custom Groups<br>• Custom Metric Groups<br>• Super Metrics<br>• Compliance Scorecards<br>• Configuration Management Templates |
| Configuration | |
| • Authentication Sources<br>• Users<br>• User Groups<br>• User Roles<br>• Integration Accounts<br>• Http Proxies<br>• Outbound Settings | • Cost Drivers<br>• Custom Services<br>• Service Based Applications<br>• Rule Based Applications<br>• Application Definition Assignments<br>• Custom Profiles<br>• Global Settings |

   **Note:**

   The Log Management options are displayed only when the component is deployed.

3. Click **Export** to create a backup.

   **Note:**
   For configurations such as Integration Accounts, HTTP Proxies, Outbound Settings, Users, and Authentication Sources that have sensitive information, you must set up a new password to export data. The password should be at least 14 characters long.

   The system compresses the content into one ZIP file. After the export is complete, the Download ZIP file link is available in the Export tab.
4. Click the **Download ZIP file** link to download the backup content.

   You can use the downloaded content to restore your content or export it to a different setup.

   **Note:**

   The ZIP file generated by a certain user will not overwrite that of another user, that is, if User A generates the ZIP file after User B, the latter's ZIP file will not be overwritten.

## Importing Content

You can take regular backups of your custom and the out-of-the-box content and import it to a different environment.

- Ensure that you have downloaded the backup ZIP file. For details, see Creating a Backup.

- Ensure that all the users who own the custom dashboards or report schedules are present in the destination setup so that the custom content is assigned to the respective owners when the content is imported. Otherwise, the custom content of the owners who are not present in the destination setup will be skipped while importing the content.

  **Note:**

  You can either import content or export content at a given point in time. When you export, ensure you export Configuration and Content separately. When you import, you must import the Configuration before you import the Content so that all user related information is imported first.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Content Management** tile.
2. Click the **Import** tab and then, click **Browse** to select the downloaded ZIP file with the exported content.

   The data included in the ZIP file is displayed in the 'Data Available' table.
3. If there is a conflict while importing the content, you can select to either **Overwrite existing content** or **Skip item(s)**.

   The import report with the time-stamp is displayed after the import operation is complete. You can view this information under the **Results** section in the same page.
4. For content types with sensitive information, enter the password that you had set while exporting the content.
5. Click **Import**.

   After the import is completed, the content is available in the destination setup.

### Best Practices for Migrating Content

Follow the below practices to ensure that your content is successfully migrated.

- Use the *admin* user account or a user assigned to the Administrator role to export all of the content, including other users' custom content, such as dashboards and report schedules.
- Before importing the content, ensure that the Management Packs to which the content is related is installed on the destination setup.

## Managing Orphaned and Unassigned Content

Dashboards, report schedules, and credentials created by deleted users or that are unassigned in VCF Operations are stored in the Orphaned and Unassigned Content page. As an administrator, you are the new owner of these dashboards, reports schedules, and credentials. You can transfer the ownership of dashboards and report schedules and assign the credentials to new users or to yourself.

#### From Where You Can Transfer Ownership of Dashboards, Report Schedules, and Credentials

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Orphaned and Unassigned** tile.

#### Orphaned and Unassigned Page

You can view a list of all deleted users or unassigned users from the **Deleted Users** panel in the left pane of the **Orphaned and Unassigned** page. Based on your selection in the **Deleted Users** panel, the dashboards, report schedules, and credentials for the deleted user are displayed under the **Dashboard**, **Report Schedules**, **Credentials** tabs in the **Orphaned and Unassigned** page.

As an admin user, you can take ownership, assign ownership, or discard orphaned dashboards, report schedules and credentials, from the **Actions** menu in the **Dashboards**, **Report Schedules**, and **Credentials** tabs. Enter the name or part of the name of a dashboard, report schedule, or credential in the **Filter** option and click **Enter**. The relevant dashboard, report schedule, or credential is displayed.

**Table 1468: Actions Menu Options**

| Actions | Options |
|---|---|
| Take Ownership | You can take ownership of the selected dashboard, report schedule, or credential. |
| Assign Ownership | You can assign a new owner for the selected dashboards or report schedules. You can select a target user from the **Transfer Dashboards/Report Schedule/Credential** dialog box. |
| Discard | You can permanently delete the dashboard, report schedule, and unassigned credentials that are not in use in any adapter instance. You cannot delete an active credential that is being used by an adapter instance even if it is unassigned. For more information on credentials, see Configuring Credentials in Integrations. |

## Adding Physical Data Centers in VCF Operations

In VCF Operations, you can create and manage physical data centers and associate cloud accounts with them.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Physical Data Centers** tile.
2. On the Physical Data Centers page, click **Add**.
   Add Physical Data Centers page opens.
3. Enter a **Name** for the physical data center.
4. Select a location on the map.
   You can use the search bar to find a specific location. You can also zoom in or zoom out for a better view of the world map and find a suitable location.
5. Double-click on the selected location to create the data center.
   The location name and coordinates are reflected in the **Location** field.
6. From the **Associate Cloud Account(s) with this Physical Data Center** section, select the cloud account(s) you want to assign to this physical data center.

   **Note:**

   The Associate Cloud Account(s) with this Physical Data Center section only lists the configured vCenter and VCF accounts. You can assign multiple cloud accounts to a physical data center.
7. Click **Save**.
   The physical data center is created.
8. View the new physical data center on the Physical Data Center page.

| Option | Description |
|---|---|
| Name | Name of the physical data center you entered at the time of creation. |
| Number of associated cloud accounts | Displays the total number of cloud accounts associated with the physical data center. |
| Filter | Filters the list of physical data centers based on Name. |

9. Optional: Click the vertical ellipsis and select **Edit** to edit the physical data center.
10. Optional: Click the vertical ellipsis or the horizontal ellipsis and then select **Delete** to remove a physical data center.

## VCF Operations Maintenance Schedules

Maintenance schedules identify objects that are in maintenance mode at specific times, which prevents VCF Operations from showing misleading data based on those objects being offline or in other unusual states because of maintenance.

Many objects in the enterprise might be intentionally taken offline. For example, a server might be deactivated to update software. If VCF Operations collects metrics when an object is offline, it might generate incorrect anomalies and alerts that affect the data for setting dynamic thresholds for the object attributes. When an object is identified as being in maintenance mode, VCF Operations does not collect metrics from the object or generate anomalies or alerts for it. In addition, VCF Operations cancels any active symptoms and alerts for the object.

If an object undergoes maintenance at fixed intervals, you can create a maintenance schedule and assign it to the object. For example, you can put an object in maintenance mode from midnight until 3 a.m. each Tuesday night. You can also manually put an object in maintenance mode, either indefinitely or for a specified period of time. These methods are not mutually exclusive. You can manually put an object in maintenance mode, or take it out of maintenance mode, even it if has an assigned maintenance schedule. For more information, see Manage Maintenance Schedules for Your Object Workspace.

### How Maintenance Schedules Work

Maintenance schedules require that you select the days and time-of-day when updates or other object maintenance occurs. Note that creating a maintenance schedule does not activate the schedule. A maintenance schedule must be part of a policy before the schedule can take effect. For more information, see Maintenance Schedule Details.

### Where You Find the Maintenance Schedules

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Configurations**, and then click the **Maintainance Schedules** tile.

Click **Add** or click the **Vertical Ellipses** to edit, or remove items.

**Table 1469: Maintenance Schedule Toolbar Options**

| Option | Description |
|---|---|
| Add | Open a window in which you can select the maintenance schedule settings for a new schedule. |
| Edit | Change the maintenance schedule settings for an existing schedule. |
| Delete | Remove the selected maintenance schedule. |

## Manage Maintenance Schedules

Add or edit a maintenance schedule to take an object offline. VCF Operations does not collect data from an object that is offline.

### Where You Find Manage Maintenance Schedules

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Configurations**, and then click the **Maintainance Schedules** tile.
2. Click **Add** or click the **Vertical Ellipses** to edit, or remove items.

**Table 1470: Manage Maintenance Schedule Add or Edit Options**

| Option | Description |
|---|---|
| Schedule Name | Name that describes the maintenance schedule. |
| Time Zone | Time zone in which you are currently located. |
| Days | Number of days the maintenance period covers. |

| Option | Description |
|---|---|
| Recurrence | Specify a maintenance schedule to run over a selected period.<br>• Once<br>• Daily<br>• Weekly<br>• Monthly |
| Expire after | The number of times the schedule is run. |
| Expire on | The date upon which the schedule stops running. |

## Create a VCF Operations Support Bundle

You can create a VCF Operations support bundle to gather log and configuration files for analysis when troubleshooting VCF Operations issues.

Support bundles require the selection of nodes or the entire cluster, and the desired logging level. When you create a support bundle, VCF Operations gathers files from the selected cluster nodes into ZIP files for convenience.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Support Bundles** tile.
2. Click **ADD**.
3. Select the bundle type:
   - **Light support bundle**
   - **Full support bundle**
4. Select the target cluster nodes.

   Only logs from the selected nodes are included in the support bundle.
5. Click **OK**, and then click **OK** again to confirm support bundle creation.

   Support bundle creation time varies depending on the size of the logs and number of selected nodes.

   The support bundle is created.
6. Once the support bundle is created, use the data grid options to view details.

**Table 1471: Support Bundle Data Grid Options**

| Option | Description |
|---|---|
| Bundle | System-generated identifier for the support bundle. |
| Bundle Type | • Light: Include 24 hours of logs.<br>• Full: Includes all available logs and configuration files. |
| Date and Time Created | Time when support bundle creation began. |
| Status | Progress of support bundle creation. |

7. Click the **Hortizontal Ellipses** to delete, download, or reload support bundles.

   **Note:**

   You can download the support bundle ZIP files for analysis.

   Review the log files for error messages. If troubleshooting assistance is required, send the diagnostic data to VMware Support. Use the toolbar to delete the outdated support bundle to save disk space when the issue is resolved or closed.

## VCF Operations Support Bundles

VCF Operations support bundles contain log and configuration files that help troubleshoot a VCF Operations issue.

### How Support Bundles Work

Support bundles require that you select nodes or the entire cluster, and the level of logging that you want to collect. After VCF Operations creates the support bundle, you download it in ZIP format for analysis.

### Where You Find Support Bundles

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Support Bundles** tile.

### Support Bundle Options

The options include toolbar and data grid options.

You can click **Add** or click the **Hortizontal Ellipses** to delete, download, or reload support bundles.

**Table 1472: Support Bundle Toolbar Options**

| Option | Description |
|---|---|
| Add | Open a dialog box that guides you through the process of creating a support bundle. |
| Delete | Remove the selected support bundle. |
| Download | Download the support bundle in ZIP format. |
| Reload Support Bundles | Refresh the list of support bundles. |

Use the data grid options to view item details.

**Table 1473: Support Bundle Data Grid Options**

| Option | Description |
|---|---|
| Bundle | System-generated identifier for the support bundle. |
| Bundle Type | • Light. Include 24 hours of logs.<br>• Full. Include all available logs and configuration files. |
| Date and Time Created | Time when support bundle creation began. |
| Status | Progress of support bundle creation. |

## VCF Operations Dynamic Thresholds

A threshold marks the boundary between normal and abnormal behavior for a metric. In addition to fixed thresholds, VCF Operations supports dynamic thresholds for a metric, calculated based on historical and incoming data.

### How Dynamic Thresholds Work

By default, dynamic thresholds are refreshed on a regular schedule, but you can recalculate dynamic thresholds outside of the schedule if you want to capture the most recent data.

### Where You Find Dynamic Thresholds

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Dynamic Thresholds** tile.

### Dynamic Threshold Options

The dynamic threshold feature includes options to activate or deactivate the calculation process and to review associated values.

**Table 1474: Dynamic Threshold Options**

| Option | Description |
|---|---|
| Activate | The dynamic threshold calculation process ia activated by default. |
| Deactivate | Stop the dynamic threshold calculation currently in progress. |
| Calculation progress | Percentage completion of the current dynamic threshold calculation. |
| Host time to calculate normal behavior of all objects | Timestamps and metric counts associated with the last dynamic threshold calculation, and the time for the next scheduled calculation. |

# VCF Operations Adapter Redescribe

When VCF Operations redescribes an adapter, VCF Operations finds the adapter files, gathers information about the abilities of the adapter, and updates the user interface with information about the adapter.

### How Adapter Redescribe Works

After installing or updating an adapter, capture the adapter information by having VCF Operations redescribe its adapters.

### Where You Find Adapter Redescribe

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Redescribe** tile.

### Adapter Redescribe Options

The feature includes an option to start the adapter describe process.

**Table 1475: Adapter Redescribe Options**

| Option | Description |
|---|---|
| Redescribe | Start the adapter describe process. |

VCF Operations provides adapter-specific details from the redescribe process.

**Table 1476: Adapter Redescribe Details**

| Option | Description |
|---|---|
| Name | Adapter to which the redescribe process applies. |
| Status | Success, failure, or other condition related to the last redescribe process. |
| Describe Version | Version of `describe.xml` against which the last redescribe process ran. |
| Adapter Version | Version of the adapter against which the last redescribe process ran. |
| Message | Additional details about the last redescribe process. |

# Customizing Icons

Every object or adapter in your environment has an icon representation. You can customize how the icon appears.

VCF Operations assigns a default icon to each object type and adapter type . Taken collectively, object types and adapter types are known as objects in your environment. Icons represent objects in the UI and help you to identify the type of object. For example, in the Topology Graph widget on a dashboard, labeled icons show how objects are connected to one other. You can quickly identify the type of object from the icon.

If you want to differentiate objects, you can change the icon. For example, a virtual machine icon is generic. If you want to pictorially distinguish the data that a vSphere virtual machine provides from the data that a Hypervisor virtual machine provides, you can assign a different icon to each.

## Customize an Object Type Icon

You can use the default icons that VCF Operations provides, or you can upload your own graphics file for an object type. When you change an icon, your changes take effect for all users.

If you plan to use your own icon files, verify that each image is in PNG format and has the same height and width. For best results, use a 256x256 pixel image size.

1. In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Icons** tile.
2. Click the **Object Type Icons** tab.
3. Assign the Object Type icon.
   a) Select the object type in the list with the icon to change.
      By default, object types for all adapter types are listed. To limit the selection to the object types that are valid for a single adapter type, select the adapter type from the drop-down menu.
   b) Click the **Upload** icon.
   c) Browse to and select the file to use and click **Done**.
4. Optional: To return to the default icon, select the object type and click the **Assign Default Icons** icon.
   The original default icon appears.

**Related Concepts**

Customizing Icons

Every object or adapter in your environment has an icon representation. You can customize how the icon appears.

## Object Type Icons Tab

VCF Operations obtains data from different sources. Data sources are classified by the type of object or object type. In UI locations where metric data appears for objects, VCF Operations includes an icon to show the object type. To graphically distinguish the different types of objects, you can customize the icon.

### Where You Customize Object Type Icons

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Administration** > **Control Panel**, and then click the **Icons** tile. Click the **Object Type Icons** tab.

**Table 1477: Object Type Icons Options**

| Option | Description |
|---|---|
| Adapter Type | Icons for all adapters are listed by default. To list a subset of the object types that are valid for one type of adapter, select the adapter type. |
| Toolbar options | Manages the selected icon.<br>• **Upload** uploads a PNG file to uniquely identify the object type.<br>• **Assign Default icons** returns the selection to the original icon. |
| Search | Search for objects with a particular name to narrow the selection of object types displayed. |
| Object Type | Name of the type of object. |
| Icon | Pictorial representation of the type of object. |

**Related Concepts**

Customizing Icons

Every object or adapter in your environment has an icon representation. You can customize how the icon appears.

**Related Tasks**

Customize an Object Type Icon

You can use the default icons that VCF Operations provides, or you can upload your own graphics file for an object type. When you change an icon, your changes take effect for all users.

## Customize an Adapter Type Icon

| Name | Name of the type of adapter. |
| Icon | Pictorial representation of the type of adapter. |

**Related Concepts**

Customizing Icons

Every object or adapter in your environment has an icon representation. You can customize how the icon appears.

**Related Tasks**

Customize an Adapter Type Icon

You can use the default icons that VCF Operations provides, or you can upload your own graphics file for an adapter type. When you change an icon, your changes take effect for all users.

## Allocate More Virtual Memory to VCF Operations

You might need to add virtual memory to keep the VCF Operations process running.

When the VCF Operations virtual machine requests more memory than is available, the Linux kernel might kill the `vcops-analytics` process, and the product might become unresponsive. If that happens, use the reservation feature in vSphere to specify the guaranteed minimum memory allocation for VCF Operations virtual machines.

1. In the vSphere Client inventory, right-click the VCF Operations virtual machine and select **Edit Settings**.
2. Click the **Resources** tab, and select **Memory**.
3. Use the **Reservation** option to allocate more memory.

# Viewing Metrics and Properties

VCF Operations provides definitions for the metrics and properties, defined on objects in your environment.

## Metric Definitions in VCF Operations

Metric definitions provide an overview of how the metric value is calculated or derived. If you understand the metric, you can better tune VCF Operations to display results that help you to manage your environment.

VCF Operations collects data from objects in your environment. Each piece of data collected is called a metric observation or value. VCF Operations uses the VMware vCenter adapter to collect raw metrics. VCF Operations uses the VCF Operations adapter to collect self-monitoring metrics. In addition to the metrics it collects, VCF Operations calculates capacity metrics, badge metrics, and metrics to monitor the health of your system.

VCF Operations collects data from objects in your environment. Each piece of data collected is called a metric observation or value. VCF Operations uses the VMware vCenter® adapter to collect raw metrics. VCF Operations uses the VCF Operations adapter to collect self-monitoring metrics. In addition to the metrics it collects, VCF Operations calculates capacity metrics, badge metrics, and metrics to monitor the health of your system.

All metric definitions are provided. The metrics reported on your system depend on the objects in your environment. You can use metrics to help troubleshoot problems. See Troubleshooting with the Metrics Tab.

All metric definitions are provided. The metrics reported on your system depend on the objects in your environment. You can use metrics to help troubleshoot problems.

### Metrics for vCenter Components

VCF Operations connects to VMware vCenter® instances through the vCenter adapter to collect metrics for vCenter components and uses formulas to derive statistics from those metrics. You can use metrics to troubleshoot problems in your environment.

vCenter components are listed in the `describe.xml` file for the vCenter adapter. The following example shows sensor metrics for the host system in the `describe.xml` file.

```
<ResourceGroup instanced="false" key="Sensor" nameKey="1350" validation="">
    <ResourceGroup instanced="false" key="fan" nameKey="1351" validation="">
        <ResourceAttribute key="currentValue" nameKey="1360" dashboardOrder="1" dataType="float"
 defaultMonitored="false"   isDiscrete="false" isRate="false" maxVal="" minVal=""  unit="percent"/>
        <ResourceAttribute key="healthState" nameKey="1361" dashboardOrder="1" dataType="float"
 defaultMonitored="false"   isDiscrete="false" isRate="false" maxVal="" minVal="" />
    </ResourceGroup>
    <ResourceGroup instanced="false" key="temperature" nameKey="1352" validation="">
        <ResourceAttribute key="currentValue" nameKey="1362" dashboardOrder="1" dataType="float"
 defaultMonitored="false"   isDiscrete="false" isRate="false" maxVal="" minVal="" />
        <ResourceAttribute key="healthState" nameKey="1363" dashboardOrder="1" dataType="float"
 defaultMonitored="false"   isDiscrete="false" isRate="false" maxVal="" minVal="" />
```

```
    </ResourceGroup>
  </ResourceGroup>
```

Each `ResourceAttribute` element includes the name of a metric that appears in the UI and is documented as a Metric Key.

**Table 1479: Sensor Metrics for Host System Cooling**

| Metric Key | Metric Name | Description |
|---|---|---|
| Sensor\|fan\|currentValue | Speed | Fan speed. |
| Sensor\|fan\|healthState | Health State | Fan health state. |
| Sensor\|temperature\|currentValue | Temperature | Host system temperature. |
| Sensor\|temperature\|healthState | Health State | Host system health state. |

## vSphere Metrics

VCF Operations collects CPU use, disk, memory, network, and summary metrics for objects in the vSphere world.

Capacity metrics can be calculated for vSphere world objects. See Capacity Analytics Generated Metrics.

### vSphere World Super Metrics for ROI Dashboard

vSphere world super metrics provide information about the new metrics added to the ROI dashboard.

| Metric Name | Description |
|---|---|
| Cost\|Total Cost of Ownership | This metric shows the total cost cost of ownership with potential savings and optimizations.<br>Key: cost\|total_aggregated_cost |
| Online Capacity Analytics Capacity Remaining Profiles | This metric shows the VMs remaining based on the average VM profile.<br>Key: OnlineCapacityAnalytics\|capacityRemainingProfile |
| Cost\|Server Hardware(Owned) Cost | This metric shows the sum of server hardware depreciated cost having purchase type as Owned across all the vCenters.<br>Key: cost\|total_serverHardware_owned_cost |
| Cost\|Server Hardware(Leased) Cost | This metric shows the sum of server hardware depreciated cost having purchase type as Leased across all the vCenters.<br>Key: cost\|total_serverHardware_leased_cost |
| Cost\|Host OS License cost | This metric shows the sum of host OS license cost across all the vCenters.<br>Key: cost\|total_hostOsl_cost |
| Cost\|Network Cost | This metric shows the sum of network cost across all the vCenters.<br>Key: cost\|total_network_cost |
| Cost\|Maintenance Cost | This metric shows the sum of maintenance cost across all the vCenters.<br>Key: cost\|total_maintenance_cost |
| Cost\|Server Labor Cost | This metric shows the sum of server labor cost across all the vCenters.<br>Key: cost\|total_serverLabor_cost |
| Cost\|Facilities Cost | This metric shows the sum of facilities cost across all the vCenters.<br>Key: cost\|total_facilities_cost |
| Cost\|Additional Cost | This metric shows the sum of additional cost across all the vCenters.<br>Key: cost\|total_additional_cost |
| Cost\|VM Direct Cost | This metric shows sum of direct Cost (VI labor + OS Labor) across all vCenters.<br>Key: cost\|total_vm_direct_cost |

| Metric Name | Description |
|---|---|
| Cost\|Capacity Used Compute Cost | This metric displays the cost of the used compute capacity.<br>Key: cost\|capacity_used\|compute |
| Cost\|Capacity Remaining Compute Cost | This metric displays the cost of the remaining compute capacity.<br>Key: cost\|capacity_remaining\|compute |
| Cost\|Capacity Used Storage Cost | This metric displays the cost of the used storage capacity.<br>Key: cost\|capacity_used\|storage |
| Cost\|Capacity Remaining Storage Cost | This metric displays the cost of the remaining storage capacity.<br>Key: cost\|capacity_remaining\|storage |
| Cost\|Potential Savings Idle VMs | This metric displays the potential savings from Idle VMs.<br>Key: cost\|potential_savings\|idle_vms |
| Cost\|Potential Savings Powered Off VMs | This metric displays the potential savings from powered off VMs.<br>Key: cost\|potential_savings\|poweredOff_vms |
| Cost\|Potential Savings VM Snapshots | This metric displays the potential savings from VM snapshots.<br>Key: cost\|potential_savings\|vm_snapshots |
| Cost\|Potential Savings Orphaned Disks | This metric displays the potential savings from orphaned disks.<br>Key: cost\|potential_savings\|orphaned_disks |
| Cost\|Potential Savings Oversized VMs | This metric displays the potential savings from oversized VMs.<br>Key: cost\|potential_savings\|oversized_vms |
| Cost\|Potential Savings Cost Optimization Opportunities | This metric displays the potential savings from cost optimization opportunities.<br>Key: cost\|potential_savings\|cost_optimization_opportunities |
| Cost\|Total Cost of Ownership | This metric shows the total cost cost of ownership with potential savings and optimizations.<br>Key: cost\|potential_savings\|total_cost_of_ownership |
| Server Purchase Cost | This metric shows the server purchase cost.<br>Key: cost\|server_purchase_cost |
| Accumulated Depreciation | This metric displays the sum of the accumulated depreciation (Depreciation is calculated from the purchase date till current date) of servers across all the vCenters.<br>Key: cost\|accumulatedDepreciation |
| Remaining Depreciation | This metric displays the sum of the remaining depreciation (Remaining Depreciation is calculated from the current date till Depreicated year) of servers across all the vCenters.<br>Key: cost\|accumulatedDepreciation |
| Number of Fully Depreciated Servers | This metric displays the number of fully depreciated servers across all the vCenters.<br>Key: cost\|hardwareTotalCost |
| Reclaimed vCPUs from Idle VMs | This metric displays the number of reclaimable vCPUs from idle VMs.<br>Key: reclaimable\|idle_vms\|cpu |
| Reclaimed Memory from Idle VMs | This metric displays the amount of reclaimable memory from the idle VMs.<br>Key: reclaimable\|idle_vms\|mem |
| Reclaimed Disk Space from Idle VMs | This metric displays the amount of reclaimable disk space from the idle VMs.<br>Key: reclaimable\|idle_vms\|diskspace |
| Reclaimed Disk Space from Powered Off VMs | This metric displays the amount of reclaimable disk space from the powered off VMs.<br>Key: reclaimable\|poweredOff_vms\|diskspace |
| Reclaimed Disk Space from VM Snapshots | This metric displays the amount of reclaimable disk space from the VM Snapshots.<br>Key: reclaimable\|vm_snapshots\|diskspace |
| Reclaimed Disk Space from Orphaned Disks | This metric displays the amount of reclaimable disk space from the orphaned disks.<br>Key: reclaimable\|orphaned_disk\|diskspace |
| Rightsize - vCPUs to Remove from Oversized VMs | This metric displays the number of vCPUs to remove from the oversized VMs.<br>Key: summary\|oversized\|vcpus |

| Metric Name | Description |
|---|---|
| Rightsize - Memory to Remove from Oversized VMs | This metric displays the amount of memory to be removed from the oversized VMs.<br>Key: summary\|oversized\|memory |
| Rightsize - vCPUs to Add from Undersized VMs | This metric displays the number of vCPUs to be added from the undersized VMs.<br>Key: summary\|undersized\|vcpus |
| Rightsize - Memory to Add from Undersized VMs | This metric displays the amount of memory to be added from the undersized VMs.<br>Key: summary\|undersized\|memory |
| Total Storage Cost | This metric displays the sum of storage cost across all vCenters.<br>Key: cost\|totalCost |
| Total Potential Savings | This metric displays the sum of all the potential savings (Idle VMs + Powered off Vms + Snapshot + Orphaned Disks + Oversized VMs).<br>Key: reclaimable\|cost |
| **New vSphere Metrics Added for ROI Dashboard** | |
| Potential Savings from Oversized VMs | This metric displays the sum of all the potentials savings gained from oversized VMs across vcenters.<br>Key: cost\|reclaimableCost |
| Reclaimable Host Cost | This metric displays the reclaimable host cost based on the recommended size.<br>Key: cost\|potential_savings\|total_reclaimable_host_cost |
| Cost\|Potential Increase\|Undersized VMs Cost | This metric displays the rightsizing value for the undersized VMs.<br>Key: cost\|potential_increase\|undersized_vms |
| Cost\|Realized Savings\|Total Realized Savings | This metric displays the total realize savings for VMs across all vCenters.<br>Key: cost\|realized_savings\|total_realized_savings |
| Cost\|Realized Savings\|Idle Savings | This metric displays the total realized savings for idle VMs across all vCenters.<br>Key: cost\|realized_savings\|realized_idle_savings |
| Cost\|Realized Savings\|Powered Off Savings | This metric displays the total realized savings for powered off VMs across all vCenters.<br>Key: cost\|realized_savings\|realized_poweredOff_savings |
| Cost\|Realized Savings\|Snapshot Space Savings | This metric displays the total realized savings for snapshot space across all vCenters.<br>Key: cost\|realized_savings\|realized_snapshotSpace_savings |
| Cost\|Realized Savings\|Oversized Savings | This metric displays the oversized savings across all vCenters.<br>Key: cost\|realized_savings\|realized_oversized_savings |
| Cost\|Realized Savings\|Orphaned Disk Space Savings | This metric displays the amount of disk space saved by orphaned disks across all vCenters.<br>Key: cost\|realized_savings\|realized_orphanedDiskSpace_savings |
| Cost\|Realized Savings\|Reclaimable Host Savings | This metric displays the amount of reclaimable host savings across all vCenters.<br>Key: cost\|realized_savings\|realized_reclaimableHost_savings |
| Compute Realized\|vCPUs from Oversized VMs | This metric displays the number of vCPUs realized across all vCenters.<br>Key: compute_realized\|realized_oversized_vcpus |
| Compute Realized\|Memory from Oversized VMs | This metric displays the amount of memory realized from oversized VMs across all vCenters.<br>Key: compute_realized\|realized_oversized_mem |
| Realized Potential Memory Consumed from Oversized VMs | This metric displays the potential memory consumed from oversized VMs across all vCenters.<br>Key: realized\|realizedPotentialMemConsumed |
| Total Number Of Reclaimable Hosts | This metric displays the total number of reclaimable hosts across all vCenters.<br>Key: metric=cost\|reclaimableHostCost |
| Compute Realized\|vCPUs from Idle VMs | This metric displays the realized vCPUs from idle VMs across all vCenters.<br>Key: compute_realized\|realized_idle_vcpus |
| Compute Realized\|Memory from Idle VMs | This metric displays the amount of memory realized from idle VMs across all vCenters.<br>Key: compute_realized\|realized_idle_mem |

| Metric Name | Description |
|---|---|
| Disk Space Realized\|Idle VMs | This metric displays the amount of disk space realized from idle VMs across all vCenters.<br>Key: storage_realized\|realized_idle_diskSpace |
| Disk Space Realized\|Powered Off VMs | This metric displays the amount of disk space realized from powered off VMs across all vCenters.<br>Key: storage_realized\|realized_poweredOff_diskSpace |
| Disk Space Realized\|VM Snapshots | This metric displays the amount of disk space realized from VM snapshots across all vCenters.<br>Key: storage_realized\|realized_snapshotSpace |
| Disk Space Realized\|Orphaned Disks | This metric displays the amount of disk space realized from orphaned disks across all vCenters.<br>Key: storage_realized\|realized_orphaned_diskSpace |

### CPU Usage Metrics

CPU usage metrics provide information about CPU use.

| Metric Name | Description |
|---|---|
| CPU\|Capacity usage | CPU usages as a percent during the interval.<br>Key: cpu\|capacity_usagepct_average |
| CPU\|CPU contention(%) | This metric shows the percentage of time the VMs in the ESX hosts are unable to run because they are contending for access to the physical CPUs. The number shown is the average number for all VMs. This number is lower than the highest number experienced by the VM most impacted by CPU contention.<br>Use this metric to verify if the host can serve all its VMs efficiently. Low contention means that the VM can access everything it demands to run smoothly. It means that the infrastructure is providing good service to the application team.<br>When using this metric, ensure that the number is within your expectation. Look at both the relative number and the absolute number. Relative means a drastic change in value, meaning that the ESX is unable to serve the VMs. Absolute means that the real value itself is high. Investigate why the number is high. One factor that impacts this metric is CPU Power Management. If CPU Power Management clocks down the CPU speed from 3 GHz to 2 GHz, the reduction in speed is accounted for because it shows that the VM is not running at full speed.<br>This metric is calculated in the following way: cpu\|capacity_contention / (200 * summary\|number_running_vcpus)<br>Key: cpu\|capacity_contentionPct |
| CPU\|Demand (%) | This metric shows the amount of CPU resources a virtual machine might use if there were no CPU contention or CPU limit. This metric represents the average active CPU load for the past five minutes.<br>Keep this number below 100% if you set the power management to maximum.<br>This metric is calculated in the following way: ( cpu.demandmhz / cpu.capacity_provisioned)*100<br>Key: cpu\|demandPct |
| CPU\|Demand (MHz) | This metric shows the amount of CPU resources a virtual machine might use if there were no CPU contention or CPU limit.<br>Key: cpu\|demandmhz |
| CPU\|Demand | CPU demand in megahertz.<br>Key: cpu\|demand_average |
| CPU\|IO wait | IO wait (ms).<br>Key: cpu\|iowait |
| CPU\|number of CPU Sockets | Number of CPU sockets.<br>Key: cpu\|numpackages |

| Metric Name | Description |
|---|---|
| CPU\|Overall CPU Contention | Overall CPU contention in milliseconds.<br>Key: cpu\|capacity_contention |
| CPU\|Provisioned Capacity (MHz) | Capacity in MHz of the physical CPU cores.<br>Key: cpu\|capacity_provisioned |
| CPU\|Provisioned vCPU(s) | Number of provisioned CPU cores.<br>Key: cpu\|corecount_provisioned |
| CPU\|Reserved Capacity (MHz) | Total CPU capacity reserved by virtual machines.<br>Key: cpu\|reservedCapacity_average |
| CPU\|Usage (MHz) | CPU usages, as measured in megahertz, during the interval.<br>• VM - Amount of actively used virtual CPU. This is the host's view of the CPU usage, not the guest operating system view.<br>• Host - Sum of the actively used CPU of all powered on virtual machines on a host. The maximum possible value is the frequency of the two processors multiplied by the number of processors. For example, if you have a host with four 2 GHz CPUs running a virtual machine that is using 4000 MHz, the host is using two CPUs completely: 400 / (4 2000) = 0.50<br>Key: cpu\|usagemhz_average |
| CPU\|Wait | Total CPU time spent in wait state. The wait total includes time spent in the CPU Idle, CPU Swap Wait, and CPU I/O Wait states.<br>Key: cpu\|wait |
| CPU\|Workload (%) | Percent of workload<br>Key: cpu\|workload |

## Memory Metrics

Memory metrics provide information about memory use and allocation.

| Metric Name | Description |
|---|---|
| mem\|Contention (%) | This metric shows the percentage of time VMs are waiting to access swapped memory.<br>Use this metric to monitor ESX memory swapping. A high value indicates that the ESX is running low on memory, and a large amount of memory is being swapped.<br>Key: mem\|host_contentionPct |
| mem\|Machine Demand (KB) | Host memory demand in kilobytes.<br>Key: mem\|host_demand |
| mem\|Provisioned Memory | Provisioned host memory in kilobytes.<br>Key: mem\|host_provisioned |
| mem\|Reserved Capacity (KB) | Total amount of memory reservation used by powered-on virtual machines and vSphere services on the host.<br>Key: mem\|reservedCapacity_average |
| mem\|Usable Memory (KB) | Usable host memory in kilobytes.<br>Key: mem\|host_usable |
| mem\|Host Usage (KB) | Host memory use in kilobytes.<br>Key: mem\|host_usage |
| mem\|Usage/Usable (%) | Memory usage as percentage of total configured or available memory.<br>Key: mem\|host_usagePct |
| mem\|Workload (%) | Percent of workload.<br>Key: mem\|workload |

### Network Metrics

Network metrics provide information about network performance.

| Metric Name | Description |
|---|---|
| net\|Packets Dropped (%) | This metric shows the percentage of received and transmitted packets dropped in the collection interval.<br>Use this metric to monitor the reliability and performance of the ESX network. A high value indicates that the network is not reliable and performance decreases.<br>Key: net\|droppedPct |
| net\|Usage Rate (KB per second) | Sum of the data transmitted and received for all of the NIC instances of the host or virtual machine.<br>Key: net\|usage_average |
| net\|Workload (%) | Percent of workload.<br>Key: net\|workload |

### Disk Metrics

Disk metrics provide information about disk use.

| Metric Name | Description |
|---|---|
| disk\|Total IOPS | Average number of commands issued per second during the collection cycle.<br>Key: disk\|commandsAveraged_average |
| disk\|Usage Rate (KB per second) | Average of the sum of the data read and written for all of the disk instances of the host or virtual machine.<br>Key: disk\|usage_average |
| disk\|Workload (%) | Percent of workload.<br>Key: disk\|workload |

### Summary Metrics

Summary metrics provide information about overall performance.

| Metric Name | Description |
|---|---|
| summary\|Number of Running Hosts | Number of running hosts.<br>Key: summary\|number_running_hosts |
| summary\|Number of Running VMs | This metric shows the number of running VMs at a given point in time. The data is sampled every five minutes.<br>A large number of running VMs might be a reason for CPU or memory spikes because more resources are used in the host. The number of running VMs gives you a good indicator of how many requests the ESX host must juggle. Powered off VMs are not included because they do not impact ESX performance. A change in the number of running VMs can contribute to performance problems. A high number of running VMs in a host also means a higher concentration risk, because all the VMs fail if the ESX crashes.<br>Use this metric to look for a correlation between spikes in the running VMs and spikes in other metrics such as CPU contention, or memory contention.<br>Key: summary\|number_running_vms |
| summary\|Number of Clusters | Total number of clusters.<br>Key: summary\|total_number_clusters |
| summary\|Total Number of Datastores | Total number of datastores.<br>Key: summary\|total_number_datastores |
| summary\|Number of Hosts | Total number of hosts.<br>Key: summary\|total_number_hosts |

| Metric Name | Description |
|---|---|
| summary\|Number of VMs | Total number of virtual machines.<br>Key: summary\|total_number_vms |
| summary\|Total Number of Datacenters | Total number of data centers.<br>Key: summary\|total_number_datacenters |
| summary\|Number VCPUs on Powered on VMs | Number of virtual CPUs on powered-on virtual machines.<br>Key: summary\|number_running_vcpus |
| summary\|Average Running VM Count per Running Host | Average running virtual machine count per running host.<br>Key: summary\|avg_vm_density |
| summary\|Number of Reclaimable Hosts | Displays the number of reclaimable hosts.<br>Key: summary\|total_number_reclaimable_hosts |

### Virtual Machine Operations Metrics for vSphere World

VM operations metrics provide information about the actions performed on VMs. The following are some important points you must know about VM operation metrics for vSphere World.

- VM operations metrics is not collected for custom data centers.
- If you edit a VM settings and do not perform any action, still it is considered as VM reconfigure operation.
- During Revert Snapshot, VMs are powered-off, but this operation is not counted under VM Power-off metric.
- Adding ESX with VMs is not counted under VM Create metric.
- Removing ESX with VMs is not coutned under VM Remove metric.
- VM hardstop operation is not counted under VM Power Off metric.

| Metric Name | Description |
|---|---|
| Inventory | |
| VM Clone | This metric displays the number of clone operations on the virtual machine.<br>Key: Inventory\|VM Clone |
| VM Create | This metric displays the number of create operations on the virtual machine.<br>Key: Inventory\|VM Create |
| VM Delete | This metric displays the number of delete operations on the virtual machine.<br>Key: Inventory\|VM Delete |
| VM Reconfigure | This metric displays the number of reconfigure operations on the virtual machine.<br>Key: Inventory\|VM Reconfigure |
| VM Register | This metric displays the number of register operations on the virtual machine.<br>Key: Inventory\|VM Register |
| VM Template Deploy | This metric displays the number templates deployed on the virtual machine.<br>Key: Inventory\|VM Template Deploy |
| VM Unregister | This metric displays the number of unregister operations on the virtual machine.<br>Key: Inventory\|VM Unregister |
| Location | |
| Storage vMotion | This metric displays the number of migrations with vMotion (datastore change operations for Powered-on VMs).<br>Key: Location\|Storage vMotion |

| Metric Name | Description |
|---|---|
| VM Datastore Change (powered-off VMs) | This metric displays the number of datastore change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Datastore Change (powered-off VMs) |
| VM Host and Datastore Change (powered-off VMs) | This metric displays the number of host and datastore change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Host and Datastore Change (powered-off VMs) |
| VM Host and Datastore Change (powered-on VMs) | This metric displays the number of host and datastore change operations, for powered-on and suspended virtual machines.<br>Key: Location\|VM Host and Datastore Change (powered-on VMs) |
| VM Host Change (powered-off VMs) | This metric displays the number of host change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Host Change (powered-off VMs) |
| vMotion | This metric displays the number of migrations with vMotion (host change operations for powered-on VMs).<br>Key: Location\|vMotion |
| State | |
| VM Guest Reboot | This metric displays the number of reboot operations on the virtual machine guest.<br>Key: State\|VM Guest Reboot |
| VM Guest Shutdown | This metric displays the number of shutdown operations on the virtual machine guest.<br>Key: State\|VM Guest Shutdown |
| VM Power Off | This metric displays the number of power-off operations on the virtual machine.<br>Key: State\|VM Power Off |
| VM Power On | This metric displays the number of power-on operations on the virtual machine.<br>Key: State\|VM Power On |
| VM Reset | This metric displays the number of reset operations on the virtual machine guest.<br>Key: State\|VM Reset |
| VM Standby Guest | This metric displays the number of standby operations on the virtual machine guest.<br>Key: State\|VM Standby Guest |
| VM Suspend | This metric displays the number of suspend operations on the virtual machine.<br>Key: State\|VM Suspend |

## vCenter Server Metrics

VCF Operations collects CPU use, disk, memory, network, and summary metrics for vCenter Server system objects.

vCenter Server metrics include capacity and badge metrics. See definitions in:

- Capacity Analytics Generated Metrics
- Badge Metrics

## CPU Usage Metrics

CPU usage metrics provide information about CPU use.

| Metric Name | Description |
|---|---|
| Capacity Usage (%) | Percent capacity used.<br>Key: cpu\|capacity_usagepct_average |
| CPU Contention (%) | Percent CPU contention.<br>Key: cpu\|capacity_contentionPct |
| Demand (%) | Percent demand.<br>Key: cpu\|demandPct |
| Demand (MHz) | CPU utilization level based on descendant virtual machines utilization. This Includes reservations, limits, and overhead to run the virtual machines.<br>Key: cpu\|demandmhz |
| Demand | CPU Demand.<br>Key: cpu\|demand_average |
| IO Wait (ms) | IO wait time in milliseconds.<br>Key: cpu\|iowait |
| Number of CPU Sockets | Number of CPU sockets.<br>Key: cpu\|numpackages |
| Overall CPU Contention (ms) | Overall CPU contention in milliseconds.<br>Key: cpu\|capacity_contention |
| Provisioned Capacity (MHz) | Provisioned capacity in megahertz.<br>Key: cpu\|capacity_provisioned |
| Provisioned vCPU | Number of provisioned virtual CPU cores.<br>Key: cpu\|corecount_provisioned |
| Reserved Capacity (MHz) | Sum of the reservation properties of the immediate children of the host's root resource pool.<br>Key: cpu\|reservedCapacity_average |
| Usage (MHz) | Average CPU use in megahertz.<br>Key: cpu\|usagemhz_average |
| Wait (ms) | CPU time spent on the idle state.<br>Key: cpu\|wait |
| Overhead | Amount of CPU that is overhead.<br>Key: cpu\|overhead_average |
| Demand without overhead | Value of demand excluding any overhead.<br>Key: cpu\|demand_without_overhead |
| Provisioned Capacity | Provisioned capacity (MHz).<br>Key: cpu\|vm_capacity_provisioned |
| Total Capacity (MHz) | Total CPU resources configured on the descendant ESX hosts.<br>Key: cpu\|capacity_provisioned |
| Usable Capacity (MHz) | The usable CPU resources that are available for the virtual machines after considering reservations for vSphere High Availability (HA) and other vSphere services.<br>Key: cpu\|haTotalCapacity_average |

### Datastore Metrics

Datastore metrics provide information about the datastore.

| Metric Name | Description |
|---|---|
| Outstanding IO requests | OIO for datastore.<br>Key: datastore\|demand_oio |
| Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: datastore\|numberReadAveraged_average |
| Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: datastore\|numberWriteAveraged_average |
| Read Throughput (KBps) | Amount of data read in the performance interval.<br>Key: datastore\|read_average |
| Write Throughput (KBps) | Amount of data written to disk in the performance interval.<br>Key: datastore\|write_average |

### Disk Metrics

Disk metrics provide information about disk use.

| Metric Name | Description |
|---|---|
| Total IOPS | Average number of commands issued per second during the collection cycle.<br>Key: disk\|commandsAveraged_average |
| Total Latency (ms) | Average amount of time taken for a command from the perspective of the guest operating system. This metric is the sum of the Kernel Device Command Latency and Physical Device Command Latency metrics.<br>Key: disk\|totalLatency_average |
| Total Throughput (KBps) | Average of the sum of the data read and written for all the disk instances of the host or virtual machine.<br>Key: disk\|usage_average |
| Total queued outstanding operations | Sum of queued operations and outstanding operations.<br>Key: disk\|sum_queued_oio |
| Max Observed OIO | Max observed IO for a disk.<br>Key: disk\|max_observed |

### Disk Space Metrics

Disk space metrics provide information about disk space use.

| Metric Name | Description |
|---|---|
| Total disk space used (KB) | Total disk space used on all datastores visible to this object.<br>Key: diskspace\|total_usage |
| Total disk space (KB) | Total disk space on all datastores visible to this object.<br>Key: diskspace\|total_capacity |
| Total provisioned disk space (KB) | Total provisioned disk space on all datastores visible to this object.<br>Key: diskspace\|total_provisioned |
| Utilization (GB) | Storage space used on the connected vSphere Datastores.<br>Key: diskspace\|total_usage |

| Metric Name | Description |
|---|---|
| Total Capacity (GB) | Total storage space available on the connected vSphere datastores.<br>Key: diskspace\|total_capacity |

### Memory Metrics

Memory metrics provide information about memory use and allocation.

| Metric Name | Description |
|---|---|
| Contention (%) | Percent host memory contention.<br>Key: mem\|host_contentionPct |
| Machine Demand (KB) | Host memory demand in kilobytes.<br>Key: mem\|host_demand |
| ESX System Usage | Memory usage by the VMkernel and ESX user-level services.<br>Key: mem\|host_systemUsage |
| Provisioned Memory (KB) | Provisioned host memory in kilobytes.<br>Key: mem\|host_provisioned |
| Reserved Capacity (KB) | Sum of the reservation properties of the immediate children of the host's root resource pool.<br>Key: mem\|reservedCapacity_average |
| Usable Memory (KB) | Usable host memory in kilobytes.<br>Key: mem\|host_usable |
| Host Usage (KB) | Host memory use in kilobytes.<br>Key: mem\|host_usage |
| Usage/Usable (%) | Percent host memory used.<br>Key: mem\|host_usagePct |
| Contention (KB) | Host contention in kilobytes.<br>Key: mem\|host_contention |
| VM Overhead (KB) | Memory overhead reported by host.<br>Key: mem\|overhead_average |
| Utilization (KB) | Memory utilization level based on the descendant virtual machines utilization. Includes reservations, limits, and overhead to run the Virtual Machines.<br>Key: mem\|total_need |
| Total Capacity (KB) | Total physical memory configured on descendant ESX hosts.<br>Key: mem\|host_provisioned |
| Usable Capacity (KB) | The usable memory resources available for the virtual machines after considering reservations for vSphere HA and other vSphere services.<br>Key: mem\|haTotalCapacity_average |

### Network Metrics

Network metrics provide information about network performance.

| Metric Name | Description |
|---|---|
| Packets Dropped (%) | Percent network packets dropped.<br>Key: net\|droppedPct |
| Total Throughput (KBps) | Sum of the data transmitted and received for all of the NIC instances of the host or virtual machine.<br>Key: net\|usage_average |

| Metric Name | Description |
|---|---|
| Packets Received | Number of packets received in the performance interval.<br>Key: net\|packetsRx_summation |
| Packets Transmitted | Number of packets transmitted in the performance interval.<br>Key: net\|packetsTx_summation |
| Received Packets Dropped | Number of received packets dropped in the performance interval.<br>Key: net\|droppedRx_summation |
| Transmitted Packets Dropped | Number of transmitted packets dropped in the performance interval.<br>Key: net\|droppedTx_summation |
| Data Transmit Rate (KBps) | Average amount of data transmitted per second.<br>Key: net\|transmitted_average |
| Data Receive Rate (KBps) | Average amount of data received per second.<br>Key: net\|received_average |

### Summary Metrics

Summary metrics provide information about overall performance.

| Metric Name | Description |
|---|---|
| Number of Running Hosts | Number of hosts that are on.<br>Key: summary\|number_running_hosts |
| Number of Running VMs | Number of virtual machines that are on.<br>Key: summary\|number_running_vms |
| Number of Clusters | Total number of clusters.<br>Key: summary\|total_number_clusters |
| Total Number of Datastores | Total number of datastores.<br>Key: summary\|total_number_datastores |
| Number of Hosts | Total number of hosts.<br>Key: summary\|total_number_hosts |
| Number of VMs | Total number of virtual machines.<br>Key: summary\|total_number_vms |
| Maximum Number of VMs | Maximum number of virtual machines.<br>Key: summary\|max_number_vms |
| Workload Indicator (%) | Percent workload indicator.<br>Key: summary\|workload_indicator |
| Total Number of data centers | Total number of data centers.<br>Key: summary\|total_number_datacenters |
| Number of Cores on Powered On Hosts | Number of cores on powered-on hosts.<br>Key: summary\|number_powered_on_cores |
| Number VCPUs on Powered on VMs | Number of virtual CPUs on powered-on virtual machines.<br>Key: summary\|number_running_vcpus |
| Average Running VM Count per Running Host | Average running virtual machine count per running host.<br>Key: summary\|avg_vm_density |
| VC Query Time (ms) | vCenter Server query time in milliseconds.<br>Key: summary\|vc_query_time |
| Derived Metrics Computation Time (ms) | Derived metrics computation time in milliseconds.<br>Key: summary\|derived_metrics_comp_time |
| Number of objects | Number of objects.<br>Key: summary\|number_objs |

| Metric Name | Description |
|---|---|
| Number of VC Events | Number of vCenter Server events.<br>Key: summary\|number_vc_events |
| Number of SMS Metrics | Number of SMS metrics.<br>Key: summary\|number_sms_metrics |
| Collector Memory Usage (MB) | Collector memory use in megabytes.<br>Key: summary\|collector_mem_usage |

### Virtual Machine Operations Metrics for vCenter Server

VM operations metrics provide information about the actions performed on VMs. The following are some important points you must know about VM operation metrics for vCenter Server.

- VM operations metrics is not collected for custom data centers.
- If you edit a VM settings and do not perform any action, still it is considered as VM reconfigure operation.
- During Revert Snapshot, VMs are powered-off, but this operation is not counted under VM Power-off metric.
- Adding ESX with VMs is not counted under VM Create metric.
- Removing ESX with VMs is not coutned under VM Remove metric.
- VM hardstop operation is not counted under VM Power Off metric.

| Metric Name | Description |
|---|---|
| Inventory | |
| VM Clone | This metric displays the number of clone operations on the virtual machine.<br>Key: Inventory\|VM Clone |
| VM Create | This metric displays the number of create operations on the virtual machine.<br>Key: Inventory\|VM Create |
| VM Delete | This metric displays the number of delete operations on the virtual machine.<br>Key: Inventory\|VM Delete |
| VM Reconfigure | This metric displays the number of reconfigure operations on the virtual machine.<br>Key: Inventory\|VM Reconfigure |
| VM Register | This metric displays the number of register operations on the virtual machine.<br>Key: Inventory\|VM Register |
| VM Template Deploy | This metric displays the number templates deployed on the virtual machine.<br>Key: Inventory\|VM Template Deploy |
| VM Unregister | This metric displays the number of unregister operations on the virtual machine.<br>Key: Inventory\|VM Unregister |
| Location | |
| Storage vMotion | This metric displays the number of migrations with vMotion (datastore change operations for Powered-on VMs).<br>Key: Location\|Storage vMotion |
| VM Datastore Change (powered-off VMs) | This metric displays the number of datastore change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Datastore Change (powered-off VMs) |

| Metric Name | Description |
|---|---|
| VM Host and Datastore Change (powered-off VMs) | This metric displays the number of host and datastore change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Host and Datastore Change (powered-off VMs) |
| VM Host and Datastore Change (powered-on VMs) | This metric displays the number of host and datastore change operations, for powered-on and suspended virtual machines.<br>Key: Location\|VM Host and Datastore Change (powered-on VMs) |
| VM Host Change (powered-off VMs) | This metric displays the number of host change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Host Change (powered-off VMs) |
| vMotion | This metric displays the number of migrations with vMotion (host change operations for powered-on VMs).<br>Key: Location\|vMotion |
| State | |
| VM Guest Reboot | This metric displays the number of reboot operations on the virtual machine guest.<br>Key: State\|VM Guest Reboot |
| VM Guest Shutdown | This metric displays the number of shutdown operations on the virtual machine guest.<br>Key: State\|VM Guest Shutdown |
| VM Power Off | This metric displays the number of power-off operations on the virtual machine.<br>Key: State\|VM Power Off |
| VM Power On | This metric displays the number of power-on operations on the virtual machine.<br>Key: State\|VM Power On |
| VM Reset | This metric displays the number of reset operations on the virtual machine guest.<br>Key: State\|VM Reset |
| VM Standby Guest | This metric displays the number of standby operations on the virtual machine guest.<br>Key: State\|VM Standby Guest |
| VM Suspend | This metric displays the number of suspend operations on the virtual machine.<br>Key: State\|VM Suspend |

## Disabled Metrics

The following metrics are disabled in this version of VCF Operations. This means that they do not collect data by default.

You can enable these metrics in the Policy workspace. For more information, in VMware Docs search for Collect Metrics and Properties Details.

You can enable these metrics in the Policy workspace. For more information, see Metrics and Properties Details.

| Metric Name | Description |
|---|---|
| Max Observed Number of Outstanding IO Operations | Maximum observed number of outstanding IO operations.<br>Key: datastore\|maxObserved_OIO |
| Max Observed Read Rate | Max observed rate of reading data from the datastore.<br>Key: datastore\|maxObserved_Read |

| Metric Name | Description |
|---|---|
| Max Observed Reads per second | Max observed average number of read commands issued per second during the collection interval.<br>Key: datastore\|maxObserved_NumberRead |
| Max Observed Writes per second | Max observed average number of write commands issued per second during the collection interval.<br>Key: datastore\|maxObserved_NumberWrite |
| Max Observed Write Rate | Max observed rate of writing data from the datastore.<br>Key: datastore\|maxObserved_Write |
| Max Observed Throughput (KBps) | Max observed rate of network throughput.<br>Key: net\|maxObserved_KBps |
| Max Observed Transmitted Throughput (KBps) | Max observed transmitted rate of network throughput.<br>Key: net\|maxObserved_Tx_KBps |
| Max Observed Received Throughput (KBps) | Max observed received rate of network throughput.<br>Key: net\|maxObserved_Rx_KBps |

## Virtual Machine Metrics

VCF Operations collects configuration, CPU use, memory, datastore, disk, virtual disk, guest file system, network, power, disk space, storage, and summary metrics for virtual machine objects.

### GPU Metrics

GPU metrics provide information about the GPU usage and performance.

| Metric Name | Description |
|---|---|
| vGPU:vGPU-id\|vGPU Memory Reservation (KB) | The amount of GPU memory reserved for the assigned vGPUs. |
| vGPU:vGPU-id\|vGPU Memory Used (KB) | The amount of GPU memory being used in kilobytes. |
| vGPU:vGPU-id\|vGPU 3D / Compute utilization (%) | The percentage of time the GPU is actively processing tasks. |
| vGPU:vGPU-id\|vGPU Memory Utilization (%) | The amount of GPU memory being used in percentage. |
| vGPU:vGPU-id\|vGPU Encode Utilization (%) | Encoding is the process of converting raw data into a compressed format. |
| vGPU:vGPU-id\|vGPU Decode Utilization (%) | Decoding is the process of converting compressed format into a raw format. |

### Guest Operating System Metrics

Guest Operating System metrics provide information about the new metrics added to the Guest Operating System.

| Metric Name | Description |
|---|---|
| Guest\|Peak Guest OS Page-out/rate within collection cycle | This metric displays the highest memory page-out rate reported by guest operating system, measured as peak of any 20-second average during the collection interval.<br>**Note:**<br>To collect the guest metrics, ensure that VM Tools is installed and up and running on virtual machine, on vCenter server.<br>Key: guest\|20_sec_peak_page.outRate_latest |

## Metrics for ROI Dashboard

Virtual machine metrics provide information about the new metrics added to the ROI dashboard.

| Metric Name | Description |
|---|---|
| Potential Memory Consumed Reclaimable(GB) | This metric displays the sum of all the reclaimble consumed memory for the virtual machine. |
| Potential CPU Usage Increase (GHz) | This metric displays the potential increase in CPU usage for the virtual machine. |
| Potential Memory Usage Increase (GB) | This metric displays the potential increase in memory usage for the virtual machine. |
| Potential Savings | This metric displays the sum of all the potential savings (Idle VMs + Powered off Vms + Snapshot + Orphaned Disks + Oversized VMs). |
| Potential Cost Increase | This metric displays the potential increase in costs associated with the virtual machine. |

## Application Level Cost Roll up Metrics

The application-level cost roll up in VCF Operations includes few additional metrics at the application level. VCF Operations has introduced Business Application as a new object, the business application object can have Tiers and Applications as its children. The cost roll up option allows you to aggregate all VM costs associated with the application and tiers and publish them at VM level.

**Table 1480: Application Level Cost Roll up Metrics**

| Metric Name | Description |
|---|---|
| Monthly Effected Projected Total Cost | This metric displays the effective virtual machine cost projected for the full month. |
| Effective MTD Cost | This metric displays the month to date effective application cost for the selected virtual machine. |
| Effective Daily Cost | This metric displays the effective daily cost of the application associated with the virtual machine. |

## Configuration Metrics for Virtual Machines

Configuration metrics provide information about virtual machine configuration.

| Metric Name | Description |
|---|---|
| Config\|Thin Provisioned Disk | Thin Provisioned Disk.<br>Key: config\|hardware\|thin_Enabled |
| Config\|Number of CPUs | Number of CPUs for a Virtual Machine.<br>From VCF Operations 6.7 and onwards, this metric is measured in vCPUs instead of cores.<br>Key: config\|hardware\|num_Cpu |
| Config\|Disk Space | Disk space metrics.<br>Key: config\|hardware\|disk_Space |

## CPU Usage Metrics for Virtual Machines

CPU usage metrics provide the information about CPU use.

| Metric Name | Description |
|---|---|
| CPU\|Other Wait (ms) | CPU time spent waiting for IO.<br>Key: cpu\|otherwait |
| CPU\|Overall CPU Contention (ms) | The amount of time the CPU cannot run due to contention.<br>Key: cpu\|capacity_contention |
| CPU\|Reservation Used | CPU Reservation Used.<br>Key: cpu\|reservation_used |
| CPU\|Effective Limit | CPU Effective Limit.<br>Key: cpu\|effective_limit |
| CPU\|Other Wait (%) | Percentage Other Wait.<br>Key: cpu\|otherwaitPct |
| CPU\|Swap wait (%) | Percentage swap waits for CPU.<br>Key: cpu\|swapwaitPct |
| CPU\|Wait (%) | Percentage of the total CPU time spent in wait state.<br>Key: cpu\|waitPct |
| CPU\|System (%) | Percentage CPU time spent on system processes.<br>Key: cpu\|systemSummationPct |
| CPU\|Capacity entitlement (MHz) | CPU entitlement for the VM after considering all limits.<br>Key: cpu\|capacity_entitlement |
| CPU\|Capacity Demand Entitlement (% | Percent capacity demand entitlement.<br>Key: cpu\|capacity_demandEntitlementPct |
| CPU\|CPU Contention (%) | CPU contention as a percentage of 20-second collection interval.<br>Key: cpu\|capacity_contentionPct |
| CPU\|Total Capacity | Provisioned CPU capacity in megahertz.<br>Key: cpu\|vm_capacity_provisioned |
| CPU\|Demand (MHz) | Total CPU resources required by the workloads on the virtual machine.<br>Key: cpu\|demandmhz |
| CPU\|Host demand for aggregation | Host demand for aggregation.<br>Key: cpu\|host_demand_for_aggregation |
| CPU\|Demand (ms) | The total CPU time that the VM might use if there was no contention.<br>Key: cpu\|demand_average |
| CPU\|Demand (%) | CPU demand as a percentage of the provisioned capacity.<br>Key: cpu\|demandPct |
| CPU\|Usage (%) | This metric indicates the percentage of CPU that was used out of all the CPU that was allocated to the VM. CPU usage can indicate when the VM is undersized.<br>Key: cpu\|usage_average |
| CPU\|Usage (MHz) | CPU use in megahertz.<br>Key: cpu\|usagemhz_average |

| Metric Name | Description |
|---|---|
| CPU Workload % | This metric indicates the CPU workload % for the VM, the maximum threshold for this is 80% and the minimum threshold is 20%. If your Maximum line is constantly ~100% flat, you may have a runaway process. If this chart is below or less than 20% all the time for the entire month, then all the large VMs are oversized. This number must hover around 40%, indicating the sizing done was accurate. |
| CPU\|System (ms) | CPU time spent on system processes.<br>Key: cpu\|system_summation |
| CPU\|Ready (%) | This metric indicates the percentage of time in which the VM was waiting in line to use the CPU on the host.<br>A large ready time for a VM indicates that the VM needed CPU resources but the infrastructure was busy serving other VMs. A large ready time might indicate that the host is trying to serve too many VMs.<br>Whenever the CPU ready is larger than 10%, you should check if the host is overloaded, or if the VM really needs all the resources that were allocated to it.<br>Key: cpu\|readyPct |
| CPU\|Extra (ms) | Extra CPU time in milliseconds.<br>Key: cpu\|extra_summation |
| CPU\|Guaranteed (ms) | CPU time that is guaranteed for the virtual machine.<br>Key: cpu\|guaranteed_latest |
| CPU\|Co-stop (%) | Percentage of time the VM is ready to run, but is unable to due to co-scheduling constraints.<br>Key: cpu\|costopPct |
| CPU\|Latency | Percentage of time the VM is unable to run because it is contending for access to the physical CPUs.<br>Key: cpu\|latency_average |
| CPU\|Max Limited | Time the VM is ready to run, but is not run due to maxing out its CPU limit setting.<br>Key: cpu\|maxlimited_summation |
| CPU\|Overlap | Time the VM was interrupted to perform system services on behalf of that VM or other VMs.<br>Key: cpu\|overlap_summation |
| CPU\|Run | Time the VM is scheduled to run.<br>Key: cpu\|run_summation |
| CPU\|Entitlement Latest | Entitlement Latest.<br>Key: cpu\|entitlement_latest |
| CPU\|Total Capacity (MHz) | Total CPU capacity allocated to the virtual machine.<br>Key: cpu\|vm_capacity_provisioned |
| CPU\|Peak vCPU Ready | The highest CPU Ready among the virtual CPUs.<br>Key: cpu\|peak_vcpu_ready |
| CPU\|Peak vCPU Usage | The highest CPU Usage among the virtual CPU, compared with the static configured CPU frequency. A constantly high number indicates that one or more of the CPUs have high utilization.<br>Key: cpu\|peak_vcpu_usage |
| CPU\|20-second Peak CPU System (%) | The highest system CPU, measured as a peak of any 20-second average during the collection interval.<br>Key: cpu\|20-second peak cpu system |

| Metric Name | Description |
|---|---|
| CPU\|20-second Peak vCPU Co-Stop (%) | The highest CPU Co-Stop among any of the vCPU, measured as a peak of any 20-second average during the collection interval.<br>Key: cpu\|20-second peak vcpu co-stop |
| CPU\|20-second Peak vCPU IO-Wait(%) | The highest CPU Other Wait among any of the vCPU, measured as a peak of any 20-second average during the collection interval.<br>Key: cpu\|20-second peak vcpu io-wait |
| CPU\|20-second Peak vCPU Overlap (ms) | The highest CPU Overlap among any of the vCPU, measured as a peak of any 20-second average during the collection interval.<br>Key: cpu\|20-second peak vcpu overlap |
| CPU\|20-second Peak vCPU Ready (%) | The highest CPU Ready among any of the vCPU, measured as a peak of any 20-second average during the collection interval.<br>Key: cpu\|20-second peak vcpu ready |
| CPU\|20-second Peak vCPU Swap Wait (%) | The highest CPU Swap Wait among any of the vCPU, measured as a peak of any 20-second average during the collection interval.<br>Key: cpu\|20-second peak vcpu swap wait |
| CPU \| vCPU Usage Disparity | The absolute gap between the highest vCPU Usage and the lowest vCPU Usage.<br>Key: cpu\|vcpu_usage_disparity |

### CPU Utilization for Resources Metrics for Virtual Machines

CPU utilization for resources metrics provides information about resource CPU use.

| Metric Name | Description |
|---|---|
| rescpu\|CPU Active (%) (*interval*) | The average active time (actav) or peak active time (actpk) for the CPU during various intervals.<br>Key:<br>rescpu\|actav1_latest<br>rescpu\|actav5_latest<br>rescpu\|actav15_latest<br>rescpu\|actpk1_latest<br>rescpu\|actpk5_latest<br>rescpu\|actpk15_latest |
| rescpu\|CPU Running (%) (*interval*) | The average runtime (runav) or peak active time (runpk) for the CPU during various intervals.<br>Key:<br>rescpu\|runav1_latest<br>rescpu\|runav5_latest<br>rescpu\|runav15_latest<br>rescpu\|runpk1_latest<br>rescpu\|runpk5_latest<br>rescpu\|runpk15_latest |

| Metric Name | Description |
|---|---|
| rescpu\|CPU Throttled (%) (*interval*) | Amount of CPU resources over the limit that were refused, average over various intervals.<br>Key:<br>rescpu\|maxLimited1_latest<br>rescpu\|maxLimited5_latest<br>rescpu\|maxLimited15_latest |
| rescpu\|Group CPU Sample Count | The sample CPU count.<br>Key: rescpu\|sampleCount_latest |
| rscpu\|Group CPU Sample Period (ms) | The sample period.<br>Key: rscpu\|samplePeriod_latest |

## Memory Metrics for Virtual Machines

Memory metrics provide information about memory use and allocation.

| Metric Name | Description |
|---|---|
| Mem\|Host Active (KB) | Host active memory use in kilobytes.<br>Key: mem\|host_active |
| Mem\|Contention (KB) | Memory contention in kilobytes.<br>Key: mem\|host_contention |
| Mem\|Contention (%) | Percent memory contention.<br>Key: mem\|host_contentionPct |
| Mem\|Guest Configured Memory (KB) | Guest operating system configured memory in kilobytes.<br>Key: mem\|guest_provisioned |
| Mem\|Guest Active Memory (%) | Percent guest operating system active memory.<br>Key: mem\|guest_activePct |
| Mem\|Guest Non-Pageable Memory (KB) | Guest operating system non-pageable memory in kilobytes.<br>Key: mem\|guest_nonpageable_estimate |
| Mem\|Reservation Used | Memory Reservation Used.<br>Key: mem\|reservation_used |
| Mem\|Effective Limit | Memory Effective Limit.<br>Key: mem\|effective_limit |
| Mem\|Demand for aggregation | Host demand for aggregation.<br>Key: mem\|host_demand_for_aggregation |
| Mem\|Balloon (%) | Percentage of total memory that has been reclaimed via ballooning.<br>Key: mem\|balloonPct |
| Mem\|Guest Usage (KB) | This metric shows the amount of memory the VM uses.<br>Key: mem\|guest_usage |
| Mem\|Guest Demand (KB) | Guest operating system demand in kilobytes.<br>Key: mem\|guest_demand |
| Mem\|Guest Non-Pageable Memory (KB) | Guest operating system non-pageable memory in kilobytes.<br>Key: mem\|host_nonpageable_estimate |
| Mem\|Host Demand (KB) | Memory demand in kilobytes.<br>Key mem\|host_demand |
| Mem\|Host Workload | Host Workload (%).<br>Key: host_workload |

| Metric Name | Description |
|---|---|
| Mem\|Zero (KB) | Amount of memory that is all 0.<br>Key: mem\|zero_average |
| Mem\|Swapped (KB) | This metric shows how much memory is being swapped. Meaning, the amount of unreserved memory in kilobytes.<br>Key: mem\|swapped_average |
| Mem\|Swap Target (KB) | Amount of memory that can be swapped in kilobytes.<br>Key: mem\|swaptarget_average |
| Mem\|Swap In (KB) | Swap-in memory in kilobytes.<br>Key: mem\|swapin_average |
| Mem\|Balloon Target (KB) | Amount of memory that can be used by the virtual machine memory control.<br>Key: mem\|vmmemctltarget_average |
| Mem\|Consumed (KB) | Amount of host memory consumed by the virtual machine for guest memory in kilobytes.<br>Key: mem\|consumed_average |
| Mem\|Overhead (KB) | Memory overhead in kilobytes.<br>Key: mem\|overhead_average |
| Mem\|Swap In Rate (KBps) | Rate at which memory is swapped from disk into active memory during the interval.<br>Key: mem\|swapinRate_average |
| Mem\|Active Write (KB) | Active writes in kilobytes.<br>Key: mem\|activewrite_average |
| Mem\|Compressed (KB) | Compressed memory in kilobytes.<br>Key: mem\|compressed_average |
| Mem\|Compression Rate (KBps) | Compression rate in kilobytes per second.<br>Key: mem\|commpressionRate_average |
| Mem\|Decompression Rate (KBps) | Decompression rate in kilobytes per second.<br>Key: mem\|decompressionRate_average |
| Mem\|Overhead Max (KB) | Maximum overhead in kilobytes.<br>Key: mem\|overheadMax_average |
| Mem\|Zip Saved (KB) | Zip-saved memory in kilobytes.<br>Key: mem\|zipSaved_latest |
| Mem\|Zipped (KB) | Zipped memory in kilobytes.<br>Key: mem\|zipped_latest |
| Mem\|Entitlement | Amount of host physical memory the VM is entitled to, as determined by the ESX schedule.<br>Key: mem\|entitlement_average |
| Mem\|Capacity Contention | Capacity Contention.<br>Key: mem\|capacity.contention_average |
| Mem\|Swap In Rate from Host Cache | Rate at which memory is being swapped from host cache into active memory.<br>Key: mem\|llSwapInRate_average |
| Mem\|Swap Out Rate to Host Cache | Rate at which memory is being swapped to host cache from active memory.<br>Key: mem\|llSwapOutRate_average |
| Mem\|Swap Space Used in Host Cache | Space used for caching swapped pages in the host cache.<br>Key: mem\|llSwapUsed_average |

| Metric Name | Description |
|---|---|
| Mem\|Overhead Touched | Actively touched overhead memory (KB) reserved for use as the virtualization overhead for the VM.<br>Key: mem\|overheadTouched_average |
| Memory\|VM Memory Demand (kb) | Key: mem\|vmMemoryDemand |
| Memory\|Consumed (%) | Key: mem\|consumedPct |
| Mem\|Utilization (KB) | Memory used by the virtual machine. Reflects the guest OS memory required for vSphere and certain VMTools versions or for virtual machine consumption.<br>Key: mem\|vmMemoryDemand |
| Mem\|Total Capacity (KB) | Memory resources allocated to powered on virtual machine.<br>Key: mem\|guest_provisioned |
| Mem\|20-second Peak Contention (%) | The highest Memory Contention, measured as peak of any 20-second average during the collection interval.<br>Key: guest\|20-second_peak_contention |
| Guest\|Peak Guest OS Page-out/rate within collection cycle | This metric shows the highest memory page-out rate reported by guest operating system, measured as peak of any 20-second average during the collection interval.<br>Key: guest\|20_sec_peak_page.outRate_latest |
| Guest\|Needed Memory | Amount of memory needed for the Guest OS to perform optimally. This memory is considered as a cache for the disk and is a little more than the actual used memory.<br>Key: guest\|mem.needed_latest |
| Guest\|Free Memory | Amount of memory that is not used but is readily available. If the cache is high, a low free memory does not mean that the Guest OS needs more memory.<br>Key: guest\|mem.free_latest |
| Guest\|Physical Usable Memory | Amount of memory available to the Guest OS. Meaning, this amount is close to the amount of configured memory to the VM.<br>Key: guest\|mem.physUsable_latest |
| Guest\|20-second Peak Disk Queue Length | The highest Disk Queue Length, measured as peak of any 20-second average during the collection interval.<br>Key: guest\|20-second_peak_disk_queue_length |
| Guest\|20-second Peak Run Queue | The highest Run Queue, measured as peak of any 20-second average during the collection interval.<br>Key: guest\|20-second_peak_run_queue |
| Guest\|20-second Peak CPU Context Switch Rate | The highest CPU Context Switch Rate, measured as peak of any 20-second average during the collection interval.<br>Key: guest\|20-second_peak_cpu_context switch rate |

### Datastore Metrics for Virtual Machines

Datastore metrics provide information about datastore use.

| Metric Name | Description |
|---|---|
| Datastore\|Total IOPS | Average number of commands issued per second during the collection interval.<br>Key: datastore\|commandsAveraged_average |
| Datastore\|Outstanding IO requests | OIO for datastore.<br>Key: datastore\|demand_oio |

| Metric Name | Description |
|---|---|
| Datastore\|Number of Outstanding IO Operations | Number of outstanding IO operations.<br>Key: datastore\|oio |
| Datastore\|Demand | Datastore demand.<br>Key: datastore\|demand |
| Datastore\|Total Latency (ms) | The average amount of time taken for a command from the perspective of a Guest OS. This is the sum of Kernel Command Latency and Physical Device Command Latency.<br>Key: datastore\|totalLatency_average |
| Datastore\|Total Throughput (KBps) | Usage Average (KBps).<br>Key: datastore\|usage_average |
| Datastore\|Used Space (MB) | Used space in megabytes.<br>Key: datastore\|used |
| Datastore\|Not Shared (GB) | Space used by VMs that is not shared.<br>Key: datastore\|notshared |
| Datastore\|Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: datastore\|numberReadAveraged_average |
| Datastore\|Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: datastore\|numberWriteAveraged_average |
| Datastore\|Read Throughput (KBps) | This metric shows the amount of data that the VM reads to the datastore per second.<br>Key: datastore\|read_average |
| Datastore\|Read Latency (ms) | Average amount of time for a read operation from the datastore. Total latency = kernel latency + device latency.<br>Key: datastore\|totalReadLatency_average |
| Datastore\|Write Latency (ms) | Average amount of time for a write operation to the datastore. Total latency = kernel latency + device latency.<br>Key: datastore\|totalWriteLatency_average |
| Datastore\|Write Throughput (KBps) | This metric shows the amount of data that the VM writes to the datastore per second.<br>Key: datastore\|write_average |
| Datastore\|Highest Latency | Highest Latency.<br>Key: datastore\|maxTotalLatency_latest |
| Datastore\|Total Latency Max | Total Latency Max (ms).<br>Key: datastore\|totalLatency_max |

## Disk Metrics for Virtual Machines

Disk metrics provide information about disk use.

| Metric Name | Description |
|---|---|
| Disk Space\|vSAN Overhead (GB) | Displays the extra virtual machine disk space used by the vSAN system.<br>Disk Space\|vSAN Overhead (GB) |
| Disk Space\|VMUsedWithoutOverhead(GB) | Displays the virtual machine disk space without vSAN overhead.<br>Disk Space\|Usage Without Overhead (GB) |

| Metric Name | Description |
|---|---|
| Disk Space<br><br>**Note:**<br>The Disk Space metrics are displayed by the virtual machine object only when the vSAN adapter is configured with vCenter. | |
| Disk\|Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: disk\|numberReadAveraged_average |
| Disk\|Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: disk\|numberWriteAveraged_average |
| Disk\|Total IOPS | Average number of commands issued per second during the collection interval.<br>Key: disk\|commandsAveraged_average |
| Disk\|Total Throughput (KBps) | Use rate in kilobytes per second.<br>Key: disk\|usage_average |
| Disk\|I/O Usage Capacity | This metric is a function of storage\|usage_average and disk\|workload. Storage\|usage_average is an average over all storage devices. This means that disk\|usage_capacity is not specific to the selected VM or the host of the VM.<br>Key: disk\|usage_capacity |
| Disk\|Number of Outstanding IO Operations | Number of outstanding IO operations.<br>Key: disk\|diskoio |
| Disk\|Queued Operations | Queued operations.<br>Key: disk\|diskqueued |
| Disk\|Demand (%) | Percent demand.<br>Key: disk\|diskdemand |
| Disk \|Total Queued Outstanding Operations | Sum of Queued Operation and Outstanding Operations.<br>Key: disk \|sum_queued_oio |
| Disk\|Max Observed OIO | Max Observed IO for a disk.<br>Key: disk\|max_observed |
| Disk\|Read Throughput KBps) | Amount of data read in the performance interval.<br>Key: disk\|read_average |
| Disk\|Write Throughput (KBps) | Amount of data written to disk in the performance interval.<br>Key: disk\|write_average |
| Disk\|Bus Resets | The number of bus resets in the performance interval.<br>Key: disk\|busResets_summation |
| Disk\|Commands canceled | The number of disk commands canceled in the performance interval.<br>Key: disk\|commandsAborted_summation |
| Disk\|Highest Latency | Highest latency.<br>Key: disk\|maxTotalLatency_latest |
| Disk\|SCSI Reservation Conflicts | SCSI Reservation Conflicts.<br>Key: disk\|scsiReservationConflicts_summation |
| Disk\|Read Latency (ms) | The average amount of time taken for a read from the perspective of a Guest OS. This is the sum of Kernel Read Latency and Physical Device Read Latency.<br>Key: disk\|totalReadLatency_average |

| Metric Name | Description |
|---|---|
| Disk\|Write Latency (ms) | The average amount of time taken for a write from the perspective of a Guest OS. This is the sum of Kernel Write Latency and Physical Device Write Latency.<br>Key: disk\|totalWriteLatency_average |
| Disk\|Total Latency (ms) | The average amount of time taken for a command from the perspective of a Guest OS. This is the sum of Kernel Command Latency and Physical Device Command Latency.<br>Key: disk\|totalLatency_average |

### Virtual Disk Metrics for Virtual Machines

Virtual disk metrics provide information about virtual disk use.

| Metric Name | Description |
|---|---|
| Virtual Disk:<scsi_controller>\|IOPS per GB | Displays the disk IO per second per Gigabyte of storage.<br>Key: virtualDisk:<scsi_controller>\|iopsPerGB |
| Virtual Disk\|Total Throughput | Amount of data read from/written to storage in a second. This is averaged over the reporting period.<br>Key: virtualDisk\|usage |
| VirtualDisk\|Total Latency | Total latency.<br>Key: virtualDisk\|totalLatency |
| VirtualDisk\|Total IOPS | Average number of commands per second.<br>Key: virtualDisk\|commandsAveraged_average |
| VirtualDisk\|Read Requests | Average number of read commands issued per second to the virtual disk during the collection interval.<br>Key: virtualDisk\|numberReadAveraged_average |
| VirtualDisk\|Write Requests | Average number of write commands issued per second to the virtual disk during the collection interval.<br>Key: virtualDisk\|numberWriteAveraged_average |
| VirtualDisk\|Read Throughput (KBps) | Rate of reading data from the virtual disk in kilobytes per second.<br>Key: virtualDisk\|read_average |
| VirtualDisk\|Read Latency (ms) | Average amount of time for a read operation from the virtual disk. Total latency = kernel latency + device latency.<br>Key: virtualDisk\|totalReadLatency_average |
| VirtualDisk\|Write Latency (ms) | Average amount of time for a write operation to the virtual disk. Total latency = kernel latency + device latency.<br>Key: virtualDisk\|totalWriteLatency_average |
| VirtualDisk\|Write Throughput (KBps) | Rate of writing data from the virtual disk in kilobytes per second.<br>Key: virtualDisk\|write_average |
| VirtualDisk\|Bus Resets | The number of bus resets in the performance interval.<br>Key: virtualDisk\|busResets_summation |
| VirtualDisk\|Commands Aborted | The number of disk commands canceled in the performance interval.<br>Key: virtualDisk\|commandsAborted_summation |
| VirtualDisk\|Read Load | Storage DRS virtual disk metric read load.<br>Key: virtualDisk\|readLoadMetric_latest |

| Metric Name | Description |
|---|---|
| VirtualDisk\|Outstanding Read Requests | Average number of outstanding read requests to the virtual disk.<br>Key: virtualDisk\|readOIO_latest |
| VirtualDisk\|Write Load | Storage DRS virtual disk write load.<br>Key: virtualDisk\|writeLoadMetric_latest |
| VirtualDisk\|Outstanding Write Requests | Average number of outstanding write requests to the virtual disk.<br>Key: virtualDisk\|writeOIO_latest |
| VirtualDisk\|Number of Small Seeks | Small Seeks.<br>Key: virtualDisk\|smallSeeks_latest |
| VirtualDisk\|Number of Medium Seeks | Medium Seeks.<br>Key: virtualDisk\|mediumSeeks_latest |
| VirtualDisk\|Number of Large Seeks | Large Seeks.<br>Key: virtualDisk\|largeSeeks_latest |
| VirtualDisk\|Read Latency (microseconds) | Read Latency in microseconds.<br>Key: virtualDisk\|readLatencyUS_latest |
| VirtualDisk\|Write Latency (microseconds) | Write Latency in microseconds.<br>Key: virtualDisk\|writeLatencyUS_latest |
| VirtualDisk\|Average Read request size | Read IO size.<br>Key: virtualDisk\|readIOSize_latest |
| VirtualDisk\|Average Write request size | Write IO size.<br>Key: virtualDisk\|writeIOSize_latest |
| Virtual Disk\|Outstanding IO requests (OIOs) | Key: virtualDisk\|vDiskOIO |
| Virtual Disk\|Used Disk Space (GB) | Key: virtualDisk\|actualUsage |
| Virtual Disk\|Peak Virtual Disk IOPS | The highest disk IO per second among the virtual disks. A constantly high number indicates that one or more virtual disks are sustaining high IOPS.<br>Key: virtualDisk\|peak_vDisk_iops |
| Virtual Disk\|Peak Virtual Disk Read Latency | The highest read latency among the virtual disks. A high number indicates that one or more virtual disks are experiencing poor performance.<br>Key: virtualDisk\|peak_vDisk_readLatency |
| Virtual Disk\|Peak Virtual Disk Write Latency | The highest write latency among the virtual disks. A high number indicates that one or more virtual disks are experiencing poor performance.<br>Key: virtualDisk\|peak_vDisk_writeLatency |
| Virtual Disk\|20-secod Peak Latency (ms) | The highest latency among any of the virtual disk, measured as peak of any 20-second average during the collection interval.<br>Key: virtualDisk\|20-second_peak_latency |
| Virtual Disk\|Peak Virtual Disk throughput | The highest disk throughput among the virtual disks.<br>Key: virtualDisk\|peak_vDisk_throughpu |

### Guest File System Metrics for Virtual Machines

Guest file system metrics provide information about guest file system capacity and free space.

The data for these metrics is only displayed when VMware Tools has been installed on the virtual machines. If VMware Tools is not installed, features dependent on these metrics, including capacity planning for virtual machine guest storage, will not be available.

| Metric Name | Description |
|---|---|
| Guest file system\|Guest File System Capacity (MB) | Total capacity on guest file system in megabytes.<br>Key: guestfilesystem\|capacity |
| Guest file system\|Guest File System Free (MB) | Total free space on guest file system in megabytes.<br>Key: guestfilesystem\|freespace |
| Guest file system\|Guest File System Usage (%) | Percent guest file system.<br>Key: guestfilesystem\|percentage |
| Guest file system\|Guest File System Usage | Total usage of guest file system.<br>From VCF Operations 6.7 and onwards, this metric is measured in GBs.<br>Key: guestfilesystem\|usage |
| Guest file system\|Total Guest File System Capacity (GB) | This metric displays the amount of disk space allocated for the VM.<br>Correlate other metrics with this metric to indicate if changes occur in the disk space allocation for the VM.<br>Key: guestfilesystem\|capacity_total |
| Guest file system\|Total Guest File System Usage (%) | This metric displays the amount of display space being used out of the total allocated disk space.<br>Use his metric to track if the overall usage is stable, or if it reaches the limits. Do not include VMs with a disk space usage of >95% since this might impact your system.<br>Key: guestfilesystem\|percentage_total |
| Guest file system\|Total Guest File System Usage | Total usage of guest file system.<br>Key: guestfilesystem\|usage_total |
| Guest file system\|Utilization (GB) | Storage space used by the Guest OS file systems. The disk space is available only if VM tools are installed and running. If the VM tools are not installed, the disk space capacity is not applicable.<br>Key: guestfilesystem\|usage_total |
| Guest file system\|Total Capacity (GB) | Storage space used by the Guest OS file systems. The disk space is available only if VM tools are installed and running. If the VM tools are not installed, the disk space capacity is not applicable.<br>Key: guestfilesystem\|capacity_total |

### Network Metrics for Virtual Machines

Network metrics provide information about network performance.

| Metric Name | Description |
|---|---|
| Network\|Peak Network Packet per second within collection cycle | This metric shows the highest VM packets per second rate, measured as peak of any 20-second average during the collection interval.<br>Key: net\|20_sec_peak_packetsPerSec |
| Net\|Total Throughput (KBps) | The sum of the data transmitted and received for all the NIC instances of the host or virtual machine.<br>Key: net\|usage_average |

| Metric Name | Description |
|---|---|
| Net\|Data Transmit Rate (KBps) | This metric shows the rate of data being sent by the VM per second.<br>Key: net\|transmitted_average |
| Net\|Data Receive Rate (KBps) | This metric shows the rate of data received by the VM per second.<br>Key: net\|received_average |
| Net\|Packets per second | Number of packets transmitted and received per second.<br>Key: net\|PacketsPerSec |
| Net\|Packets Received | Number of packets received in the performance interval.<br>Key: net\|packetsRx_summation |
| Net\|Packets Transmitted | Number of packets transmitted in the performance interval.<br>Key: net\|packetsTx_summation |
| Net\|Transmitted Packets Dropped | This metric shows the number of transmitted packets dropped in the collection interval<br>Key: net\|dropppedTx_summation |
| Net\|Packets Dropped (%) | Percentage of packets dropped.<br>Key: net\|droppedPct |
| Net\|Packets Dropped | Number of packets dropped in the performance interval.<br>Key: net\|dropped |
| Net\|Broadcast Packets Transmitted | Number of broadcast packets transmitted during the sampling interval.<br>Key: net\|broadcastTx_summation |
| Net\|Broadcast Packets Received | Number of broadcast packets received during the sampling interval.<br>Key: net\|broadcastRx_summation |
| Net\|Multicast Packets Received | Number of multicast packets received.<br>Key: net\|multicastRx_summation |
| Net\|Multicast Packets Transmitted | Number of multicast packets transmitted.<br>Key: net\|multicastTx_summation |
| Net\|VM to Host Data Transmit Rate | Average amount of data transmitted per second between VM and host.<br>Key: net\|host_transmitted_average |
| Net\|VM to Host Data Receive Rate | Average amount of data received per second between VM and host.<br>Key: net\|host_received_average |
| Net\|VM to Host Usage Rate | The sum of the data transmitted and received for all the NIC instances between VM and host.<br>Key: net\|host_usage_average |
| Net\|20-second Peak Usage Rate (KBps) | The higest Usage Rate, measured as peak of any 20 second average during the collection interval.<br>Key: net\|20-second_peak_usage_rate |

## System Metrics for Virtual Machines

System metrics for virtual machines provide general information about the virtual machine, such as its build number and running state.

| Metric Name | Description |
|---|---|
| Sys\|Powered ON | Powered on virtual machines. 1 if powered on, 0 if powered off, -1 if unknown<br>Key: sys\|poweredOn |
| Sys\|OS Uptime | Total time elapsed, in seconds, since last operating system start.<br>Key: sys\|osUptime_latest |

## Power Metrics for Virtual Machines

Power metrics provide information about power use.

| Metric Name | Description |
|---|---|
| Power\|Total Energy Consumed in the collection period (Wh) | Displays the total electricity consumed based on the time interval selected. The default collection cycle is set to 5 mins. You can continue using the default setting or edit it for each adapter instance. For example, if the time interval is set to its default value, the value represents the energy consumed per 5 mins. |
| Power\|Total Power Consumed By VM (Wh) | Displays the total power consumed by a virtual machine in an hour. The data collected is over a period of an hour and published along with the other metrics in VCF Operations. In case of a connectivity or availability issue in VCF Operations or vCenter adapter instance, this hourly metric might not be published and the missed value during this period does not get recalculated. Once the connection is re-established, the next data points get published.<br>**Note:**<br>This metric is deactivated by default. You can activate it from the Policies page. For more information, see Metrics and Properties Details in the *VCF Operations Configuration Guide*. |
| Power\|Power (Watt) | Average power use in watts. |
| Power\|Current Power Consumption Rate (Watt) | The power consumption rate per second, averaged over the reporting period.<br>Key: power\|power_average |
| Power\|(DEP) Energy (Joule) | Total energy consumed in joules.<br>Key: power\|energy_summation |

## Disk Space Metrics for Virtual Machines

Disk space metrics provide information about disk space use.

| Metric Name | Description |
|---|---|
| Diskspace\|Provisioned Space (GB) | Provisioned space in gigabytes.<br>Key: diskspace\|provisioned |
| Diskspace\|Provisioned Space for VM | Provisioned space for VM.<br>Key: diskspace\|provisionedSpace |

| Metric Name | Description |
|---|---|
| Diskspace\|Snapshot Space (GB) | Space used by snapshots.<br>Key: diskspace\|snapshot |
| Diskspace\|Virtual machine used (GB) | Space used by virtual machine files in gigabytes.<br>Key: diskspace\|perDsUsed |
| Diskspace\|Active not shared | Unshared disk space used by VMs excluding snapshot.<br>Key: diskspace\|activeNotShared |

### Storage Metrics for Virtual Machines

Storage metrics provide information about storage use.

| Metric Name | Description |
|---|---|
| Storage\|Total IOPS | Average number of commands issued per second during the collection interval.<br>Key: storage\|commandsAveraged_average |
| Storage\|Contention (%) | Percent contention.<br>Key: storage\|contention |
| Storage\|Read Throughput (KBps) | Read throughput rate in kilobytes per second.<br>Key: storage\|read_average |
| Storage\|Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: storage\|numberReadAveraged_average |
| Storage\|Total Latency (ms) | Total latency in milliseconds.<br>Key: storage\|totalLatency_average |
| Storage\|Total Usage (KBps) | Total throughput rate in kilobytes per second.<br>Key: storage\|usage_average |
| Storage\|Write Throughput (KBps) | Write throughput rate in kilobytes per second.<br>Key: storage\|write_average |
| Storage\|Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: storage\|numberWriteAveraged_average |

### Summary Metrics for Virtual Machines

Summary metrics provide information about overall performance.

| Metric Name | Description |
|---|---|
| Summary\|Availability % | Displays the uptime of Guest OS, expressed as a percentage of the collection period.<br>Key: summary\|availability_kpi |
| Summary\|Running | Number of running virtual machines.<br>Key: summary\|running |
| Summary\|Desktop Status | Horizon view desktop status.<br>Key: summary\|desktop_status |

| Metric Name | Description |
|---|---|
| Summary\|Configuration\|Type | Indicates the type of virtual machine object based on which you can identify the type of virtual machine. The valid values for the virtual machine object property are:<br>• default - represents a regular virtual machine<br>• template - represents a powered off virtual machine template.<br>• srm_placeholder - represents a powered on VMware Live Recovery virtual machine.<br>• ft_primary - represents the primary Fault Tolerance virtual machine.<br>• ft_secondary - represents the secondary Fault Tolerance virtual machine.<br>Key: summary\|config\|type |
| Summary\|Guest Operating System\|Guest OS Full Name | Displays the guest operating system name.<br>Key: summary\|guest os full name |
| Summary\|Oversized\|Potential Memory | Displays the oversized potential memory.<br>Key: summary\|oversized\|potentialMemConsumed |
| Summary\|Undersized\|Potential CPU Usage | Displays the undersized potential CPU used.<br>Key: summary\|undersized\|potentialCpuUsage |
| Summary\|Undersized\|Potential Memory | Displays the undersized potential memory used.<br>Key: summary\|undersized\|potentialMemUsage |
| Reclaimable Idle | Boolean flag indicating whether VM is considered as reclaimable because it is in Idle state.<br>Key: summary\|idle |
| Reclaimable Powered Off | Boolean flag indicating whether VM is considered as reclaimable because it is in powered off state.<br>Key: summary\| poweredOff |
| Reclaimable Snapshot Space (GB) | Reclaimable snapshot space.<br>Key: summary\| snapshotSpace |

### Cost Metrics for Virtual Machines

Cost metrics provide information about the cost.

| Metric Name | Description |
|---|---|
| Monthly OS Labor Cost | Monthly operating system labor cost of the virtual machine.<br>Key: cost\|osLaborTotalCost |
| Monthly Projected Total Cost | Virtual machine cost projected for full month.<br>Key: Cost\|monthlyProjectedCost |
| Monthly VI Labor Cost | Monthly virtual infrastructure labor cost of the virtual machine.<br>Key: cost\|viLaborTotalCost |
| MTD Compute Total Cost | Total compute cost (including CPU and memory) of the virtual machine.<br>Key: cost\|compTotalCost |
| MTD CPU Cost | Month to Date Virtual Machine CPU Cost. It is based on utilization. The more the VM uses, the higher its cost.<br>Key: cost\|cpuCost |

| Metric Name | Description |
|---|---|
| MTD Monthly Cost | Month to date direct cost (comprising of OS labor, VI labor and any windows desktop instance license) of the virtual machine. It also comprises of the additional and application cost of the virtual machine.<br>Key: cost\|vmDirectCost |
| MTD Memory Cost | Month to Date Memory Cost of Virtual Machine. It is based on utilization. The more the VM uses, the higher its cost.<br>Key: cost\|memoryCost |
| MTD Storage Cost | Month to date storage cost of the virtual machine.<br>Key: cost\|storageCost |
| MTD Total Cost | Month to date total compute cost (including CPU and memory) of the virtual machine.<br>Key: cost\|monthlyTotalCost |
| Potential Savings | Reclaimable cost of VM for being either idle, powered-off, or having snapshots.<br>Key: cost\|reclaimableCost |
| Cost\|Allocation\|MTD VM CPU Cost (Currency) | Month to Date Virtual Machine CPU Cost computed based on resource overcommit ratio set for its parent cluster in policy.<br>cost\|allocation\|allocationBasedCpuMTDCost |
| Cost\|Allocation\|MTD VM Memory Cost (Currency) | Month to Date Virtual Machine CPU Memory cost computed based on resource overcommit ratio set for its parent cluster in policy.<br>cost\|allocation\|allocationBasedMemoryMTDCost |
| Cost\|Allocation\|MTD VM Storage Cost (Currency) | Month to Date Virtual Machine CPU Storage cost computed based on resource overcommit ratio set for its parent cluster (or datastore cluster) in policy.<br>cost\|allocation\|allocationBasedStorageMTDCost |
| Cost\|Allocation\|MTD VM Total Cost (Currency) | Month to Date Virtual Machine Total Cost is the summation of the CPU Cost, Memory Cost, Storage Cost and Direct Cost, based on overcommit ratios set in policy for the parent cluster or datastore cluster.<br>cost\|allocation\|allocationBasedTotalCost |
| Cost\|Effective Daily Cpu Cost (Currency) | Daily CPU cost of the selected virtual machine. |
| Cost\|Effective Daily Memory Cost (Currency) | Daily Memory cost of the selected virtual machine. |
| Cost\|Effective Daily Storage Cost (Currency) | Daily Storage cost of the selected virtual machine. |
| Cost\|Daily Additional Cost | Daily Additional cost of the selected virtual machine. |
| Cost\|Effective Daily Cost (Currency) | Effective Daily cost is the sum of effective daily CPU cost + effective daily memory cost + effective daily storage cost + daily additional cost. |
| Cost\|Effective MTD Cost (Currency) | Effective MTD cost is the sum of effective daily CPU cost from beginning of month until now + effective daily memory cost from beginning of month until now + effective daily storage cost from beginning of month until now + daily additional cost from beginning of month until now. |

## Virtual Hardware Metrics for Virtual Machines

| Metric Name | Description |
|---|---|
| Configuration\|Hardware\|Number of CPU cores per socket | This metric displays the number of CPU cores per socket. |
| Configuration\|Hardware\|Number of virtual CPUs | This metric displays the number of CPUs in the virtual machine. |
| Configuration\|Hardware\|Number of virtual sockets: | This metric displays the number of virtual sockets in the virtual machine. |
| Configuration\|Hardware\|Memory: | This metric displays the memory used in the virtual machine. |
| Configuration\|CPU Resource Allocation\|Limit | This metric displays the resource allocation limit of the virtual machine. |
| Configuration\|CPU Resource Allocation\|Reservation | This metric displays the reserved resources for the virtual machine. |
| Configuration\|CPU Resource Allocation\|Shares\| | This metric displays the shared resources for the virtual machine. |
| Summary\|Guest Operating System\|Tools Version | This metric displays the tools version of the guest operating system. |
| Summary\|Guest Operating System\|Tools Version Status | This metric displays the status of the tools in the guest operating system. |
| Summary\|Guest Operating System\|Tools Running Status | This metric displays whether the tools are functional in the guest operating system. |
| Guest File System:/boot\|Partition Capacity (GB) | This metric displays the boot partition capacity in the guest file system. |
| Guest File System:/boot\|Partition Utilization (%) | This metric displays the boot partition usage percentage in the guest file system. |
| Guest File System:/boot\|Partition Utilization (GB) | This metric displays the boot partition used in the guest file system. |
| Virtual Disk\|Configured | This metric displays the disk space of the configured virtual disk. |
| Virtual Disk\|Label | This metric displays the disk label of the configured virtual disk. |
| Disk Space\|Snapshot Space | This metric displays the snap shot details of the virtual machine. |
| Network\|IP Address | This metric displays the IP address of the virtual machine. |
| Network\|MAC Address | This metric displays the MAC address of the virtual machine. |

## Disabled Instanced Metrics

The instance metrics created for the following metrics are disabled in this version of VCF Operations. This means that these metrics collect data by default but all the instanced metrics created for these metrics, do not collect data by default.

| Metric Name |
|---|
| Configuration\|Hardware\|Number of virtual CPUs |
| CPU\|Ready (%) |
| CPU\|Usage (MHz) |
| Net\|Broadcast Packets Transmitted |
| Net\|Data Transmit Rate (KBps) |
| Net\|Data Receive Rate (KBps) |
| Net\|Multicast Packets Transmitted |
| Net\|Packets Dropped |
| Net\|Packets Dropped (%) |

| Metric Name |
|---|
| Net\|pnicByteRx_average |
| Net\|pnicByteTx_average |
| Net\|Transmitted Packets Dropped |
| Net\|Usage Rate (KBps) |
| VirtualDisk\|Read IOPS |
| VirtualDisk\|Read Latency (ms) |
| VirtualDisk\|Read Throughput (KBps) |
| VirtualDisk\|Total IOPS |
| VirtualDisk\|Total Latency |
| VirtualDisk\|Total Throughput (KBps) |
| Virtual Disk\|Used Disk Space (GB) |
| VirtualDisk\|Write IOPS |
| VirtualDisk\|Write Latency (ms) |
| VirtualDisk\|Write Throughput (KBps) |
| Datastore\|Outstanding IO requests |
| Datastore\|Read IOPS |
| Datastore\|Read Latency (ms) |
| Datastore\|Read Throughput (KBps) |
| Datastore\|Total IOPS |
| Datastore\|Total Latency (ms) |
| Datastore\|Total Throughput (KBps) |
| Datastore\|Write IOPS |
| Datastore\|Write Latency (ms) |
| Datastore\|Write Throughput (KBps) |
| Disk\|Total IOPS |
| Disk\|Total Throughput (KBps) |
| Disk\|Read Throughput KBps) |
| Disk\|Write Throughput (KBps) |
| Diskspace\|Access Time (ms) |
| Diskspace\|Virtual machine used (GB) |

**Disabled Metrics**

The following metrics are disabled in this version of VCF Operations. This means that they do not collect data by default.

You can enable these metrics in the Policy workspace. For more information, in VMware Docs search for Collect Metrics and Properties Details.

You can enable these metrics in the Policy workspace.

| Metric Name | Description |
|---|---|
| CPU\|50% of Recommended number of vCPUs to Remove | This metric is superseded by the capacity engine. cpu\|numberToRemove50Pct |
| CPU\|Capacity entitlement (mhz) | cpu\|capacity_entitlement |

| Metric Name | Description |
|---|---|
| CPU\|Co-stop (msec) | Use the Co-Stop (%) metric instead of this metric.<br>cpu\|costop_summation |
| CPU\|Demand Over Capacity (mhz) | cpu\|demandOverCapacity |
| CPU\|Demand Over Limit (mhz) | Use Contention (%) metric instead of this metric.<br>cpu\|demandOverLimit |
| CPU\|Dynamic entitlement | cpu\|dynamic_entitlement |
| CPU\|Estimated entitlement | cpu\|estimated_entitlement |
| CPU\|Idle (%) | cpu\|idlePct |
| CPU\|Idle (msec) | cpu\|idle_summation |
| CPU\|Other Wait (msec) | cpu\|otherwait |
| CPU\|Normalized Co-stop (%) | Use the Co-Stop (%) metric instead of this metric.<br>cpu\|perCpuCoStopPct |
| CPU\|Provisioned vCPU(s) (Cores) | cpu\|corecount_provisioned |
| CPU\|Ready (msec) | Choose the Use Ready (%) metric instead of this metric.<br>cpu\|ready_summation |
| CPU\|Recommended Size Reduction (%) | cpu\|sizePctReduction |
| CPU\|Swap Wait (msec) | cpu\|swapwait_summation |
| CPU\|Total Wait (msec) | cpu\|wait |
| CPU\|Used (msec) | cpu\|used_summation |
| CPU\|Wait (msec) | cpu\|wait_summation |
| Datastore I/O\|Max Observed Number of Outstanding IO Operations | datastore\|maxObserved_OIO |
| Datastore I/O\|Max Observed Read Rate (kbps) | datastore\|maxObserved_Read |
| Datastore I/O\|Max Observed Reads per second | datastore\|maxObserved_NumberRead |
| Datastore I/O\|Max Observed Write Rate (kbps) | datastore\|maxObserved_Write |
| Datastore I/O\|Max Observed Writes per second | datastore\|maxObserved_NumberWrite |
| Disk Space\|Not Shared (gb) | diskspace\|notshared |
| Disk Space\|Number of Virtual Disks | diskspace\|numvmdisk |
| Disk Space\|Shared Used (gb) | diskspace\|shared |
| Disk Space\|Total disk space used (gb) | diskspace\|total_usage |
| Disk Space\|Total disk space (gb) | diskspace\|total_capacity |
| Disk Space\|Virtual Disk Used (gb) | diskspace\|diskused |
| Guest File System stats\|Total Guest File System Free (gab) | guestfilesystem\|freespace_total |
| Guest\|Active File Cache Memory (kb) | guest\|mem.activeFileCache_latest |
| Guest\|Context Swap Rate per second | guest\|contextSwapRate_latest |
| Guest\|Huge Page Size (kb) | guest\|hugePage.size_latest |
| Guest\|Page Out Rate per second | guest\|page.outRate_latest |
| Guest\|Total Huge Pages | guest\|hugePage.total_latest |
| Memory\|50% of Reclaimable Memory Capacity (gb) | This metric is superseded by the capacity engine.<br>mem\|wasteValue50PctInGB |
| Memory\|Balloon (kb) | mem\|vmmemctl_average |
| Memory\|Demand Over Capacity | mem\|demandOverCapacity |
| Memory\|Demand Over Limit | mem\|demandOverLimit |

| Metric Name | Description |
|---|---|
| Memory\|Granted (kb) | mem\|granted_average |
| Memory\|Guest Active (kb) | mem\|active_average |
| Memory\|Guest Dynamic Entitlement (kb) | mem\|guest_dynamic_entitlement |
| Memory\|Guest Workload (%) | mem\|guest_workload |
| Memory\|Host Demand with Reservation (kb) | mem\|host_demand_reservation |
| Memory\|Host Dynamic Entitlement (kb) | mem\|host_dynamic_entitlement |
| Memory\|Host Usage (kb) | mem\|host_usage |
| Memory\|Host Workload (%) | mem\|host_workload |
| Memory\|Latency (%) | Use the Memory Contention (%) metric instead of this metric.<br>mem\|latency_average |
| Memory\|Recommended Size Reduction (%) | mem\|sizePctReduction |
| Memory\|Shared (kb) | mem\|shared_average |
| Memory\|Swap Out Rate (kbps) | mem\|swapoutRate_average |
| Memory\|Usage (%) | mem\|usage_average |
| Memory\|Estimated entitlement | mem\|estimated_entitlement |
| Network I/O\|Data Receive Demand Rate (kbps) | net\|receive_demand_average |
| Network I/O\|Data Transmit Demand Rate (kbps) | net\|transmit_demand_average |
| Network I/O\|VM to Host Data Receive Rate (kbps) | net\|host_received_average |
| Network I/O\|VM to Host Data Transmit Rate (kbps) | net\|host_transmitted_average |
| Network I/O\|VM to Host Max Observed Received Throughput (kbps) | net\|host_maxObserved_Rx_KBps |
| Network I/O\|VM to Host Max Observed Throughput (kbps) | net\|host_maxObserved_KBps |
| Network I/O\|VM to Host Max Observed Transmitted Throughput (kbps) | net\|host_maxObserved_Tx_KBps |
| Network I/O\|VM to Host Usage Rate (kbps) | net\|host_usage_average |
| Network\|bytesRx (kbps) | net\|bytesRx_average |
| Network\|bytesTx (kbps) | net\|bytesTx_average |
| Network\|Demand (%) | Use absolute numbers instead of this metric.<br>net\|demand |
| Network\|I/O Usage Capacity | net\|usage_capacity |
| Network\|Max Observed Received Throughput (kbps) | net\|maxObserved_Rx_KBps |
| Network\|Max Observed Throughput (kbps) | net\|maxObserved_KBps |
| Network\|Max Observed Transmitted Throughput (kbps) | net\|maxObserved_Tx_KBps |
| Network\|Packets Received per second | net\|packetsRxPerSec |
| Network\|Packets Transmitted per second | net\|packetsTxPerSec |
| Network\|Received Packets Dropped | net\|droppedRx_summation |
| Storage\|Demand (kbps) | storage\|demandKBps |
| Storage\|Read Latency (msec) | storage\|totalReadLatency_average |
| Storage\|Write Latency (msec) | storage\|totalWriteLatency_average |
| Summary\|CPU Shares | summary\|cpu_shares |
| Summary\|Memory Shares | summary\|mem_shares |
| Summary\|Number of Datastores | summary\|number_datastore |
| Summary\|Number of Networks | summary\|number_network |

| Metric Name | Description |
|---|---|
| Summary\|Workload Indicator | summary\|workload_indicator |
| System\|Build Number | sys\|build |
| System\|Heartbeat | sys\|heartbeat_summation |
| System\|Product String | sys\|productString |
| System\|Uptime (sec) | sys\|uptime_latest |
| System\|vMotion Enabled | vMotion should be enabled for all. It is not necessary to track all VMs every five minutes.<br>sys\|vmotionEnabled |

## Host System Metrics

VCF Operations collects many metrics for host systems, including CPU use, datastore, disk, memory, network, storage, and summary metrics for host system objects.

Capacity metrics can be calculated for host system objects. See Capacity Analytics Generated Metrics.

### GPU Metrics

GPU metrics provide information about the GPU usage and performance.

| Metric Name | Description |
|---|---|
| **Metrics Aggregated at Host Level** | |
| GPU\|Compute Utilization (%) | The compute utilization percentage of a GPU. |
| GPU\|Memory Usage (%) | Memory currently in use as a percentage of total available memory. |
| GPU\|Memory Used (KB) | The amount of GPU memory used in kilobytes. |
| GPU\|Number of GPUs | Number of GPUs. |
| GPU\|Total Memory (KB) | Total memory in kilobytes. |
| **GPU Level Metrics** | |
| GPU\|<GPU-ID>\|Compute Utilization (%) | The compute utilization percentage of a GPU. |
| GPU\|<GPU-ID>\|Memory Usage (%) | Memory currently in use as a percentage of total available memory. |
| GPU\|<GPU-ID>\|Memory Used (KB) | The amount of GPU memory used in kilobytes. |
| GPU\|<GPU-ID>\|Memory Reserved (KB) | The amount of GPU memory reserved in kilobytes. |
| GPU\|<GPU-ID>\|Total Memory (KB) | Total memory in kilobytes. |
| GPU\|<GPU-ID>\|Temperature (Celsius) | The temperature of a GPU in degrees Celsius. |
| GPU\|<GPU-ID>\|Power Used (Watt) | The power used by a GPU in watts. |
| GPU:GPU-id\|GPU Compute Usage (MHz) | Total MHZ currently consumed by workloads (note time delay). |
| GPU:GPU-id\|GPU Compute Limit (MHz) | Total MHZ available on the GPU. |
| GPU:GPU-id\|GPU Compute Demand (MHz) | MHZ requested for a GPU over time. |
| GPU:GPU-id\|GPU Memory Demand (MHz) | KB requested over time. |
| GPU\|Number of vGPU Configured VM-s | Sum of GPU configured VMs. |

### Host System Metrics for ROI Dashboard

Host system metrics provide information about cost saving across vCenters

| Metric Name | Description |
|---|---|
| Cost\|Monthly Additional Total Cost | This metric shows the total sum of additional cost across all the vCenters for an entire month.<br>Key: cost\|additionalTotalCost |

### Configuration Metrics for Host Systems

Configuration metrics provide information about host system configuration.

| Metric Name | Description |
|---|---|
| Configuration\|Hyperthreading\|Active | Displays the hyperthreading status of the host.<br>Key: configuration\|hypwerthreading\|active |
| Configuration\|Hyperthreading\|Available | Displays whether the hyperthreading option is available for this host.<br>Key: configuration\|hypwerthreading\|available |
| Configuration\|Storage Device\|Multipath Info\|Total number of Active Path | Displays the amount of active path information for the storage device<br>Key: configuration\|storagedevice\|multipathinfo\|total numberofActive path |
| Configuration\|Storage Device\|Total number of path | Displays the total number of path for the storage device.<br>Key: configuration\|storagedevice\|total number of path |
| Configuration\|Failover Hosts | Failover Hosts.<br>Key: configuration\|dasConfig\|admissionControlPolicy\|failoverHost |

### Hardware Metrics for Host Systems

Hardware metrics provide information about host system hardware.

| Metric Name | Description |
|---|---|
| Hardware\|Number of CPUs | Number of CPUs for a host.<br>Key: hardware\|cpuinfo\|num_CpuCores |
| Hardware\|ServiceTag | Displays the service tag of the host system.<br>Key: hardware\|servicetag |

### CPU Usage Metrics for Host Systems

CPU usage metrics provide information about CPU use.

| Metric Name | Description |
|---|---|
| CPU\|Capacity Usage (%) | Percent CPU capacity used.<br>Key: cpu\|capacity_usagepct_average |
| CPU\|Usage (%) | Average CPU usage as a percentage.<br>Key: cpu\|usage_average |

| Metric Name | Description |
|---|---|
| CPU\|CPU Contention (%) | This metric indicates the percentage of time the virtual machines in the ESX hosts are unable to run because they are contending for access to the physical CPU(s). This is the average number of all VMs. Naturally, the number will be lower than the highest number experienced by the worst hit VM (a VM that suffers the highest CPU contention).<br>Use this metric to verify if the host is able to serve all of its VMs well.<br>When using this metric, ensure the number is within your expectation. The metric is affected by several factors so you need to watch both relative numbers and absolute numbers. Relative means a drastic change in value. This indicates that the ESX is unable to service its VMs.<br>Absolute means that the real value is high and should be checked. One factor that impacts the CPU contention metric is CPU Power Management. If CPU Power Management clocks down the CPU speed from 3 GHz to 2 GHz that reduction in speed is taken into consideration. This is because the VM is not running at full speed.<br>Key: cpu\|capacity_contentionPct |
| CPU\|Demand (%) | This metric shows the percentage of CPU resources all the VMs would use if there was no CPU contention or any CPU limits set. It represents the average active CPU load for the past five minutes.<br>Keep the number of this metric below 100% if you set Power Management to Maximum.<br>Key: cpu\|demandPct |
| CPU\|Demand (MHz) | CPU demand in megahertz. CPU utilization level based on descendant Virtual Machines utilization. Includes limits and overhead to run Virtual Machines, but not reservations.<br>Key: cpu\|demandmhz |
| CPU\|IO Wait (ms) | IO wait time in milliseconds.<br>Key: cpu\|iowait |
| CPU\|Number of CPU Sockets | Number of CPU sockets.<br>Key: cpu\|numpackages |
| CPU\|Overall CPU Contention (ms) | Overall CPU contention in milliseconds.<br>Key: cpu\|capacity_contention |
| CPU\|Provisioned Capacity (MHz) | Capacity in MHz of the physical CPU cores.<br>Key: cpu\|capacity_provisioned |
| CPU\|Provisioned virtual CPUs | Provisioned virtual CPUs.<br>Key: cpu\|corecount_provisioned |
| CPU\|Total Wait | CPU time spent in idle state.<br>Key: cpu\|wait |
| CPU\|Demand | CPU demand.<br>Key: cpu\|demand_average |
| CPU\|Usage (MHz) | CPU use in megahertz.<br>Key: cpu\|usagemhz_average |
| CPU\|Reserved Capacity (MHz) | The sum of the reservation properties of the (immediate) children of the host's root resource pool.<br>Key: cpu\|reservedCapacity_average |

| Metric Name | Description |
|---|---|
| CPU\|Total Capacity (MHz) | Total CPU capacity in megahertz. Amount of CPU resources configured on the ESX hosts.<br>Key: cpu\|capacity_provisioned |
| CPU\|Overhead (KB) | Amount of CPU overhead.<br>Key: cpu\|overhead_average |
| CPU\|Demand without overhead | Value of demand excluding any overhead.<br>Key: cpu\|demand_without_overhead |
| CPU\|Core Utilization (%) | Percent core utilization.<br>Key: cpu\|coreUtilization_average |
| CPU\|Utilization(%) | Percent CPU utilization.<br>Key: cpu\|utilization_average |
| CPU\|Core Utilization (%) | Core Utilization.<br>Key: cpu\|coreUtilization_average |
| CPU\|Utilization (%) | Utilization.<br>Key: cpu\|utilization_average |
| CPU\|Co-stop (ms) | Time the VM is ready to run, but is unable to due to co-scheduling constraints.<br>Key: cpu\|costop_summation |
| CPU\|Latency (%) | Percentage of time the VM is unable to run because it is contending for access to the physical CPUs.<br>Key: cpu\|latency_average |
| CPU\|Ready (ms) | Time spent in ready state.<br>Key: cpu\|ready_summation |
| CPU\|Run (ms) | Time the virtual machine is scheduled to run.<br>Key: cpu\|run_summation |
| CPU\|Swap wait (ms) | Amount of time waiting for swap space.<br>Key: cpu\|swapwait_summation |
| CPU\|Wait (ms) | Total CPU time spent in wait state.<br>Key: cpu\|wait_summation |
| CPU\|Provisioned Capacity | Provisioned capacity (MHz).<br>Key: cpu\|vm_capacity_provisioned |
| CPU\|Active Host Load For Balance (Long Term) | Active Host Load For Balance (Long Term).<br>Key: cpu\|acvmWorkloadDisparityPcttive_longterm_load |
| CPU\|Active Host Load For Balance (Short Term) | Active Host Load For Balance (Short Term).<br>Key: cpu\|active_shortterm_load |
| CPU\| CPU Model | Displays the host's CPU model.<br>Key: cpu\|cpu model |
| CPU\|Peak CPU Core Usage | The highest CPU Usage among the CPU cores. A constantly high number indicates that one or more physical cores have high utilization.<br>Key: cpu\|peak_cpu_core_usage |

## CPU Utilization for Resources Metrics for Host Systems

CPU utilization for resources metrics provide information about CPU activity.

| Metric Name | Description |
|---|---|
| Rescpu\|CPU Active (%) (*interval*) | Average active time for the CPU over the past minute, past five minutes, and at one-minute, five-minute, and 15-minute peak active times.<br>Key:<br>rescpu\|actav1_latest<br>rescpu\|actav5_latest<br>rescpu\|actav15_latest<br>rescpu\|actpk1_latest<br>rescpu\|actpk5_latest<br>rescpu\|actpk15_latest |
| Rescpu\|CPU Running (%) (*interval*) | Average run time for the CPU over the past minute, past five minutes, past 15 minutes, and at one-minute, five-minute, and 15-minute peak times.<br>Key:<br>rescpu\|runav1_latest<br>rescpu\|runav5_latest<br>rescpu\|runav15_latest<br>rescpu\|runpk1_latest<br>rescpu\|runpk5_latest<br>rescpu\|runpk15_latest |
| Rescpu\|CPU Throttled (%) (*interval*) | Scheduling limit over the past minute, past five minutes, and past 15 minutes.<br>Key:<br>rescpu\|maxLimited1_latest<br>rescpu\|maxLimited5_latest<br>rescpu\|maxLimited15_latest |
| Rescpu\|Group CPU Sample Count | Group CPU sample count.<br>Key: rescpu\|sampleCount_latest |
| Rescpu\|Group CPU Sample Period (ms) | Group CPU sample period in milliseconds.<br>Key: rescpu\|samplePeriod_latest |

## Datastore Metrics for Host Systems

Datastore metrics provide information about datastore use.

| Metric Name | Description |
|---|---|
| Datastore\|Outstanding IO requests | OIO for datastore.<br>Key: datastore\|demand_oio |
| Datastore\|Commands Averaged | Average number of commands issued per second during the collection interval.<br>Key: datastore\|commandsAveraged_average |
| Datastore\|Number of Outstanding IO Operations | Number of outstanding IO operations.<br>Key: datastore\|oio |
| Datastore\|Total Latency (ms) | The average amount of time taken for a command from the perspective of a Guest OS. This is the sum of Kernel Command Latency and Physical Device Command Latency.<br>Key: datastore\|totalLatency_average |

| Metric Name | Description |
|---|---|
| Datastore\|Total Throughput (KBps) | Usage Average (KBps).<br>Key: datastore\|usage_average |
| Datastore\|Demand | Demand.<br>Key: datastore\|demand |
| Datastore\|Storage I/O Control aggregated IOPS | Aggregate number of IO operations on the datastore.<br>Key: datastore\|datastoreIops_average |
| Datastore\|Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: datastore\|numberReadAveraged_average |
| Datastore\|Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: datastore\|numberWriteAveraged_average |
| Datastore\|Read Throughput (KBps) | Rate of reading data from the datastore in kilobytes per second.<br>Key: datastore\|read_average |
| Datastore\|Storage I/O Control normalized latency (ms) | Normalized latency in microseconds on the datastore. Data for all virtual machines is combined.<br>Key: datastore\|sizeNormalizedDatastoreLatency_average |
| Datastore\|Read Latency (ms) | Average amount of time for a read operation from the datastore. Total latency = kernel latency + device latency.<br>Key: datastore\|totalReadLatency_average |
| Datastore\|Write Latency (ms) | Average amount of time for a write operation to the datastore. Total latency = kernel latency + device latency.<br>Key: datastore\|totalWriteLatency_average |
| Datastore\|Write Throughput (KBps) | Rate of writing data to the datastore in kilobytes per second.<br>Key: datastore\|write_average |
| Datastore\|Max Queue Depth | Max Queue Depth.<br>Key: datastore\|datastoreMaxQueueDepth_latest |
| Datastore\|Highest Latency | Highest Latency.<br>Key: datastore\|maxTotalLatency_latest |
| Datastore\|Total Latency Max | Total Latency Max (ms).<br>Key: datastore\|totalLatency_max |
| Datastore\|Read Latency | Read Latency.<br>Key: datastore\|datastoreNormalReadLatency_latest |
| Datastore\|Write Latency | Write Latency.<br>Key: datastore\|datastoreNormalWriteLatency_latest |
| Datastore\|Data Read | Data Read.<br>Key: datastore\|datastoreReadBytes_latest |
| Datastore\|Data Read Rate | Data Rate.<br>Key: datastore\|datastoreReadIops_latest |
| Datastore\|Read Load | Storage DRS metric read load.<br>Key: datastore\|datastoreReadLoadMetric_latest |
| Datastore\|Outstanding Read Requests | Outstanding Read Requests.<br>Key: datastore\|datastoreReadOIO_latest |
| Datastore\|Data Written | Data Written.<br>Key: datastore\|datastoreWriteBytes_latest |
| Datastore\|Data Write Rate | Data Write Rate.<br>Key: datastore\|datastoreWriteIops_latest |

| Metric Name | Description |
|---|---|
| Datastore\|Write Load | Storage DRS metric write load.<br>Key: datastore\|datastoreWriteLoadMetric_latest |
| Datastore\|Outstanding Write Requests | Outstanding Write Requests.<br>Key: datastore\|datastoreWriteOIO_latest |
| Datastore\|VM Disk I/O Workload Disparity | Percentage Disk I/O workload disparity among the VMs on the Host.<br>Key: datastore\|vmWorkloadDisparityPc |
| Datastore\|Peak Datastore Read Latency | The highest read latency among the datastores. A high number indicates that one or more datastores are experiencing poor performance.<br>Key: datastore\|peak_datastore_readLatency |
| Datastore\|Peak Datastore Write Latency | The highest write latency among the datastores. A high number indicates that one or more datastores are experiencing poor performance.<br>Key: datastore\|peak_datastore_writeLatency |

### Disk Metrics for Host Systems

Disk metrics provide information about disk use.

| Metric Name | Description |
|---|---|
| Disk\|Total Throughput (KBps) | Average of the sum of the data read and written for all of the disk instances of the host or virtual machine.<br>disk\|usage_average |
| Disk\|I/O Usage Capacity | This metric is a function of storage\|usage_average and disk\|workload. storage\|usage_average is an average over all storage devices. This means that disk\|usage_capacity is not specific to the selected VM or the host of the VM.<br>Key: disk\|usage_capacity |
| Disk\|Total IOPS | Average number of commands issued per second during the collection interval.<br>Key: disk\|commandsAveraged_average |
| Disk\|Total Latency (ms) | The average amount of time taken for a command from the perspective of a Guest OS. This is the sum of Kernel Command Latency and Physical Device Command Latency.<br>Key: disk\|totalLatency_average |
| Disk\|Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: disk\|numberReadAveraged_average |
| Disk\|Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: disk\|numberWriteAveraged_average |
| Disk\|Read Throughput (KBps) | Amount of data read in the performance interval.<br>Key: disk\|read_average |
| Disk\|Write Throughput (KBps) | Amount of data written to disk in the performance interval.<br>Key: disk\|write_average |
| Disk\|Bus Resets | The number of bus resets in the performance interval.<br>Key: disk\|busResets_summation |

| Metric Name | Description |
|---|---|
| Disk\|Read Latency (ms) | The average amount of time taken for a read from the perspective of a Guest OS. This is the sum of Kernel Read Latency and Physical Device Read Latency.<br>Key: disk\|totalReadLatency_average |
| Disk\|Write Latency (ms) | The average amount of time taken for a write from the perspective of a Guest OS. This is the sum of Kernel Write Latency and Physical Device Write Latency.<br>Key: disk\|totalWriteLatency_average |
| Disk\|Physical Device Latency (ms) | The average time taken to complete a command from the physical device.<br>Key: disk\|deviceLatency_average |
| Disk\|Kernel Latency (ms) | The average time spent in ESX Server VMKernel per command.<br>Key: disk\|kernelLatency_average |
| Disk\|Queue Latency (ms) | The average time spent in the ESX Server VMKernel queue per command.<br>Key: disk\|queueLatency_average |
| Disk\|Number of Outstanding IO Operations | Number of Outstanding IO Operations.<br>Key: disk\|diskoio |
| Disk\|Queued Operations | Queued Operations.<br>Key: disk\|diskqueued |
| Disk\|Demand | Demand.<br>Key: disk\|diskdemand |
| Disk\|Total Queued Outstanding operations | Sum of Queued Operation and Outstanding Operations.<br>Key: disk\|sum_queued_oio |
| Disk\|Max Observed OIO | Max Observed IO for a disk.<br>Key: disk\|max_observed |
| Disk\|Highest Latency | Highest Latency.<br>Key: disk\|maxTotalLatency_latest |
| Disk\|Max Queue Depth | Maximum queue depth during the collection interval.<br>Key: disk\|maxQueueDepth_average |
| Disk\|SCSI Reservation Conflicts | SCSI Reservation Conflicts.<br>Key: disk\|scsiReservationConflicts_summation |

## Memory Metrics for Host Systems

Memory metrics provide information about memory use and allocation.

| Metric Name | Description |
|---|---|
| Mem\|Contention (%) | This metric is used to monitor ESX memory usage.<br>When the value is high, it means the ESX is using a good percentage of available memory. You may need to add more memory to other memory-related metrics.<br>Key: mem\|host_contentionPct |
| Mem\|Contention (KB) | Host contention in kilobytes.<br>Key: mem\|host_contention |
| Mem\|Host Usage (KB) | Machine usage in kilobytes.<br>Key: mem\|host_usage |
| Mem\|Machine Demand (KB) | Host demand in kilobytes.<br>Key: mem\|host_demand |

| Metric Name | Description |
|---|---|
| Mem\|Overall Memory used to run VMs on Host (KB) | Overall memory used to run virtual machines on the host in kilobytes.<br>Key: mem\|host_usageVM |
| Mem\|Provisioned Memory (KB) | Provisioned memory in kilobytes.<br>Key: mem\|host_provisioned |
| Mem\|Minimum Free Memory (KB) | Minimum free memory.<br>Key: mem\|host_minfree |
| Mem\|Reserved Capacity (%) | Percent reserved capacity.<br>Key: mem\|reservedCapacityPct |
| Mem\|Usable Memory (KB) | Usable memory in kilobytes.<br>Key: mem\|host_usable |
| Mem\|Usage (%) | Memory currently in use as a percentage of total available memory.<br>Key: mem\|host_usagePct |
| Mem\|ESX System Usage | Memory usage by the VMkernel and ESX user-level services.<br>Key: mem\|host_systemUsage |
| Mem\|Guest Active (KB) | Amount of memory that is actively used.<br>Key: mem\|active_average |
| Mem\|Consumed (KB) | Amount of host memory consumed by the virtual machine for guest memory.<br>Key: mem\|consumed_average |
| Mem\|Granted (KB) | Amount of memory available for use.<br>Key: mem\|granted_average |
| Mem\|Heap (KB) | Amount of memory allocated for heap.<br>Key: mem\|heap_average |
| Mem\|Heap Free (KB) | Amount of free space in the heap.<br>Key: mem\|heapfree_average |
| Mem\|VM Overhead (KB) | Memory overhead reported by host.<br>Key: mem\|overhead_average |
| Mem\|Reserved Capacity (KB) | Sum of memory reserved by consumers - Resource Pools (RP) and powered on VMs that are not in Resource Pools. RP reservations at the vCenter level are distributed to the hosts depending on the number of powered on VMs and their entitlement within the RP.<br>Key: mem\|reservedCapacity_average |
| Mem\|Shared (KB) | Amount of shared memory in kilobytes.<br>Key: mem\|shared_average |
| Mem\|Shared Common (KB) | Amount of shared common memory in kilobytes.<br>Key: mem\|sharedcommon_average |
| Mem\|Swap In (KB) | Amount of memory swapped in.<br>Key: mem\|swapin_average |
| Mem\|Swap Out KB) | Amount of memory swapped out.<br>Key: mem\|swapout_average |
| Mem\|Swap Used (KB) | Amount of memory used for swapped space in kilobytes.<br>Key: mem\|swapused_average |
| Mem\|VM kernel Usage (KB) | Amount of memory used by the VM kernel.<br>Key: mem\|sysUsage_average |
| Mem\|Unreserved (KB) | Amount of unreserved memory in kilobytes.<br>Key: mem\|unreserved_average |

| Metric Name | Description |
|---|---|
| Mem\|Balloon (KB) | This metric shows the total amount of memory currently used by the VM memory control. This memory was reclaimed from the respective VMs at some point in the past, and was not returned.<br>Use this metric to monitor how much VM memory has been reclaimed by ESX through memory ballooning.<br>The presence of ballooning indicates the ESX has been under memory pressure. The ESX activates ballooning when consumed memory reaches a certain threshold.<br>Look for increasing size of ballooning. This indicates that there has been a shortage of memory more than once. Look for size fluctuations which indicate the ballooned out page was actually required by the VM. This translates into a memory performance problem for the VM requesting the page, since the page must first be brought back from the disk.<br>Key: mem\|vmmemctl_average |
| Mem\|Zero (KB) | Amount of memory that is all zero.<br>Key: mem\|zero_average |
| Mem\|State (0-3) | Overall state of the memory. The value is an integer between 0 (high) and 3 (low).<br>Key: mem\|state_latest |
| Mem\|Usage (KB) | Host memory use in kilobytes.<br>Key: mem\|host_usage |
| Mem\|Usage (%) | Memory currently in use as a percentage of total available memory.<br>Key: mem\|usage_average |
| Mem\|Swap In Rate (KBps) | Rate at which memory is swapped from disk into active memory during the interval in kilobyte per second.<br>Key: mem\|swapinRate_average |
| Mem\|Swap Out Rate (KBps) | Rate at which memory is being swapped from active memory to disk during the current interval in kilobytes per second.<br>Key: mem\|swapoutRate_average |
| Mem\|Active Write (KB) | Average active writes in kilobytes.<br>Key: mem\|activewrite_average |
| Mem\|Compressed (KB) | Average memory compression in kilobytes.<br>Key: mem\|compressed_average |
| Mem\|Compression Rate (KBps) | Average compression rate in kilobytes per second.<br>Key: mem\|compressionRate_average |
| Mem\|Decompression Rate (KBps) | Decompression rate in kilobytes per second.<br>Key: mem\|decompressionRate_average |
| Mem\|Total Capacity (KB) | Sum of the amount of physical memory configured on ESX hosts of the cluster in KB.<br>Key: mem\|host_provisioned |
| Mem\|Latency | Percentage of time the VM is waiting to access swapped or compressed memory.<br>Key: mem\|latency_average |
| Mem\|Capacity Contention | Capacity Contention.<br>Key: mem\|capacity.contention_average |
| Mem\|Swap In Rate from Host Cache | Rate at which memory is being swapped from host cache into active memory.<br>Key: mem\|llSwapInRate_average |

| Metric Name | Description |
|---|---|
| Mem\|Swap In from Host Cache | Amount of memory swapped-in from host cache.<br>Key: mem\|llSwapIn_average |
| Mem\|Swap Out Rate to Host Cache | Rate at which memory is being swapped to host cache from active memory.<br>Key: mem\|llSwapOutRate_average |
| Mem\|Swap Out to Host Cache | Amount of memory swapped-out to host cache.<br>Key: mem\|llSwapOut_average |
| Mem\|Swap Space Used in Host Cache | Space used for caching swapped pages in the host cache.<br>Key: mem\|llSwapUsed_average |
| Mem\|Low Free Threshold | Threshold of free host physical memory below which ESX begins to reclaim memory from VMs through ballooning and swapping.<br>Key: mem\|lowfreethreshold_average |
| Mem\|VM Memory Workload Disparity | Percentage Memory workload disparity among the VMs on the Host.<br>Key: mem\|vmWorkloadDisparityPct |
| Mem\|Active Host Load For Balance (Long Term) | Active Host Load For Balance (Long Term).<br>Key: mem\|active_longterm_load |
| Mem\|Active Host Load For Balance (Short Term) | Active Host Load For Balance (Short Term).<br>Key: mem\|active_shortterm_load |
| Mem\|Utilization | Memory utilization level based on descendant Virtual Machines utilization. Includes reservations, limits and overhead to run Virtual Machines<br>Key: mem\|total_need |

### Network Metrics for Host Systems

Network metrics provide information about network performance.

| Metric Name | Description |
|---|---|
| Network\|Driver | This metric displays the type of network driver.<br>Key: net\|driver |
| Network\|Speed | This metric displays the network speed.<br>Key: net\|speed |
| Network\|Management Address | This metric displays the management address of the host network.<br>Key: net\|management address |
| Network\|IP Address | This metric displays the IP address of the host network.<br>Key: net\|IPaddress |
| Net\|Packets Transmitted per second | This metric shows the number of packets transmitted during the collection interval.<br>Key: net\|packetsTxPerSec |
| Net\|Packets per second | Number of packets transmitted and received per second.<br>Key: net\|packetsPerSec |
| Net\|Total Throughput (KBps) | The sum of the data transmitted and received for all the NIC instances of the host or virtual machine.<br>Key: net\|usage_average |
| Net\|I/O Usage Capacity | I/O Usage Capacity.<br>Key: net\|usage_capacity |

| Metric Name | Description |
|---|---|
| Net\|Data Transmit Rate (KBps) | Average amount of data transmitted per second.<br>Key: net\|transmitted_average |
| Net\|Data Receive Rate (KBps) | Average amount of data received per second.<br>Key: net\|received_average |
| Net\|Packets Received | Number of packets received in the performance interval.<br>Key: net\|packetsRx_summation |
| Net\|Packets Transmitted | Number of packets transmitted in the performance interval.<br>Key: net\|packetsTx_summation |
| Net\|Broadcast Packets Received | Number of broadcast packets received during the sampling interval.<br>Key: net\|broadcastRx_summation |
| Net\|Broadcast Packets Transmitted | Number of broadcast packets transmitted during the sampling interval.<br>Key: net\|broadcastTx_summation |
| Net\|Error Packets Transmitted | Number of packets with errors transmitted.<br>Key: net\|errorsTx_summation |
| Net\|Multicast Packets Received | Number of multicast packets received.<br>Key: net\|multicastRx_summation |
| Net\|Multicast Packets Transmitted | Number of multicast packets transmitted.<br>Key: net\|multicastTx_summation |
| Net\|FT Throughput Usage | FT Throughput Usage.<br>Key: net\|throughput.usage.ft_average |
| Net\|HBR Throughput Usage | HBR Throughput Usage.<br>Key: net\|throughput.usage.hbr_average |
| Net\|iSCSI Throughput Usage | iSCSI Throughput Usage.<br>Key: net\|throughput.usage.iscsi_average |
| Net\|NFS Throughput Usage | NFS Throughput Usage.<br>Key: net\|throughput.usage.nfs_average |
| Net\|VM Throughput Usage | VM Throughput Usage.<br>Key: net\|throughput.usage.vm_average |
| Net\|vMotion Throughput Usage | vMotion Throughput Usage.<br>Key: net\|throughput.usage.vmotion_average |
| Net\|Unknown Protocol Frames Received | Number of frames with unknown protocol received.<br>Key: net\|unknownProtos_summation |

### System Metrics for Host Systems

System metrics provide information about the amount of CPU that resources and other applications use.

| Metric Name | Description |
|---|---|
| Sys\|Power On | 1 if the host system is powered on, 0 if the host system is powered off, or -1 if the power state is unknown.<br>Key: sys\|poweredOn |
| Sys\|Uptime (seconds) | Number of seconds since the last system startup.<br>Key: sys\|uptime_latest |
| Sys\|Disk Usage (%) | Percent disk use.<br>Key: sys\|diskUsage_latest |

| Metric Name | Description |
|---|---|
| Sys\|Resource CPU Usage (MHz) | Amount of CPU that the Service Console and other applications use.<br>Key: sys\|resourceCpuUsage_average |
| Sys\|Resource CPU Active (1 min. average) | Percentage of resource CPU that is active. Average value during a one-minute period.<br>Key: sys\|resourceCpuAct1_latest |
| Sys\|Resource CPU Active (%) (5 min. average) | Percentage of resource CPU that is active. Average value during a five-minute period.<br>Key: sys\|resourceCpuAct5_latest |
| Sys\|Resource CPU Alloc Max (MHz) | Maximum resource CPU allocation in megahertz.<br>Key: sys\|resourceCpuAllocMax_latest |
| Sys\|Resource CPU Alloc Min (MHz) | Minimum resource CPU allocation in megahertz.<br>Key: sys\|resourceCpuAllocMin_latest |
| Sys\|Resource CPU Alloc Shares | Number of resource CPU allocation shares.<br>Key: sys\|resourceCpuAllocShares_latest |
| Sys\|Resource CPU Max Limited (%) (1 min. average) | Percent of resource CPU that is limited to the maximum amount. Average value during a one-minute period.<br>Key: sys\|resourceCpuMaxLimited1_latest |
| Sys\|Resource CPU Max Limited (%) (5 min. average) | Percentage of resource CPU that is limited to the maximum amount. Average value during a five-minute period.<br>Key: sys\|resourceCpuMaxLimited5_latest |
| Sys\|Resource CPU Run1 (%) | Percent resource CPU for Run1.<br>Key: sys\|resourceCpuRun1_latest |
| Sys\|Resource CPU Run5 (%) | Percent resource CPU for Run5.<br>Key: sys\|resourceCpuRun5_latest |
| Sys\|Resource Memory Alloc Max (KB) | Maximum resource memory allocation in kilobytes.<br>Key: sys\|resourceMemAllocMax_latest |
| Sys\|Resource Memory Alloc Min (KB) | Minimum resource memory allocation in kilobytes.<br>Key: sys\|resourceMemAllocMin_latest |
| Sys\|Resource Memory Alloc Shares | Number of resource memory shares allocated.<br>Key: sys\|resourceMemAllocShares_latest |
| Sys\|Resource Memory Cow (KB) | Cow resource memory in kilobytes.<br>Key: Sys\|resourceMemCow_latest |
| Sys\|Resource Memory Mapped (KB) | Mapped resource memory in kilobytes.<br>Key: ys\|resourceMemMapped_latest |
| Sys\|Resource Memory Overhead (KB) | Resource memory overhead in kilobytes.<br>Key: sys\|resourceMemOverhead_latest |
| Sys\|Resource Memory Shared (KB) | Shared resource memory in kilobytes.<br>Key: sys\|resourceMemShared_latest |
| Sys\|Resource Memory Swapped (KB) | Swapped resource memory in kilobytes.<br>Key: sys\|resourceMemSwapped_latest |
| Sys\|Resource Memory Touched (KB) | Touched resource memory in kilobytes.<br>Key: sys\|resourceMemTouched_latest |
| Sys\|Resource Memory Zero (KB) | Zero resource memory in kilobytes.<br>Key: sys\|resourceMemZero_latest |
| Sys\|Resource Memory Consumed | Resource Memory Consumed Latest (KB).<br>Key: sys\|resourceMemConsumed_latest |

| Metric Name | Description |
|---|---|
| Sys\|Resource File descriptors usage | Resource File descriptors usage (KB).<br>Key: sys\|resourceFdUsage_latest |
| Sys\|vMotion Enabled | 1 if vMotion is enabled or 0 if vMotion is not enabled.<br>Key: sys\|vmotionEnabled |
| Sys\|Not in Maintenance | Not in maintenance.<br>Key: sys\|notInMaintenance |

### Management Agent Metrics for Host Systems

Management agent metrics provide information about memory use.

| Metric Name | Description |
|---|---|
| Management Agent\|Memory Used (%) | Amount of total configured memory that is available for use.<br>Key: managementAgent\|memUsed_average |
| Management Agent\|Memory Swap Used (KB) | Sum of the memory swapped by all powered-on virtual machines on the host.<br>Key: managementAgent\|swapUsed_average |
| Management Agent\|Memory Swap In (KBps) | Amount of memory that is swapped in for the Service Console.<br>Key: managementAgent\|swapIn_average |
| Management Agent\|Memory Swap Out (KBps) | Amount of memory that is swapped out for the Service Console.<br>Key: managementAgent\|swapOut_average |
| Management Agent\|CPU Usage | CPU usage.<br>Key: managementAgent\|cpuUsage_average |

### Storage Adapter Metrics for Host Systems

Storage adapter metrics provide information about data storage use.

| Metric Name | Description |
|---|---|
| Storage Adapter\|Driver | Displays the driver details of the storage adapter.<br>Key: storage adapter\|driver |
| Storage Adapter\|Port WWN | Displays the world wide network port for the storage adapter.<br>Key: storage adapter\|portwwn |
| Storage Adapter\|Total Usage (KBps) | Total latency.<br>Key: storageAdapter\|usage |
| Storage Adapter\|Total IOPS | Average number of commands issued per second by the storage adapter during the collection interval.<br>Key: storageAdapter\|commandsAveraged_average |
| Storage Adapter\|Read IOPS | Average number of read commands issued per second by the storage adapter during the collection interval.<br>Key: storageAdapter\|numberReadAveraged_average |
| Storage Adapter\|Write IOPS | Average number of write commands issued per second by the storage adapter during the collection interval.<br>Key: storageAdapter\|numberWriteAveraged_average |
| Storage Adapter\|Read Throughput (KBps) | Rate of reading data by the storage adapter.<br>Key: storageAdapter\|read_average |

| Metric Name | Description |
|---|---|
| Storage Adapter\|Read Latency (ms) | This metric shows the average amount of time for a read operation by the storage adapter.<br>Use this metric to monitor the storage adapter read operation performance. A high value means that the ESX is performing a slow storage read operation.<br>Total latency is the sum of kernel latency and device latency.<br>Key: storageAdapter\|totalReadLatency_average |
| Storage Adapter\|Write Latency (ms) | This metric shows the average amount of time for a write operation by the storage adapter.<br>Use this metric to monitor the storage adapter write performance operation. A high value means that the ESX is performing a slow storage write operation.<br>Total latency is the sum of kernel latency and device latency.<br>Key: storageAdapter\|totalWriteLatency_average |
| Storage Adapter\|Write Throughput (KBps) | Rate of writing data by the storage adapter.<br>Key: storageAdapter\|write_average |
| Storage Adapter\|Demand | Demand.<br>Key: storageAdapter\|demand |
| Storage Adapter\|Highest Latency | Highest Latency.<br>Key: torageAdapter\|maxTotalLatency_latest |
| Storage Adapter\|Outstanding Requests | Outstanding Requests.<br>Key: storageAdapter\|outstandingIOs_average |
| Storage Adapter\|Queue Depth | Queue Depth.<br>Key: storageAdapter\|queueDepth_average |
| Storage Adapter\|Queue Latency (ms) | The average time spent in the ESX Server VM Kernel queue per command.<br>Key: storageAdapter\|queueLatency_average |
| Storage Adapter\|Queued | Queued.<br>Key: storageAdapter\|queued_average |
| Storage Adapter\|Peak Adapter Read Latency | The highest read latency among the storage adapters. A high number indicates that one or more storage adapters are experiencing poor performance.<br>Key: storageAdapter\|peak_adapter_readLatency |
| Storage Adapter\|Peak Adapter Write Latency | The highest write latency among the storage adapters. A high number indicates that one or more storage adapters are experiencing poor performance.<br>Key: storageAdapter\|peak_adapter_writeLatency |

## Storage Metrics for Host Systems

Storage metrics provide information about storage use.

| Metric Name | Description |
|---|---|
| Storage\|Total IOPS | Average number of commands issued per second during the collection interval.<br>Key: storage\|commandsAveraged_average |
| Storage\|Read Latency (ms) | Average amount of time for a read operation in milliseconds.<br>Key: storage\|totalReadLatency_average |
| Storage\|Read Throughput (KBps) | Read throughput rate in kilobytes.<br>Key: storage\|read_average |

| Metric Name | Description |
|---|---|
| Storage\|Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: storage\|numberReadAveraged_average |
| Storage\|Total Latency (ms) | Total latency in milliseconds.<br>Key: storage\|totalLatency_average |
| Storage\|Total Usage (KBps) | Total throughput rate in kilobytes per second.<br>Key: storage\|usage_average |
| Storage\|Write Latency (ms) | Average amount of time for a write operation in milliseconds.<br>Key: storage\|totalWriteLatency_average |
| Storage\|Write Throughput (KBps) | Write throughput rate in kilobytes per second.<br>Key: storage\|write_average |
| Storage\|Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: storage\|numberWriteAveraged_average |

### Sensor Metrics for Host Systems

Sensor metrics provide information about host system cooling.

| Metric Name | Description |
|---|---|
| Sensor\|Fan\|Speed (%) | Percent fan speed.<br>Key: Sensor\|fan\|currentValue |
| Sensor\|Fan\|Health State | Fan health state.<br>Key: Sensor\|fan\|healthState |
| Sensor\|Temperature\|Temp C | Fan temperature in centigrade.<br>Key: Sensor\|temperature\|currentValue |
| Sensor\|Temperature\|Health State | Fan health state.<br>Key: Sensor\|temperature\|healthState |

## Power Metrics for Host Systems

Power metrics provide information about host system power use.

| Metric Name | Description |
|---|---|
| Power\|Total Energy Consumed in the collection period (Wh) | Displays the total electricity consumed based on the time interval selected. The default collection cycle is set to 5 mins. You can continue using the default setting or edit it for each adapter instance. For example, if the time interval is set to its default value, the value represents the energy consumed per 5 mins. |
| Power\|Total Host System Power Consumed in an Hour (Wh) | Displays the the total electricity power consumed in an hour by ESX Host. The data collected is over a period of an hour and published along with the other metrics in VCF Operations. In case of a connectivity or availability issue in VCF Operations or vCenter adapter instance, this hourly metric might not be published and the missed value during this period does not get recalculated. Once the connection is re-established, the next data points get published.<br>**Note:**<br>This metric is deactivated by default. You can activate it from the Policies page. |
| Power\|Power (Watt) | Host power use in watts.<br>Key: power\|power_average |
| Power\|Current Power Consumption Rate (Watt) | The power consumption rate per second, averaged over the reporting period.<br>Key: power\|power_average |
| Power\|Power Cap (Watt) | Host power capacity in watts.<br>Key: power\|powerCap_average |
| Power\|Host Power Capacity Usage – Idle | Power consumed by the host in its idle state. This is the power consumed by the host when there are no VMs in it.<br>Key: power\|capacity.usageIdle_average |
| Power\|(DEP) Energy (Joule) | Total energy consumed in joules.<br>Key: power\|energy_summation |

## Disk Space Metrics for Host Systems

Disk space metrics provide information about disk space use.

| Metric Name | Description |
|---|---|
| Diskspace\|Number of Virtual Disks | Number of virtual disks.<br>Key: diskspace\|numvmdisk |
| Diskspace\|Shared Used (GB) | Used shared disk space in gigabytes.<br>Key: diskspace\|shared |
| Diskspace\|Snapshot | Disk space used by snapshots in gigabytes.<br>Key: diskspace\|snapshot |
| Diskspace\|Virtual Disk Used (GB) | Disk space used by virtual disks in gigabytes.<br>Key: diskspace\|diskused |
| Diskspace\|Virtual machine used (GB) | Disk space used by virtual machines in gigabytes.<br>Key: diskspace\|used |
| Diskspace\|tTotal disk space used | Total disk space used on all datastores visible to this object.<br>Key: diskspace\|total_usage |

| Metric Name | Description |
|---|---|
| Diskspace\|Total disk spacey | Total disk space on all datastores visible to this object.<br>Key: diskspace\|total_capacity |
| Diskspace\|Total provisioned disk space | Total provisioned disk space on all datastores visible to this object.<br>Key: diskspace\|total_provisioned . |
| Diskspace\|Utilization (GB) | Storage space utilized on connected vSphere datastores.<br>Key: diskspace\|total_usage |
| Diskspace\|Workload (%) | Total storage space available on connected vSphere datastores.<br>Key: diskspace\|total_capacity |

## Summary Metrics for Host Systems

Summary metrics provide information about overall host system performance.

| Metric Name | Description |
|---|---|
| Summary\|Number of Running VMs | This metric shows the number of VMs running on the host during the last metric collection time.<br>Large spikes of running VMs might be a reason for CPU or memory spikes as more resources are used in the host.<br>Number of Running VMs gives you a good indicator of how many requests the ESX host must juggle. This excludes powered off VMs as they do not impact ESX performance. A change in this number in your environment can contribute to performance problems. A high number of running VMs in a host also means a higher concentration risk, as all the VMs will become unavailable (or be relocated by HA) if the ESX crashes.<br>Look for any correlation between spikes in the number of running VMs and spikes in other metrics such as CPU Contention/Memory Contention.<br>Key: summary\|number_running_vms |
| Summary\|Maximum Number of VMs | Maximum number of virtual machines<br>Key: summary\|max_number_vms |
| Summary\|Number of vMotions | This metric shows the number of vMotions that occurred in the host in the last X minutes.<br>The number of vMotions is a good indicator of stability. In a healthy environment, this number should be stable and relatively low.<br>Look for correlation between vMotions and spikes in other metrics such as CPU/Memory contention.<br>The vMotion should not create any spikes, however, the VMs moved into the host might create spikes in memory usage, contention and CPU demand and contention.<br>Key: summary\|number_vmotion |
| Summary\|Total Number of Datastores | Total Number of Datastores.<br>Key: summary\|total_number_datastores |
| Summary\|Number of VCPUs on Powered On VMs | Total number of VCPUs of Virtual Machines that are powered on.<br>Key: summary\|number_running_vcpus |

| Metric Name | Description |
|---|---|
| Summary\|Total Number of VMs | Total number of virtual machines.<br>**Note:**<br>This is the total number of VMs excluding VM templates.<br>Key: summary\|total_number_vms |
| Summary\|Number of VM Templates | Number of VM Templates<br>Key: summary\|number_vm_templates |
| Summary\|Consider for Balance | Summary\|Consider for Balance = 1 when the host is Powered On, Connected, not in Maintenance Mode, and not a Failover Host, otherwise it = -1 |

### HBR Metrics for Host Systems

Host-based replication (HBR) metrics provide information about vSphere replication.

| Metric Name | Description |
|---|---|
| HBR\|Replication Data Received Rate | Replication Data Received Rate.<br>Key: hbr\|hbrNetRx_average |
| HBR\|Replication Data Transmitted Rate | Replication Data Transmitted Rate.<br>Key: hbr\|hbrNetTx_average |
| HBR\|Replicated VM Count | Number of replicated virtual machines.<br>Key: hbr\|hbrNumVms_average |

### Cost Metrics for Host Systems

Cost metrics provide information about the cost.

| Metric Name | Description |
|---|---|
| Monthly Maintenance Total Cost | Monthly total cost for maintenance.<br>Key: cost\|maintenanceTotalCost |
| Monthly Host OS License Total Cost | Monthly total cost for the host operating system license.<br>Key: cost\|hostOslTotalCost |
| Monthly Network Total Cost | Monthly total cost for network including cost of NIC cards associated with host.<br>Key: cost\|networkTotalCost |
| Monthly Server Hardware Total Cost | Monthly total cost for server hardware, based on amortized monthly value.<br>Key: cost\|hardwareTotalCost |
| Monthly Facilities Total Cost | Monthly total cost of facilities including real estate, power, and cooling.<br>Key: cost\|facilitiesTotalCost |
| Monthly Server Labor Total Cost | Monthly total cost for the server operating system labor.<br>Key: cost\|hostLaborTotalCost |
| Monthly Server Fully Loaded Cost | Monthly cost for a fully loaded server incorporating all cost driver values attributed to the server.<br>Key: cost\|totalLoadedCost |
| MTD Server Total Cost | Month to date cost for a fully loaded server incorporating all cost driver values attributed to the server.<br>Key: totalMTDCost |

| Metric Name | Description |
|---|---|
| Server Accumulated Depreciation | Month to date accumulated cost for a deprecated server.<br>Key: Cost\|Server Accumulated Depreciation |
| Aggregated Daily Total Cost | Daily aggregate daily total cost of the deleted VM present in the host system.<br>Key: Cost\|aggregatedDailyTotalCost |
| Aggregated Deleted VM Daily Total Cost | Daily aggregate cost of the deleted VM present in the host system.<br>Key: Cost\|aggregatedDeletedVmDailyTotalCost |

## Disabled Instanced Metrics

The instance metrics created for the following metrics are disabled in this version of VCF Operations. This means that these metrics collect data by default but all the instanced metrics created for these metrics, do not collect data by default.

| Metric Name |
|---|
| Datastore\|Outstanding IO requests (OIOs) |
| Datastore\|Read IOPS |
| Datastore\|Read Latency (ms) |
| Datastore\|Read Throughput (KBps) |
| Datastore\|Total Latency (ms) |
| Datastore\|Total Throughput (KBps) |
| Datastore\|unmapIOs_summation |
| Datastore\|unmapsize_summation |
| Datastore\|Write IOPS |
| Datastore\|Write Latency (ms) |
| Datastore\|Write Throughput (KBps) |
| Disk\|Physical Device Latency (ms) |
| Disk\|Queue Latency (ms) |
| Disk\|Read IOPS |
| Disk\|Read Latency (ms) |
| Disk\|Read Throughput (KBps) |
| Disk\|Write IOPS |
| Disk\|Write Latency (ms) |
| Disk\|Write Throughput (KBps) |
| Net\|Data Receive Rate (KBps) |
| Net\|Data Transmit Rate (KBps) |
| Net\|Error Packets Transmitted |
| Net\|Packets Dropped (%) |
| Net\|Packets Transmitted per second |
| Net\|Received Packets Dropped |
| Net\|Transmitted Packets Dropped |
| Net\|Usage Rate (%) |
| Storage Adapter\|Read IOPS |
| Storage Adapter\|Read Latency (ms) |

| Metric Name |
|---|
| Storage Adapter\|Read Throughput (KBps) |
| Storage Adapter\|Write IOPS |
| Storage Adapter\|Write Latency (ms) |
| Storage Adapter\|Write Throughput (KBps) |

## Disabled Metrics

The following metrics are disabled in this version of VCF Operations. This means that they do not collect data by default.

You can enable these metrics in the Policy workspace. For more information, in VMware Docs search for Collect Metrics and Properties Details.

| Metric Name | Key |
|---|---|
| CPU\|Idle (msec) | cpu\|idle_summation |
| CPU\|Used (msec) | cpu\|used_summation |
| Datastore I/O\|Average Observed Virtual Machine Disk I/O Workload | datastore\|vmPopulationAvgWorkload |
| Datastore I/O\|Max Observed Number of Outstanding IO Operations | datastore\|maxObserved_OIO |
| Datastore I/O\|Max Observed Read Rate (kbps) | datastore\|maxObserved_Read |
| Datastore I/O\|Max Observed Reads per second | datastore\|maxObserved_NumberRead |
| Datastore I/O\|Max Observed Write Rate (kbps) | datastore\|maxObserved_Write |
| Datastore I/O\|Max Observed Writes per second | datastore\|maxObserved_NumberWrite |
| Datastore I/O\|Maximum Observed VM Disk I/O Workload | datastore\|vmPopulationMaxWorkload |
| Network I/O\|bytesRx (kbps) | net\|bytesRx_average |
| Network I/O\|bytesTx (kbps) | net\|bytesTx_average |
| Network I/O\|Demand (%) | net\|demand |
| Network I/O\|Error Packets Received | net\|errorsRx_summation |
| Network I/O\|Max Observed Received Throughput (kbps) | net\|maxObserved_Rx_KBps |
| Network I/O\|Max Observed Throughput (kbps) | net\|maxObserved_KBps |
| Network I/O\|Max Observed Transmitted Throughput (kbps) | net\|maxObserved_Tx_KBps |
| Network I/O\|Packets Received per second | net\|packetsRxPerSec |
| Network I/O\|Packets Dropped | net\|dropped |
| Summary\|Workload Indicator | summary\|workload_indicator |
| vFlash Module\|Latest Number of Active Vm Disks | vflashModule\|numActiveVMDKs_latest |
| Net\|Received Packets Dropped | Number of received packets dropped in the performance interval.<br>Key: net\|droppedRx_summation |
| Net\|Transmitted Packets Dropped | Number of transmitted packets dropped in the performance interval.<br>Key: net\|droppedTx_summation |
| Net\|Packets Dropped (%) | This metric shows the percentage of received and transmitted packets dropped during the collection interval.<br>This metric is used to monitor reliability and performance of the ESX network. When a high value is displayed, the network is not reliable and performance suffers.<br>Key: net\|droppedPct |

| Metric Name | Key |
|---|---|
| Diskspace\|Not Shared (GB) | Unshared disk space in gigabytes.<br>Key: diskspace\|notshared |

## Cluster Compute Resource Metrics

VCF Operations collects configuration, disk space, CPU use, disk, memory, network, power, and summary metrics for cluster compute resources.

Cluster Compute Resource metrics include capacity and badge metrics. See definitions in:

- Capacity Analytics Generated Metrics
- Badge Metrics

### GPU Metrics

GPU metrics provide information about the GPU usage and performance.

| Metric Name | Description |
|---|---|
| GPU\|Compute Utilization (%) | The compute utilization percentage of a GPU. |
| GPU\|Memory Usage (%) | Memory currently in use as a percentage of total available memory. |
| GPU\|Memory Used (KB) | The amount of GPU memory used in kilobytes. |
| GPU\|Number of GPUs | Number of GPUs. |
| GPU\|Total Memory (KB) | Total memory in kilobytes. |
| GPU\|Number of vGPU Configured VM-s | Sum of GPU configured VMs. |

### Cluster Metrics for ROI Dashboard

Cluster metrics provide information about the metrics in ROI dashboard.

| Metric Name | Description |
|---|---|
| Total Number Of Reclaimable Hosts | This metric displays the total number of reclaimable hosts across all vCenters.<br>Key: metric=cost\|reclaimableHostCost |
| Total Reclaimable Host Cost | This metric displays the reclaimable host cost based on the recommended size.<br>Key: cost\|reclaimableHostCost |

### Configuration Metrics for Cluster Compute Resources

Configuration metrics provide information about configuration settings.

| Metric Name | Description |
|---|---|
| Configuration\|DAS Configuration\|Admission Control Enabled | DAS configuration admission control enabled.<br>Key: configuration\|dasconfig\|AdministrationControlEnabled |
| Configuration\|DAS Configuration\|Active Admission Control Policy | DAS configuration active admission control policy.<br>Key: configuration\|dasconfig\|activeAdministrationControlPolicy |
| Configuration\|DRS Configuration\|Affinity Rules | Affinity rules for DRS configuration.<br>Key: configuration\|DRSconfiguration\|affinity rules |

| Metric Name | Description |
|---|---|
| Configuration\|DRS Configuration\|Tolerance Imbalance Threshold | Displays the tolerance imbalance threshold for DRS configuration.<br>Key: configuration\|DRSconfiguration\|ToleranceimbalanceThreshold |
| Configuration\|DRS Configuration\|Default DRS behavior | Displays the default DRS configuration behavior.<br>Key: configuration\|DRSconfiguration\|DefaultDRSbehaviour |
| Configuration\|DRS Configuration\|Idle Consumed Memory | Displays the idle memory consumed by DRS configuration.<br>Key: configuration\|DRSconfiguration\|IdleConsumedMemory |
| Configuration\|DRS Configuration\| DRS vMotion Rate | Displays the vMotion rate for the DRS configuration.<br>Key: configuration\|DRSconfiguration\|DRSvMotion Rate |
| Configuration\|DPM Configuration\|Default DPM behavior | Displays the default behavior for the DPM configuration.<br>Key: configuration\|DPMconfiguration\|DefaultDPMbehaviour |
| Configuration\|DPM Configuration\|DPM Enabled | Displays whehter the DPM Configuration is enabled or not.<br>Key: configuration\|DPMConfiguration\|DPMEnabled |
| Configuration\|Failover Level | DAS configuration failover level.<br>Key: configuration\|dasconfig\|failoverLevel |
| Configuration\|Active Admission Control Policy | DAS configuration active admission control policy.<br>Key: configuration\|dasconfig\|activeAdministrationControlPolicy |
| Configuration\|CPU Failover Resources Percent | Percent CPU failover resources for DAS configuration admission control policy.<br>Key: configuration\|dasconfig\|adminissionControlPolicy\|cpuFailoverResourcesPercent |
| Configuration\|Memory Failover Resources Percent | Percent memory failover resources for DAS configuration admission control policy.<br>Key: configuration\|dasconfig\|adminissionControlPolicy\|memoryFailoverResourcesPercent |

## Disk Space Metrics for Cluster Compute Resources

Disk space metrics provide information about disk space use.

| Metric Name | Description |
|---|---|
| DiskSpace\|Snapshot Space | Displays the disk space used by the snapshot.<br>Key: DiskSpace\|snapshot space |
| Diskspace\|Virtual machine used (GB) | Space used by virtual machine files in gigabytes.<br>Key: diskspace\|used |
| Diskspace\|Total disk space used | Total disk space used on all datastores visible to this object.<br>Key: diskspace\|total_usage |
| Diskspace\|Total disk space | Total disk space on all datastores visible to this object.<br>Key: diskspace\|total_capacity |
| Diskspace\|Total provisioned disk space | Total provisioned disk space on all datastores visible to this object.<br>Key: diskspace\|total_provisioned |
| Diskspace\|Virtual Disk Used (GB) | Space used by virtual disks in gigabytes.<br>Key: diskspace\|diskused |
| Diskspace\|Snapshot Space (GB) | Space used by snapshots in gigabytes.<br>Key: diskspace\|snapshot |
| Diskspace\|Shared Used (GB) | Shared used space in gigabytes.<br>Key: diskspace\|shared |
| Diskspace\|Utilization (GB) | Storage space used on the connected vSphere Datastores.<br>Key: diskspace\|total_usage |

| Metric Name | Description |
|---|---|
| Diskspace\|Total Capacity (GB) | Total storage space available on the connected vSphere datastores.<br>Key: diskspace\|total_capacity |

### CPU Usage Metrics for Cluster Compute Resources

CPU usage metrics provide information about CPU use.

| Metric Name | Description |
|---|---|
| CPU\|Allocation\|Usable Capacity after HA and Buffer (vCPUs) | This metric shows the total capacity taking into consideration the over-commit ratio and after subtracting the CPU resources needed for HA and reserved buffer.<br>Key: cpu\|alloc\|usableCapacity |
| CPU\|Capacity Usage | This metric shows the percentage of the capacity used.<br>Key: cpu\|capacity_usagepct_average |
| CPU\|CPU Contention (%) | This metric is an indicator of the overall contention for CPU resources that occurs across the workloads in the cluster. When contention occurs, it means that some of the virtual machines are not immediately getting the CPU resources they are requesting.<br>Use this metric to identify when a lack of CPU resources might be causing performance issues in the cluster.<br>This metric is the sum of the CPU contention across all hosts in the cluster averaged over two times the number of physical CPUs in the cluster to account for hyper-threading. CPU contention takes into account:<br>• CPU Ready<br>• CPU Co-stop<br>• Power management<br>• Hyper threading<br>This metric is more accurate than CPU Ready since it takes into account CPU Co-stop and Hyper threading.<br>When using this metric, the number should be lower than the performance you expect. If you expect performance at 10%, then the number should be lower than 10%.<br>Since this value is averaged across all hosts in the cluster, you might find that some hosts have a higher CPU contention while others are lower. To ensure that vSphere spreads out the running workloads across hosts, consider enabling a fully automated DRS in the cluster.<br>Key: cpu\|capacity_contentionPct |
| CPU\|Demand\|Usable Capacity after HA and Buffer (MHz) | This metric shows the total capacity after subtracting the CPU resources needed for HA and reserved buffer.<br>Key: cpu\|demand\|usableCapacity |
| CPU\|Demand (%) | This metric is an indicator of the overall demand for CPU resources by the workloads in the cluster.<br>It shows the percentage of CPU resources that all the virtual machines might use if there were no CPU contention or CPU limits set. It represents the average active CPU load in the past five minutes.<br>Key: cpu\|demandPct |
| CPU\|Demand (MHz) | Sum of CPU utilization of all virtual machines on this cluster, including limits and VM overhead.<br>Key: cpu\|demandmhz |
| CPU\|Number of CPU Sockets | Number of CPU sockets.<br>Key: cpu\|numpackages |

| Metric Name | Description |
|---|---|
| CPU\|Overall CPU Contention | Overall CPU contention in milliseconds.<br>Key: cpu\|capacity_contention |
| CPU\|Host Provisioned Capacity | Provisioned CPU capacity in megahertz.<br>Key: cpu\|capacity_provisioned |
| CPU\|Provisioned CPUs | Number of Physical CPUs (Cores).<br>Key: cpu\|corecount_provisioned |
| CPU\|Usage (MHz) | Average CPU use in megahertz.<br>Key: cpu\|usagemhz_average |
| CPU\| VM CPU Usage (Mhz) | Sum of CPU usages of all VMs in the cluster. The CPU\|Usage (Mhz) metric value of each VM is taken for summation.<br>Key: cpu\|vm_usagemhz_average |
| CPU\|Demand | CPU Demand.<br>Key: cpu\|demand_average |
| CPU\|Overhead | Amount of CPU overhead.<br>Key: cpu\|overhead_average |
| CPU\|Demand without overhead | Value of demand excluding any overhead.<br>Key: cpu\|demand_without_overhead |
| CPU\|Provisioned Capacity | Provisioned Capacity (MHz).<br>Key: cpu\|vm_capacity_provisioned |
| CPU\|Number of hosts stressed | Number of hosts stressed.<br>Key: cpu\|num_hosts_stressed |
| CPU\|Stress Balance Factor | Stress Balance Factor.<br>Key: cpu\|stress_balance_factor |
| CPU\|Lowest Provider Capacity Remaining | Lowest Provider Capacity Remaining.<br>Key: cpu\|min_host_capacity_remaining |
| CPU\|Workload Balance Factor | Workload Balance Factor.<br>Key: cpu\|workload_balance_factor |
| CPU\|Highest Provider Workload | Highest Provider Workload.<br>Key: cpu\|max_host_workload |
| CPU\|Host workload Max-Min Disparity | Difference of Max and Min host workload in the container.<br>Key: cpu\|host_workload_disparity |
| CPU\|Host stress Max-Min Disparity | Difference of Max and Min host stress in the container.<br>Key: cpu\|host_stress_disparity |
| CPU\|Total Capacity (MHz) | Total CPU resources configured on the descendant ESX hosts.<br>Key: cpu\|capacity_provisioned |
| CPU\|Usable Capacity (MHz) | The usable CPU resources that are available for the virtual machines after considering reservations for vSphere High Availability (HA) and other vSphere services.<br>Key: cpu\|haTotalCapacity_average |

## Disk Metrics for Cluster Compute Resources

Disk metrics provide information about disk use.

| Metric Name | Description |
|---|---|
| Disk\|Total IOPS | Average number of commands issued per second during the collection interval.<br>Key: disk\|commandsAveraged_average |
| Disk\|Total Latency (ms) | Average amount of time taken for a command from the perspective of the guest operating system. This metric is the sum of the Kernel Command Latency and Physical Device Command Latency metrics.<br>Key: disk\|totalLatency_average |
| Disk\|Read Latency (ms) | Average amount of time for a read operation from the virtual disk. The total latency is the sum of Kernel latency and device latency.<br>Key: disk\|totalReadLatency_average |
| Disk\|Write Latency (ms) | The average amount of time taken for a read from the perspective of a Guest OS. This is the sum of Kernel Read Latency and Physical Device Read Latency.<br>Key: disk\|totalWriteLatency_averag |
| Disk\|Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: disk\|numberReadAveraged_averag |
| Disk\|Total Throughput (KBps) | Average of the sum of the data read and written for all the disk instances of the host or virtual machine.<br>Key: disk\|usage_average |
| Disk\|Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: disk\|numberWriteAveraged_average |
| Disk\|Read Requests | Amount of data read from the disk during the collection interval.<br>Key: disk\|read_average |
| Disk\|Write Requests | Amount of data written to the disk during the collection interval.<br>Key: disk\|write_average |
| Disk\|Total Queued Outstanding operations | Sum of queued operation and outstanding operations.<br>Key: disk\|sum_queued_oio |
| Disk\|Max Observed OIO | Max observed outstanding IO for a disk.<br>Key: disk\|max_observed |

## Memory Metrics for Cluster Compute Resources

Memory metrics provide information about memory use and allocation.

| Metric Name | Description |
|---|---|
| Mem\|Active Write (KB) | Active writes in kilobytes.<br>Key: mem\|activewrite_average |
| Mem\|Compressed (KB) | Average compression in kilobytes.<br>Key: mem\|compressed_average |
| Mem\|Compression Rate (KBps) | Average compression rate in kilobytes.<br>Key: mem\|compressionRate_average |
| Mem\|Consumed (KB) | Amount of host memory consumed by the virtual machine for guest memory.<br>Key: mem\|consumed_average |

| Metric Name | Description |
|---|---|
| Mem\|Contention (%) | This metric is an indicator of the overall contention for memory resources that occurs across the workloads in the cluster. When contention occurs, it means that some of the VMs are not immediately getting the memory resources that they are requesting.<br>Use this metric to identify when lack of memory resources might be causing performance issues in the cluster.<br>Key: mem\|host_contentionPct |
| Mem\|Contention (KB) | Contention in kilobytes.<br>Key: mem\|host_contention |
| Mem\|Decompression Rate (KBps | Decompression rate in kilobytes.<br>Key: mem\|decompressionRate_average |
| Mem\|Granted (KB) | Amount of memory available for use.<br>Key: mem\|granted_average |
| Mem\|Guest Active (KB) | Amount of memory that is actively used.<br>Key: mem\|active_average |
| Mem\|Heap (KB) | Amount of memory allocated for heap.<br>Key: mem\|heap_average |
| Mem\|Heap Free (KB) | Free space in the heap.<br>Key: mem\|heapfree_average |
| Mem\|Balloon | This metric shows the amount of memory currently used by the virtual machine memory control. It is only defined at the VM level.<br>Key: mem\|vmmemctl_average |
| Mem\|VM Overhead (KB) | Memory overhead reported by host.<br>Key: mem\|overhead_average |
| Mem\|Provisioned Memory (KB) | Provisioned memory in kilobytes.<br>Key: mem\|host_provisioned |
| Mem\|Reserved Capacity (KB) | Sum of memory reservations by consumers such as Resource Pools (RP) and powered on VMs that are not in Resource Pools, aggregated and published on cluster level. RP reservations at the vCenter level are distributed to hosts depending on the number of powered on VMs and their entitlement within the Resource Pool. For more information on resource allocation reservation, share, and limit, see Configuring Resource Allocation Settings.<br>Key: mem\|reservedCapacity_average |
| Mem\|Shared (KB) | Amount of shared memory.<br>Key: mem\|shared_average |
| Mem\|Shared Common (KB) | Amount of shared common memory.<br>Key: mem\|sharedcommon_average |
| Mem\|Swap In (KB) | Amount of memory that is swapped in for the service console.<br>Key: mem\|swapin_average |
| Mem\|Swap In Rate (KBps) | Rate at which memory is swapped from disk into active memory during the interval.<br>Key: mem\|swapinRate_average |
| Mem\|Swap Out (KB) | Amount of memory that is swapped out for the service console.<br>Key: mem\|swapout_average |
| Mem\|Swap Out Rate (KBps) | Rate at which memory is being swapped from active memory into disk during the current interval.<br>Key: mem\|swapoutRate_average |

| Metric Name | Description |
|---|---|
| Mem\|Swap Used (KB) | Amount of memory used for swap space.<br>Key: mem\|swapused_average |
| Mem\|Total Capacity (KB) | Total capacity in kilobytes.<br>Key: mem\|totalCapacity_average |
| Mem\|Unreserved (KB) | Memory available for reservation by VMs and Resource Pools (RP), aggregated and published on cluster level. The reservations are set for VMs and RPs and not for ESX hosts or clusters. For more information on resource allocation reservation, share, and limit, see Configuring Resource Allocation Settings.<br>Key: mem\|unreserved_average |
| Mem\|Usable Memory (KB) | Usable memory in kilobytes.<br>Key: mem\|host_usable |
| Mem\|Usage/Usable | Percent memory used.<br>Key: mem\|host_usagePct |
| Mem\|Host Usage (KB) | Memory use in kilobytes.<br>Key: mem\|host_usage |
| Mem\|Machine Demand | Memory Machine Demand in KB.<br>Key: mem\|host_demand |
| Mem\|ESX System Usage | Memory usage by the VMkernel and ESX user-level services.<br>Key: mem\|host_systemUsage |
| Mem\|Usage (%) | This metric shows the portion of the total memory in all hosts in the cluster that is being used.<br>This metric is the sum of memory consumed across all hosts in the cluster divided by the sum of physical memory across all hosts in the cluster. |
| Memory \|Workload (%) | Demand over usable capacity. Wherever applicable, demand includes limit and contention. |
| Mem\|Usage (KB) | Memory currently in use as a percentage of total available memory.<br>Key: mem\|usage_average |
| Mem\|VM kernel Usage (KB) | Amount of memory that the VM kernel uses.<br>Key: mem\|sysUsage_average |
| Mem\|Zero (KB) | Amount of memory that is all 0.<br>Key: mem\|zero_average |
| Mem\|Number of Hosts Stressed | Number of hosts stressed.<br>Key: mem\|num_hosts_stressed |
| Mem\|Stress Balance Factor | Stress balance factor.<br>Key: mem\|stress_balance_factor |
| Mem\|Lowest Provider Capacity Remaining | Lowest provider capacity remaining.<br>Key: mem\|min_host_capacity_remaining |
| Mem\|Workload Balance Factor | Workload balance factor.<br>Key: mem\|workload_balance_factor |
| Mem\|Highest Provider Workload | Highest provider workload.<br>Key: mem\|max_host_workload |
| Mem\|Host workload Max-Min Disparity | Difference of Max and Min host workload in the container.<br>Key: mem\|host_workload_disparity |
| Mem\|Host stress Max-Min Disparity | Difference of Max and Min host stress in the container.<br>Key: mem\|host_stress_disparity |

| Metric Name | Description |
|---|---|
| Mem\|Utilization (KB) | Memory utilization level based on the descendant virtual machines utilization. Includes reservations, limits, and overhead to run the Virtual Machines.<br>Key: mem\|total_need |
| Mem\|Total Capacity (KB) | Sum of the amount of physical memory configured on ESX hosts of the cluster.<br>Key: mem\|host_provisioned |
| Mem\|Usable Capacity (KB) | Memory resources available after subtracting reservations for vSphere HA (failover host/s) from the cluster's total memory capacity.<br>Hosts that are in the maintenance mode are not included in the calculation.<br>Key: mem\|haTotalCapacity_average |

### Network Metrics for Cluster Compute Resources

Network metrics provide information about network performance.

| Metric Name | Description |
|---|---|
| Net\|Data Receive Rate (KBps) | Average amount of data received per second.<br>Key: net\|received_average |
| Net\|Data Transmit Rate (KBps) | Average amount of data transmitted per second.<br>Key: net\|transmitted_average |
| Net\|Packets Dropped | Number of packets dropped in the performance interval.<br>Key: net\|dropped |
| Net\|Packets Dropped (%) | Percentage of packets dropped.<br>Key: net\|droppedPct |
| Net\|Packets Received | Number of packets received in the performance interval.<br>Key: net\|packetsRx_summation |
| Net\|Packets Transmitted | Number of packets transmitted in the performance interval.<br>Key: net\|packetsTx_summation |
| Net\|Received Packets Dropped | Number of received packets dropped in the performance interval.<br>Key: net\|droppedRx_summation |
| Net\|Transmitted Packets Dropped | Number of transmitted packets dropped in the performance interval.<br>Key: net\|droppedTx_summation |
| Net\|Total Throughput (KBps) | The sum of the data transmitted and received for all the NIC instances of the host or virtual machine.<br>Key: net\|usage_average |
| Network\|Error Packets | Displays the total number of error packets (transmitted and received) from all the ESX in the cluster within a time interval of 20 seconds.<br>Key: Network\|Error Packets |

### Datastore Metrics for Cluster Compute Resources

Datastore metrics provide information about Datastore use.

| Metric Name | Description |
|---|---|
| Datastore\|TotalThroughput | Displays the total throughput for the datastore.<br>Key: datastore\|thorughput |
| Datastore\|Outstanding IO requests | OIO for datastore.<br>Key: datastore\|demand_oio |

| Metric Name | Description |
|---|---|
| Datastore\|Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: datastore\|numberReadAveraged_average |
| Datastore\|Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: datastore\|numberWriteAveraged_average |
| Datastore\|Read Throughput (KBps) | Amount of data read in the performance interval.<br>Key: datastore\|read_average |
| Datastore\|Write Throughput (KBps) | Amount of data written to disk in the performance interval.<br>Key: datastore\|write_average |
| Datastore\|Read Latency | Average amount of time taken for a read operation from the datastore.<br>Key: datastore\|ReadLatency |
| Datastore\|Write Latency | Average amount of time taken for a write operation from the datastore.<br>Key: datastore\|WriteLatency |
| Datastore\|Max VM Disk Latency | Maximum amount of time taken to read or write data from a virtual machine.<br>Key: datastore\|MaxVMDiskLatency |
| Datastore\|Outstanding IO Requests (OIOs) | This metric displays the outstanding datastore IO requests.<br>Key: datastore\|OutstandingIORequests |
| Datastore\|Host SCSI Disk Partition | This metric displays the datastore host scsi partition.<br>Key: datastore\|HostSCSIDiskPartition |
| Devices\|Command Aborted | The metric lists the stopped device commands.<br>Key: devices\|CommandAborted |

### Cluster Services Metrics for Cluster Compute Resources

Cluster Services metrics provide information about cluster services.

| Metric Name | Description |
|---|---|
| Cluster Services\|Total Imbalance | Total imbalance in cluster services<br>Key: clusterServices\|total_imbalance |
| ClusterServices\|Effective CPU Resources (MHz) | VMware DRS effective CPU resources available.<br>Key: clusterServices\|effectivecpu_average |
| ClusterServices\|Effective Memory Resources (KB) | VMware DRS effective memory resources available.<br>Key: clusterServices\|effectivemem_average |
| Cluster Services\|DRS Initiated vMotion Count | clusterServices\|number_drs_vmotion |

## Power Metrics for Cluster Compute Resources

Power metrics provide information about power use.

| Metric Name | Description |
|---|---|
| Power\|Total Energy Consumed in the collection period (Wh) | Displays the total electricity consumed based on the time interval selected. The default collection cycle is set to 5 mins. You can continue using the default setting or edit it for each adapter instance. For example, if the time interval is set to its default value, the value represents the energy consumed per 5 mins. |
| Power\|Current Power Consumption Rate (Watt) | The power consumption rate per second, averaged over the reporting period.<br>Key: power\|power_average |
| Power\|Power Cap (Watt) | Average power capacity in watts.<br>Key: power\|powerCap_average |
| Power\|(DEP) Energy (Joule) | Total energy consumed in joules<br>Key: power\|energy_summation |

## Summary Metrics for Cluster Compute Resources

Summary metrics provide information about overall performance.

| Metric Name | Description |
|---|---|
| Summary\|Number of Running Hosts | Number of running hosts.<br>Key: summary\|number_running_hosts |
| Summary\|Number of Running VMs | This metric shows the total number of VMs running on all hosts in the cluster.<br>Key: summary\|number_running_vms |
| Summary\|Number of vMotions | This metric shows the number of vMotions that occurred during the last collection cycle.<br>When using this metric, look for a low number which indicates that the cluster might serve its VMs. A vMotion can impact VM performance during the stun time.<br>Key: summary\|number_vmotion |
| Summary\|Number of Hosts | Total number of hosts.<br>Key: summary\|total_number_hosts |
| Summary\|Total Number of VMs | Total number of virtual machines.<br>**Note:**<br>This shows the total number of VMs excluding VM templates under the datastore.<br>Key: summary\|total_number_vms |
| Summary\|Total Number of Datastores | Total number of datastores.<br>Key: summary\|total_number_datastores |
| Summary\|Number of VCPUs on Powered On VMs | Number of virtual CPUs on powered-on virtual machines.<br>Key: summary\|number_running_vcpus |
| Summary\|Average Running VM Count per Running Host | Average number of running virtual machines per running host.<br>Key: summary\|avg_vm_density |
| Summary\|Cluster Availability (%) | Percentage of hosts powered-on in the cluster.<br>Key: summary\|cluster_availability |
| Summary\|Datastore | Displays the status of the datastore.<br>Key: summary\|datastore |

| Metric Name | Description |
|---|---|
| Summary\|Type | Displays the datastore type.<br>Key: summary\|type |
| Summary\|Is Local | Displays whether the datastore is local or not.<br>Key: summary\|Islocal |
| Summary\|Number of VM Templates | Number of VM templates.<br>Key: summary\|number_vm_templates |
| Summary\|Number of Pods | Number of pods.<br>**Note:**<br>This is published if the cluster is Workload Management enabled or there are pods under the cluster.<br>Key: summary\|total_number_pods |
| Summary\|Number of Namespaces | Number of namespaces.<br>**Note:**<br>This is published if the cluster is Workload Management enabled or there are namespaces under the cluster.<br>Key: summary\|numberNamespaces |
| Summary\|Number Kubernetes Clusters | Number of Kuberntes clusters.<br>**Note:**<br>This is published if the cluster is Workload Management enabled or there are Kuberntes clusters under the cluster.<br>Key: summary\|numberKubernetesClusters |
| Summary\|Number of Developer Managed VMs | Number of developer managed VMs.<br>**Note:**<br>This is published if the cluster is Workload Management enabled or there are developer managed VMs under the cluster.<br>Key: summary\|numberDeveloperManagedVMs |
| Namespaces\|Config Status | Workload Management configuration status.<br>**Note:**<br>This is published if the cluster is Workload Management enabled.<br>Key: namespaces\|configStatus |
| Namespaces\|Kubernetes Status | Kubernetes status.<br>**Note:**<br>This is published if the cluster is Workload Management enabled.<br>Key: namespaces\|kuberntesStatus |

## Reclaimable Metrics for Cluster Compute Resources

Reclaimable metrics provide information about reclaimable resources.

| Metric Name | Description |
|---|---|
| Idle VMs\|CPU (vCPUs) | Number of reclaimable vCPUs of Idle VMs within the cluster.<br>Key: reclaimable\|idle_vms\|cpu |
| Idle VMs\|Disk Space (GB) | Reclaimable disk space of Idle VMs within the cluster.<br>Key: reclaimable\|idle_vms\|disksapce |
| Idle VMs\|Memory (KB) | Reclaimable memory of Idle VMs within the cluster.<br>Key: reclaimable\|idle_vms\|mem |

| Metric Name | Description |
|---|---|
| Idle VMs\|Potential Savings | Potential saving after reclamation of resources of Idle VMs within the cluster.<br>Key: reclaimable\|idle_vms\|cost |
| Powered Off VMs\|Disk Space (GB) | Reclaimable disk space of Powered Off VMs within the cluster.<br>Key: reclaimable\|poweredOff_vms\| diskspace |
| Powered Off VMs\|Potential Savings | Potential saving after reclamation of resources of Powered Off VMs within the cluster.<br>Key: reclaimable\|poweredOff_vms\|cost |
| VM Snapshots\|Disk Space (GB) | Reclaimable disk space of VM Snapshots within the cluster.<br>Key: reclaimable\| vm_snapshots \| diskspace |
| VM Snapshots \|Potential Savings | Potential saving after reclamation of VM Snapshots within the cluster.<br>Key: reclaimable\| vm_snapshots \|cost |

## Cost Metrics for Cluster Compute Resources

Cost metrics provide information about the cost.

| Metric Name | Description |
|---|---|
| Cluster CPU Base Rate | Base rate for Cluster CPU calculated by dividing the monthly total cluster CPU cost by cluster CPU utilization % and CPU cluster capacity (gHZ).<br>Key:cost\|cpuBaseRate |
| Cluster CPU Utilization (%) | Expected CPU utilization that is set by the user in cluster cost page.<br>Key:cost\|cpuExpectedUtilizationPct |
| Cluster Memory Base Rate | Cluster memory base rate calculated by dividing the monthly total cluster memory cost by cluster memory utilization % and memory cluster capacity (GB).<br>Key: cost\|memoryBaseRate |
| Cluster Memory Utilization (%) | Expected memory utilization that is set by the user in cluster cost page.<br>Key: cost\|memoryExpectedUtilizationPct |
| Monthly Cluster Allocated Cost | Monthly cluster allocated cost calculated by subtracting the monthly cluster unallocated cost from the monthly cluster total cost.<br>Key: cost\|allocatedCost |
| Monthly Cluster Total Cost | Fully loaded compute cost of all hosts underneath the cluster.<br>Key: cost\|totalCost |
| Monthly Cluster Unallocated Cost | Monthly cluster unallocated cost calculated by subtracting the monthly cluster allocated cost from the monthly cluster total cost.<br>Key: cost\|unAllocatedCost |
| Monthly Total Cluster CPU Cost | Cost attributed to the cluster CPU from monthly cluster total cost.<br>Key: cost\|totalCpuCost |
| Monthly Total Cluster Memory Cost | Cost attributed to the cluster memory from monthly cluster total cost.<br>Key: cost\|totalMemoryCost |
| MTD Cluster CPU Utilization (GHz) | Month to date CPU utilization of the cluster.<br>Key: cost\|cpuActualUtilizationGHz |

| Metric Name | Description |
|---|---|
| MTD Cluster Memory Utilization (GB) | Month to date memory utilization of the cluster.<br>Key: cost\|memoryActualUtilizationGB |
| Monthly Cluster Allocated Cost (Currency) | The monthly allocated cost of all VMs in a cluster.<br>cost\|clusterAllocatedCost |
| Cost\|Allocation\|Monthly Cluster Unallocated Cost (Currency) | The monthly unallocated is calculated by subtracting the monthly allocated cost from the cluster's cost.<br>cost\|clusterUnAllocatedCost |
| Aggregated Daily Total Cost | Daily aggregate daily total cost of the deleted VM present in the host system.<br>Key: Cost\|aggregatedDailyTotalCost |
| Aggregated Deleted VM Daily Total Cost | Daily aggregate cost of the deleted VM present in the host system.<br>Key: Cost\|aggregatedDeletedVmDailyTotalCost |

### Profiles Metrics for Cluster Compute Resources

Profiles metrics provide information about the profile specific capacity.

| Metric Name | Description |
|---|---|
| Profiles\|Capacity Remaining Profile (Average) | The capacity remaining in terms of fitting the average consumer.<br>Key: Profiles\|capacityRemainingProfile_<profile uuid> |
| Profiles\|Capacity Remaining Profile (<custom profile name>) | Published for custom profiles enabled from policy on Cluster Compute Resource.<br>Key: Profiles\|capacityRemainingProfile_<profile uuid> |

### Capacity Allocation Metrics for Cluster Compute Resources

Capacity allocation metrics provide information about the allotment of capacity, see Capacity Analytics Generated Metrics.

### Virtual Machine Operations Metrics for Clusters

VM operations metrics provide information about the actions performed on VMs. The following are some important points you must know about VM operation metrics for clusters.

- VM operations metrics is not collected for custom data centers.
- If you edit a VM settings and do not perform any action, still it is considered as VM reconfigure operation.
- During Revert Snapshot, VMs are powered-off, but this operation is not counted under VM Power-off metric.
- Adding ESX with VMs is not counted under VM Create metric.
- Removing ESX with VMs is not coutned under VM Remove metric.
- VM hardstop operation is not counted under VM Power Off metric.

| Metric Name | Description |
|---|---|
| Inventory | |
| VM Clone | This metric displays the number of clone operations on the virtual machine.<br>Key: Inventory\|VM Clone |
| VM Create | This metric displays the number of create operations on the virtual machine.<br>Key: Inventory\|VM Create |
| VM Delete | This metric displays the number of delete operations on the virtual machine.<br>Key: Inventory\|VM Delete |

| Metric Name | Description |
|---|---|
| VM Reconfigure | This metric displays the number of reconfigure operations on the virtual machine.<br>Key: Inventory\|VM Reconfigure |
| VM Register | This metric displays the number of register operations on the virtual machine.<br>Key: Inventory\|VM Register |
| VM Template Deploy | This metric displays the number templates deployed on the virtual machine.<br>Key: Inventory\|VM Template Deploy |
| VM Unregister | This metric displays the number of unregister operations on the virtual machine.<br>Key: Inventory\|VM Unregister |
| Location | |
| Storage vMotion | This metric displays the number of migrations with vMotion (datastore change operations for Powered-on VMs).<br>Key: Location\|Storage vMotion |
| VM Datastore Change (powered-off VMs) | This metric displays the number of datastore change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Datastore Change (powered-off VMs) |
| VM Host and Datastore Change (powered-off VMs) | This metric displays the number of host and datastore change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Host and Datastore Change (powered-off VMs) |
| VM Host and Datastore Change (powered-on VMs) | This metric displays the number of host and datastore change operations, for powered-on and suspended virtual machines.<br>Key: Location\|VM Host and Datastore Change (powered-on VMs) |
| VM Host Change (powered-off VMs) | This metric displays the number of host change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Host Change (powered-off VMs) |
| vMotion | This metric displays the number of migrations with vMotion (host change operations for powered-on VMs).<br>Key: Location\|vMotion |
| State | |
| VM Guest Reboot | This metric displays the number of reboot operations on the virtual machine guest.<br>Key: State\|VM Guest Reboot |
| VM Guest Shutdown | This metric displays the number of shutdown operations on the virtual machine guest.<br>Key: State\|VM Guest Shutdown |
| VM Power Off | This metric displays the number of power-off operations on the virtual machine.<br>Key: State\|VM Power Off |
| VM Power On | This metric displays the number of power-on operations on the virtual machine.<br>Key: State\|VM Power On |
| VM Reset | This metric displays the number of reset operations on the virtual machine guest.<br>Key: State\|VM Reset |

| Metric Name | Description |
|---|---|
| VM Standby Guest | This metric displays the number of standby operations on the virtual machine guest.<br>Key: State\|VM Standby Guest |
| VM Suspend | This metric displays the number of suspend operations on the virtual machine.<br>Key: State\|VM Suspend |

### Disabled Metrics

The following metrics are disabled in this version of VCF Operations. This means that they do not collect data by default.

You can enable these metrics in the Policy workspace. For more information, in VMware Docs search for Collect Metrics and Properties Details.

You can enable these metrics in the Policy workspace. For more information, see *Metrics and Properties Details*.

| Metric Name | Key |
|---|---|
| CPU\|Capacity Available to VMs (mhz) | cpu\|totalCapacity_average |
| CPU\|IO Wait (msec) | cpu\|iowait |
| CPU\|Reserved Capacity (mhz) | cpu\|reservedCapacity_average |
| CPU\|Total Wait (msec) | cpu\|wait |
| Datastore I/O\|Max Observed Number of Outstanding IO Operations | datastore\|maxObserved_OIO |
| Datastore I/O\|Max Observed Read Rate (kbps) | datastore\|maxObserved_Read |
| Datastore I/O\|Max Observed Reads per second | datastore\|maxObserved_NumberRead |
| Datastore I/O\|Max Observed Write Rate (kbps) | datastore\|maxObserved_Write |
| Datastore I/O\|Max Observed Writes per second | datastore\|maxObserved_NumberWrite |
| Storage\|Total Usage (kbps) | storage\|usage_average |
| Summary\|Average Provisioned Capacity per Running VM (mhz) | summary\|avg_vm_cpu |
| Summary\|Average Provisioned Memory per Running VM (kb) | summary\|avg_vm_mem |
| Summary\|Average Provisioned Memory per Running VM (kb) | summary\|avg_vm_mem |
| Summary\|Maximum Number of VMs | summary\|max_number_vms |
| Summary\|Workload Indicator | summary\|workload_indicator |
| Network I/O\|Max Observed Received Throughput (KBps) | net\|maxObserved_Rx_KBps |
| Network I/O\|Max Observed Throughput (KBps) | net\|maxObserved_KBps |
| Network I/O\|Max Observed Transmitted Throughput (KBps) | net\|maxObserved_Tx_KBps |
| Diskspace\|Not Shared (GB) | Space used by VMs that is not shared.<br>Key: diskspace\|notshared |

## Resource Pool Metrics

VCF Operations collects configuration, CPU usage, memory, and summary metrics for resource pool objects.

Resource Pool metrics include capacity and badge metrics. See definitions in:

- Capacity Analytics Generated Metrics
- Badge Metrics

### Configuration Metrics for Resource Pools

Configuration metrics provide information about memory and CPU allocation configuration.

| Metric Name | Description |
|---|---|
| Memory Allocation Reservation | Memory Allocation Reservation.<br>Key: config\|mem_alloc_reservation |

### CPU Usage Metrics for Resource Pools

CPU usage metrics provide information about CPU use.

| Metric Name | Description |
|---|---|
| Capacity Demand Entitlement (%) | CPU Capacity Demand Entitlement Percentage.<br>Key: cpu\|capacity_demandEntitlementPct |
| Capacity entitlement (MHz) | CPU Capacity Entitlement.<br>Key: cpu\|capacity_entitlement |
| CPU Contention (%) | CPU capacity contention.<br>Key: cpu\|capacity_contentionPct |
| Demand (MHz) | CPU demand in megahertz.<br>Key: cpu\|demandmhz |
| Overall CPU Contention | Overall CPU contention in milliseconds.<br>Key: cpu\|capacity_contention |
| Usage | Average CPU use in megahertz.<br>Key: cpu\|usagemhz_average |
| Effective limit | CPU effective limit.<br>Key: cpu\|effective_limit |
| Reservation Used | CPU reservation used.<br>Key: cpu\|reservation_used |
| Estimated entitlement | CPU estimated entitlement.<br>Key: cpu\|estimated_entitlement |
| Dynamic entitlement | CPU dynamic entitlement.<br>Key: cpu\|dynamic_entitlement |
| Demand without overhead | Value of demand excluding any overhead.<br>Key: cpu\|demand_without_overhead |

### Memory Metrics for Resource Pools

Memory metrics provide information about memory use and allocation.

| Metric Name | Description |
|---|---|
| Balloon | Amount of memory currently used by the virtual machine memory control.<br>Key: mem\|vmmemctl_average |
| Compression Rate | Compression rate in kilobytes per second.<br>Key: mem\|compressionRate_average |
| Consumed | Amount of host memory consumed by the virtual machine for guest memory.<br>Key: mem\|consumed_average |
| Contention | Machine contention.<br>Key: mem\|host_contentionPct |

| Metric Name | Description |
|---|---|
| Guest usage | Guest memory entitlement.<br>Key: mem\|guest_usage |
| Guest demand | Guest memory entitlement.<br>Key: mem\|guest_demand |
| Contention (KB) | Machine contention in kilobytes.<br>Key: mem\|host_contention |
| Decompression Rate | Decompression rate in kilobytes per second.<br>Key: mem\|decompressionRate_average |
| Granted | Average of memory available for use.<br>Key: mem\|granted_average |
| Guest Active | Amount of memory that is actively used.<br>Key: mem\|active_average |
| VM Overhead | Memory overhead reported by host.<br>Key: mem\|overhead_average |
| Shared | Amount of shared memory.<br>Key: mem\|shared_average |
| Reservation Used | Memory Reservation Used.<br>Key: mem\|reservation_used |
| Dynamic Entitlement | Memory Dynamic Entitlement.<br>Key: mem\|dynamic_entitlement |
| Effective Limit | Memory Effective Limit.<br>Key: mem\|effective_limit |
| Swap In Rate | Rate at which memory is swapped from disk into active memory during the interval.<br>Key: mem\|swapinRate_average |
| Swap Out Rate | Rate at which memory is being swapped from active memory to disk during the current interval.<br>Key: mem\|swapoutRate_average |
| Swapped | Amount of unreserved memory.<br>Key: mem\|swapped_average |
| Usage (%) | Memory currently in use as a percentage of total available memory.<br>Key: mem\|usage_average |
| Zero | Amount of memory that is all zero.<br>Key: mem\|zero_average |
| Zipped (KB) | Latest zipped memory in kilobytes.<br>Key: mem\|zipped_latest |
| Swap In (KB) | Amount of memory swapped in kilobytes.<br>Key: mem\|swapin_average |
| Swap Out (KB) | Amount of memory swapped out in kilobytes.<br>Key: mem\|swapout_average |
| Swap Used | Amount of memory used for swap space in kilobytes.<br>Key: mem\|swapused_average |
| Total Capacity | Total capacity.<br>Key: mem\|guest_provisioned |

### Summary Metrics for Resource Pools

Summary metrics provide information about overall performance.

| Metric Name | Description |
|---|---|
| Number of Running VMs | Number of running virtual machines.<br>Key: summary\|number_running_vms |
| Total Number of VMs | Total number of virtual machines.<br>**Note:**<br>This shows the total number of VMs excluding VM templates.<br>Key: summary\|total_number_vms |
| IO Wait (ms) | IO wait time in milliseconds.<br>Key: summary\|iowait |
| Number of VM Templates | Number of VM Templates.<br>Key: summary\|number_vm_templates |

## Data Center Metrics

VCF Operations collects CPU usage, disk, memory, network, storage, disk space, and summary metrics for data center objects.

Data center metrics include capacity and badge metrics. See definitions in:

- Capacity Analytics Generated Metrics
- Badge Metrics

### Data Center Metrics for ROI Dashboard

Data center metrics provide information about data center savings across vCenters.

| Metric Name | Description |
|---|---|
| Realized Cost Savings | |
| Realized Savings Idle Cost | This metric displays the total realize savings for VMs across all vCenters.<br>Key: cost\|realized_savings\|realizedIdleCost |
| Realized Savings Powered Off Cost (AOA) | This metric displays the total realized savings for powered off VMs across all vCenters.<br>Key: cost\|realized_savings\|realizedPoweredOffCost |
| Realized Savings Snapshot Space Cost (AOA) | This metric displays the snapshots space saved across all vCenters.<br>Key: cost\|realized_savings\|realizedSnapshotSpaceCost |
| Realized Savings Oversized Cost (AOA) | This metric displays the oversized savings across all vCenters.<br>Key: cost\|realized_savings\|realizedOversizedCost |
| Realized Savings Orphaned Disk Space Cost (AOA) | This metric displays the amount of disk space saved by orphaned disks across all vCenters.<br>Key: cost\|realized_savings\|realizedOrphanedDiskSpaceCost |
| Realized Savings Reclaimable Host Cost (AOA) | This metric displays the amount of reclaimable host savings across all vCenters.<br>Key: cost\|realized_savings\|realizedReclaimableHostCost |
| Realized vCPUs from Oversized VMs | This metric displays the number of vCPUs realized across all vCenters.<br>Key: realized\|realizedVCpus |

| Metric Name | Description |
|---|---|
| Compute Realized Memory from Oversized VMs | This metric displays the amount of memory realized from oversized VMs across all vCenters.<br>Key: compute_realized\|realizedOversizedMem |
| Realized Potential Memory Consumed from Oversized VMs | This metric displays the potential memory consumed from oversized VMs across all vCenters.<br>Key: realized\|realizedPotentialMemConsumed |
| Compute Realized vCPUs from Oversized VMs | This metric displays the realized vCPUs from oversized VMs across all vCenters.<br>Key: compute_realized\|realizedOversizedVCpus |
| Compute Realized vCPUs from Idle VMs | This metric displays the realized vCPUs from idle VMs across all vCenters.<br>Key: compute_realized\|realizedIdleVCpus |
| Compute Realized Memory from Idle VMs | This metric displays the amount of memory realized from idle VMs across all vCenters.<br>Key: compute_realized\|realizedIdleMem |
| Disk Space Realized Idle VMs | This metric displays the amount of disk space realized from idle VMs across all vCenters.<br>Key: storage_realized\|realizedIdleDiskSpace |
| Disk Space Realized PoweredOff VMs | This metric displays the amount of disk space realized from powered off VMs across all vCenters.<br>Key: storage_realized\|realizedPoweredOffDiskSpace |
| Disk Space Realized VM Snapshots | This metric displays the amount of disk space realized from VM snapshots across all vCenters.<br>Key: storage_realized\|realizedSnapshotSpace |
| Disk Space Realized Orphaned Disks | This metric displays the amount of disk space realized from orphaned disks across all vCenters.<br>Key: storage_realized\|realizedIdleDiskSpace |
| Realized Savings Total Realized Cost | This metric displays the total realized cost across all vCenters.<br>Key: cost\|realized_savings\|realizedTotalCost |

### CPU Usage Metrics for Data Centers

CPU usage metrics provide information about CPU use.

| Metric Name | Description |
|---|---|
| Capacity Usage (%) | Percent capacity used.<br>Key: cpu\|capacity_usagepct_average |
| CPU Contention (%) | CPU capacity contention.<br>Key: cpu\|capacity_contentionPct |
| Demand (%) | CPU demand percentage.<br>Key: cpu\|demandPct |
| Demand | Demand in megahertz.<br>Key: cpu\|demandmhz |
| Demand (MHz) | CPU utilization level based on descendant virtual machines utilization. This Includes reservations, limits, and overhead to run the virtual machines.<br>Key: cpu\|demandmhz |
| Overhead (KB) | Amount of CPU overhead.<br>Key: cpu\|overhead_average |

| Metric Name | Description |
|---|---|
| Demand without overhead | Value of demand excluding any overhead.<br>Key: cpu\|demand_without_overhead |
| Total Wait | CPU time spent on idle state.<br>Key: cpu\|wait |
| Number of CPU Sockets | Number of CPU sockets.<br>Key: cpu\|numpackages |
| Overall CPU Contention (ms) | Overall CPU contention in milliseconds.<br>Key: cpu\|capacity_contention |
| Host Provisioned Capacity (MHz) | Host provisioned capacity in megahertz.<br>Key: cpu\|capacity_provisioned |
| Provisioned vCPU(s) | Provisioned vCPU(s).<br>Key: cpu\|corecount_provisioned |
| Reserved Capacity (MHz) | The sum of the reservation properties of the (immediate) children of the host's root resource pool.<br>Key: cpu\|reservedCapacity_average |
| Usage | Average CPU usage in megahertz.<br>Key: cpu\|usagemhz_average |
| IO Wait | IO wait time in milliseconds.<br>Key: cpu\|iowait |
| Provisioned Capacity | Provisioned Capacity.<br>Key: cpu\|vm_capacity_provisioned |
| Stress Balance Factor | Stress Balance Factor.<br>Key: cpu\|stress_balance_factor |
| Lowest Provider Capacity Remaining | Lowest Provider Capacity Remaining.<br>Key: cpu\|min_host_capacity_remaining |
| Workload Balance Factor | Workload Balance Factor.<br>Key: cpu\|workload_balance_factor |
| Highest Provider Workload | Highest Provider Workload.<br>Key: cpu\|max_host_workload |
| Host workload Max-Min Disparity | Difference of Max and Min host workload in the container.<br>Key: cpu\|host_workload_disparity |
| Host stress Max-Min Disparity | Difference of Max and Min host stress in the container.<br>Key: cpu\|host_stress_disparity |
| Total Capacity (MHz) | Total CPU resources configured on the descendant ESX hosts.<br>Key: cpu\|capacity_provisioned |
| Usable Capacity (MHz) | The usable CPU resources that are available for the virtual machines after considering reservations for vSphere High Availability (HA) and other vSphere services.<br>Key: cpu\|haTotalCapacity_average |

## Disk Metrics for Data Centers

Disk metrics provide information about disk use.

| Metric Name | Description |
|---|---|
| Total IOPS | Average number of commands issued per second during the collection interval.<br>Key: disk\|commandsAveraged_average |
| Total Latency (ms) | Average amount of time taken for a command from the perspective of the guest operating system. This metric is the sum of the Kernel Latency and Physical Device Latency metrics.<br>Key: disk\|totalLatency_average |
| Total Throughput (KBps) | Average of the sum of the data read and written for all the disk instances of the host or virtual machine.<br>Key: disk\|usage_average |
| Total queued outstanding operations | Sum of queued operations and outstanding operations.<br>Key: disk\|sum_queued_oio |
| Max observed OIO | Max observed IO for a disk.<br>Key: disk\|max_observed |

## Memory Metrics for Data Centers

Memory metrics provide information about memory use and allocation.

| Metric Name | Description |
|---|---|
| Contention (%) | Machine Contention Percentage.<br>Key: mem\|host_contentionPct |
| Machine Demand (KB) | Memory machine demand in kilobytes.<br>Key: mem\|host_demand |
| ESX System Usage | Memory usage by the VM kernel and ESX user-level services.<br>Key: mem\|host_systemUsage |
| Provisioned Memory (KB) | Provisioned host memory in kilobytes.<br>Key: mem\|host_provisioned |
| Reserved Capacity (KB) | Reserved memory capacity in kilobytes.<br>Key: mem\|reservedCapacity_average |
| Usable Memory (KB) | Usable host memory in kilobytes.<br>Key: mem\|host_usable |
| Host Usage | Host memory use in kilobytes.<br>Key: mem\|host_usage |
| Usage/Usable (%) | Percent host memory used.<br>Key: mem\|host_usagePct |
| VM Overhead | Memory overhead reported by host.<br>Key: mem\|overhead_average |
| Stress Balance Factor | Stress Balance Factor.<br>Key: mem\|stress_balance_factor |
| Lowest Provider Capacity Remaining | Lowest Provider Capacity Remaining.<br>Key: mem\|min_host_capacity_remaining |
| Workload Balance Factor | Workload Balance Factor.<br>Key: mem\|workload_balance_factor |

| Metric Name | Description |
|---|---|
| Highest Provider Workload | Highest Provider Workload.<br>Key: mem\|max_host_workload |
| Host workload Max-Min Disparity | Difference of Max and Min host workload in the container.<br>Key: mem\|host_workload_disparity |
| Host stress Max-Min Disparity | Difference of Max and Min host stress in the container.<br>Key: mem\|host_stress_disparity |
| Utilization (KB) | Memory utilization level based on the descendant virtual machines utilization. Includes reservations, limits, and overhead to run the Virtual Machines.<br>Key: mem\|total_need |
| Total Capacity (KB) | Total physical memory configured on descendant ESX hosts.<br>Key: mem\|host_provisioned |
| Usable Capacity (KB) | The usable memory resources available for the virtual machines after considering reservations for vSphere HA and other vSphere services.<br>Key: mem\|haTotalCapacity_average |

### Network Metrics for Data Centers

Network metrics provide information about network performance.

| Metric Name | Description |
|---|---|
| Packets Dropped | Percentage of packets dropped.<br>Key: net\|droppedPct |
| Max Observed Throughput | Max observed rate of network throughput.<br>Key: net\|maxObservedKBps |
| Data Transmit Rate | Average amount of data transmitted per second.<br>Key: net\|transmitted_average |
| Data Receive Rate | Average amount of data received per second.<br>Key: net\|received_average |
| Total Throughput (KBps) | The sum of the data transmitted and received for all the NIC instances of the host or virtual machine.<br>Key: net\|usage_average |

### Storage Metrics for Data Centers

Storage metrics provide information about storage use.

| Metric Name | Description |
|---|---|
| Total Usage | Total throughput rate.<br>Key: storage\|usage_average |

### Datastore Metrics for Data Centers

Datastore metrics provide information about Datastore use.

| Metric Name | Description |
|---|---|
| Outstanding IO requests | OIO for datastore.<br>Key: datastore\|demand_oio |
| Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: datastore\|numberReadAveraged_average |
| Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: datastore\|numberWriteAveraged_average |
| Read Throughput (KBps) | Amount of data read in the performance interval.<br>Key: datastore\|read_average |
| Write Throughput (KBps) | Amount of data written to disk in the performance interval.<br>Key: datastore\|write_average |

### Disk Space Metrics for Data Centers

Disk space metrics provide information about disk use.

| Metric Name | Description |
|---|---|
| Virtual machine used | Used virtual machine disk space in gigabytes.<br>Key: diskspace\|used |
| Total disk space used | Total disk space used on all datastores visible to this object.<br>Key: diskspace\|total_usage |
| Total disk space | Total disk space on all datastores visible to this object.<br>Key: diskspace\|total_capacity |
| Total provisioned disk space | Total provisioned disk space on all datastores visible to this object.<br>Key: diskspace\|total_provisioned |
| Shared Used (GB) | Shared disk space in gigabytes.<br>Key: diskspace\|shared |
| Snapshot Space (GB) | Snapshot disk space in gigabytes.<br>Key: diskspace\|snapshot |
| Virtual Disk Used (GB) | Used virtual disk space in gigabytes.<br>Key: diskspace\|diskused |
| Number of Virtual Disks | Number of Virtual Disks.<br>Key: diskspace\|numvmdisk |
| Utilization (GB) | Storage space used on the connected vSphere Datastores.<br>Key: diskspace\|total_usage |
| Total Capacity (GB) | Total storage space available on the connected vSphere datastores.<br>Key: diskspace\|total_capacity |

## Summary Metrics for Data Centers

Summary metrics provide information about overall performance.

| Metric Name | Description |
|---|---|
| Number of Running Hosts | Number of hosts that are ON.<br>Key: summary\|number_running_hosts |
| Number of Running VMs | Number of running virtual machines.<br>Key: summary\|number_running_vms |
| Maximum Number of VMs | Maximum number of virtual machines.<br>Key: summary\|max_number_vms |
| Number of Clusters | Total number of clusters.<br>Key: summary\|total_number_clusters |
| Number of Hosts | Total number of hosts.<br>Key: summary\|total_number_hosts |
| Number of VMs | Total number of virtual machines.<br>Key: summary\|total_number_vms |
| Total Number of Datastores | Total number of datastores.<br>Key: summary\|total_number_datastores |
| Number of VCPUs on Powered On VMs | Total number of VCPUs of virtual machines that are powered on.<br>Key: summary\|number_running_vcpus |
| Workload Indicator | Workload indicator.<br>Key: summary\|workload_indicator |
| Average Running VM Count per Running Host | Average number of running virtual machines per running host.<br>Key: summary\|avg_vm_density |
| WLP | Displays the VM migration trend as part of workload optimization. These metrics are deactivated by default. You must activate them from policies.<br>• Fail Count: Number of failed VM move attempts in the last daily cycle.<br>• Number of runs: The total number of times the WLP was run during the last daily cycle.<br>• Success Count: The number of successful VM moves during the last daily cycle. |

## Reclaimable Metrics for Data Centers

Reclaimable metrics provide information about reclaimable resources.

| Metric Name | Description |
|---|---|
| CPU (vCPUs) | Number of reclaimable vCPUs within the data center.<br>Key: reclaimable\|cpu |
| Disk Space | Reclaimable disk space within the data center.<br>Key: reclaimable\|diskspace |
| Potential Savings | Potential saving after reclamation of resources of all reclaimable VMs (Idle VMs, Powered Off VMs, VM snapshots) within the data center.<br>Key: reclaimable\|cost |
| Memory (KB) | Reclaimable memory within the data center.<br>Key: reclaimable\|mem |

| Metric Name | Description |
|---|---|
| Virtual Machines | Number of VMs having reclaimable resources (Memory, disk space, vCPU) within the data center.<br>Key: reclaimable\|vm_count |
| Idle VMs\|Potential Savings | Potential saving after reclamation of resources of Idle VMs within the data center.<br>Key: reclaimable\|idle_vms\|cost |
| Powered Off VMs\|Potential Savings | Potential saving after reclamation of resources of Powered Off VMs within the data center.<br>Key: reclaimable\|poweredOff_vms\|cost |
| VM Snapshots\|Potential Savings | Potential saving after reclamation of VM snapshots within the data center.<br>Key: reclaimable\|vm_snapshots \|cost |
| Reclaimable\|Orphaned Disks\|Potential Savings (Currency) | Displays the potential savings after reclaimation of disk space by removing orphaned VMDks from all datastores under datacenter.<br>reclaimable\|cost |
| Reclaimable\|Number of Orphaned Disks | Number of reclaimable orphaned disks is the sum of all orphaned disks on it's datastore.<br>reclaimable\|orphaned_disk_count |
| Reclaimable Host Cost | This metric calculates the cumulated reclaimable host cost at cluster level and displays the same metric at data center level.<br>Reclaimable\|Reclaimable Host Cost (Currency) |

## Cost Metrics for Data Centers

Cost metrics provide information about the cost.

**Note:**
The Effective metrics based on the capacity model assigned at the cluster (Demand/Allocation) pick the corresponding metric from underneath the clusters.

| Metric Name | Description |
|---|---|
| Monthly Cluster Aggregated Allocated Cost | This metric displays the sum of the monthly allocated cost for both cluster and unclustered hosts.<br>Key: Cost\|Allocation\|Monthly Cluster Aggregated Allocated Cost |
| Monthly Cluster Aggregated Unallocated Cost | This metric displays the sum of both cluster and unclustered hosts unallocated cost.<br>Key: Cost\|Allocation\|Monthly Cluster Aggregated Unallocated Cost |
| Monthly Datastore Aggregated Allocated Cost | This metric displays the monthly aggregated allocated cost at datastore level.<br>Key: Cost\|Allocation\|Monthly Datastore Aggregated Allocated Cost |
| Monthly Datastore Aggregated Unallocated Cost | This metric displays the monthly aggregated unallocated cost at datastore level.<br>Key: Cost\|Allocation\|Monthly Datastore Aggregated Unallocated Cost |
| Monthly Cluster Effective Aggregated Allocated Cost | This metric displays the Monthly Cluster Effective Aggregated Allocated Cost cost.<br>Key: Cost\|Monthly Cluster Effective Aggregated Allocated Cost |
| Monthly Cluster Effective Aggregated Unallocated Cost | This metric displays the Monthly Cluster Effective Aggregated Unallocated Cost.<br>Key: Cost\|Monthly Cluster Effective Aggregated Unallocated Cost |

| Metric Name | Description |
|---|---|
| Monthly Datastore Effective Aggregated Allocated Cost | This metric displays the Monthly Datastore Effective Aggregated Allocated Cost at datastore level.<br>Key: Cost\|Allocation\|Monthly Datastore Effective Aggregated Allocated Cost |
| Monthly Datastore Effective Aggregated Unallocated Cost | This metric displays the Monthly Datastore Effective Aggregated Unallocated Cost at datastore level.<br>Key: Cost\|Allocation\|Monthly Datastore Effective Aggregated Unallocated Cost |
| **Note:**<br>The eight allocation metrics mentioned above, helps you to calculate the cost when you enable the allocation model for costing. The same set of metrics are available when you enable demand model also. | |
| Monthly Cluster Aggregated Cost | This metric displays the sum of monthly aggregated allocated and unallocated cost for clusters.<br>Key: cost\|clusterCost |
| Monthly Cluster Aggregated Unallocated Cost | This metric displays the sum of the monthly unallocated cost for both cluster and unclustered hosts.<br>Key: Cost\|Monthly Cluster Aggregated Unallocated Cost |
| Monthly Datacenter Aggregated Total Cost | Monthly aggregated total cost for the data center.<br>Key: Cost\|Monthly Datacenter Aggregated Total Cost |
| Monthly Datastore Total Cost | Monthly data store total cost.<br>Key: cost\|totalCost |
| Monthly Datastore Aggregated Allocated Cost | Monthly aggregated allocated cost for the datastore.<br>Key: cost\|aggrDataStoreAllocatedCost |
| Monthly Datastore Aggregated Unallocated Cost | Monthly aggregated unallocated cost for the datastore.<br>Key: cost\|aggrDataStoreUnallocatedCost |
| Monthly VM Aggregated Direct Cost | Month to date aggregated VM direct cost across all the VMs under the data center.<br>Key: cost\|vmDirectCost |

## Virtual Machine Operations Metrics for Data Centers

VM operations metrics provide information about the actions performed on the VMs in the datacenter. The following are some important points you must know about VM operation metrics for data centers.

- VM operations metrics is not collected for custom data centers.
- If you edit a VM settings and do not perform any action, still it is considered as VM reconfigure operation.
- During Revert Snapshot, VMs are powered-off, but this operation is not counted under VM Power-off metric.
- Adding ESX with VMs is not counted under VM Create metric.
- Removing ESX with VMs is not coutned under VM Remove metric.
- VM hardstop operation is not counted under VM Power Off metric.

| Metric Name | Description |
|---|---|
| Inventory | |
| VM Clone | This metric displays the number of clone operations on the virtual machine.<br>Key: Inventory\|VM Clone |
| VM Create | This metric displays the number of create operations on the virtual machine.<br>Key: Inventory\|VM Create |

| Metric Name | Description |
|---|---|
| VM Delete | This metric displays the number of delete operations on the virtual machine.<br>Key: Inventory\|VM Delete |
| VM Reconfigure | This metric displays the number of reconfigure operations on the virtual machine.<br>Key: Inventory\|VM Reconfigure |
| VM Register | This metric displays the number of register operations on the virtual machine.<br>Key: Inventory\|VM Register |
| VM Template Deploy | This metric displays the number templates deployed on the virtual machine.<br>Key: Inventory\|VM Template Deploy |
| VM Unregister | This metric displays the number of unregister operations on the virtual machine.<br>Key: Inventory\|VM Unregister |
| Location | |
| Storage vMotion | This metric displays the number of migrations with vMotion (datastore change operations for Powered-on VMs).<br>Key: Location\|Storage vMotion |
| VM Datastore Change (powered-off VMs) | This metric displays the number of datastore change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Datastore Change (powered-off VMs) |
| VM Host and Datastore Change (powered-off VMs) | This metric displays the number of host and datastore change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Host and Datastore Change (powered-off VMs) |
| VM Host and Datastore Change (powered-on VMs) | This metric displays the number of host and datastore change operations, for powered-on and suspended virtual machines.<br>Key: Location\|VM Host and Datastore Change (powered-on VMs) |
| VM Host Change (powered-off VMs) | This metric displays the number of host change operations, for powered-off and suspended virtual machines.<br>Key: Location\|VM Host Change (powered-off VMs) |
| vMotion | This metric displays the number of migrations with vMotion (host change operations for powered-on VMs).<br>Key: Location\|vMotion |
| State | |
| VM Guest Reboot | This metric displays the number of reboot operations on the virtual machine guest.<br>Key: State\|VM Guest Reboot |
| VM Guest Shutdown | This metric displays the number of shutdown operations on the virtual machine guest.<br>Key: State\|VM Guest Shutdown |
| VM Power Off | This metric displays the number of power-off operations on the virtual machine.<br>Key: State\|VM Power Off |
| VM Power On | This metric displays the number of power-on operations on the virtual machine.<br>Key: State\|VM Power On |

| Metric Name | Description |
|---|---|
| VM Reset | This metric displays the number of reset operations on the virtual machine guest.<br>Key: State\|VM Reset |
| VM Standby Guest | This metric displays the number of standby operations on the virtual machine guest.<br>Key: State\|VM Standby Guest |
| VM Suspend | This metric displays the number of suspend operations on the virtual machine.<br>Key: State\|VM Suspend |

### Disabled Metrics

The following metrics are disabled in this version of VCF Operations. This means that they do not collect data by default.

You can enable these metrics in the Policy workspace. For more information, in VMware Docs search for Collect Metrics and Properties Details.

You can enable these metrics in the Policy workspace. For more information, see Metrics and Properties Details.

| Metric Name | Key |
|---|---|
| Datastore I/O\|Max Observed Number of Outstanding IO Operations (IOPS) | datastore\|maxObserved_OIO |
| Datastore I/O\|Max Observed Read Rate (KBps) | datastore\|maxObserved_Read |
| Datastore I/O\|Max Observed Reads per second (IOPS) | datastore\|maxObserved_NumberRead |
| Datastore I/O\|Max Observed Write Rate (KBps) | datastore\|maxObserved_Write |
| Datastore I/O\|Max Observed Writes per second (IOPS)0 | datastore\|maxObserved_NumberWrite |
| Max Observed Transmitted Throughput | Max observed transmitted rate of network throughput.<br>Key: net\|maxObserved_Tx_KBps |
| Max Observed Received Throughput | Max observed received rate of network throughput.<br>Key: net\|maxObserved_Rx_KBps |
| Not Shared (GB) | Unshared disk space in gigabytes.<br>Key: diskspace\|notshared |

## Custom Data Center Metrics

VCF Operations collects CPU usage, memory, summary, network, and datastore metrics for custom data center objects.

Custom data center metrics include capacity and badge metrics. See definitions in:

- Capacity Analytics Generated Metrics
- Badge Metrics

### CPU Usage Metrics for Custom Data Centers

CPU usage metrics provide information about CPU use.

| Metric Name | Description |
|---|---|
| Host Provisioned Capacity | Host provisioned capacity (MHz).<br>Key: cpu\|capacity_provisioned |
| Provisioned vCPU(s) | Provisioned vCPU(s).<br>Key: cpu\|corecount_provisioned |

| Metric Name | Description |
|---|---|
| Demand without overhead | Value of demand excluding any overhead.<br>Key: cpu\|demand_without_overhead |
| Number of hosts stressed | Number of hosts stressed.<br>Key: cpu\|num_hosts_stressed |
| Stress Balance Factor | Stress balance factor.<br>Key: cpu\|stress_balance_factor |
| Lowest Provider Capacity Remaining | Lowest provider capacity remaining.<br>Key: cpu\|min_host_capacity_remaining |
| Workload Balance Factor | Workload balance factor.<br>Key: cpu\|workload_balance_factor |
| Highest Provider Workload | Highest provider workload.<br>Key: cpu\|max_host_workload |
| Host workload Max-Min Disparity | Host workload max-min disparity.<br>Key: cpu\|host_workload_disparity |
| Host stress Max-Min Disparity | Difference of max and min host stress in the container.<br>Key: cpu\|host_stress_disparity |
| Demand (MHz) | CPU utilization level based on descendant virtual machines utilization. This Includes reservations, limits, and overhead to run the virtual machines.<br>Key: cpu\|demandmhz |
| Total Capacity (MHz) | Total CPU resources configured on the descendant ESX hosts.<br>Key: cpu\|capacity_provisioned |
| Usable Capacity (MHz) | The usable CPU resources that are available for the virtual machines after considering reservations for vSphere High Availability (HA) and other vSphere services.<br>Key: cpu\|haTotalCapacity_average |

### Memory Metrics for Custom Data Centers

Memory metrics provide information about memory use.

| Metric Name | Description |
|---|---|
| Usable Memory | Usable memory.<br>Key: mem\|host_usable |
| Machine Demand | Memory machine demand in KB.<br>Key: mem\|host_demand |
| Number of hosts stressed | Number of hosts stressed.<br>Key: mem\|num_hosts_stressed |
| Stress Balance Factor | Stress balance factor.<br>Key: mem\|stress_balance_factor |
| Lowest Provider Capacity Remaining | Lowest provider capacity remaining.<br>Key: mem\|min_host_capacity_remaining |
| Workload Balance Factor | Workload balance factor.<br>Key: mem\|workload_balance_factor |
| Highest Provider Workload | Highest provider workload.<br>Key: mem\|max_host_workload |
| Host workload Max-Min Disparity | Host workload max-min disparity.<br>Key: mem\|host_workload_disparity |

| Metric Name | Description |
|---|---|
| Host stress max-min disparity | Host stress max-min disparity.<br>Key: mem\|host_stress_disparity |
| Utilization (KB) | Memory utilization level based on the descendant virtual machines utilization. Includes reservations, limits, and overhead to run the Virtual Machines.<br>Key: mem\|total_need |
| Total Capacity (KB) | Total physical memory configured on descendant ESX hosts.<br>Key: mem\|host_provisioned |
| Usable Capacity (KB) | The usable memory resources available for the virtual machines after considering reservations for vSphere HA and other vSphere services.<br>Key: mem\|haTotalCapacity_average |

### Summary Metrics for Custom Data Centers

Summary metrics provide information about overall performance.

| Metric Name | Description |
|---|---|
| Number of Running VMs | Number of virtual machines that are ON.<br>Key: summary\|number_running_vms |
| Maximum Number of VMs | Maximum number of virtual machines.<br>Key: summary\|max_number_vms |
| Status | Status of the data center.<br>Key: summary\|status |
| WLP | Displays the VM migration trend as part of workload optimization. These metrics are deactivated by default. You must activate them from policies.<br>• Fail Count: Number of failed VM move attempts in the last daily cycle.<br>• Number of runs: The total number of times the WLP was run during the last daily cycle.<br>• Success Count: The number of successful VM moves during the last daily cycle. |

### Network Metrics for Custom Data Centers

Network metrics provide information about network performance.

| Metric Name | Description |
|---|---|
| Usage Rate | The sum of the data transmitted and received for all the NIC instances of the host or virtual machine.<br>Key: net\|usage_average |
| Data Transmit Rate | Average amount of data transmitted per second.<br>Key: net\|transmitted_average |
| Data REceive Rate | Average amount of data received per second.<br>Key: net\|received_average |

## Datastore Metrics for Custom Data Centers

Datastore metrics provide information about datastore use.

| Metric Name | Description |
|---|---|
| Outstanding IO requests | OIO for datastore.<br>Key: datastore\|demand_oio |
| Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: datastore\|numberReadAveraged_average |
| Write IOPS | Average number of write commands issued per second during the collection interval.<br>Key: datastore\|numberWriteAveraged_average |
| Read Throughput (KBps) | Amount of data read in the performance interval.<br>Key: datastore\|read_average |
| Write Throughput (KBps) | Amount of data written to disk in the performance interval.<br>Key: datastore\|write_average |

## Reclaimable Metrics for Custom Data Centers

Reclaimable metrics provide information about reclaimable resources.

| Metric Name | Description |
|---|---|
| CPU (vCPUs) | Number of reclaimable vCPUs within the custom data center.<br>Key: reclaimable\|cpu |
| Disk Space | Reclaimable disk space within the custom data center.<br>Key: reclaimable\|diskspace |
| Potential Savings | Potential saving after reclamation of resources of all reclaimable VMs (Idle VMs, Powered Off VMs, VM snapshots) within the custom data center.<br>Key: reclaimable\|cost |
| Memory (KB) | Reclaimable memory within the custom data center.<br>Key: reclaimable\|mem |
| Number of Orphaned Disks | Number of reclaimable orphaned disks within the custom data center.<br>reclaimable\|orphaned_disk_count |
| Reclaimable\|Orphaned Disks\|Potential Savings | Potential savings in cost after reclamation of orphaned disks across the custom data center.<br>Key: reclaimable\|orphaned_disk\|cost<br>**Note:**<br>The orphaned disk reclamation feature might not work as expected when VCF Operations monitors multiple vCenters which use shared data stores. |
| Virtual Machines | Number of VMs having reclaimable resources (Memory, disk space, vCPU) within the custom data center.<br>Key: reclaimable\|vm_count |
| Idle VMs\|Potential Savings | Potential saving after reclamation of resources of Idle VMs within the custom data center.<br>Key: reclaimable\|idle_vms\|cost |
| Powered Off VMs\|Potential Savings | Potential saving after reclamation of resources of Powered Off VMs within the custom data center.<br>Key: reclaimable\|poweredOff_vms\|cost |

| Metric Name | Description |
|---|---|
| VM Snapshots\|Potential Savings | Potential saving after reclamation of VM snapshots within the custom data center.<br>Key: reclaimable\|vm_snapshots \|cost |
| Reclaimable\|Orphaned Disks\|Potential Savings (Currency) | Displays the potential savings after reclaimation of disk space by removing orphaned VMDks from all datastores under custom datacenters.<br>reclaimable\|cost |
| Reclaimable\|Number of Orphaned Disks | Number of reclaimable orphaned disks is the sum of the numbers of orphaned disks on it's datastore.<br>reclaimable\|orphaned_disk_count |

### Disk Space Metrics for Custom Data Centers

Disk space metrics provide information about disk use.

| Metric Name | Description |
|---|---|
| Utilization (GB) | Storage space used on the connected vSphere Datastores.<br>Key: diskspace\|total_usage |
| Total Capacity (GB) | Total storage space available on the connected vSphere datastores.<br>Key: diskspace\|total_capacity |

### Disabled Metrics

The following metrics are disabled in this version of VCF Operations. This means that they do not collect data by default.

You can enable these metrics in the Policy workspace. For more information, in VMware Docs search for Collect Metrics and Properties Details.

You can enable these metrics in the Policy workspace. For more information, see Metrics and Properties Details.

| Metric Name | Key |
|---|---|
| Max Observed Throughput | Max observed rate of network throughput.<br>Key: net\|maxObserved_KBps |
| Max Observed Transmitted Throughput | Max observed transmitted rate of network throughput.<br>Key: net\|maxObserved_Tx_KBps |
| Max Observed Received Throughput | Max observed received rate of network throughput.<br>Key: net\|maxObserved_Rx_KBps |
| Max Observed Reads per second | Max observed average number of read commands issued per second during the collection interval.<br>Key: datastore\|maxObserved_NumberRead |
| Max Observed Read Rate | Max observed rate of reading data from the datastore.<br>Key: datastore\|maxObserved_Read |
| Max Observed Writes per second | Max observed average number of write commands issued per second during the collection interval.<br>Key: datastore\|maxObserved_NumberWrite |
| Max Observed Write Rate | Max observed rate of writing data from the datastore.<br>Key: datastore\|maxObserved_Write |
| Max Observed Number of Outstanding IO Operations | Max observer number of outstanding IO operations.<br>Key: datastore\|maxObserved_OIO |

## Storage Pod Metrics

VCF Operations collects datastore and disk space metrics for storage pod objects.

Storage Pod metrics include capacity and badge metrics. See definitions in:

- Capacity Analytics Generated Metrics
- Badge Metrics

### Table 1481: Datastore Metrics for Storage Pods

| Metric Name | Description |
|---|---|
| Read IOPS | Average number of read commands issued per second during the collection interval.<br>Key: datastore\|numberReadAveraged_average |
| Writes per second | Average number of write commands issued per second during the collection interval.<br>Key: datastore\|numberWriteAveraged_average |
| Read Throughput (KBps) | Amount of data read in the performance interval.<br>Key: datastore\|read_average |
| Write Throughput (KBps) | Amount of data written to disk in the performance interval.<br>Key: datastore\|write_average |
| Total Throughput (KBps) | Usage Average.<br>Key: datastore\|usage_average |
| Read Latency | Average amount of time for a read operation from the datastore. Total latency = kernel latency + device latency.<br>Key: datastore\|totalReadLatency_average |
| Write Latency | Average amount of time for a write operation to the datastore. Total latency = kernel latency + device latency.<br>Key: datastore\|totalWriteLatency_average |
| Total Latency (ms) | The average amount of time taken for a command from the perspective of a Guest OS. This is the sum of Kernel Command Latency and Physical Device Command Latency.<br>Key: datastore\|totalLatency_average |
| Total IOPS | Average number of commands issued per second during the collection interval.<br>Key: datastore\|commandsAveraged_average |

### Table 1482: Disk Space Metrics for Storage Pods

| Metric Name | Description |
|---|---|
| Freespace | Unused space available on datastore.<br>Key: diskspace\|freespace |
| Total used | Total space used.<br>Key: diskspace\|disktotal |
| Capacity | Total capacity of datastore.<br>Key: diskspace\|capacity |
| Virtual Machine used | Space used by virtual machine files.<br>Key: diskspace\|used |
| Snapshot Space | Space used by snapshots.<br>Key: diskspace\|snapshot |

## VMware Distributed Virtual Switch Metrics

VCF Operations collects network and summary metrics for VMware distributed virtual switch objects.

VMware Distributed Virtual Switch metrics include badge metrics. See definitions in Badge Metrics.

### Table 1483: Network Metrics for VMware Distributed Virtual Switches

| Metric Name | Description |
|---|---|
| Total Ingress Traffic | Total ingress traffic (KBps).<br>Key: network\|port_statistics\|rx_bytes |
| Total Egress Traffic | Total egress traffic (KBps).<br>Key: network\|port_statistics\|tx_bytes |
| Egress Unicast Packets per second | Egress unicast packets per second.<br>Key: network\|port_statistics\|ucast_tx_pkts |
| Egress Multicast Packets per second | Egress multicast packets per second.<br>Key: network\|port_statistics\|mcast_tx_pkts |
| Egress Broadcast Packets per second | Egress broadcast packets per second.<br>Key: network\|port_statistics\|bcast_tx_pkts |
| Ingress Unicast Packets per second | Ingress unicast packets per second.<br>Key: network\|port_statistics\|ucast_rx_pkts |
| Ingress Multicast Packets per second | Ingress multicast packets per second.<br>Key: network\|port_statistics\|mcast_rx_pkts |
| Ingress Broadcast Packets per second | Ingress broadcast packets per second.<br>Key: network\|port_statistics\|bcast_rx_pkts |
| Egress Dropped Packets per second | Egress dropped packets per second.<br>Key: network\|port_statistics\|dropped_tx_pkts |
| Ingress Dropped Packets per second | Ingress dropped packets per second.<br>Key: network\|port_statistics\|dropped_rx_pkts |
| Total Ingress Packets per second | Total ingress packets per second.<br>Key: network\|port_statistics\|rx_pkts |
| Total Egress Packets per second | Total egress packets per second.<br>Key: network\|port_statistics\|tx_pkts |
| Utilization | Use (KBps).<br>Key: network\|port_statistics\|utilization |
| Total Dropped Packets per second | Total dropped packets per second.<br>Key: network\|port_statistics\|dropped_pkts |
| Percentage of Dropped Packets | Percentage of dropped packets.<br>Key: network\|port_statistics\|dropped_pkts_pct |
| Max Observed Ingress Traffic (KBps) | Max observed ingress traffic (KBps).<br>Key: network\|port_statistics\|maxObserved_rx_bytes |
| Max Observed Egress Traffic (KBps) | Max observed egress traffic (KBps).<br>Key: network\|port_statistics\|maxObserved_tx_bytes |
| Max Observed Utilization (KBps) | Max observed utilization (KBps).<br>Key: network\|port_statistics\|maxObserved_utilization |

**Table 1484: Summary Metrics for VMware Distributed Virtual Switches**

| Metric Name | Description |
|---|---|
| Maximum Number of Ports | Maximum number of ports.<br>Key: summary\|max_num_ports |
| Used Number of Ports | Used number of ports.<br>Key: summary\|used_num_ports |
| Number of Blocked Ports | Number of blocked ports.<br>Key: summary\|num_blocked_ports |

**Table 1485: Host Metrics for VMware Distributed Virtual Switches**

| Metric Name | Description |
|---|---|
| MTU Mismatch | Maximum Transmission Unit (MTU) mismatch.<br>Key: host\|mtu_mismatch |
| Teaming Mismatch | Teaming mismatch.<br>Key: host\|teaming_mismatch |
| Unsupported MTU | Unsupported MTU.<br>Key: host\|mtu_unsupported |
| Unsupported VLANs | Unsupported VLANs.<br>Key: host\|vlans_unsupported |
| Config Out Of Sync | Config Out Of Sync.<br>Key: host\|config_outofsync |
| Number of Attached pNICs | Number of attached physical NICs.<br>Key: host\|attached_pnics |

## Distributed Virtual Port Group Metrics

The vCenter Adapter instance collects network and summary metrics for distributed virtual port groups.

Distributed Virtual Port Group metrics include badge metrics. See definitions in Badge Metrics.

**Table 1486: Network Metrics for Distributed Virtual Port Groups**

| Metric Name | Description |
|---|---|
| Ingress Traffic | Ingress traffic (KBps).<br>Key: network\|port_statistics\|rx_bytes |
| Egress Traffic | Egress traffic (KBps).<br>Key: network\|port_statistics\|tx_bytes |
| Egress Unicast Packets per second | Egress unicast packets per second.<br>Key: network\|port_statistics\|ucast_tx_pkts |
| Egress Multicast Packets per second | Egress multicast packets per second.<br>Key: network\|port_statistics\|mcast_tx_pkts |
| Egress Broadcast Packets per second | Egress broadcast packets per second.<br>Key: network\|port_statistics\|bcast_tx_pkts |
| Ingress Unicast Packets per second | Ingress unicast packets per second.<br>Key: network\|port_statistics\|ucast_rx_pkts |
| Ingress Multicast Packets per second | Ingress multicast packets per second.<br>Key: network\|port_statistics\|mcast_rx_pkts |

| Metric Name | Description |
|---|---|
| Ingress Broadcast Packets per second | Ingress broadcast packets per second.<br>Key: network\|port_statistics\|bcast_rx_pkts |
| Egress Dropped Packets per second | Egress dropped packets per second.<br>Key: network\|port_statistics\|dropped_tx_pkts |
| Ingress Dropped Packets per second | Ingress dropped packets per second.<br>Key: network\|port_statistics\|dropped_rx_pkts |
| Total Ingress Packets per second | Total Ingress packets per second.<br>Key: network\|port_statistics\|rx_pkts |
| Total Egress Packets per second | Total Egress packets per second.<br>Key: network\|port_statistics\|tx_pkts |
| Utilization | Utilization (KBps).<br>Key: network\|port_statistics\|utilization |
| Total Dropped Packets per second | Total dropped packets per second.<br>Key: network\|port_statistics\|dropped_pkts |
| Percentage of Dropped Packets | Percentage of dropped packets.<br>Key: network\|port_statistics\|dropped_pkts_pct |
| Max Observed Ingress Traffic (KBps) | Max observed ingress traffic (KBps).<br>Key: network\|port_statistics\|maxObserved_rx_bytes |
| Max Observed Egress Traffic (KBps) | Max observed egress traffic (KBps).<br>Key: network\|port_statistics\|maxObserved_tx_bytes |
| Max Observed Utilization (KBps) | Max observed utilization (KBps).<br>network\|port_statistics\|maxObserved_utilization |

**Table 1487: Summary Metrics for Distributed Virtual Port Groups**

| Metric Name | Description |
|---|---|
| Maximum Number of Ports | Maximum number of ports.<br>Key: summary\|max_num_ports |
| Used Number of Ports | Used number of ports.<br>Key: summary\|used_num_ports |
| Number of Blocked Ports | The number of blocked ports.<br>Key: summary\|num_blocked_ports |

## Datastore Cluster Metrics

VCF Operations collects profile metrics for the datastore cluster resources.

### Profiles Metrics for Datastore Cluster Resources

Profiles metrics provide information about the profile specific capacity.

| Metric Name | Description |
|---|---|
| Profiles\|Capacity Remaining Profile (Average) | The capacity remaining in terms of fitting the average consumer.<br>Key: Profiles\|capacityRemainingProfile_<profile uuid> |
| Profiles\|Capacity Remaining Profile (<custom profile name>) | Published for custom profiles enabled from policy on Datastore Cluster Resource.<br>Key: Profiles\|capacityRemainingProfile_<profile uuid> |

### Capacity Allocation Metrics for Datastore Cluster Resources

Capacity allocation metrics provide information about the allotment of capacity, see Capacity Analytics Generated Metrics.

## Datastore Metrics

VCF Operations collects capacity, device, and summary metrics for datastore objects.

Capacity metrics can be calculated for datastore objects. See Capacity Analytics Generated Metrics.

### Capacity Metrics for Datastores

Capacity metrics provide information about datastore capacity.

| Metric Name | Description |
|---|---|
| Capacity\|Available Space (GB) | This metric shows the amount of free space that a datastore has available.<br>Use this metric to know how much storage space is unused on the datastore. Try to avoid having too little free disk space in order to accommodate unexpected storage growth on the datastore. The exact size of the datastore is based on company policy.<br>Key: capacity\|available_space |
| Capacity\|Provisioned (GB) | This metric shows the amount of storage that was allocated to the virtual machines.<br>Use this metric to know how much storage space is being used on the datastore.<br>Check the metric trend to identify spikes or abnormal growth.<br>Key: capacity\|provisioned |
| Capacity\|Total Capacity (GB) | This metric shows the overall size of the datastore.<br>Use this metric to know the total capacity of the datastore. Typically the size of the datastore should not be too small. VMFS datastore size has grown over the years as virtualization matures and larger virtual machines are now onboard. Ensure that the size can handle enough virtual machines to avoid datastore sprawl. A best practice is to use 5 TB for VMFS and more for vSAN.<br>Key: capacity\|total_capacity |
| Capacity\|Used Space (GB) | This metric shows the amount of storage that is being used on the datastore.<br>Key: capacity\|used_space |
| Capacity\|Workload (%) | Capacity workload.<br>Key: capacity\|workload |
| Capacity\|Uncommitted Space (GB) | Uncommitted space in gigabytes.<br>Key: capacity\|uncommitted |
| Capacity\|Total Provisioned Consumer Space | Total Provisioned Consumer Space.<br>Key: capacity\|consumer_provisioned |

| Metric Name | Description |
|---|---|
| Capacity\|Used Space (%) | This metric shows the amount of storage that is being used on the datastore.<br>Use this metric to know the percentage of storage space being used on the datastore.<br>When using this metric, verify that you have at least 20% of free storage. Less than this, and you might experience problems when a snapshot is not deleted. If you have more than 50% free storage space, you are not utilizing your storage in the best possible way.<br>Key: capacity\|usedSpacePct |

### Device Metrics for Datastores

Device metrics provide information about device performance.

| Metric Name | Description |
|---|---|
| Devices\|Bus Resets | This metric shows the number of bus resets in the performance interval.<br>Key: devices\|busResets_summation |
| Devices\|Commands Aborted | This metric shows the number of disk commands canceled in the performance interval.<br>Key: devices\|commandsAborted_summation |
| Devices\|Commands Issued | This metric shows the number of disk commands issued in the performance interval.<br>Key: devices\|commands_summation |
| Devices\|Read Latency (ms) | This metric shows the average time taken for a read from the perspective of a guest operating system. This metric is the sum of the Kernel Disk Read Latency and Physical Device Read Latency metrics.<br>Key: devices\|totalReadLatency_averag |
| Devices\|Kernel Disk Read Latency (ms) | Average time spent in ESX host VM Kernel per read.<br>Key: devices\|kernelReadLatency_average |
| Devices\|Kernel Write Latency (ms) | Average time spent in ESX Server VM Kernel per write.<br>Key: devices\|kernelWriteLatency_average |
| Devices\|Physical Device Read Latency (ms) | Average time taken to complete a read from the physical device.<br>Key: devices\|deviceReadLatency_average |
| Devices\|Queue Write Latency (ms) | Average time spent in the ESX Server VM Kernel queue per write.<br>Key: devices\|queueWriteLatency_average |
| Devices\|Physical Device Write Latency (ms) | Average time taken to complete a write from the physical disk.<br>Key: devices\|deviceWriteLatency_average |

## Datastore Metrics for Datastores

Datastore metrics provide information about datastore use.

| Metric Name | Description |
|---|---|
| Datastore\|Total Latency (ms) | This metric shows the adjusted read and write latency at the datastore level. Adjusted means that the latency is taking into account the number of IOs. If your IO is read-dominated, the combined value is influenced by the reads.<br>This is the average of all the VMs running in the datastore. Because it is an average, some VMs logically experience higher latency that the value shown by this metric. To see the worst latency experienced by any VM, use the Maximum VM Disk Latency metric.<br>Use this metric to see the performance of the datastore. It is one of two key performance indicators for a datastore, the other being the Max Read Latency. The combination of Maximum and Average gives better insight into how well the datastore is coping with the demand.<br>The number should be lower than the performance you expect.<br>Key: datastore\|totalLatency_average |
| Datastore\|Total Throughput (KBps) | Average use in kilobytes per second.<br>Key: datastore\|usage_average |
| Datastore\|Read Latency (ms | Average amount of time for a read operation from the datastore. Total latency = kernel latency + device latency.<br>Key: datastore\|totalReadLatency_average |
| Datastore\|Write Latency (ms) | Average amount of time for a write operation to the datastore. Total latency = kernel latency + device latency.<br>Key: datastore\|totalWriteLatency_average |
| Datastore\|Demand | Demand.<br>Key: datastore\|demand |
| Datastore\|Outstanding IO requests | OIO for datastore.<br>Key: datastore\|demand_oio |
| Datastore\|Read IOPS | This metric displays the average number of read commands issued per second during the collection interval.<br>Use this metric when the total IOPS is higher than expected. See if the metric is read or write dominated. This helps determine the cause of the high IOPS. Certain workloads such as backups, anti-virus scans, and Windows updates carry a Read/Write pattern. For example, an anti-virus scan is heavy on read since it is mostly reading the file system.<br>Key: datastore\|numberReadAveraged_average |
| Datastore\|Write IOPS | This metric displays the average number of write commands issued per second during the collection interval.<br>Use this metric when the total IOPS is higher than expected. Drill down to see if the metric is read or write dominated. This helps determine the cause of the high IOPS. Certain workloads such as backups, anti-virus scans, and Windows updates carry a Read/Write pattern. For example, an anti-virus scan is heavy on read since it is mostly reading the file system.<br>Key: datastore\|numberWriteAveraged_average |
| Datastore\|Read Throughput (KBps) | This metric displays the amount of data read in the performance interval.<br>Key: datastore\|read_average |

| Metric Name | Description |
|---|---|
| Datastore\|Write Throughput (KBps) | This metric displays the amount of data written to disk in the performance interval.<br>Key: datastore\|write_average |

### About Datastore Metrics for Virtual SAN

The metric named `datastore|oio|workload` is not supported on Virtual SAN datastores. This metric depends on `datastore|demand_oio`, which is supported for Virtual SAN datastores.

The metric named `datastore|demand_oio` also depends on several other metrics for Virtual SAN datastores, one of which is not supported.

- The metrics named `devices|numberReadAveraged_average` and `devices|numberWriteAveraged_average` are supported.
- The metric named `devices|totalLatency_average` is not supported.

As a result, VCF Operations does not collect the metric named `datastore|oio|workload` for Virtual SAN datastores.

### Disk Space Metrics for Datastores

Disk space metrics provide information about disk space use.

| Metric Name | Description |
|---|---|
| Diskspace\|Number of Virtual Disk | Number of virtual disks.<br>Key: diskspace\|numvmdisk |
| Diskspace\|Provisioned Space (GB) | Provisioned space in gigabytes.<br>Key: diskspace\|provisioned |
| Diskspace\|Shared Used (GB) | Shared used space in gigabytes.<br>Key: diskspace\|shared |
| Diskspace\|Snapshot Space (GB) | This metric shows the amount of space taken by snapshots on a given database.<br>Use this metric to know how much storage space is being used by virtual machine snapshots on the datastore.<br>Check that the snapshot is using 0 GB or minimal space. Anything over 1 GB should trigger a warning. The actual value depends on how IO intensive the virtual machines in the datastore are. Run a DT on them to detect anomaly. Clear the snapshot within 24 hours, preferably when you have finished backing up, or patching.<br>Key: diskspace\|snapshot |
| Diskspace\|Virtual Disk Used (GB) | Virtual disk used space in gigabytes.<br>Key: diskspace\|diskused |
| Diskspace\|Virtual machine used (GB) | Virtual machine used space in gigabytes.<br>Key: diskspace\|used |
| Diskspace\|Total disk space used | Total disk space used on all datastores visible to this object.<br>Key: diskspace\|total_usage |
| Diskspace\|Total disk space | Total disk space on all datastores visible to this object.<br>Key: diskspace\|total_capacity |
| Diskspace\|Total used (GB) | Total used space in gigabytes.<br>Key: diskspace\|disktotal |
| Diskspace\|Swap File Space (GB) | Swap file space in gigabytes.<br>Key: diskspace\|swap |

| Metric Name | Description |
|---|---|
| Diskspace\|Other VM Space (GB) | Other virtual machine space in gigabytes.<br>Key: diskspace\|otherused |
| Diskspace\|Freespace (GB) | Unused space available on datastore.<br>Key: diskspace\|freespace |
| Diskspace\|Capacity (GB) | Total capacity of datastore in gigabytes.<br>Key: diskspace\|capacity |
| Diskspace\|Overhead | Amount of disk space that is overhead.<br>Key: diskspace\|overhead |

## Summary Metrics for Datastores

Summary metrics provide information about overall performance.

| Metric Name | Description |
|---|---|
| Summary\|Number of Hosts | This metric shows the number of hosts that the datastore is connected to.<br>Use this metric to know how many clusters the datastore is attached to.<br>The number should not be too high, as a datastore should not be mounted by every host. The datastore and cluster should be paired to keep operations simple.<br>Key: summary\|total_number_hosts |
| Summary\|Total Number of VMs | This metric shows the number of virtual machines which save their VMDK files on the datastore. If a VM has four VMDKs stored in four datastores, the VM is counted on each datastore.<br>Use this metric to know how many VMs have at least one VMDK on a specific datastore.<br>The number of VMs should be within your Concentration Risk policy.<br>You should also expect the datastore to be well used. If only a few VMs are using the datastore, this is not considered a good use.<br>Key: summary\|total_number_vms |
| Summary\|Maximum Number of VMs | Maximum number of virtual machines.<br>Key: summary\|max_number_vms |
| Summary\|Workload Indicator | Workload indicator.<br>Key: summary\|workload_indicator |
| Summary\|Number of Clusters | This metric shows the number of clusters that the datastore is connected to.<br>Key: summary\|total_number_clusters |
| Summary\|Number of VM Templates | Number of VM Templates.<br>Key: Summary\|Number of VM Templates |

## Template Metrics for Datastores

| Metric Name | Description |
|---|---|
| Template\|Virtual Machine used | Space used by virtual machine files.<br>Key: template\|used |
| Template\|Access Time | Last access time.<br>Key: template\|accessTime |

### Cost Metrics for Datastores

Cost metrics provides information about the cost.

| Metric Name | Description |
|---|---|
| Monthly Disk Space Base Rate | Disk space base rate for datastore displays the cost of 1 GB storage.<br>Key: cost\|storageRate |
| Monthly Total Cost | Monthly total cost, computed by multiplying datastore capacity with monthly storage rate.<br>Key: cost\|totalCost |
| Cost\|Allocation\|Disk Space Base Rate (Currency) | Monthly storage rate for datastore displays the cost of 1 GB storage when the overcommit ratio is set in policy.<br>cost\|storageRate |
| Cost\|Allocation\|Monthly Datastore Allocated Cost(Currency/Month) | Monthly allocated cost as compared to the total cost of the datastore |
| Cost\|Allocation\|Monthly Datastore Unallocated Cost(Currency/Month) | Monthly unallocated cost as compared to the total cost of the datastore. |

### Reclaimable Metrics

Reclaimable metrics provide information about reclaimable resources.

| Metric Name | Description |
|---|---|
| Reclaimable\|Orphaned Disks\|Disk Space (GB) | Summary of storage used by all orphaned VMDKs on the datastore.<br>Key: reclaimable\|orphaned_disk\|diskspace |
| Reclaimable\|Orphaned Disks\|Potential Savings (Currency) | Potential saving after reclamation of storage by removing orphaned VMDks from the datastore.<br>Key: reclaimable\|orphaned_disk\|cost |

### Disabled Instanced Metrics

The instance metrics created for the following metrics are disabled in this version of VCF Operations. This means that these metrics collect data by default but all the instanced metrics created for these metrics, do not collect data by default.

| Metric Name |
|---|
| Devices\|Kernel Latency (ms) |
| Devices\|Number of Running Hosts |
| Devices\|Number of Running VMs |
| Devices\|Physical Device Latency (ms) |
| Devices\|Queue Latency (ms) |
| Devices\|Queue Read Latency (ms) |
| Devices\|Read IOPS |
| Devices\|Read Latency (ms) |
| Devices\|Read Requests |
| Devices\|Read Throughput (KBps) |
| Devices\|Total IOPS |
| Devices\|Total Latency (ms) |

| Metric Name |
|---|
| Devices\|Total Throughput (KBps) |
| Devices\|Write IOPS |
| Devices\|Write Latency (ms) |
| Devices\|Write Requests |
| Devices\|Write Throughput (KBps) |

### Disabled Metrics

The following metrics are disabled in this version of VCF Operations. This means that they do not collect data by default.

You can enable these metrics in the Policy workspace. For more information, in VMware Docs search for Collect Metrics and Properties Details.

You can enable these metrics in the Policy workspace. For more information, see Metrics and Properties Details.

| Metric Name | Key |
|---|---|
| Capacity\|Data Store Capacity Contention (%) | capacity\|contention |
| Datastore I/O\|Demand Indicator | datastore\|demand_indicator |
| Datastore I/O\|Max Observed Number of Outstanding IO Operations | datastore\|maxObserved_OIO |
| Datastore I/O\|Max Observed Read Latency (msec) | datastore\|maxObserved_Read |
| Datastore I/O\|Max Observed Read Latency (msec) | datastore\|maxObserved_ReadLatency |
| Datastore I/O\|Max Observed | datastore\|maxObserved_NumberRead |
| Datastore I/O\|Max Observed Write Latency (msec) | datastore\|maxObserved_Write |
| Datastore I/O\|Max Observed Write Latency (msec) | datastore\|maxObserved_WriteLatency |
| Datastore I/O\|Max Observed Writes per second | datastore\|maxObserved_NumberWrite |
| Datastore\|Demand Indicator | Demand Indicator.<br>Key: datastore\|demand_indicator |
| Diskspace\|Not Shared (GB) | Unshared space in gigabytes.<br>Key: diskspace\|notshared |

## Cluster Compute Metrics for Allocation Model

VCF Operations collects configuration, disk space, CPU use, disk, memory, network, power, and summary metrics for cluster compute resources.

### Cost Metrics for Cluster Compute Resources

Cost metrics provide information about the cost.

| Metric Name | Description |
|---|---|
| Cluster CPU Base Rate | Base rate for Cluster CPU calculated by dividing the monthly total cluster CPU cost by cluster CPU over-commit ratio.<br>Key:Cost\|Allocation\|ClusterCPUBaseRate |
| Cluster Memory Base Rate | Cluster memory base rate calculated by dividing the monthly total cluster memory cost b cost by cluster memory over-commit ratio.<br>Key: Cost\|Allocation\|ClusterMemoryBaseRate |

| Metric Name | Description |
|---|---|
| Monthly Cluster Allocated Cost | Sum of of monthly cluster CPU, Memory, and Storage costs<br>Key: Cost\|Allocation\|MonthlyClusterAllocatedCost |
| Monthly Cluster Unallocated Cost | Monthly cluster unallocated cost calculated by subtracting the monthly cluster allocated cost from the monthly cluster total cost.<br>Key: Cost\|Allocation\| MonthlyClusterUnallocatedCost |
| Monthly Storage Rate | Datastore base rate is calculated by dividing Storage base rate based on utilization by over commit ratio.<br>Key:Cost\|Allocation\|Monthly Storage Rate |

## Virtual Machine Metrics for Allocation Model

VCF Operations collects configuration, disk space, CPU use, disk, memory, network, power, and summary metrics for virtual machine resources.

### Cost Metrics for Virtual Machines

Cost metrics provide information about the cost.

| Metric Name | Description |
|---|---|
| MTD VM CPU Cost | Month to date virtual machine CPU cost.<br>Key: Cost\|Allocation\|MTD VM CPU Cost |
| MTD VM Memory Cost | Month to date virtual machine memory cost.<br>Key: Cost\|Allocation\|MTD VM Memory Cost |
| MTD VM Storage Cost | Month to date storage cost of the virtual machine.<br>Key: Cost\|Allocation\|MTD VM Storage Cost |
| MTD VM Total Cost | Addition of CPU ,Memory ,Storage, and Direct cost.<br>Key: Cost\|Allocation\|MTD VM Total Cost |

## Metrics for Namespace

VCF Operations collects metrics for Namspace through the vCenter adapter and uses formulas to derive statistics from those metrics. You can use metrics to troubleshoot problems in your environment.

**Table 1488: Metrics for Namespace**

| Metric Key | Localized Name | Description |
|---|---|---|
| cpu\|usagemhz_average | CPU\|Usage | Average CPU usage in MHZ. |
| cpu\|demandmhz | CPU\|Demand | Demand(MHz). |
| cpu\|capacity_contentionPct | CPU\|Contention | Percent of time descendant virtual machines are unable to run because they are contending for access to the physical CPU(s). |
| cpu\|effective_limit | CPU\|Effective limit | CPU Effective limit. |
| cpu\|reservation_used | CPU\|Reservation Used | CPU Reservation Used. |
| cpu\|estimated_entitlement | CPU\|Estimated entitlement | CPU Estimated entitlement. |
| cpu\|dynamic_entitlement | CPU\|Dynamic entitlement | CPU Dynamic Entitlement. |
| cpu\|capacity_contention | CPU\|Overall CPU Contention | Overall CPU Contention (ms). |
| cpu\|capacity_demandEntitlementPct | CPU\|Capacity Demand Entitlement | CPU Capacity Demand Entitlement Percentage. |

| Metric Key | Localized Name | Description |
|---|---|---|
| mem\|usage_average | Memory\|Usage | Memory currently in use as a percentage of total available memory. |
| mem\|guest_provisioned | Memory\|Total Capacity | Total Capacity. |
| mem\|active_average | Memory\|Guest Active | Amount of memory that is actively used. |
| mem\|granted_average | Memory\|Granted | Amount of memory available for use. |
| mem\|shared_average | Memory\|Shared | Amount of shared memory. |
| mem\|overhead_average | Memory\|VM Overhead | Memory overhead reported by host. |
| mem\|consumed_average | Memory\|Consumed | Amount of host memory consumed by the virtual machine for guest memory. |
| mem\|host_contentionPct | Memory\|Contention | Machine Contention Percentage. |
| mem\|guest_usage | Memory\|Guest Usage | Guest Memory Entitlement. |
| mem\|guest_demand | Memory\|Guest Demand | Guest Memory Entitlement. |
| mem\|reservation_used | Memory\|Reservation Used | Memory Reservation Used. |
| mem\|effective_limit | Memory\|Effective limit | Memory Effective limit. |
| mem\|swapinRate_average | Memory\|Swap In Rate | Rate at which memory is swapped from disk into active memory during the collection interval. This can impact performance. |
| mem\|swapoutRate_average | Memory\|Swap Out Rate | Rate at which memory is being swapped from active memory to disk during the current interval. |
| mem\|vmmemctl_average | Memory\|Balloon | Amount of memory currently used by the virtual machine memory control. |
| mem\|zero_average | Memory\|Zero | Amount of memory that is all 0. |
| mem\|swapped_average | Memory\|Swapped | Amount of unreserved memory. |
| mem\|zipped_latest | Memory\|Zipped | N/A |
| mem\|compressionRate_average | Memory\|Compression Rate | N/A |
| mem\|decompressionRate_average | Memory\|Decompression Rate | N/A |
| mem\|swapin_average | Memory\|Swap In | Amount of memory swapped in. |
| mem\|swapout_average | Memory\|Swap Out | Amount of memory swapped out. |
| mem\|swapused_average | Memory\|Swap Used | Amount of memory used for swap space. |
| mem\|host_contention | Memory\|Contention | Machine Contention. |
| mem\|dynamic_entitlement | Memory\|Dynamic Entitlement | Memory Dynamic Entitlement. |
| diskspace\|total_usage | Disk Space\|Utilization | Storage space utilized on connected vSphere Datastores. |
| summary\|configStatus | Summary\|Config Status | Workload Management Configuration Status. |
| summary\|total_number_pods | Summary\|Number of Pods | Number of Pods. |
| summary\|numberKubernetesClusters | Summary\|Number of Kubernetes clusters | Number of Kubernetes clusters. |
| summary\|number_running_vms | Summary\|Number of Running VMs | Number of Running VMs. |
| summary\|total_number_vms | Summary\|Total Number of VMs | Total Number of VMs. |
| summary\|iowait | Summary\|IO Wait | IO Wait. |

## Metrics for Tanzu Kubernetes cluster

VCF Operations collects metrics for Tanzu Kubernetes cluster through the vCenter adapter and uses formulas to derive statistics from those metrics. You can use metrics to troubleshoot problems in your environment.

**Table 1489: Metrics for Tanzu Kubernetes clusters**

| Metric Key | Localized Name | Description |
|---|---|---|
| cpu\|usagemhz_average | CPU\|Usage | Average CPU usage in MHZ |
| cpu\|demandmhz | CPU\|Demand | Demand(MHz) |
| cpu\|capacity_contentionPct | CPU\|Contention | Percent of time descendant virtual machines are unable to run because they are contending for access to the physical CPU(s). |
| cpu\|effective_limit | CPU\|Effective limit | CPU Effective limit |
| cpu\|reservation_used | CPU\|Reservation Used | CPU Reservation Used |
| cpu\|estimated_entitlement | CPU\|Estimated entitlement | CPU Estimated entitlement |
| cpu\|dynamic_entitlement | CPU\|Dynamic entitlement | CPU Dynamic Entitlement |
| cpu\|capacity_contention | CPU\|Overall CPU Contention | Overall CPU Contention (ms) |
| cpu\|capacity_demandEntitlementPct | CPU\|Capacity Demand Entitlement | CPU Capacity Demand Entitlement Percentage |
| mem\|usage_average | Memory\|Usage | Memory currently in use as a percentage of total available memory |
| mem\|guest_provisioned | Memory\|Total Capacity | Total Capacity |
| mem\|active_average | Memory\|Guest Active | Amount of memory that is actively used |
| mem\|granted_average | Memory\|Granted | Amount of memory available for use |
| mem\|shared_average | Memory\|Shared | Amount of shared memory |
| mem\|overhead_average | Memory\|VM Overhead | Memory overhead reported by host |
| mem\|consumed_average | Memory\|Consumed | Amount of host memory consumed by the virtual machine for guest memory |
| mem\|host_contentionPct | Memory\|Contention | Machine Contention Percentage |
| mem\|guest_usage | Memory\|Guest Usage | Guest Memory Entitlement |
| mem\|guest_demand | Memory\|Guest Demand | Guest Memory Entitlement |
| mem\|reservation_used | Memory\|Reservation Used | Memory Reservation Used |
| mem\|effective_limit | Memory\|Effective limit | Memory Effective limit |
| mem\|swapinRate_average | Memory\|Swap In Rate | Rate at which memory is swapped from disk into active memory during the collection interval. This can impact performance. |
| mem\|swapoutRate_average | Memory\|Swap Out Rate | Rate at which memory is being swapped from active memory to disk during the current interval |
| mem\|vmmemctl_average | Memory\|Balloon | Amount of memory currently used by the virtual machine memory control |
| mem\|zero_average | Memory\|Zero | Amount of memory that is all 0 |
| mem\|swapped_average | Memory\|Swapped | Amount of unreserved memory |
| mem\|zipped_latest | Memory\|Zipped | N/A |
| mem\|compressionRate_average | Memory\|Compression Rate | N/A |
| mem\|decompressionRate_average | Memory\|Decompression Rate | N/A |

| Metric Key | Localized Name | Description |
|---|---|---|
| mem\|swapin_average | Memory\|Swap In | Amount of memory swapped in |
| mem\|swapout_average | Memory\|Swap Out | Amount of memory swapped out |
| mem\|swapused_average | Memory\|Swap Used | Amount of memory used for swap space |
| mem\|host_contention | Memory\|Contention | Machine Contention |
| mem\|dynamic_entitlement | Memory\|Dynamic Entitlement | Memory Dynamic Entitlement |
| summary\|number_running_vms | Summary\|Number of Running VMs | Number of Running VMs |
| summary\|total_number_vms | Summary\|Total Number of VMs | Total Number of VMs |
| summary\|iowait | Summary\|IO Wait | IO Wait |

## Metrics for vSphere Pods

VCF Operations collects metrics for vSphere Pods through the vCenter adapter and uses formulas to derive statistics from those metrics. You can use metrics to troubleshoot problems in your environment.

**Table 1490: Metrics for vSphere Pods**

| Metric Key | Metric Name | Description |
|---|---|---|
| config\|hardware\|num_Cpu | Configuration\|Hardware\|Number of CPUs | Number of CPUs. It counts both the vSocket and vCore. A VM with 2 vSockets x 4 vCores each has 8 vCPU. |
| config\|hardware\|disk_Space | Configuration\|Hardware\|Disk Space | Disk space metrics |
| config\|hardware\|thin_Enabled | Configuration\|Hardware\|Thin Provisioned Disk | Thin Provisioned Disk |
| config\|cpuAllocation\|slotSize | Configuration\|CPU Resource Allocation\|HA Slot Size | vSphere HA Slot Size for CPU |
| config\|memoryAllocation\|slotSize | Configuration\|Memory Resource Allocation\|HA Slot Size | vSphere HA Slot Size for Memory |
| cpu\|usage_average | CPU\|Usage | CPU Usage divided by VM CPU Configuration in MHz |
| cpu\|usagemhz_average | CPU\|Usage | Amount of actively used virtual CPU. This is the host's view of the CPU usage, not the guest operating system view. |
| cpu\|usagemhz_average_mtd | CPU\|Usage average MTD | Month to date average CPU usage in MHZ |
| cpu\|readyPct | CPU\|Ready | Percentage of CPU the VM is ready to run, but unable due to ESX has no ready physical core to run it. High Ready value impacts VM performance |
| cpu\|capacity_contentionPct | CPU\|Contention | Percentage of time VM is not getting the CPU resource it demanded. Impacted by Ready, Co-Stop, Hyper Threading and Power Management |
| cpu\|corecount_provisioned | CPU\|Provisioned vCPU(s) | Number of CPUs. It counts both the vSocket and vCore. A VM with 2 vSockets x 4 vCores each has 8 vCPU. |
| cpu\|vm_capacity_provisioned | CPU\|Total Capacity | Configured Capacity in MHz, based on nominal (static) frequency of the CPU |

| Metric Key | Metric Name | Description |
|---|---|---|
| cpu\|demandmhz | CPU\|Demand | The amount of CPU resources virtual machine would use if there were no CPU contention or CPU limit. |
| cpu\|demandPct | CPU\|Demand (%) | The percentage of CPU resources virtual machine would use if there were no CPU contention or CPU limit. |
| cpu\|reservation_used | CPU\|Reservation Used | CPU Reserved for the VM. It's guaranteed to be available when the VM demands it. |
| cpu\|effective_limit | CPU\|Effective limit | Limit placed on the VM by vSphere. Avoid using limit as it impacts VM performance |
| cpu\|iowaitPct | CPU\|IO Wait | Percentage of time VM CPU is waiting for IO. Formula is Wait - Idle - Swap Wait. High value indicates slow storage subsystem |
| cpu\|swapwaitPct | CPU\|Swap wait | Percentage of time CPU is waiting on data swap-in. Mapped to vCenter CPU Swap wait |
| cpu\|costopPct | CPU\|Co-stop (%) | Percentage of time the VM is ready to run, but is unable to due to co-scheduling constraints. VM with less vCPU have lower co-stop value. |
| cpu\|system_summation | CPU\|System | CPU time spent on system processes |
| cpu\|wait_summation | CPU\|Wait | Total CPU time spent in wait state |
| cpu\|ready_summation | CPU\|Ready | CPU time spent on ready state |
| cpu\|used_summation | CPU\|Used | CPU time that is used |
| cpu\|iowait | CPU\|IO Wait | IO Wait |
| cpu\|wait | CPU\|Total Wait | CPU time spent on idle state |
| cpu\|capacity_demandEntitlementPct | CPU\|Capacity Demand Entitlement | CPU Capacity Demand Entitlement Percentage |
| cpu\|host_demand_for_aggregation | CPU\|Host Demand For Aggregation | Host demand for aggregation |
| cpu\|dynamic_entitlement | CPU\|Dynamic entitlement | CPU Dynamic entitlement |
| cpu\|capacity_contention | CPU\|Overall CPU Contention | Overall CPU Contention (ms) |
| cpu\|estimated_entitlement | CPU\|Estimated entitlement | CPU Estimated entitlement |
| cpu\|idlePct | CPU\|Idle | % CPU time that is idle |
| cpu\|waitPct | CPU\|Wait | % Total CPU time spent in wait state |
| cpu\|systemSummationPct | CPU\|System | % CPU time spent on system processes |
| cpu\|demandOverLimit | CPU\|Demand Over Limit | Amount of CPU Demand that is over the configured CPU Limit |
| cpu\|demandOverCapacity | CPU\|Demand Over Capacity | Amount of CPU Demand that is over the configured CPU Capacity |
| cpu\|perCpuCoStopPct | CPU\|Normalized Co-stop | Percentage of co-stop time, normalized across all vCPUs |
| cpu\|swapwait_summation | CPU\|Swap Wait | Amount of time waiting on swap. |
| cpu\|costop_summation | CPU\|Co-stop | Time the VM is ready to run, but is unable to due to co-scheduling constraints. |
| cpu\|idle_summation | CPU\|Idle | CPU time that is idle. |
| cpu\|latency_average | CPU\|Latency | Percentage of time the VM is unable to run because it is contending for access to the physical CPUs. |

| Metric Key | Metric Name | Description |
|---|---|---|
| cpu\|maxlimited_summation | CPU\|Max Limited | Time the VM is ready to run, but is not run due to maxing out its CPU limit setting. |
| cpu\|overlap_summation | CPU\|Overlap | Time the VM was interrupted to perform system services on behalf of that VM or other VMs. |
| cpu\|run_summation | CPU\|Run | Time the VM is scheduled to run. |
| cpu\|entitlement_latest | CPU\|Entitlement Latest | Entitlement Latest. |
| cpu\|demandEntitlementRatio_latest | CPU\|Demand-to-entitlement Ratio | CPU resource entitlement to CPU demand ratio (in percents) |
| cpu\|readiness_average | CPU\|Readiness | Percentage of time that the virtual machine was ready, but could not get scheduled to run on the physical CPU. |
| rescpu\|actav1_latest | CPU Utilization for Resources\|CPU Active (1 min. average) | The average active time for the CPU over the past minute |
| rescpu\|actav5_latestswapinRate_average | CPU Utilization for Resources\|CPU Active (5 min. average) | The average active time for the CPU over the past five minutes. |
| rescpu\|actav5_latest | CPU Utilization for Resources\|CPU Active (5 min. average) | The average active time for the CPU over the past five minutes |
| rescpu\|actav15_latest | CPU Utilization for Resources\|CPU Active (15 min. average) | The average active time for the CPU over the past fifteen minutes |
| rescpu\|actpk1_latest | CPU Utilization for Resources\|CPU Active (1 min. peak) | The peak active time for the CPU over the past minute |
| rescpu\|actpk5_latest | CPU Utilization for Resources\|CPU Active (5 min. peak) | The peak active time for the CPU over the past five minutes |
| rescpu\|actpk15_latest | CPU Utilization for Resources\|CPU Active (15 min. peak) | The peak active time for the CPU over the past fifteen minutes |
| rescpu\|runav1_latest | CPU Utilization for Resources\|CPU Running (1 min. average) | The average runtime for the CPU over the past minute |
| rescpu\|runav5_latest | CPU Utilization for Resources\|CPU Running (5 min. average) | The average runtime for the CPU over the past five minutes |
| rescpu\|runav15_latest | CPU Utilization for Resources\|CPU Running (15 min. average) | The average runtime for the CPU over the past fifteen minutes |
| rescpu\|runpk1_latest | CPU Utilization for Resources\|CPU Running (1 min. peak) | The peak active time for the CPU over the past minute |
| rescpu\|runpk5_latest | CPU Utilization for Resources\|CPU Running (5 min. peak) | The peak active time for the CPU over the past five minutes |
| rescpu\|runpk15_latest | CPU Utilization for Resources\|CPU Running (15 min. peak) | The peak active time for the CPU over the past fifteen minutes |
| rescpu\|maxLimited1_latest | CPU Utilization for Resources\|CPU Throttled (1 min. average) | The scheduling limit over the past minute |
| rescpu\|maxLimited5_latest | CPU Utilization for Resources\|CPU Throttled (5 min. average) | The scheduling limit over the past five minutes |
| rescpu\|maxLimited15_latest | CPU Utilization for Resources\|CPU Throttled (15 min. average) | The scheduling limit over the past fifteen minutes |
| rescpu\|sampleCount_latest | CPU Utilization for Resources\|Group CPU Sample Count | The sample CPU count |
| rescpu\|samplePeriod_latest | CPU Utilization for Resources\|Group CPU Sample Period | The sample period |

| Metric Key | Metric Name | Description |
|---|---|---|
| mem\|usage_average | Memory\|Usage | Memory currently in use as a percentage of total available memory |
| mem\|balloonPct | Memory\|Balloon | Percentage of guest physical memory that is currently claimed from the virtual machine through ballooning. This is the percentage of guest physical memory that has been allocated and pinned by the balloon driver. Balloon does not necessarily mean the VM performance is affected. |
| mem\|swapped_average | Memory\|Swapped | Amount of unreserved memory |
| mem\|consumed_average | Memory\|Consumed | Amount of ESX Host memory mapped/consumed by the virtual machine for guest memory |
| mem\|consumed_average_mtd | Memory\|Consumed average MTD | average MTD Amount of host memory consumed by the virtual machine for guest memory |
| mem\|consumedPct | Memory\|Consumed (%) | Amount of host memory consumed by the virtual machine for guest memory. Consumed memory does not include overhead memory. It includes shared memory and memory that might be reserved, but not actually used. |
| mem\|overhead_average | Memory\|Overhead | Amount of overhead memory used by ESX to run the Virtual Machine. |
| mem\|host_contentionPct | Memory\|Contention | Percentage of time the VM has contended for memory. |
| mem\|guest_provisioned | Memory\|Total Capacity | Memory resources allocated to the Virtual Machine |
| mem\|guest_usage | Memory\|Guest Usage | Guest Memory Entitlement |
| mem\|guest_demand | Memory\|Guest Demand | Guest Memory Entitlement |
| mem\|host_demand | Memory\|Host Demand | Memory Demand in KB |
| mem\|reservation_used | Memory\|Reservation Used | Memory Reservation Used |
| mem\|effective_limit | Memory\|Effective limit | Memory Effective limit |
| mem\|vmMemoryDemand | Memory\|Utilization | Amount of memory utilized by the Virtual Machine. Reflects the guest OS memory required (for certain vSphere and VMTools versions) or Virtual Machine consumption |
| mem\|nonzero_active | Memory\|Non Zero Active | Non Zero Active Memory |
| mem\|swapinRate_average | Memory\|Swap In Rate | Rate at which memory is swapped from disk into active memory during the collection interval. This can impact performance. |
| mem\|swapoutRate_average | Memory\|Swap Out Rate | Rate at which memory is being swapped from active memory to disk during the current interval. |
| mem\|compressed_average | Memory\|Compressed | Percentage of total memory that has been compressed by vSphere. If and only if the page is accessed by the Guest OS, will performance be affected. |
| mem\|overheadMax_average | Memory\|Overhead Max | N/A |
| mem\|vmmemctl_average | Memory\|Balloon | Amount of memory currently used by the virtual machine memory control |
| mem\|active_average | Memory\|Guest Active | Amount of memory that is actively used |
| mem\|granted_average | Memory\|Granted | Amount of memory available for use |

| Metric Key | Metric Name | Description |
|---|---|---|
| mem\|shared_average | Memory\|Shared | Amount of shared memory |
| mem\|zero_average | Memory\|Zero | Amount of memory that is all 0 |
| mem\|swaptarget_average | Memory\|Swap Target | Amount of memory that can be swapped |
| mem\|swapin_average | Memory\|Swap In | Amount of memory swapped in |
| mem\|swapout_average | Memory\|Swap Out | Amount of memory swapped out |
| mem\|vmmemctltarget_average | Memory\|Balloon Target | Amount of memory that can be used by the virtual machine memory control |
| mem\|host_dynamic_entitlement | Memory\|Host Dynamic Entitlement | Mem Machine Dynamic Entitlement |
| mem\|host_active | Memory\|Host Active | Machine Active |
| mem\|host_usage | Memory\|Host Usage | Machine Usage |
| mem\|host_contention | Memory\|Contention | Machine Contention |
| mem\|guest_activePct | Memory\|Guest Active Memory | Guest active memory as percentage of configured |
| mem\|guest_dynamic_entitlement | Memory\|Guest Dynamic Entitlement | Guest Memory Dynamic Entitlement |
| mem\|host_demand_reservation | Memory\|Host Demand with Reservation | Memory Demand with Reservation considered in KB |
| mem\|host_nonpageable_estimate | Memory\|Guest Non Pageable Memory | Guest Non Pageable Memory Estimates |
| mem\|guest_nonpageable_estimate | Memory\|Host Non Pageable Memory | Guest Non Pageable Memory Estimates |
| mem\|estimated_entitlement | Memory\|Estimated entitlement | Memory Estimated entitlement |
| mem\|host_demand_for_aggregation | Memory\|Host Demand For Aggregation | Host demand for aggregation |
| mem\|demandOverLimit | Memory\|Demand Over Limit | Amount of Memory Demand that is over the configured Memory Limit |
| mem\|demandOverCapacity | Memory\|Demand Over Capacity | Amount of Memory Demand that is over the configured Memory Capacity |
| mem\|activewrite_average | Memory\|Active Write | N/A |
| mem\|compressionRate_average | Memory\|Compression Rate | N/A |
| mem\|decompressionRate_average | Memory\|Decompression Rate | N/A |
| mem\|zipSaved_latest | Memory\|Zip Saved | N/A |
| mem\|zipped_latest | Memory\|Zipped | N/A |
| mem\|entitlement_average | Memory\|Entitlement | Amount of host physical memory the VM is entitled to, as determined by the ESX schedule. |
| mem\|latency_average | Memory\|Latency | Percentage of time the VM is waiting to access swapped or compressed memory. |
| mem\|capacity.contention_average | Memory\|Capacity Contention | Capacity Contention. |
| mem\|llSwapInRate_average | Memory\|Swap In Rate from Host Cache | Rate at which memory is being swapped from host cache into active memory. |
| mem\|llSwapOutRate_average | Memory\|Swap Out Rate to Host Cache | Rate at which memory is being swapped to host cache from active memory. |
| mem\|llSwapUsed_average | Memory\|Swap Space Used in Host Cache | Space used for caching swapped pages in the host cache. |
| mem\|overheadTouched_average | Memory\|Overhead Touched | Actively touched overhead memory (KB) reserved for use as the virtualization overhead for the VM. |

| Metric Key | Metric Name | Description |
|---|---|---|
| net\|usage_average | Network\|Usage Rate | The sum of the data transmitted and received for all the NIC instances of the host or virtual machine |
| net\|transmitted_average | Network\|Data Transmit Rate | Average amount of data transmitted per second |
| net\|received_average | Network\|Data Receive Rate | Average amount of data received per second |
| net\|droppedTx_summation | Network\|Transmitted Packets Dropped | Number of outgoing packets dropped in the performance interval. Investigate if the number is not 0 |
| net\|droppedPct | Network\|Packets Dropped (%) | Percentage of packets dropped |
| net\|dropped | Network\|Packets Dropped | Number of packets dropped in the performance interval |
| net\|broadcastTx_summation | Network\|Broadcast Packets Transmitted | Total number of broadcast packets transmitted. Investigate further if this number is high |
| net\|multicastTx_summation | Network\|Multicast Packets Transmitted | Number of multicast packets transmitted. Investigate further if this number is high |
| net\|idle | NetworkIidle | N/A |
| net\|usage_capacity | Network\|I/O Usage Capacity | I/O Usage Capacity |
| net\|maxObserved_KBps | Network\|Max Observed Throughput | Max observed rate of network throughput |
| net\|maxObserved_Tx_KBps | Network\|Max Observed Transmitted Throughput | Max observed transmitted rate of network throughput |
| net\|maxObserved_Rx_KBps | Network\|Max Observed Received Throughput | Max observed received rate of network throughput |
| net\|packetsRx_summation | Network\|Packets Received | Number of packets received in the performance interval |
| net\|packetsTx_summation | Network\|Packets Transmitted | Number of packets transmitted in the performance interval |
| net\|demand | Network\|Demand | N/A |
| net\|packetsRxPerSec | Network\|Packets Received per second | Number of packets received in the performance interval |
| net\|packetsTxPerSec | Network\|Packets Transmitted per second | Number of packets transmitted in the performance interval |
| net\|packetsPerSec | Network\|Packets per second | Number of packets transmitted and received per second |
| net\|droppedRx_summation | Network\|Received Packets Dropped | Number of received packets dropped in the performance interval |
| net\|broadcastRx_summation | Network\|Broadcast Packets Received | Number of broadcast packets received during the sampling interval |
| net\|multicastRx_summation | Network\|Multicast Packets Received | Number of multicast packets received |
| net\|bytesRx_average | Network\|bytesRx | Average amount of data received per second |
| net\|bytesTx_average | Network\|bytesTx | Average amount of data transmitted per second |
| net\|host_transmitted_average | Network\|VM to Host Data Transmit Rate | Average amount of data transmitted per second between VM and host |
| net\|host_received_average | Network\|VM to Host Data Receive Rate | Average amount of data received per second between VM and host |
| net\|host_usage_average | Network\|VM to Host Usage Rate | The sum of the data transmitted and received for all the NIC instances between VM and host |

| Metric Key | Metric Name | Description |
|---|---|---|
| net\|host_maxObserved_Tx_KBps | Network\|VM to Host Max Observed Transmitted Throughput | Max observed transmitted rate of network throughput between VM and host |
| net\|host_maxObserved_Rx_KBps | Network\|VM to Host Max Observed Received Throughput | Max observed received rate of network throughput between VM and host |
| net\|host_maxObserved_KBps | Network\|VM to Host Max Observed Throughput | Max observed rate of network throughput between VM and host |
| net\|transmit_demand_average | Network\|Data Transmit Demand Rate | Data Transmit Demand Rate |
| net\|receive_demand_average | Network\|Data Receive Demand Rate | Data Receive Demand Rate |
| disk\|usage_average | Physical Disk\|Total Throughput | Amount of data read from/written to storage in a second. This is averaged over the reporting period |
| disk\|read_average | Physical Disk\|Read Throughput | Amount of data read from storage in a second. This is averaged over the reporting period |
| disk\|write_average | Physical Disk\|Write Throughput | Amount of data written to storage in a second. This is averaged over the reporting period |
| disk\|usage_capacity | Physical Disk\|I/O Usage Capacity | I/O Usage Capacity |
| disk\|busResets_summation | Physical Disk\|Bus Resets | The number of bus resets in the performance interval |
| disk\|commandsAborted_summation | Physical Disk\|Commands Aborted | The number of disk commands stopped in the performance interval |
| disk\|diskoio | Physical Disk\|Number of Outstanding IO Operations | Number of Outstanding IO Operations |
| disk\|diskqueued | Physical Disk\|Queued Operations | Queued Operations |
| disk\|diskdemand | Physical Disk\|Demand | Demand |
| disk\|sum_queued_oio | Physical Disk\|Total Queued Outstanding operations | Sum of Queued Operation and Outstanding Operations. |
| disk\|max_observed | Physical Disk\|Max Observed OIO | Max Observed IO for a disk. |
| disk\|numberReadAveraged_average | Physical Disk\|Read IOPS | Number of read operations per second. This is averaged over the reporting period. |
| disk\|numberWriteAveraged_average | Physical Disk\|Write IOPS | Number of write operations per second. This is averaged over the reporting period. |
| disk\|maxTotalLatency_latest | Physical Disk\|Highest Latency | Highest Latency. |
| disk\|scsiReservationConflicts_summation | Physical Disk\|SCSI Reservation Conflicts | SCSI Reservation Conflicts. |
| disk\|totalReadLatency_average | Physical Disk\|Read Latency | Average amount of time for a read operation by the storage adapter. |
| disk\|totalWriteLatency_average | Physical Disk\|Write Latency | Average amount of time for a write operation by the storage adapter. |
| disk\|totalLatency_average | Physical Disk\|Total Latency | Total Latency. |
| sys\|poweredOn | System\|Powered ON | 1 if the VM is connected (available for management) and powered on, otherwise 0. |
| sys\|osUptime_latest | System\|OS Uptime | Total time elapsed, in seconds, since last operating system boot-up |
| sys\|uptime_latest | System\|Uptime | Number of seconds since system startup |
| sys\|heartbeat_summation | System\|Heartbeat | Number of heart beats from the virtual machine in the defined interval |

| Metric Key | Metric Name | Description |
|---|---|---|
| sys\|vmotionEnabled | System\|vMotion Enabled | 1 if vMotion enabled, 0 if not enabled |
| sys\|productString | System\|Product String | VMware product string |
| sys\|heartbeat_latest | System\|Heartbeat Latest | Number of heartbeats issued per virtual machine during the interval |
| summary\|running | Summary\|Running | Running |
| summary\|desktop_status | Summary\|Desktop Status | Horizon View Desktop Status |
| summary\|poweredOff | Summary\|Reclaimable Powered Off | Powered Off = 1. Not powered off = 0 |
| summary\|idle | Summary\|Reclaimable Idle | Idle = 1. Not idle = 0 |
| summary\|oversized | Summary\|Is Oversized | Oversized = 1. Not oversized = 0 |
| summary\|undersized | Summary\|Is Undersized | Is Undersized |
| summary\|snapshotSpace | Summary\|Reclaimable Snapshot Space | Reclaimable Snapshot Space |
| summary\|oversized\|vcpus | Summary\|Oversized\|Virtual CPUs | Virtual CPUs |
| summary\|oversized\|memory | Summary\|Oversized\|Memory | Memory |
| summary\|undersized\|vcpus | Summary\|Undersized\|Virtual CPUs | Virtual CPUs |
| summary\|undersized\|memory | Summary\|Undersized\|Memory | Memory |
| summary\|metering\|value | Summary\|Metering\|Total price | Total price of the resource(Sum of all price components) |
| summary\|metering\|storage | Summary\|Metering\|Storage price | Price of Storage related components of the resource |
| summary\|metering\|memory | Summary\|Metering\|Memory price | Price of Memory related components of the resource |
| summary\|metering\|cpu | Summary\|Metering\|CPU price | Price of CPU related components of the resource |
| summary\|metering\|additional | Summary\|Metering\|Additional price | Price of additional components of the resource |
| summary\|metering\|partialPrice | Summary\|Metering\|Partial price | Shows whether the calculated price is partial for the resource |
| summary\|workload_indicator | Summary\|Workload Indicator | Workload Indicator |
| summary\|cpu_shares | Summary\|CPU Shares | CPU Shares |
| summary\|mem_shares | Summary\|Memory Shares | Memory Shares |
| summary\|number_datastore | Summary\|Number of Datastores | Number of Datastores |
| summary\|number_network | Summary\|Number of Networks | Number of Networks |
| guestfilesystem\|capacity | Guest File System\|Partition Capacity | Disk space capacity on guest file system partition. |
| guestfilesystem\|percentage | Guest File System\|Partition Utilization (%) | Guest file system partition space utilization in percentage |
| guestfilesystem\|usage | Guest File System\|Partition Utilization | Guest file system partition space utilization |
| guestfilesystem\|capacity_total | Guest File System\|Total Capacity | Disk space capacity on guest file system |
| guestfilesystem\|percentage_total | Guest File System\|Utilization (%) | Guest file system disk space utilization in percentage |
| guestfilesystem\|usage_total | Guest File System\|Utilization | Guest file system disk space utilization |
| guestfilesystem\|freespace | Guest File System\|Guest File System Free | Total free space on guest file system |
| guestfilesystem\|capacity_property | Guest File System\|Guest File System Capacity Property | Total capacity of guest file system as a property |

| Metric Key | Metric Name | Description |
|---|---|---|
| guestfilesystem\|freespace_total | Guest File System\|Total Guest File System Free | Total free space on guest file system |
| guestfilesystem\|capacity_property_total | Guest File System\|Total Capacity Property | Total capacity of guest file system as a property |
| guest\|mem.free_latest | Guest\|Free Memory | Free Memory |
| guest\|mem.needed_latest | Guest\|Needed Memory | Needed Memory |
| guest\|mem.physUsable_latest | Guest\|Physically Usable Memory | Physically Usable Memory |
| guest\|page.inRate_latest | Guest\|Page In Rate per second | Page In Rate per second |
| guest\|page.size_latest | Guest\|Page Size | Page Size |
| guest\|swap.spaceRemaining_latest | Guest\|Remaining Swap Space | Remaining Swap Space |
| guest\|cpu_queue | Guest\|CPU Queue | The number of ready threads queuing in the CPU. Linux includes threads in running state. A number greater than 2 for prolong period indicates CPU core bottleneck. |
| guest\|disk_queue | Guest\|Disk Queue | The number of outstanding requests + IO currently in progress. |
| guest\|contextSwapRate_latest | Guest\|Context Swap Rate per second | Context Swap Rate per second |
| guest\|hugePage.size_latest | Guest\|Huge Page Size | Huge Page Size |
| guest\|hugePage.total_latest | Guest\|Total Huge Pages | Total Huge Pages |
| guest\|mem.activeFileCache_latest | Guest\|Active File Cache Memory | Active File Cache Memory |
| guest\|page.outRate_latest | Guest\|Page Out Rate per second | Page Out Rate per second |
| guest\|disk_queue_latest | Guest\|Disk Queue Latest | The number of outstanding requests + IO currently in progress. |
| virtualDisk\|numberReadAveraged_average | Virtual Disk\|Read IOPS | Number of read operations per second. This is averaged over the reporting period |
| virtualDisk\|numberWriteAveraged_average | Virtual Disk\|Write IOPS | Number of write operations per second. This is averaged over the reporting period |
| virtualDisk\|read_average | Virtual Disk\|Read Throughput | Amount of data read from storage in a second. This is averaged over the reporting period |
| virtualDisk\|totalReadLatency_average | Virtual Disk\|Read Latency | Average amount of time for a read operation by the storage adapter. |
| virtualDisk\|totalWriteLatency_average | Virtual Disk\|Write Latency | Average amount of time for a write operation by the storage adapter. |
| virtualDisk\|write_average | Virtual Disk\|Write Throughput | Amount of data written to storage in a second. This is averaged over the reporting period |
| virtualDisk\|usage | Virtual Disk\|Total Throughput | Amount of data read from/written to storage in a second. This is averaged over the reporting period |
| virtualDisk\|totalLatency | Virtual Disk\|Total Latency | Total Latency |
| virtualDisk\|commandsAveraged_average | Virtual Disk\|Total IOPS | Number of read/write operations per second. This is averaged over the reporting period |
| virtualDisk\|vDiskOIO | Virtual Disk\|Outstanding IO requests | OIO for datastore. |
| virtualDisk\|actualUsage | Virtual Disk\|Used Disk Space | Virtual Disk space usage |
| virtualDisk\|busResets_summation | Virtual Disk\|Bus Resets | The number of bus resets in the performance interval |

| Metric Key | Metric Name | Description |
|---|---|---|
| virtualDisk\|commandsAborted_summation | Virtual Disk\|Commands Aborted | The number of disk commands stopped in the performance interval |
| virtualDisk\|readLoadMetric_latest | Virtual Disk\|Read Load | Storage DRS virtual disk metric read load |
| virtualDisk\|readOIO_latest | Virtual Disk\|Outstanding Read Requests | Average number of outstanding read requests to the virtual disk |
| virtualDisk\|writeLoadMetric_latest | Virtual Disk\|Write Load | Storage DRS virtual disk write load |
| virtualDisk\|writeOIO_latest | Virtual Disk\|Outstanding Write Requests | Average number of outstanding write requests to the virtual disk |
| virtualDisk\|smallSeeks_latest | Virtual Disk\|Number of Small Seeks | Small Seeks |
| virtualDisk\|mediumSeeks_latest | Virtual Disk\|Number of Medium Seeks | Medium Seeks |
| virtualDisk\|largeSeeks_latest | Virtual Disk\|Number of Large Seeks | Large Seeks |
| virtualDisk\|readLatencyUS_latest | Virtual Disk\|Read Latency (microseconds) | Read latency in microseconds |
| virtualDisk\|writeLatencyUS_latest | Virtual Disk\|Write Latency (microseconds) | Write Latency in microseconds |
| virtualDisk\|readIOSize_latest | Virtual Disk\|Average Read request size | Read IO size |
| virtualDisk\|writeIOSize_latest | Virtual Disk\|Average Write request size | Write IO size |
| diskspace\|pod_used | Disk Space\|Pod used | Space used by Pod files |
| diskspace\|provisionedSpace | Disk Space\|Provisioned Space for Pod | Provisioned space for Pod. In thin provisioned, it is the full space allocated (which may not be used yet). |
| diskspace\|notshared | Disk Space\|Not Shared | Space used by VM that is not shared with other VM |
| diskspace\|activeNotShared | Disk Space\|Active not shared | Unshared disk space used by VMs excluding snapshot |
| diskspace\|perDsUsed | Disk Space\|Pod used | Space used by all files of the Pod on the datastore (disks, snapshots, configs, logs, etc). |
| diskspace\|total_usage | Disk Space\|Utilization | Total disk space used on all datastores visible to this object |
| diskspace\|total_capacity | Disk Space\|Total Capacity | Total disk space on all datastores visible to this object |
| diskspace\|diskused | Disk Space\|Virtual Disk Used | Space used by virtual disks |
| diskspace\|snapshot | Disk Space\|Snapshot Space | Space used by snapshots |
| diskspace\|shared | Disk Space\|Shared Used | Shared space used |
| diskspace\|provisioned | Disk Space\|Provisioned Space | Provisioned space |
| diskspace\|snapshot\|used | Disk Space\|Snapshot\|Pod used | Disk space used by the Pod snapshot files. This is the space that can be potentially reclaimed if the snapshot is removed. |
| diskspace\|snapshot\|accessTime | Disk Space\|Snapshot\|Access Time | The date and time the snapshot was taken. |
| storage\|totalReadLatency_average | Storage\|Read Latency | Average amount of time for a read operation. |
| storage\|totalWriteLatency_average | Storage\|Write Latency | Average amount of time for a write operation. |
| storage\|read_average | Storage\|Read Rate | Read throughput rate |
| storage\|write_average | Storage\|Write Rate | Write throughput rate |

| Metric Key | Metric Name | Description |
|---|---|---|
| storage\|usage_average | Storage\|Total Usage | Total throughput rate |
| storage\|numberReadAveraged_average | Storage\|Reads per second | Average number of read commands issued per second during the collection interval |
| storage\|numberWriteAveraged_average | Storage\|Writes per second | Average number of write commands issued per second during the collection interval |
| storage\|commandsAveraged_average | Storage\|Commands per second | Average number of commands issued per second during the collection interval |
| storage\|totalLatency_average | Storage\|Total Latency | Total latency |
| storage\|demandKBps | Storage\|Demand | N/A |
| storage\|contention | Storage\|Contention percentage | N/A |
| cost\|monthlyTotalCost | Cost\|MTD Total Cost | Month To Date Cost of Virtual Machine |
| cost\|monthlyProjectedCost | Cost\|Monthly Projected Total Cost | Virtual Machine cost projected for full month |
| cost\|compTotalCost | Cost\|MTD Compute Total Cost | Month to Date Total Compute Cost (Including CPU and Memory) of Virtual Machine |
| cost\|directCost | Cost\|Monthly Direct Cost | Monthly Direct Cost (comprising of OS Labor, VI Labor and any windows desktop instance license) of Virtual Machine |
| cost\|cpuCost | Cost\|MTD CPU Cost | Month to Date Virtual Machine CPU Cost. It is based on utilization. The more the VM uses, the higher its cost. |
| cost\|memoryCost | Cost\|MTD Memory Cost | Month to Date Memory Cost of Virtual Machine. It is based on utilization. The more the VM uses, the higher its cost. |
| cost\|storageCost | Cost\|MTD Disk Space Cost | Month to Date Disk Space Cost of Virtual Machine |
| cost\|reclaimableCost | Cost\|Potential Savings | Potential Savings |
| cost\|osLaborTotalCost | Cost\|Monthly OS Labor Cost | Operating System Labor Cost of Virtual Machine for full month |
| cost\|viLaborTotalCost | Cost\|Monthly VI Labor Cost | Monthly VI Labor Cost |
| cost\|effectiveTotalCost | Cost\|MTD Effective Total Cost | Month to Date Cost of Virtual Machine considering the allocation and demand model |
| cost\|effectiveProjectedTotalCost | Cost\|Monthly Effective Projected Total Cost | Virtual Machine cost projected for full month considering the allocation and demand model |
| cost\|allocation\|allocationBasedCpuMTD Cost | Cost\|Allocation\|MTD CPU Cost | Month to Date Virtual Machine CPU Cost. It is based on utilization. The more the VM uses, the higher its cost. |
| cost\|allocation\|allocationBasedMemoryM TDCost | Cost\|Allocation\|MTD Memory Cost | Month to Date Memory Cost of Virtual Machine. It is based on utilization. The more the VM uses, the higher its cost. |
| cost\|allocation\|allocationBasedStorageM TDCost | Cost\|Allocation\|MTD Disk Space Cost | Month to Date Disk Space Cost of Virtual Machine |
| cost\|allocation\|allocationBasedTotalMTD Cost | Cost\|Allocation\|MTD Total Cost | Month To Date Cost of Virtual Machine |
| cost\|allocation\|allocationBasedTotalCost | Cost\|Allocation\|Monthly Projected Total Cost | Virtual Machine cost projected for full month |

| Metric Key | Metric Name | Description |
|---|---|---|
| datastore\|demand_oio | Datastore\|Outstanding IO requests | Amount of IO waiting in the queue to be executed. High IO, coupled with high latency, impacts performance. |
| datastore\|numberReadAveraged_average | Datastore\|Read IOPS | Number of read operations per second. This is averaged over the reporting period. |
| datastore\|numberWriteAveraged_average | Datastore\|Write IOPS | Number of write operations per second. This is averaged over the reporting period. |
| datastore\|read_average | Datastore\|Read Throughput | Amount of data read from storage in a second. This is averaged over the reporting period. |
| datastore\|totalReadLatency_average | Datastore\|Read Latency | Average amount of time for a read operation at the datastore level. It's an average of all the VMs in the datastore. |
| datastore\|totalWriteLatency_average | Datastore\|Write Latency | Average amount of time for a write operation by the storage adapter. |
| datastore\|write_average | Datastore\|Write Throughput | Amount of data written from storage in a second. This is averaged over the reporting period. |
| datastore\|totalLatency_average | Datastore\|Total Latency | Normalized Latency, taking into account the read/write ratio. |
| datastore\|usage_average | Datastore\|Total Throughput | Amount of data read from/written to storage in a second. This is averaged over the reporting period. |
| datastore\|commandsAveraged_average | Datastore\|Total IOPS | Number of read/write operations per second. This is averaged over the reporting period. |
| datastore\|used | Datastore\|Used Space | Used Space. |
| datastore\|demand | Datastore\|Demand | Max of datastore "Reads Per Sec", "Writes Per Sec", "Read Rate", "Write Rate", "OIO Per Sec" percentages. |
| datastore\|maxTotalLatency_latest | Datastore\|Highest Latency | Highest Latency. |
| datastore\|totalLatency_max | Datastore\|Total Latency Max | Total Latency Max (ms). |
| datastore\|maxObserved_NumberRead | Datastore\|Max Observed Reads per second | Max observed average number of read commands issued per second during the collection interval. |
| datastore\|maxObserved_Read | Datastore\|Max Observed Read Rate | Max observed rate of reading data from the datastore. |
| datastore\|maxObserved_NumberWrite | Datastore\|Max Observed Writes per second | Max observed average number of write commands issued per second during the collection interval. |
| datastore\|maxObserved_Write | Datastore\|Max Observed Write Rate | Max observed rate of writing data from the datastore. |
| datastore\|maxObserved_OIO | Datastore\|Max Observed Number of Outstanding IO Operations | N/A |

#### Power Metrics for vSphere Pods

Power metrics provide information about the vSphere pods power use.

| Metric Name | Description |
|---|---|
| Power\|Total Energy Consumed in the collection period (Wh) | Displays the total electricity consumed based on the time interval selected. The default collection cycle is set to 5 mins. You can continue using the default setting or edit it for each adapter instance. For example, if the time interval is set to its default value, the value represents the energy consumed per 5 mins. |
| Power\|Current Power Consumption Rate (Watt) | The power consumption rate per second, averaged over the reporting period.<br>Key: power\|power_average |
| Power\|(DEP) Energy (Joule) | Total energy consumed in joules.<br>Key: power\|energy_summation |

## OS and Application Monitoring Metrics

Metrics are collected for operating systems, application services, remote checks, Linux processes, and Windows services.

### Operating System Metrics

Metrics are collected for Linux and Windows operating systems.

#### Linux Platforms

The following metrics are collected for Linux operating systems:

**Table 1491: Metrics for Linux**

| Metric | Metric Category | KPI |
|---|---|---|
| <Instance name>\| Usage Idle | CPU | False |
| <Instance name>\| Usage IO-Wait | CPU | False |
| <Instance name>\|Time Active | CPU | True |
| <Instance name>\|Time Guest | CPU | False |
| <Instance name>\|Time Guest Nice | CPU | False |
| <Instance name>\|Time Idle | CPU | False |
| <Instance name>\|Time IO-Wait | CPU | False |
| <Instance name>\|Time IRQ | CPU | True |
| <Instance name>\|Time Nice | CPU | False |
| <Instance name>\|Time Soft IRQ | CPU | True |
| <Instance name>\|Time Steal | CPU | False |
| <Instance name>\|Time System | CPU | False |
| <Instance name>\|Time User | CPU | True |
| <Instance name>\|Usage Active (%) | CPU | True |
| <Instance name>\|Usage Guest (%) | CPU | False |
| <Instance name>\|Usage Guest Nice (%) | CPU | False |
| <Instance name>\|Usage IRQ (%) | CPU | True |

| Metric | Metric Category | KPI |
|---|---|---|
| <Instance name>\|Usage Nice (%) | CPU | False |
| <Instance name>\|Usage Soft IRQ (%) | CPU | True |
| <Instance name>\|Usage Steal (%) | CPU | False |
| <Instance name>\|Usage System (%) | CPU | True |
| <Instance name>\|Usage User (%) | CPU | True |
| CPU Load1 (%) | CPU Load | False |
| CPU Load15 (%) | CPU Load | False |
| CPU Load5 (%) | CPU Load | False |
| <Instance name>\|IO Time | Disk IO | False |
| <Instance name>\|Read Time | Disk IO | False |
| <Instance name>\|Reads | Disk IO | False |
| <Instance name>\|Write Time | Disk IO | False |
| <Instance name>\|Writes | Disk IO | False |
| <Instance name>\|Disk Free | Disk | False |
| <Instance name>\|Disk Total | Disk | False |
| <Instance name>\|Disk Used (%) | Disk | False |
| Cached | Memory | False |
| Free | Memory | False |
| Inactive | Memory | False |
| Total | Memory | True |
| Used | Memory | True |
| Used Percent | Memory | True |
| Blocked | Processes | True |
| Dead | Processes | False |
| Running | Processes | False |
| Sleeping | Processes | False |
| Stopped | Processes | False |
| Zombies | Processes | False |
| Free | Swap | False |
| In | Swap | False |
| Out | Swap | False |
| Total | Swap | True |
| Used | Swap | True |
| Used Percent | Swap | True |
| Telegraf Availability | None | False |

**Windows Platforms**

The following metrics are collected for Windows operating systems:

### Table 1492: Metrics for Windows

| Metric | Metric Category | KPI |
|---|---|---|
| Idle Time | CPU | False |
| Interrupt Time | CPU | False |
| Interrupts persec | CPU | True |
| Privileged Time | CPU | False |
| Processor Time | CPU | False |
| User Time | CPU | False |
| DPC Time (%) | CPU | False |
| Usage Guest (%) | CPU | False |
| Usage System (%) | CPU | False |
| Usage User (%) | CPU | False |
| Avg. Disk Bytes Read | Disk | False |
| Avg. Disk sec Read | Disk | False |
| Avg. Disk sec Write | Disk | False |
| Avg. Disk Write Queue Length | Disk | False |
| Avg. Disk Read Queue Length | Disk | False |
| Disk Read Time | Disk | False |
| Disk Write Time | Disk | False |
| Free Megabytes | Disk | False |
| Free Space | Disk | False |
| Idle Time | Disk | False |
| Split IO persec | Disk | False |
| Available Bytes | Memory | True |
| Cache Bytes | Memory | False |
| Cache Faults persec | Memory | False |
| Committed Bytes | Memory | True |
| Demand Zero Faults persec | Memory | False |
| Page Faults persec | Memory | True |
| Pages persec | Memory | False |
| Pool Nonpaged Bytes | Memory | True |
| Pool Paged Bytes | Memory | False |
| Transition Faults persec | Memory | False |
| Total (bytes) | Memory | False |
| Used (bytes) | Memory | False |
| Used Percent(%) | Memory | False |
| Bytes Received persec | Network | False |
| Bytes Sent persec | Network | False |
| Packets Outbound Discarded | Network | False |
| Packets Outbound Errors | Network | False |
| Packets Received Discarded | Network | False |

| Metric | Metric Category | KPI |
|---|---|---|
| Packets Received Errors | Network | False |
| Packets Received persec | Network | False |
| Packets Sent persec | Network | False |
| Elapsed Time | Process | False |
| Handle Count | Process | False |
| IO Read Bytes persec | Process | False |
| IO Read Operations persec | Process | False |
| IO Write Bytes persec | Process | False |
| IO Write Operations persec | Process | False |
| Privileged Time | Process | False |
| Processor Time | Process | False |
| Thread Count | Process | False |
| User Time | Process | False |
| Context Switches persec | System | False |
| Processes | System | False |
| Processor Queue Length | System | False |
| System Calls persec | System | False |
| System Up Time | System | False |
| Threads | System | False |
| Used Percent (%) | Swap | False |
| Total (bytes) | Swap | False |
| Telegraf Availability | None | False |

### Application Service Metrics

Metrics are collected for 23 application services.

Here is the list of application services:

- Active Directory
- Apache HTTPD
- Microsoft SQL Server
- PostgreQL
- Microsoft IIS
- MS Exchange
- JBoss Server
- RabbitMQ
- MySQL
- NGINX
- SharePoint
- Oracle WebLogic Server
- Pivotal TC Server
- ActiveMQ
- Apache HTTPD
- Oracle DB
- Cassandra

- HyperV
- MongoDB
- Riak KV
- Network Time Protocol
- WebSphere
- Java Application

### Active Directory Metrics

Metrics are collected for the Active Directory application service.

**Table 1493: Active Directory Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| Database Cache % Hit (%) | Active Directory Database | True |
| Database Cache Page Faults/sec | Active Directory Database | True |
| Database Cache Size | Active Directory Database | False |
| Data Lookups | Active Directory DFS Replication | False |
| Database Commits | Active Directory DFS Replication | True |
| Avg Response Time | Active Directory DFSN | True |
| Requests Failed | Active Directory DFSN | False |
| Requests Processed | Active Directory DFSN | False |
| Dynamic Update Received | Active Directory DNS | False |
| Dynamic Update Rejected | Active Directory DNS | False |
| Recursive Queries | Active Directory DNS | False |
| Recursive Queries Failure | Active Directory DNS | False |
| Secure Update Failure | Active Directory DNS | False |
| Total Query Received | Active Directory DNS | True |
| Total Response Sent | Active Directory DNS | True |
| Digest Authentications | Active Directory Security System-Wide Statistics | True |
| Kerberos Authentications | Active Directory Security System-Wide Statistics | True |
| NTLM Authentications | Active Directory Security System-Wide Statistics | True |
| Directory Services:<InstanceName>\|Base Searches persec | Active Directory Services | False |
| Directory Services:<InstanceName>\|Database adds persec | Active Directory Services | False |
| Directory Services:<InstanceName>\|Database deletes persec | Active Directory Services | False |
| Directory Services<InstanceName>\|Database modifys/sec | Active Directory Services | False |
| Directory Services<InstanceName>\|Database recycles/sec | Active Directory Services | False |
| Directory Services<InstanceName>\|DRA Inbound Bytes Total/sec | Active Directory Services | False |
| Directory Services<InstanceName>\|DRA Inbound Objects/sec | Active Directory Services | False |

| Metric Name | Category | KPI |
|---|---|---|
| Directory Services<InstanceName>\|DRA Outbound Bytes Total/sec | Active Directory Services | False |
| Directory Services<InstanceName>\|DRA Outbound Objects/sec | Active Directory Services | False |
| Directory Services<InstanceName>\|DRA Pending Replication Operations | Active Directory Services | False |
| Directory Services<InstanceName>\|DRA Pending Replication Synchronizations | Active Directory Services | False |
| Directory Services<InstanceName>\|DRA Sync Requests Made | Active Directory Services | False |
| Directory Services<InstanceName>\|DRA Sync Requests Successful | Active Directory Services | False |
| Directory Services<InstanceName>\|DS Client Binds/sec | Active Directory Services | True |
| Directory Services<InstanceName>\|DS Directory Reads/sec | Active Directory Services | False |
| Directory Services<InstanceName>\|DS Directory Searches/sec | Active Directory Services | True |
| Directory Services<InstanceName>\|DS Server Binds/sec | Active Directory Services | True |
| Directory Services<InstanceName>\|DS Threads in Use | Active Directory Services | True |
| Directory Services:<InstanceName>\|LDAP Active Threads | Active Directory Services | False |
| Directory Services:<InstanceName>\|LDAP Client Sessions | Active Directory Services | True |
| Directory Services<InstanceName>\|LDAP Closed Connections/sec | Active Directory Services | False |
| Directory Services<InstanceName>\|LDAP New Connections/sec | Active Directory Services | True |
| Directory Services<InstanceName>\|LDAP Searches/sec | Active Directory Services | True |
| Directory Services<InstanceName>\|LDAP Successful Binds/sec | Active Directory Services | False |
| Directory Services<InstanceName>\|LDAP UDP operations/sec | Active Directory Services | False |
| Directory Services:<InstanceName>\|LDAP Writes/sec | Active Directory Services | False |
| Application Availability | Active Directory | False |

### ActiveMQ Metrics

Metrics are collected for the ActiveMQ application service.

**Table 1494: ActiveMQ Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| Buffer Pool<InstanceName>\|Count | Active MQ | False |
| Buffer Pool<InstanceName>\|Memory Used | Active MQ | False |
| Buffer Pool<InstanceName>\|Total Capacity | Active MQ | False |
| Class Loading\|Loaded Class Count | Active MQ | False |
| Class Loading\|Unloaded Class Count | Active MQ | False |
| Class Loading\|Total Loaded Class Count | Active MQ | False |
| File Descriptor Usage\|Max File Descriptor Count | Active MQ | False |
| File Descriptor Usage\|Open File Descriptor Count | Active MQ | False |
| Garbage Collection<InstanceName>\|Total Collection Count | Active MQ | False |
| Garbage Collection<InstanceName>\|Total Collection Time | Active MQ | False |
| JVM Memory Pool<InstanceName>\|Peak Usage\|Committed Memory | Active MQ | False |
| JVM Memory Pool<InstanceName>\|Peak Usage\|Initial Memory | Active MQ | False |
| JVM Memory Pool<InstanceName>\|Peak Usage\|Maximum Memory | Active MQ | False |
| JVM Memory Pool<InstanceName>\|Peak Usage\|Used Memory | Active MQ | False |
| JVM Memory Pool<InstanceName>\|Usage\|Committed Memory | Active MQ | False |
| JVM Memory Pool<InstanceName>\|Usage\|Initial Memory | Active MQ | False |
| JVM Memory Pool<InstanceName>\|Usage\|Maximum Memory | Active MQ | False |
| JVM Memory Pool<InstanceName>\|Usage\|Used Memory | Active MQ | False |

| Metric Name | Category | KPI |
|---|---|---|
| Application Availability | Active MQ | False |
| Threading\|Thread Count | Active MQ | False |
| Uptime | Active MQ | False |
| UTILIZATION\|Process CpuLoad | Active MQ | False |
| UTILIZATION\|Memory Limit | ActiveMQ Broker | True |
| UTILIZATION\|Memory Percent Usage (%) | ActiveMQ Broker | True |
| UTILIZATION\|Store Limit | ActiveMQ Broker | False |
| UTILIZATION\|Store Percent Usage (%) | ActiveMQ Broker | False |
| UTILIZATION\|Temp Limit | ActiveMQ Broker | False |
| UTILIZATION\|Temp Percent Usage (%) | ActiveMQ Broker | False |
| UTILIZATION\|Total Consumer Count | ActiveMQ Broker | True |
| UTILIZATION\|Total Dequeue Count | ActiveMQ Broker | True |
| UTILIZATION\|Total Enqueue Count | ActiveMQ Broker | True |
| UTILIZATION\|Total Message Count | ActiveMQ Broker | True |
| JVM Memory\|Heap Memory Usage\|Initial Memory | ActiveMQ JVM Memory Usage | False |
| JVM Memory\|Heap Memory Usage\|Committed Memory | ActiveMQ JVM Memory Usage | False |
| JVM Memory\|Heap Memory Usage\|Maximum Memory | ActiveMQ JVM Memory Usage | False |
| JVM Memory\|Heap Memory Usage\|Used Memory | ActiveMQ JVM Memory Usage | False |
| JVM Memory\|Non Heap Memory Usage\|Committed Memory | ActiveMQ JVM Memory Usage | False |
| JVM Memory\|Non Heap Memory Usage\|Initial Memory | ActiveMQ JVM Memory Usage | False |
| JVM Memory\|Non Heap Memory Usage\|Maximum Memory | ActiveMQ JVM Memory Usage | False |
| JVM Memory\|Non Heap Memory Usage\|Used Memory | ActiveMQ JVM Memory Usage | False |
| JVM Memory\|Object Pending FinalizationCount | ActiveMQ JVM Memory Usage | False |
| UTILIZATION\|Process CpuLoad | ActiveMQ OS | False |
| UTILIZATION\|System Cpu Load | ActiveMQ OS | False |
| UTILIZATION\|Consumer Count | ActiveMQ Topic | True |
| UTILIZATION\|Dequeue Count | ActiveMQ Topic | True |

| Metric Name | Category | KPI |
|---|---|---|
| UTILIZATION\|Enqueue Count | ActiveMQ Topic | True |
| UTILIZATION\|Queue Size | ActiveMQ Topic | True |
| UTILIZATION\|Producer Count | ActiveMQ Topic | False |

### Apache HTTPD Metrics

Metrics are collected for the Apache HTTPD application service.

**Note:**
Metrics are collected for the Events MPM. Metrics are not collected for the other MPMs.

**Table 1495: Apache HTTPD Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| UTILIZATION\|Busy Workers | Apache HTTPD | True |
| UTILIZATION\|Bytes Per Req | Apache HTTPD | False |
| UTILIZATION\|Bytes Per Sec | Apache HTTPD | False |
| UTILIZATION\|CPU Load | Apache HTTPD | True |
| UTILIZATION\|CPU User | Apache HTTPD | False |
| UTILIZATION\|Idle Workers | Apache HTTPD | True |
| UTILIZATION\|Request Per Sec | Apache HTTPD | True |
| UTILIZATION\|SCBoard Closing | Apache HTTPD | False |
| UTILIZATION\|SCBoard DNS Lookup | Apache HTTPD | False |
| UTILIZATION\|SCBoard Finishing | Apache HTTPD | False |
| UTILIZATION\|SCBoard Idle Cleanup | Apache HTTPD | False |
| UTILIZATION\|SCBoard Keep Alive | Apache HTTPD | False |
| UTILIZATION\|SCBoard Logging | Apache HTTPD | False |
| UTILIZATION\|SCBoard Open | Apache HTTPD | False |
| UTILIZATION\|SCBoard Reading | Apache HTTPD | False |
| UTILIZATION\|SCBoard Sending | Apache HTTPD | False |
| UTILIZATION\|SCBoard Starting | Apache HTTPD | False |
| UTILIZATION\|SCBoard Waiting | Apache HTTPD | False |
| UTILIZATION\|Total Accesses | Apache HTTPD | False |
| UTILIZATION\|Total Bytes | Apache HTTPD | True |
| UTILIZATION\|Total Connections | Apache HTTPD | False |
| UTILIZATION\|Uptime | Apache HTTPD | True |
| UTILIZATION\|Asynchronous Closing Connections | Apache HTTPD | False |
| UTILIZATION\|Asynchronous Keep Alive Connections | Apache HTTPD | False |
| UTILIZATION\|Asynchronous Writing Connections | Apache HTTPD | False |
| UTILIZATION\|ServerUptimeSeconds | Apache HTTPD | False |
| UTILIZATION\|Load1 | Apache HTTPD | False |
| UTILIZATION\|Load5 | Apache HTTPD | False |
| UTILIZATION\|ParentServerConfigGeneration | Apache HTTPD | False |

| Metric Name | Category | KPI |
|---|---|---|
| UTILIZATION\|ParentServerMPMGeneration | Apache HTTPD | False |
| Application Availability | Apache HTTPD | False |

### Tomcat Server

Metrics are collected for the Tomcat Server application service.

**Table 1496: Tomcat Server**

| Metric Name | Category | KPI |
|---|---|---|
| Buffer Pool<InstanceName>\|Count | Tomcat Server | False |
| Buffer Pool<InstanceName>\|Memory Used | Tomcat Server | False |
| Buffer Pool<InstanceName>\|Total Capacity | Tomcat Server | False |
| Class Loading\|Loaded Class Count | Tomcat Server | False |
| Class Loading\|Total Loaded Class Count | Tomcat Server | False |
| Class Loading\|Unloaded Class Count | Tomcat Server | False |
| File Descriptor Usage\|Max File Descriptor Count | Tomcat Server | False |
| File Descriptor Usage\|Open File Descriptor Count | Tomcat Server | False |
| Garbage Collection:<InstanceName>\|Total Collection Count | Tomcat Server | False |
| Garbage Collection:<InstanceName>\|Total Collection Time | Tomcat Server | True |
| JVM Memory\|Heap Memory Usage\|Committed Memory | Tomcat Server | False |
| JVM Memory\|Heap Memory Usage\|Initial Memory | Tomcat Server | False |
| JVM Memory\|Heap Memory Usage\|Maximum Memory | Tomcat Server | False |
| JVM Memory\|Heap Memory Usage\|Used Memory | Tomcat Server | False |
| JVM Memory\|Non Heap Memory Usage\|Committed Memory | Tomcat Server | False |
| JVM Memory\|Non Heap Memory Usage\|Initial Memory | Tomcat Server | False |
| JVM Memory\|Non Heap Memory Usage\|Maximum Memory | Tomcat Server | False |
| JVM Memory\|Non Heap Memory Usage\|Used Memory | Tomcat Server | False |
| JVM Memory\|Number of Object Pending Finalization Count | Tomcat Server | False |
| JVM Memory\|Pool:<InstanceName>\|Peak Usage\|Committed Memory | Tomcat Server | False |
| JVM Memory\|Pool:<InstanceName>\|Peak Usage\|Initial Memory | Tomcat Server | False |
| JVM Memory\|Pool:<InstanceName>\|Peak Usage\|Maximum Memory | Tomcat Server | False |
| JVM Memory\|Pool:<InstanceName>\|Peak Usage\|Used Memory | Tomcat Server | False |

| Metric Name | Category | KPI |
|---|---|---|
| JVM Memory\|Pool:<InstanceName>\|Usage\| Committed Memory | Tomcat Server | False |
| JVM Memory\|Pool:<InstanceName>\|Usage\|Initial Memory | Tomcat Server | False |
| JVM Memory\|Pool:<InstanceName>\|Usage\| Maximum Memory | Tomcat Server | False |
| JVM Memory\|Pool:<InstanceName>\|Usage\|Used Memory | Tomcat Server | False |
| Process CPU Usage (%) | Tomcat Server | True |
| System CPU Usage (%) | Tomcat Server | True |
| System Load Average (%) | Tomcat Server | True |
| Threading\|Thread Count | Tomcat Server | False |
| Uptime | Tomcat Server | True |
| Application Availability | Tomcat Server | False |
| JSP Count | Tomcat Server Web Module | False |
| JSP Reload Count | Tomcat Server Web Module | False |
| JSP Unload Count | Tomcat Server Web Module | False |
| Servlet:<InstanceName>\|Total Request Count | Tomcat Server Web Module | False |
| Servlet:<InstanceName>\|Total Request Error Count | Tomcat Server Web Module | False |
| Servlet:<InstanceName>\|Total Request Processing Time | Tomcat Server Web Module | False |
| Cache : Hit Count | Tomcat Server Web Module | False |
| Cache : Lookup Count | Tomcat Server Web Module | False |
| Current Thread Count | Tomcat Server Global Request Processor | True |
| Current Threads Busy | Tomcat Server Global Request Processor | True |
| errorRate | Tomcat Server Global Request Processor | False |
| Total Request Bytes Received | Tomcat Server Global Request Processor | False |
| Total Request Bytes Sent | Tomcat Server Global Request Processor | False |
| Total Request Count | Tomcat Server Global Request Processor | True |
| Total Request Error Count | Tomcat Server Global Request Processor | True |
| Total Request Processing Time | Tomcat Server Global Request Processor | False |

### Microsoft IIS Metrics

Metrics are collected for the Microsoft IIS application service.

#### Table 1497: IIS Metrics

| Metric Name | Category | KPI |
|---|---|---|
| HTTP Service Request Queues<InstanceName>AppPool\|CurrentQueueSize | IIS HTTP Service Request Queues | True |
| HTTP Service Request Queues<InstanceName>AppPool\|RejectedRequests | IIS HTTP Service Request Queues | False |
| Web Services<InstanceName> Web Site\|Bytes Received | IIS Web Services | False |

| Metric Name | Category | KPI |
|---|---|---|
| Web Services<InstanceName> Web Site\|Bytes Sent/sec | IIS Web Services | False |
| Web Services<InstanceName> Web Site\|Bytes Total/sec | IIS Web Services | False |
| Web Services<InstanceName> Web Site\|Connection Attempts/sec | IIS Web Services | False |
| Web Services<InstanceName> Web Site\|Current Connections | IIS Web Services | False |
| Web Services<InstanceName> Web Site\|Get Requests/sec | IIS Web Services | False |
| Web Services<InstanceName> Web Site\|Locked Errors/sec | IIS Web Services | False |
| Web Services<InstanceName> Web Site\|Not Found Errors/sec | IIS Web Services | False |
| Web Services<InstanceName> Web Site\|Post Requests/sec | IIS Web Services | False |
| Web Services<InstanceName> Web Site\|Service Uptime | IIS Web Services | False |
| Web Services<InstanceName> Web Site\|Total Bytes Sent | IIS Web Services | False |
| Web Services<InstanceName> Web Site\|Total Get Requests | IIS Web Services | True |
| Web Services<InstanceName> Web Site\|Total Post Requests | IIS Web Services | True |
| Web Services<InstanceName> Web Site\|Total Put Requests | IIS Web Services | False |
| Current File Cache Memory Usage (bytes) | IIS Web Services Cache | False |
| File Cache Hits Percent (%) | IIS Web Services Cache | False |
| Kernel URI Cache Hits Percent (%) | IIS Web Services Cache | False |
| Kernel URI Cache Misses | IIS Web Services Cache | False |
| Total Flushed URIs | IIS Web Services Cache | False |
| URI Cache Hits | IIS Web Services Cache | False |
| URI Cache Hits Percent (%) | IIS Web Services Cache | False |
| URI Cache Misses | IIS Web Services Cache | False |
| ASP.NET<InstanceName>\|Application Restarts | IIS ASP.NET | True |
| ASP.NET<InstanceName>\|Request Wait Time | IIS ASP.NET | True |
| ASP.NET<InstanceName>\|Requests Current | IIS ASP.NET | True |
| ASP.NET<InstanceName>\|Requests Queued | IIS ASP.NET | True |
| ASP.NET<InstanceName>\|Requests Rejected | IIS ASP.NET | True |
| MS.NET<InstanceName>\|Allocated Bytes/sec | MS.NET | True |
| MS.NET<InstanceName>\|Current Queue Length | MS.NET | False |
| MS.NET<InstanceName>\|Finalization Survivors | MS.NET | False |
| MS.NET<InstanceName>\|Gen 0 Collections | MS.NET | False |
| MS.NET<InstanceName>\|Gen 0 heap size | MS.NET | False |

| Metric Name | Category | KPI |
|---|---|---|
| MS.NET<InstanceName>\|Gen 1 Collections | MS.NET | False |
| MS.NET<InstanceName>\|Gen 1 heap size | MS.NET | False |
| MS.NET<InstanceName>\|Gen 2 Collections | MS.NET | False |
| MS.NET<InstanceName>\|Gen 2 heap size | MS.NET | False |
| MS.NET<InstanceName>\|IL Bytes Jitted / sec | MS.NET | False |
| MS.NET<InstanceName>\|Induced GC | MS.NET | False |
| MS.NET<InstanceName>\|Large Object Heap size | MS.NET | False |
| MS.NET<InstanceName>\|No of current logical Threads | MS.NET | True |
| MS.NET<InstanceName>\|No of current physical Threads | MS.NET | True |
| MS.NET<InstanceName>\|No of current recognized threads | MS.NET | False |
| MS.NET<InstanceName>\|No of Exceps Thrown / sec | MS.NET | True |
| MS.NET<InstanceName>\|No of total recognized threads | MS.NET | False |
| MS.NET<InstanceName>\|Percent Time in Jit | MS.NET | False |
| MS.NET<InstanceName>\|Pinned Objects | MS.NET | False |
| MS.NET<InstanceName>\|Stack Walk Depth | MS.NET | False |
| MS.NET<InstanceName>\|Time in RT checks | MS.NET | False |
| MS.NET<InstanceName>\|Time Loading | MS.NET | True |
| MS.NET<InstanceName>\|Total No of Contentions | MS.NET | False |
| MS.NET<InstanceName>\|Total Runtime Checks | MS.NET | True |
| Application Availability | Microsoft IIS | False |

### Java Application Metrics

Metrics are collected for the Java application service.

#### Table 1498: Java Application Metrics

| Metric Name | Category | KPI |
|---|---|---|
| Buffer Pool<InstanceName>\|Count | Java Application | False |
| Buffer Pool<InstanceName>\|Memory Used | Java Application | False |
| Buffer Pool<InstanceName>\|Total Capacity | Java Application | False |
| Class Loading\|Loaded Class Count | Java Application | True |
| Class Loading\|Total Loaded Class Count | Java Application | False |
| Class Loading\|Unloaded Class Count | Java Application | False |
| Garbage Collection<InstanceName>\|Total Collection Count | Java Application | False |
| Garbage Collection<InstanceName>\|Total Collection Time | Java Application | False |
| JVM Memory\|Heap Memory Usage\|Committed Memory | Java Application | False |

| Metric Name | Category | KPI |
|---|---|---|
| JVM Memory\|Heap Memory Usage\|Initial Memory | Java Application | False |
| JVM Memory\|Heap Memory Usage\|Maximum Memory | Java Application | False |
| JVM Memory\|Heap Memory Usage\|Used Memory | Java Application | False |
| JVM Memory\|JVM Memory Pool<InstanceName>\|Peak Usage\|Committed Memory | Java Application | False |
| JVM Memory\|JVM Memory Pool<InstanceName>\|Peak Usage\|Initial Memory | Java Application | False |
| JVM Memory\|JVM Memory Pool<InstanceName>\|Peak Usage\|Maximum Memory | Java Application | False |
| JVM Memory\|JVM Memory Pool<InstanceName>\|Peak Usage\|Used Memory | Java Application | False |
| JVM Memory\|JVM Memory Pool<InstanceName>\|Usage\|Committed Memory | Java Application | False |
| JVM Memory\|JVM Memory Pool<InstanceName>\|Usage\|Initial Memory | Java Application | False |
| JVM Memory\|JVM Memory Pool<InstanceName>\|Usage\|Maximum Memory | Java Application | False |
| JVM Memory\|JVM Memory Pool<InstanceName>\|Usage\|Used Memory | Java Application | False |
| JVM Memory\|Non Heap Memory Usage\|Committed Memory | Java Application | False |
| JVM Memory\|Non Heap Memory Usage\|Initial Memory | Java Application | False |
| JVM Memory\|Non Heap Memory Usage\|Maximum Memory | Java Application | False |
| JVM Memory\|Non Heap Memory Usage\|Used Memory | Java Application | False |
| JVM Memory\|Object Pending Finalization Count | Java Application | False |
| Uptime | Java Application | True |
| Threading\|Thread Count | Java Application | True |
| Process CPU Usage % | Java Application | False |
| System CPU Usage % | Java Application | False |
| System Load Average % | Java Application | False |

### JBoss Server Metrics

Metrics are collected for the JBoss Server application service.

#### Table 1499: JBoss Server Metrics

| Metric Name | Category | KPI |
|---|---|---|
| Buffer Pool<InstanceName>\|Count | Jboss Server | False |
| Buffer Pool<InstanceName>\|Memory Used | Jboss Server | False |
| Buffer Pool<InstanceName>\|Total Capacity | Jboss Server | False |
| Class Loading\|Loaded Class Count | Jboss Server | False |

| Metric Name | Category | KPI |
|---|---|---|
| Class Loading\|Total Loaded Class Count | Jboss Server | False |
| Class Loading\|Unloaded Class Count | Jboss Server | False |
| File Descriptor Usage\|Max File Descriptor Count | Jboss Server | False |
| File Descriptor Usage\|Open File Descriptor Count | Jboss Server | False |
| Http Listener<InstanceName>\|Bytes Received | Jboss Server | False |
| Http Listener<InstanceName>\|Bytes Sent | Jboss Server | False |
| Http Listener<InstanceName>\|Error Count | Jboss Server | False |
| Http Listener<InstanceName>\|Request Count | Jboss Server | False |
| Https Listener<InstanceName>\|Bytes Received | Jboss Server | False |
| Https Listener<InstanceName>\|Bytes Sent | Jboss Server | False |
| Https Listener<InstanceName>\|Error Count | Jboss Server | False |
| Https Listener<InstanceName>\|Request Count | Jboss Server | False |
| Process CPU Usage (%) | Jboss Server | False |
| System CPU Usage (%) | Jboss Server | False |
| System Load Average (%) | Jboss Server | False |
| Threading\|Daemon Thread Count | Jboss Server | False |
| Threading\|Peak Thread Count | Jboss Server | False |
| Threading\|Thread Count | Jboss Server | False |
| Threading\|Total Started Thread Count | Jboss Server | False |
| Uptime | Jboss Server | False |
| UTILIZATION\|Heap Memory Usage | Jboss Server | False |
| Application Availability | Jboss Server | False |
| Garbage Collection<InstanceName>\|Total Collection Count | Jboss JVM Garbage Collector | False |
| Garbage Collection<InstanceName>\|Total Collection Time | Jboss JVM Garbage Collector | False |
| JVM Memory\|Heap Memory Usage\|Committed Memory | Jboss JVM Memory | False |
| JVM Memory\|Heap Memory Usage\|Initial Memory | Jboss JVM Memory | False |
| JVM Memory\|Heap Memory Usage\|Maximum Memory | Jboss JVM Memory | False |
| JVM Memory\|Heap Memory Usage\|Used Memory | Jboss JVM Memory | True |
| JVM Memory\|Non Heap Memory Usage\|Committed Memory | Jboss JVM Memory | False |
| JVM Memory\|Non Heap Memory Usage\|Initial Memory | Jboss JVM Memory | False |
| JVM Memory\|Non Heap Memory Usage\|Maximum Memory | Jboss JVM Memory | False |
| JVM Memory\|Non Heap Memory Usage\|Used Memory | Jboss JVM Memory | False |
| JVM Memory\|Object Pending Finalization Count | Jboss JVM Memory | True |
| UTILIZATION\|Active Count | Jboss Datasource Pool | False |
| UTILIZATION\|Available Count | Jboss Datasource Pool | False |

| Metric Name | Category | KPI |
|---|---|---|
| JVM Memory Pool<InstanceName>\|Collection Usage\|Committed Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Collection Usage\|Initial Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Collection Usage\|Used Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Collection Usage\|Maximum Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Peak Usage\| Committed Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Peak Usage\| Initial Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Peak Usage\| Maximum Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Peak Usage\| Used Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Usage\| Committed Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Usage\|Initial Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Usage\|Maximum Memory | Jboss JVM Memory Pool | False |
| JVM Memory Pool<InstanceName>\|Usage\|Used Memory | Jboss JVM Memory Pool | False |

### HyperV Metrics

Metrics are collected for the HyperV application service.

**Table 1500: HyperV Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| VM:Hyper-V Virtual Machine Health Summary\|Health Critical | HyperV | False |
| VM<instanceName>\|Physical Memory | HyperV | False |
| VM<instanceName>Hv VP 0\|Total Run Time | HyperV | False |
| VM<instanceName>\|Bytes Received | HyperV | False |
| VM<instanceName>\|Bytes Sent | HyperV | False |
| VM<instanceName>\|Error Count | HyperV | False |
| VM<instanceName>\|Latency | HyperV | False |
| VM<instanceName>\|Queue Length | HyperV | False |
| VM<instanceName>\|Throughput | HyperV | False |
| CPU<instanceName>\|Idle Time | HyperV | True |
| CPU<instanceName>\|Processor Time | HyperV | True |
| CPU<instanceName>\|User Time | HyperV | True |
| Disk<instanceName>\|Avg Disk Queue Length | HyperV | False |
| Disk<instanceName>\|Idle Time | HyperV | False |

| Metric Name | Category | KPI |
|---|---|---|
| Disk<instanceName>\|Read Time | HyperV | True |
| Disk<instanceName>\|Write Time | HyperV | True |
| Process<instanceName>\|Private Bytes | HyperV | False |
| Process<instanceName>\|Processor Time | HyperV | False |
| Process<instanceName>\|Thread Count | HyperV | False |
| Process<instanceName>\|User Time | HyperV | False |
| System\|Processes | HyperV | False |
| System\|Processor Queue Length | HyperV | False |
| System\|System UpTime | HyperV | False |
| Memory\|Available Bytes | HyperV | False |
| Memory\|Cache Bytes | HyperV | False |
| Memory\|Cache Faults | HyperV | False |
| Memory\|Pages | HyperV | False |
| Network<instanceName>\|Packets Outbound Error | HyperV | False |
| Network<instanceName>\|Packets Received Error | HyperV | False |
| Application Availability | HyperV | False |

### Oracle DB Metrics

Metrics are collected for the Oracle DB application service.

Oracle DB cannot be activated on Linux platforms.

**Table 1501: Oracle DB Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| Utilization\|Active Sessions | OracleDB | True |
| Utilization\|Buffer CacheHit Ratio | OracleDB | False |
| Utilization\|Cursor CacheHit Ratio | OracleDB | False |
| Utilization\|Database Wait Time | OracleDB | False |
| Utilization\|Disk Sort persec | OracleDB | False |
| Utilization\|Enqueue Timeouts Persec | OracleDB | False |
| Utilization\|Global Cache Blocks Corrupted | OracleDB | False |
| Utilization\|Global Cache Blocks Lost | OracleDB | False |
| Utilization\|Library CacheHit Ratio | OracleDB | False |
| Utilization\|Logon persec | OracleDB | True |
| Utilization\|Memory Sorts Ratio | OracleDB | True |
| Utilization\|Rows persort | OracleDB | False |
| Utilization\|Service Response Time | OracleDB | False |
| Utilization\|Session Count | OracleDB | True |
| Utilization\|Session Limit | OracleDB | False |
| Utilization\|Shared Pool Free | OracleDB | False |
| Utilization\|Temp Space Used | OracleDB | False |
| Utilization\|Total Sorts persec | OracleDB | False |
| Utilization\|Physical Read Bytes Persc | OracleDB | False |
| Utilization\|Physical Read IO Requests Persc | OracleDB | False |

| Metric Name | Category | KPI |
|---|---|---|
| Utilization\|Physical Read Total Bytes Persec | OracleDB | False |
| Utilization\|Physical Reads Persec | OracleDB | True |
| Utilization\|Physical Reads Per Txn | OracleDB | False |
| Utilization\|Physical Write Bytes Persc | OracleDB | False |
| Utilization\|Physical Write IO Requests Persc | OracleDB | False |
| Utilization\|Physical Write Total Bytes Persc | OracleDB | False |
| Utilization\|Physical Writes Persc | OracleDB | True |
| Utilization\|Physical Writes Per Txn | OracleDB | False |
| Utilization\|User Commits Percentage | OracleDB | False |
| Utilization\|User Commits Persc | OracleDB | False |
| Utilization\|User Rollbacks Percentage | OracleDB | False |
| Utilization\|User Rollbacks persec | OracleDB | True |
| Utilization\|User Transaction Persec | OracleDB | False |
| Utilization\|Database Time Persc | OracleDB | False |
| Application Availability | Oracle DB | False |

### Cassandra Metrics

Metrics are collected for the Cassandra application service.

#### Table 1502: Cassandra Metrics

| Metric Name | Category | KPI |
|---|---|---|
| Cache<InstanceName>\|Capacity | Cassandra | False |
| Cache<InstanceName>\|Entries | Cassandra | True |
| Cache<InstanceName>\|HitRate | Cassandra | True |
| Cache<InstanceName>\|Requests | Cassandra | True |
| Cache<InstanceName>\|Size | Cassandra | False |
| ClientRequest<InstanceName>\|Failures | Cassandra | False |
| ClientRequest<InstanceName>\|Latency | Cassandra | False |
| ClientRequest<InstanceName>\|Timeouts | Cassandra | False |
| ClientRequest<InstanceName>\|Total Latency | Cassandra | False |
| ClientRequest<InstanceName>\|Unavailables | Cassandra | False |
| CommitLog\|Pending Tasks | Cassandra | False |
| CommitLog\|Total Commit Log Size | Cassandra | False |
| Compaction\|Bytes Compacted | Cassandra | False |
| Compaction\|Completed Tasks | Cassandra | False |
| Compaction\|Pending Tasks | Cassandra | False |
| Compaction\|Total Compactions Completed | Cassandra | False |
| Connected Native Clients | Cassandra | False |
| HeapMemoryUsage\|committed | Cassandra | False |
| HeapMemoryUsage\|init | Cassandra | False |
| HeapMemoryUsage\|max | Cassandra | False |

| Metric Name | Category | KPI |
|---|---|---|
| HeapMemoryUsage\|used | Cassandra | False |
| NonHeapMemoryUsage\|committed | Cassandra | False |
| NonHeapMemoryUsage\|init | Cassandra | False |
| NonHeapMemoryUsage\|max | Cassandra | False |
| NonHeapMemoryUsage\|used | Cassandra | False |
| ObjectPendingFinalizationCount | Cassandra | False |
| Storage\|Exceptions Count | Cassandra | False |
| Storage\|Load Count | Cassandra | False |
| Table<InstanceName>\|Coordinator Read Latency | Cassandra | False |
| Table<InstanceName>\|Live Diskspace Used | Cassandra | False |
| Table<InstanceName>\|Read Latency | Cassandra | False |
| Table<InstanceName>\|Total Diskspace Used | Cassandra | False |
| Table<InstanceName>\|Total Read Latency | Cassandra | False |
| Table<InstanceName>\|Total Write Latency | Cassandra | False |
| Table<InstanceName>\|Write Latency | Cassandra | False |
| ThreadPools<InstanceName>\|Active Tasks | Cassandra | False |
| ThreadPools<InstanceName>\|Currently Blocked Tasks | Cassandra | False |
| ThreadPools<InstanceName>\|Pending Tasks | Cassandra | False |
| Application Availability | Cassandra | False |

### MongoDB Metrics

Metrics are collected for the MongoDB application service.

**Table 1503: MongoDB Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| UTILIZATION\|Active Reads | MongoDB | True |
| UTILIZATION\|Active Writes | MongoDB | True |
| UTILIZATION\|Connections Available | MongoDB | False |
| UTILIZATION\|Connections Total Created | MongoDB | False |
| UTILIZATION\|Current Connections | MongoDB | True |
| UTILIZATION\|Cursor Timed Out | MongoDB | True |
| UTILIZATION\|Deletes Per Sec | MongoDB | False |
| UTILIZATION\|Document Inserted | MongoDB | False |
| UTILIZATION\|Document Deleted | MongoDB | False |
| UTILIZATION\|Flushes Per Sec | MongoDB | False |
| UTILIZATION\|Inserts Per Sec | MongoDB | False |
| UTILIZATION\|Net Input Bytes | MongoDB | False |
| UTILIZATION\|Open Connections | MongoDB | True |
| UTILIZATION\|Page Faults Per Second | MongoDB | False |
| UTILIZATION\|Net Output Bytes | MongoDB | False |

| Metric Name | Category | KPI |
|---|---|---|
| UTILIZATION\|Queries Per Sec | MongoDB | False |
| UTILIZATION\|Queued Reads | MongoDB | True |
| UTILIZATION\|Queued Writes | MongoDB | True |
| UTILIZATION\|Total Available | MongoDB | False |
| UTILIZATION\|Total Deletes Per Sec | MongoDB | False |
| UTILIZATION\|Total Passes Per Sec | MongoDB | False |
| UTILIZATION\|Total Refreshing | MongoDB | False |
| UTILIZATION\|Updates Per Sec | MongoDB | False |
| UTILIZATION\|Volume Size MB | MongoDB | False |
| Application Availability | MongoDB | False |
| UTILIZATION\|Collection Stats | MongoDB DataBases | False |
| UTILIZATION\|Data Index Stats | MongoDB DataBases | True |
| UTILIZATION\|Data Indexes | MongoDB DataBases | False |
| UTILIZATION\|Data Size Stats | MongoDB DataBases | True |
| UTILIZATION\|Average Object Size stats | MongoDB DataBases | False |
| UTILIZATION\|Num Extents Stats | MongoDB DataBases | False |

### MS Exchange Metrics

Metrics are collected for the MS Exchange application service.

**Table 1504: MS Exchange Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| Active Manager Server\|Active Manager Role | MS Exchange | False |
| Active Manager Server\|Database State Info Writes per second | MS Exchange | False |
| Active Manager Server\|GetServerForDatabase Server-Side Calls | MS Exchange | False |
| Active Manager Server\|Server-Side Calls per second | MS Exchange | True |
| Active Manager Server\|Total Number of Databases | MS Exchange | True |
| ActiveSync\|Average Request Time | MS Exchange | True |
| ActiveSync\|Current Requests | MS Exchange | False |
| ActiveSync\|Mailbox Search Total | MS Exchange | False |
| ActiveSync\|Ping Commands Pending | MS Exchange | False |
| ActiveSync\|Requests per second | MS Exchange | True |
| ActiveSync\|Sync Commands per second | MS Exchange | True |
| ASP.NET\|Application Restarts | MS Exchange | False |
| ASP.NET\|Request Wait Time | MS Exchange | True |
| ASP.NET\|Worker Process Restarts | MS Exchange | False |
| Autodiscover Service\|Requests per second | MS Exchange | True |
| Availability Service\|Average Time to Process a Free Busy Request | MS Exchange | True |

| Metric Name | Category | KPI |
|---|---|---|
| Outlook Web Access\|Average Search Time | MS Exchange | True |
| Outlook Web Access\|Requests per second | MS Exchange | False |
| Outlook Web Access\|Current Unique Users | MS Exchange | False |
| Application Availability | MS Exchange | False |
| Performance\|Database Cache Hit (%) | MS Exchange Database | False |
| Performance\|Database Page Fault Stalls per second | MS Exchange Database | True |
| Performance\|I/O Database Reads Average Latency | MS Exchange Database | True |
| Performance\|I/O Database Writes Average Latency | MS Exchange Database | True |
| Performance\|I/O Log Reads Average Latency | MS Exchange Database | False |
| Performance\|I/O Log Writes Average Latency | MS Exchange Database | False |
| Performance\|Log Record Stalls per second | MS Exchange Database | False |
| Performance\|Log Threads Waiting | MS Exchange Database | False |
| Performance\|I/O Database Reads Average Latency | MS Exchange Database Instance | False |
| Performance\|I/O Database Writes Average Latency | MS Exchange Database Instance | False |
| Performance\|Log Record Stalls per second | MS Exchange Database Instance | False |
| Performance\|Log Threads Waiting | MS Exchange Database Instance | False |
| Performance\|LDAP Read Time | MS Exchange Domain Controller | False |
| Performance\|LDAP Search Time | MS Exchange Domain Controller | False |
| Performance\|LDAP Searches Timed Out per minute | MS Exchange Domain Controller | False |
| Performance\|Long Running LDAP Operations per minute | MS Exchange Domain Controller | False |
| Performance\|Connection Attempts per second | MS Exchange Web Server | True |
| Performance\|Current Connections | MS Exchange Web Server | False |
| Performance\|Other Request Methods per second | MS Exchange Web Server | False |
| Process\|Handle Count | MS Exchange Windows Service | False |
| Process\|Memory Allocated | MS Exchange Windows Service | False |
| Process\|Processor Time (%) | MS Exchange Windows Service | True |
| Process\|Thread Count | MS Exchange Windows Service | False |
| Process\|Virtual Memory Used | MS Exchange Windows Service | False |
| Process\|Working Set | MS Exchange Windows Service | False |

### Microsoft SQL Server Metrics

Metrics are collected for the Microsoft SQL Server application service.

**Table 1505: MS SQL Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| CPU<InstanceName>\|CPU Usage (%) | Microsoft SQL Server | False |
| Database IO\|Rows Reads Bytes/Sec | Microsoft SQL Server | False |
| Database IO\|Rows Reads/Sec | Microsoft SQL Server | False |
| Database IO\|Rows Writes Bytes/Sec | Microsoft SQL Server | False |
| Database IO\|Rows Writes/Sec | Microsoft SQL Server | False |

| Metric Name | Category | KPI |
|---|---|---|
| Performance\|Access Methods\|Full Scans per second | Microsoft SQL Server | False |
| Performance\|Access Methods\|Index Searches | Microsoft SQL Server | False |
| Performance\|Access Methods\|Page Splits per second | Microsoft SQL Server | False |
| Performance\|Broker Activation\|Stored Procedures Invoked per second | Microsoft SQL Server | False |
| Performance\|Buffer Manager\|Buffer cache hit ratio (%) | Microsoft SQL Server | True |
| Performance\|Buffer Manager\|Checkpoint Pages/sec | Microsoft SQL Server | True |
| Performance\|Buffer Manager\|Lazy writes per second | Microsoft SQL Server | True |
| Performance\|Buffer Manager\|Page life expectancy | Microsoft SQL Server | True |
| Performance\|Buffer Manager\|Page lookups per second | Microsoft SQL Server | False |
| Performance\|Buffer Manager\|Page reads per second | Microsoft SQL Server | False |
| Performance\|Buffer Manager\|Page writes per second | Microsoft SQL Server | False |
| Performance\|Databases\|Active Transactions | Microsoft SQL Server | True |
| Performance\|Databases\|Data File(s) Size | Microsoft SQL Server | True |
| Performance\|Databases\|Log Bytes Flushed/Sec | Microsoft SQL Server | False |
| Performance\|Databases\|Log File(s) Size | Microsoft SQL Server | False |
| Performance\|Databases\|Log File(s) Used Size | Microsoft SQL Server | False |
| Performance\|Databases\|Log Flush Wait Time | Microsoft SQL Server | False |
| Performance\|Databases\|Log Flushes per second | Microsoft SQL Server | False |
| Performance\|Databases\|Transactions per second | Microsoft SQL Server | False |
| Performance\|Databases\|Write Transactions per second | Microsoft SQL Server | False |
| Performance\|Databases\|XTP Memory Used | Microsoft SQL Server | False |
| Performance\|General Statistics\|Active temp Tables | Microsoft SQL Server | False |
| Performance\|General Statistics\|Logins per second | Microsoft SQL Server | False |
| Performance\|General Statistics\|Logouts per second | Microsoft SQL Server | False |
| Performance\|General Statistics\|Processes Blocked | Microsoft SQL Server | False |
| Performance\|General Statistics\|Temp Tables Creation Rate | Microsoft SQL Server | False |
| Performance\|General Statistics\|User Connections | Microsoft SQL Server | False |
| Performance\|Locks\|Average Wait Time | Microsoft SQL Server | False |
| Performance\|Locks\|Lock Requests per second | Microsoft SQL Server | False |
| Performance\|Locks\|Lock Wait Time | Microsoft SQL Server | True |
| Performance\|Locks\|Lock Waits per second | Microsoft SQL Server | True |
| Performance\|Locks\|Number of Deadlocks per second | Microsoft SQL Server | True |
| Performance\|Memory Manager\|Connection Memory | Microsoft SQL Server | False |
| Performance\|Memory Manager\|Lock Memory | Microsoft SQL Server | False |
| Performance\|Memory Manager\|Log Pool Memory | Microsoft SQL Server | False |

| Metric Name | Category | KPI |
|---|---|---|
| Performance\|Memory Manager\|Memory Grants Pending | Microsoft SQL Server | True |
| Performance\|Memory Manager\|SQL Cache Memory | Microsoft SQL Server | False |
| Performance\|Memory Manager\|Target Server Memory | Microsoft SQL Server | True |
| Performance\|Memory Manager\|Total Server Memory | Microsoft SQL Server | True |
| Performance\|Resource Pool Stats\|internal\|Active memory grant amount | Microsoft SQL Server | False |
| Performance\|Resource Pool Stats\|internal\|CPU Usage Percentage (%) | Microsoft SQL Server | False |
| Performance\|Resource Pool Stats\|internal\|Disk Read Bytes per second | Microsoft SQL Server | False |
| Performance\|Resource Pool Stats\|internal\|Disk Read IO | Microsoft SQL Server | False |
| Wait Stats:<InstanceName>\|Wait Time (ms) | Microsoft SQL Server | False |
| Wait Stats<InstanceName>\|Number of Waiting tasks (ms) | Microsoft SQL Server | False |
| Performance\|Resource Pool Stats\|internal\|Disk Read IO Throttled Per Second | Microsoft SQL Server | False |
| Performance\|Resource Pool Stats\|internal\|Disk Write Bytes per second (Bps) | Microsoft SQL Server | False |
| Performance\|Resource Pool Stats\|internal\|Disk Write IO Throttled per second | Microsoft SQL Server | False |
| Performance\|Resource Pool Stats\|internal\|Used Memory | Microsoft SQL Server | False |
| Performance\|SQL Statistics \| Batch Requests Per Second | Microsoft SQL Server | False |
| Performance\|SQL Statistics \| SQL Compilations per second | Microsoft SQL Server | False |
| Performance\|SQL Statistics \| SQL Re-Compilations per second | Microsoft SQL Server | False |
| Performance\|Transactions \| Free space in tempdb (KB) | Microsoft SQL Server | False |
| Performance\|Transactions \| Transactions | Microsoft SQL Server | False |
| Performance\|Transactions \| Version Store Size (KB) | Microsoft SQL Server | False |
| Performance\|User Settable Counter \| User Counter 0 to 10 | Microsoft SQL Server | False |
| Performance\|Workload Group Stats\|internal\|Active Requests | Microsoft SQL Server | False |
| Performance\|Workload Group Stats\|internal\|Blocked Tasks | Microsoft SQL Server | False |
| Performance\|Workload Group Stats\|internal\|CpU Usage (%) | Microsoft SQL Server | False |
| Performance\|Workload Group Stats\|internal\|Queued Requests | Microsoft SQL Server | False |

| Metric Name | Category | KPI |
|---|---|---|
| Performance\|Workload Group Stats\|internal\|Request Completed/sec | Microsoft SQL Server | False |
| Application Availability | Microsoft SQL Server | False |

There are no metrics collected for Microsoft SQL Server Database.

### MySQL Metrics

Metrics are collected for the MySQL application service.

**Table 1506: MySQL Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| Aborted connection count | MySQL | True |
| Connection count | MySQL | True |
| Event wait average time | MySQL | False |
| Event wait count | MySQL | False |
| Binary Files\|Binary Files Count | MySQL | False |
| Binary Files\|Binary Size Bytes | MySQL | False |
| Global Status\|Aborted Clients | MySQL | False |
| Global Status\|Binlog Cache Disk Use | MySQL | False |
| Global Status\|Bytes Received | MySQL | False |
| Global Status\|Bytes Sent | MySQL | False |
| Global Status\|Connection Errors Accept | MySQL | False |
| Global Status\|Connection Errors Internal | MySQL | False |
| Global Status\|Connection Errors Max Connections | MySQL | False |
| Global Status\|Queries | MySQL | False |
| Global Status\|Threads Cached | MySQL | False |
| Global Status\|Threads Connected | MySQL | False |
| Global Status\|Threads Running | MySQL | False |
| Global Status\|Uptime | MySQL | False |
| Global Variables\|Delayed Insert Limit | MySQL | False |
| Global Variables\|Delayed Insert Timeout | MySQL | False |
| Global Variables\|Delayed Queue Size | MySQL | False |
| Global Variables\|Max Connect Errors | MySQL | False |
| Global Variables\|Max Connections | MySQL | False |
| Global Variables\|Max Delayed Threads | MySQL | False |
| Global Variables\|Max Error Count | MySQL | False |
| InnoDB\|All deadlock count | MySQL | False |
| InnoDB\|Buffer Pool Bytes Data | MySQL | False |
| InnoDB\|Buffer Pool Bytes Data | MySQL | False |
| InnoDB\|Buffer Pool Bytes Dirty | MySQL | False |
| InnoDB\|Buffer Pool Dump Status | MySQL | False |

| Metric Name | Category | KPI |
|---|---|---|
| InnoDB\|Buffer Pool Load Status | MySQL | False |
| InnoDB\|Buffer Pool Pages Data | MySQL | False |
| InnoDB\|Buffer Pool Pages Dirty | MySQL | False |
| InnoDB\|Buffer Pool Pages Flushed | MySQL | False |
| InnoDB\|Buffer pool size | MySQL | True |
| InnoDB\|Checksums | MySQL | False |
| InnoDB\|Open file count | MySQL | False |
| InnoDB\|Row lock average time | MySQL | False |
| InnoDB\|Row lock current waits | MySQL | False |
| InnoDB\|Row lock maximum time | MySQL | False |
| InnoDB\|Row lock time | MySQL | False |
| InnoDB\|Row lock waits | MySQL | True |
| InnoDB\|Table lock count | MySQL | False |
| Performance Table IO Waits\|IO Waits Total Delete | MySQL | False |
| Performance Table IO Waits\|IO Waits Total Fetch | MySQL | False |
| Performance Table IO Waits\|IO Waits Total Insert | MySQL | False |
| Performance Table IO Waits\|IO Waits Total Update | MySQL | False |
| Process List\|Connections | MySQL | False |
| Application Availability | MySQL | False |
| IO waits average time | MySQL Database | False |
| IO waits count | MySQL Database | True |
| Read high priority average time | MySQL Database | False |
| Read high priority count | MySQL Database | False |
| Write concurrent insert average time | MySQL Database | False |
| Write concurrent insert count | MySQL Database | False |

### NGINX Metrics

Metrics are collected for the NGINX application service.

**Table 1507: NGINX Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| HTTP Status Info\|Accepts | Nginx | True |
| HTTP Status Info\|Active connections | Nginx | False |
| HTTP Status Info\|Handled | Nginx | True |
| HTTP Status Info\|Reading | Nginx | False |
| HTTP Status Info\|Requests | Nginx | False |
| HTTP Status Info\|Waiting | Nginx | True |
| HTTP Status Info\|Writing | Nginx | False |
| Application Availability | Nginx | False |

### Network Time Protocol Metrics

Metrics are collected for the Network Time Protocol application service.

#### Table 1508: Network Time Protocol Metrics

| Metric Name | Category | KPI |
|---|---|---|
| NTPD \|delay | Network Time Protocol | True |
| NTPD \| jitter | Network Time Protocol | True |
| NTPD \| offset | Network Time Protocol | True |
| NTPD \| poll | Network Time Protocol | False |
| NTPD \| reach | Network Time Protocol | True |
| NTPD \| when | Network Time Protocol | False |
| Application Availability | Network Time Protocol | False |

### Oracle WebLogic Server Metrics

Metrics are collected for the Oracle WebLogic Server application service.

#### Table 1509: Oracle WebLogic Server Metrics

| Metric Name | Category | KPI |
|---|---|---|
| UTILIZATION\|Process Cpu Load | Oracle WebLogic Server | True |
| UTILIZATION\|System Cpu Load | Oracle WebLogic Server | False |
| UTILIZATION\|System Load Average | Oracle WebLogic Server | False |
| Application Availability | Oracle WebLogic Server | False |
| UTILIZATION\|Collection Time | Weblogic Garbage Collector | True |
| UTILIZATION\|Connections HighCount | Weblogic JMS Runtime | True |
| UTILIZATION\|JMS Servers TotalCount | Weblogic JMS Runtime | False |
| UTILIZATION\|Active Total Count Used | Weblogic JTA Runtime | False |
| UTILIZATION\|Active Transactions TotalCount | Weblogic JTA Runtime | False |
| UTILIZATION\|Transaction Abandoned TotalCount | Weblogic JTA Runtime | True |
| UTILIZATION\|Transaction RolledBack App TotalCount | Weblogic JTA Runtime | True |
| UTILIZATION\|Heap Memory Usage | Weblogic JVM Memory | True |
| UTILIZATION\|Non Heap Memory Usage | Weblogic JVM Memory | False |
| UTILIZATION\|Peak Usage | Weblogic JVM Memory Pool | True |
| UTILIZATION\|Usage | Weblogic JVM Memory Pool | False |
| UTILIZATION\|UpTime | Weblogic JVM Runtime | False |

### Pivotal TC Server Metrics

Metrics are collected for the Pivotal TC Server application service.

**Table 1510: Pivotal TC Server Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| Buffer Pool<InstanceName>\|Count | Pivotal TC Server | False |
| Buffer Pool<InstanceName>\|Memory Used | Pivotal TC Server | False |
| Buffer Pool<InstanceName>\|Total Capacity | Pivotal TC Server | False |
| Class Loading\|Loaded Class Count | Pivotal TC Server | False |
| Class Loading\|Total Loaded Class Count | Pivotal TC Server | False |
| Class Loading\|Unloaded Class Count | Pivotal TC Server | False |
| File Descriptor Usage\|Max File Descriptor Count | Pivotal TC Server | False |
| File Descriptor Usage\|Open File Descriptor Count | Pivotal TC Server | False |
| Garbage Collection:<InstanceName>\|Total Collection Count | Pivotal TC Server | False |
| Garbage Collection:<InstanceName>\|Total Collection Time | Pivotal TC Server | False |
| Process CPU Usage (%) | Pivotal TC Server | True |
| JVM Memory\|Heap Memory Usage\|Committed Memory | Pivotal TC Server | True |
| JVM Memory\|Heap Memory Usage\|Initial Memory | Pivotal TC Server | False |
| JVM Memory\|Heap Memory Usage\|Maximum Memory | Pivotal TC Server | False |
| JVM Memory\|Heap Memory Usage\|Used Memory | Pivotal TC Server | True |
| JVM Memory\|Non Heap Memory Usage\|Committed Memory | Pivotal TC Server | True |
| JVM Memory\|Non Heap Memory Usage\|Initial Memory | Pivotal TC Server | False |
| JVM Memory\|Non Heap Memory Usage\|Maximum Memory | Pivotal TC Server | False |
| JVM Memory\|Non Heap Memory Usage\|Used Memory | Pivotal TC Server | True |
| JVM Memory\|Number of Object Pending Finalization Count | Pivotal TC Server | True |
| JVM Memory\|Pool:<InstanceName>\|Peak Usage\| Committed Memory | Pivotal TC Server | False |
| JVM Memory\|Pool:<InstanceName>\|Peak Usage\| Initial Memory | Pivotal TC Server | False |
| JVM Memory\|Pool:<InstanceName>\|Peak Usage\| Maximum Memory | Pivotal TC Server | False |
| JVM Memory\|Pool:<InstanceName>\|Peak Usage\| Used Memory | Pivotal TC Server | False |
| JVM Memory\|Pool:<InstanceName>\|Usage\| Committed Memory | Pivotal TC Server | False |
| JVM Memory\|Pool:<InstanceName>\|Usage\|Initial Memory | Pivotal TC Server | False |
| JVM Memory\|Pool:<InstanceName>\|Usage\| Maximum Memory | Pivotal TC Server | False |

| Metric Name | Category | KPI |
|---|---|---|
| JVM Memory\|Pool:<InstanceName>\|Usage\|Used Memory | Pivotal TC Server | False |
| Process CPU Usage (%) | Pivotal TC Server | True |
| System CPU Usage (%) | Pivotal TC Server | True |
| Uptime | Pivotal TC Server | True |
| Threading\|Thread Count | Pivotal TC Server | False |
| System Load Average | Pivotal TC Server | False |
| Application Availability | Pivotal TC Server | False |
| Current Thread Count | Pivotal TC Server Thread Pool | False |
| Current Threads Busy | Pivotal TC Server Thread Pool | True |
| Total Request Bytes Received | Pivotal TC Server Thread Pool | False |
| Total Request Bytes Sent | Pivotal TC Server Thread Pool | False |
| Total Request Count | Pivotal TC Server Thread Pool | True |
| Total Request Error Count | Pivotal TC Server Thread Pool | True |
| Total Request Processing Time | Pivotal TC Server Thread Pool | True |
| JSP Count | Pivotal TC Server Web Module | False |
| JSP Reload Count | Pivotal TC Server Web Module | False |
| JSP Unload Count | Pivotal TC Server Web Module | False |

**PostgreSQL**
Metrics are collected for the PostgreSQL application service.

**Table 1511: PostgreSQL**

| Metric Name | Category | KPI |
|---|---|---|
| Buffers\|Buffers Allocated | PostgreSQL | False |
| Buffers\|Buffers Written by Backend | PostgreSQL | True |
| Buffers\|Buffers Written by Background Writer | PostgreSQL | True |
| Buffers\|Buffers Written During Checkpoints | PostgreSQL | True |
| Buffers\|fsync Call Executed by Backend | PostgreSQL | False |
| Checkpoints\|Checkpoints sync time | PostgreSQL | False |
| Checkpoints\|Checkpoints write time | PostgreSQL | False |
| Checkpoints\|Requested checkpoints performed count | PostgreSQL | False |
| Checkpoints\|Scheduled checkpoints performed count | PostgreSQL | False |
| Clean scan stopped count | PostgreSQL | False |
| Application Availability | PostgreSQL | False |
| Disk Blocks\|Blocks Cache Hits | PostgreSQL Database | False |
| Disk Blocks\|Blocks Read | PostgreSQL Database | False |
| Disk Blocks\|Blocks Read Time | PostgreSQL Database | False |
| Disk Blocks\|Blocks Write Time | PostgreSQL Database | False |
| Statistics\|Backends Connected | PostgreSQL Database | False |

| Metric Name | Category | KPI |
|---|---|---|
| Statistics\|Data Written by Queries | PostgreSQL Database | True |
| Statistics\|Deadlocks Detected | PostgreSQL Database | True |
| Statistics\|Queries Cancelled | PostgreSQL Database | True |
| Statistics\|Temp Files Created by Queries | PostgreSQL Database | False |
| Transactions\|Transactions Committed | PostgreSQL Database | True |
| Transactions\|Transactions Rolled Back | PostgreSQL Database | True |
| Tuples\|Tuples Deleted | PostgreSQL Database | True |
| Tuples\|Tuples Fetched | PostgreSQL Database | True |
| Tuples\|Tuples Inserted | PostgreSQL Database | True |
| Tuples\|Tuples Returned | PostgreSQL Database | True |
| Tuples\|Tuples Updated | PostgreSQL Database | True |

### RabbitMQ Metrics

Metrics are collected for the RabbitMQ application service.

**Table 1512: RabbitMQ Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| CPU\|Limit | RabbitMQ | False |
| CPU\|Used | RabbitMQ | True |
| Disk\|Free | RabbitMQ | False |
| Disk\|Free limit | RabbitMQ | False |
| FileDescriptor\|Total | RabbitMQ | False |
| FileDescriptor\|Used | RabbitMQ | False |
| Memory\|Limit | RabbitMQ | False |
| Memory\|Used | RabbitMQ | True |
| Messages\|Acked | RabbitMQ | False |
| Messages\|Delivered | RabbitMQ | False |
| Messages\|Delivered get | RabbitMQ | False |
| Messages\|Published | RabbitMQ | False |
| Messages\|Ready | RabbitMQ | False |
| Messages\|Unacked | RabbitMQ | False |
| Socket\|Limit | RabbitMQ | False |
| Socket\|Used | RabbitMQ | True |
| UTILIZATION\|Channels | RabbitMQ | True |
| UTILIZATION\|Connections | RabbitMQ | True |
| UTILIZATION\|Consumers | RabbitMQ | True |
| UTILIZATION\|Exchanges | RabbitMQ | True |
| UTILIZATION\|Messages | RabbitMQ | True |
| UTILIZATION\|Queues | RabbitMQ | True |
| Application Availability | RabbitMQ | False |

| Metric Name | Category | KPI |
|---|---|---|
| Messages\|Publish in | RabbitMQ Exchange | False |
| Messages\|Publish out | RabbitMQ Exchange | False |
| Consumer Utilisation | RabbitMQ Queue | False |
| Consumers | RabbitMQ Queue | False |
| Memory | RabbitMQ Queue | False |
| Messages\|Ack | RabbitMQ Queue | False |
| Messages\|Ack rate | RabbitMQ Queue | False |
| Messages\|Deliver | RabbitMQ Queue | False |
| Messages\|Deliver get | RabbitMQ Queue | False |
| Messages\|Persist | RabbitMQ Queue | False |
| Messages\|Publish | RabbitMQ Queue | False |
| Messages\|Publish rate | RabbitMQ Queue | False |
| Messages\|Ram | RabbitMQ Queue | False |
| Messages\|Ready | RabbitMQ Queue | False |
| Messages\|Redeliver | RabbitMQ Queue | False |
| Messages\|Redeliver rate | RabbitMQ Queue | False |
| Messages\|Space | RabbitMQ Queue | False |
| Messages\|Unack | RabbitMQ Queue | False |
| Messages\|Unacked | RabbitMQ Queue | False |
| Messages | RabbitMQ Queue | False |

There are no metrics collected for RabbitMQ Virtual Host.

**Riak KV Metrics**
Metrics are collected for the Riak KV application service.

**Table 1513: Riak KV Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| UTILIZATION\|CPU Average | Riak KV | False |
| UTILIZATION\|Memory Processes | Riak KV | False |
| UTILIZATION\|Memory Total | Riak KV | False |
| UTILIZATION\|Node GETs | Riak KV | True |
| UTILIZATION\|Node GETs Total | Riak KV | False |
| UTILIZATION\|Node PUTs | Riak KV | True |
| UTILIZATION\|Node PUTs Total | Riak KV | False |
| UTILIZATION\|PBC Active | Riak KV | True |
| UTILIZATION\|PBC Connects | Riak KV | True |
| UTILIZATION\|Read Repairs | Riak KV | True |
| UTILIZATION\|vNODE Index Reads | Riak KV | True |
| UTILIZATION\|vNODE Index Writes | Riak KV | True |
| Application Availability | Riak KV | False |

### SharePoint Metrics

Metrics are collected for the SharePoint Server application service.

**Table 1514: SharePoint Server Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| Sharepoint Foundation\|Active Threads | SharePoint Server | True |
| Sharepoint Foundation\|Current Page Requests | SharePoint Server | False |
| Sharepoint Foundation\|Executing SQL Queries | SharePoint Server | False |
| Sharepoint Foundation\|Executing Time/Page Request | SharePoint Server | True |
| Sharepoint Foundation\|Incoming Page Requests Rate | SharePoint Server | False |
| Sharepoint Foundation\|Object Cache Hit Count | SharePoint Server | False |
| Sharepoint Foundation\|Reject Page Requests Rate | SharePoint Server | False |
| Sharepoint Foundation\|Responded Page Requests Rate | SharePoint Server | True |
| SQL query executing time | SharePoint Server | False |
| Application Availability | SharePoint Server | False |
| Network\|Received Data Rate | SharePoint Web Server | True |
| Network\|Sent Data Rate | SharePoint Web Server | True |
| Process\|Processor Time (%) | SharePoint Windows Service | False |
| Process\|Threads | SharePoint Windows Service | False |

### WebSphere Metrics

Metrics are collected for the WebSphere application service.

**Table 1515: WebSphere Metrics**

| Metric Name | Category | KPI |
|---|---|---|
| Thread Pool\|Active Count\| Current | Thread Pool | False |
| Thread Pool\|Active Count\|High | Thread Pool | False |
| Thread Pool\|Active Count\|Low | Thread Pool | False |
| Thread Pool\|Active Count\|Lower | Thread Pool | False |
| Thread Pool\|Active Count\|Upper | Thread Pool | False |
| JDBC\|Close Count | JDBC | False |
| JDBC\|Create Count | JDBC | False |
| JDBC\|JDBC Pool Size\|Average | JDBC | False |
| JDBC\|JDBC Pool Size\|Current | JDBC | False |
| JDBC\|JDBC Pool Size\|Lower | JDBC | False |
| JDBC\|JDBC Pool Size\|Upper | JDBC | False |
| Garbage Collection<InstanceName>\|Total Collection Count | WebSphere | False |

| Metric Name | Category | KPI |
|---|---|---|
| Garbage Collection<InstanceName>\|Total Collection Time | WebSphere | False |
| JVM Memory\|Heap Memory Usage\|Committed Memory | WebSphere | False |
| JVM Memory\|Heap Memory Usage\|Initial Memory | WebSphere | False |
| JVM Memory\|Heap Memory Usage\|Maximum Memory | WebSphere | False |
| JVM Memory\|Heap Memory Usage\|Used Memory | WebSphere | False |
| JVM Memory\|Non Heap Memory Usage\|Committed Memory | WebSphere | False |
| JVM Memory\|Non Heap Memory Usage\|Initial Memory | WebSphere | False |
| JVM Memory\|Non Heap Memory Usage\|Maximum Memory | WebSphere | False |
| JVM Memory\|Non Heap Memory Usage\|Used Memory | WebSphere | False |
| JVM Memory\|Number of Object Pending Finalization Count | WebSphere | False |
| JVM Memory\| Pool<InstanceName>\|Peak Usage\|Committed Memory | WebSphere | False |
| JVM Memory\| Pool<InstanceName>\|Peak Usage\|Initial Memory | WebSphere | False |
| JVM Memory\| Pool<InstanceName>\|Peak Usage\|Maximum Memory | WebSphere | False |
| JVM Memory\| Pool<InstanceName>\|Peak Usage\|Used Memory | WebSphere | False |
| JVM Memory\| Pool<InstanceName>\|Usage\| Committed Memory | WebSphere | False |
| JVM Memory\| Pool<InstanceName>\|Usage\| Initial Memory | WebSphere | False |
| JVM Memory\| Pool<InstanceName>\|Usage\| Maximum Memory | WebSphere | False |
| JVM Memory\| Pool<InstanceName>\|Usage\| Used Memory | WebSphere | False |
| Process Cpu Load | WebSphere | False |

| Metric Name | Category | KPI |
|---|---|---|
| System Cpu Load | WebSphere | False |
| System Load Average | WebSphere | False |
| Application Availability | WebSphere | False |

## Windows Service Metrics

Metrics are collected for Windows services.

### Table 1516: Windows Service Metrics

| Metric Name | Category | KPI |
|---|---|---|
| AVAILABILITY\|Resource Availability | Services | False |
| UTILIZATION\|Memory Usage(%) | Services | False |
| UTILIZATION\|CPU Usage(%) | Services | False |

## Linux Process Metrics

Metrics are collected for Linux services.

### Table 1517: Linux Process Metrics

| Metric Name | Category | KPI |
|---|---|---|
| AVAILABILITY\|Resource Availability | Processes | False |
| UTILIZATION\|Memory Usage (%) | Processes | False |
| UTILIZATION\|CPU Usage (%) | Processes | False |
| UTILIZATION\|Number of Processes | Processes | False |

## Remote Check Metrics

Metrics are collected for object types such as HTTP, ICMP, TCP, and UDP.

**HTTP Metrics**
VCF Operations discovers metrics for HTTP remote checks.

**HTTP Metrics**

### Table 1518: HTTP Metrics

| Metric Name | KPI |
|---|---|
| Availability | False |
| Content Length | False |
| Response Code | False |
| Response Time | True |
| Result Code | False |

### ICMP Metrics
VCF Operations discovers metrics for the ICMP object type.

**Table 1519: ICMP Metrics**

| Metric Name | KPI |
|---|---|
| Availability | False |
| Average Response Time | True |
| Packet Loss (%) | False |
| Packets Received | False |
| Packets Transmitted | False |
| Result Code | False |

### TCP Metrics
VCF Operations discovers metrics for the TCP object type.

**Table 1520: TCP Metrics**

| Metric Name | KPI |
|---|---|
| Availability | False |
| Response Time | True |
| Result Code | False |

### UDP Metrics
VCF Operations discovers metrics for the UDP object type.

**Table 1521: UDP Metrics**

| Metric Name | KPI |
|---|---|
| Availability | False |
| Response Time | True |
| Result Code | False |

## VeloCloud Application Service Metrics

Metrics are collected for application services supported by VeloCloud.

### VeloCloud Gateway Metrics
Metrics are collected for the VeloCloud Gateway.

**Table 1522: VeloCloud Gateway Metrics**

| Component | Metrics |
|---|---|
| DPDK | DPDK:mbuf \| pool free |
| NAT | NAT \| Active Flows (%) |
| | NAT \| Active Flows |

| Component | Metrics |
|---|---|
| | NAT \| Active Routes |
| | NAT \| Active Routes Used (%) |
| | NAT \| Connected Peers |
| | NAT \| NAT Entries |
| NTP Server | NTP Server:ntp.ubuntu.com \| offset value |
| Summary | Summary \| Active Tunnels Count (%) |
| | Summary \| Average Packets Dropped |
| | Summary \| Average wMarkDrop |
| | Summary \| BGP Enabled VRFs |
| | Summary \| BGP Neighbors |
| | Summary \| CLR Count |
| | Summary \| Connected Edges |
| | Summary \| NAT |
| | Summary \| SSH Failed Login |
| | Summary \| Unstable Path Percentage |
| | Summary \| VMCP CTRL Drop Count |
| | Summary \| VMCP TX Drop Count |
| VC Queue | VC Queue \| ipv4_bh packet drop |
| VCMP Tunnel | VCMP Tunnel \| ctrl_0 packet drop |
| | VCMP Tunnel \| ctrl_1 packet drop |
| | VCMP Tunnel \| data_0 packet drop |
| | VCMP Tunnel \| data_1 packet drop |
| | VCMP Tunnel \| init packet drop |

### VeloCloud Orchestrator Metrics

Metrics are collected for the VeloCloud Orchestrator.

#### Table 1523: VeloCloud Orchestrator Metrics

| Component | Metrics |
|---|---|
| General | General \| Free Memory (%) |
| | General \| Status |

### Metrics - Ngnix

Metrics are collected for the VeloCloud Ngnix.

#### Table 1524: Ngnix Metrics

| Component | Metrics |
|---|---|
| HTTP Status Info | HTTP Status Info \| Accepts |
| | HTTP Status Info \| Active Connections |
| | HTTP Status Info \| Handled |

| Component | Metrics |
|---|---|
| | HTTP Status Info \| Reading |
| | HTTP Status Info \| Requests |
| | HTTP Status Info \| Waiting |
| | HTTP Status Info \| Writing |

### Metrics - Redis

Metrics are collected for the VeloCloud Redis.

#### Table 1525: Redis Metrics

| Component | Metrics |
|---|---|
| Publish Subscribe. | Publish Subscribe \| Channels |
| Total | Total \| Commands Processed |
| | Total \| Connections Received |
| Used | Used \| CPU |
| | Used \| Memory |
| | Used \| Peak Memory |

### Metrics - ClickHouse

Metrics are collected for the VeloCloud Clickhouse.

#### Table 1526: Clickhouse Metrics

| Component | Metrics |
|---|---|
| Background | Background \| Pool Task |
| Buffer | Buffers \| Allocation (Bytes) |
| | Buffers \| Compressed Read Buffer (Bytes) |
| | Buffers \| Compressed Read Buffer Blocks |
| | Buffers \| IO Allocation (Bytes) |
| | Buffers \| Storage Buffer (Bytes) |
| | Buffers \| Storage Buffer Rows |
| Events | Events \| Context Lock |
| | Events \| Disk Write Elapsed (µs) |
| | Events \| File Open |
| | Events \| Function Execute |
| | Events \| Hard Page Faults |
| | Events \| Lock Readers Wait (µs) |
| | Events \| OS IO wait (ms) |
| | Events \| OS Write (Bytes) |
| | Events \| Query |
| | Events \| Readers Wait (ms) |
| | Events \| Real Time |

| Component | Metrics |
|---|---|
| | Events \| Soft Page Faults (µs) |
| | Events \| System Time (µs) |
| | Events \| User Time (µs) |
| Global Thread | Global \| Global Thread |
| | Global \| Global Thread Active |
| Local Thread | Local \| Local Thread |
| | Local \| Local Thread Active |
| Replicas | Replicas \| Max Absolute Delay |
| | Replicas \| Max Insert In Queue |
| | Replicas \| Max Merge In Queue |
| | Replicas \| Max Queue Size |
| | Replicas \| Max Relative Delay |
| | Replicas \| Total Insert In Queue |
| | Replicas \| Total Merge Queues |
| | Replicas \| Total Queue Size |
| Summary | Summary \| Background Pool Task |
| | Summary \| Dict Cache Requests |
| | Summary \| File Open Writes |
| | Summary \| Merge |
| | Summary \| Number of Databases |
| | Summary \| Number of Distributed Send |
| | Summary \| Number of Tables |
| | Summary \| Read |
| | Summary \| Replicated Checks |
| | Summary \| Storage Buffer Rows |
| | Summary \| Uncompressed Cache Cells |
| | Summary \| Uptime |
| | Summary \| Write |
| | Summary \| Zookeeper Session |
| | Summary \| Zookeeper Watch |
| Write Buffer | Write Buffer \| File Descriptor Write |
| Replicated | Replicated Fetch |
| Memory | Memory Tracking |
| Query | Query Thread |

## Service Discovery Metrics

Service discovery discovers metrics for several objects. It also discovers CPU and memory metrics for discovered services.

### Virtual Machine Metrics

Service Discovery discovers metrics for virtual machines.

**Table 1527: Virtual Machine Metrics**

| Metric Name | Description |
|---|---|
| Guest OS Services\|Total Number of Services | Number of out-of-the-box and user-defined services discovered in the VM. |
| Guest OS Services\|Number of User Defined Services | Number of user-defined services discovered in the VM. |
| Guest OS Services\|Number of OOTB Services | Number of out-of-the-box services discovered in the VM. |
| Guest OS Services\|Number of Outgoing Connections | Number of outgoing connection counts from the discovered services. |
| Guest OS Services\|Number of Incoming Connections | Number of incoming connection counts to the discovered services. |

## Service Summary Metrics

Service discovery discovers summary metrics for the service object. The object is a single service object.

**Table 1528: Service Summary Metrics**

| Metric Name | Description |
|---|---|
| Summary\|Incoming Connections Count | Number of incoming connections. |
| Summary\|Outgoing Connections Count | Number of outgoing connections. |
| Summary\|Connections Count | Number of incoming and outgoing connections. |
| Summary\|Pid | Process ID. |

## Service Performance Metrics

Service discovery discovers performance metrics for the service object. The object is a single service object.

**Table 1529: Service Performance Metrics**

| Metric Name | Description |
|---|---|
| Performance metrics group\|CPU | CPU usage in percentage. |
| Performance metrics group\|Memory | Memory usage in KB. |
| Performance metrics group\|IO Read Throughput | IO read throughput in KBps. |
| Performance metrics group\|IO Write Throughput | IO write throughput in KBps. |

## Service Type Metrics

Service discovery discovers metrics for service type objects.

**Table 1530: Service Type Metrics**

| Metric Name | Description |
|---|---|
| Number of instances | Number of instances of this service type. |

## Calculated Metrics

VCF Operations calculates metrics for capacity, badges, and the health of the system. Calculated metrics apply to a subset of objects found in the `describe.xml` file that describes each adapter.

From data that the vCenter adapter collects, VCF Operations calculates metrics for objects of type:

- vSphere World
- Virtual Machine
- Host System
- Datastore

From data that the VCF Operations adapter collects, VCF Operations calculates metrics for objects of type:

- Node
- Cluster

### Capacity Analytics Generated Metrics

The capacity engine computes and publishes metrics that can be found in the Capacity Analytics Generated group. These metrics help you to plan your resource use based on consumer demand.

#### Capacity Analytics Generated Metrics Group

Capacity analytics uses the capacity engine to analyze historical utilization and generate projected utilization. The engine takes the Demand and Usable Capacity (Total Capacity - HA - buffer) metrics as input and calculates the output metrics that belong to the capacity analytics generated metrics group.

The capacity analytics generated metrics group contains containers and each container contains three output metrics, which are Capacity Remaining, Recommended Size, and Recommended Total Capacity. It also contains the Capacity Remaining Percentage and Time Remaining metrics, which show the most constrained values of the containers.

For the capacity metrics group, full metric names include the name of the resource container. For example, if recommended size metrics are computed for CPU or memory, the actual metric names appear as cpu|demand|recommendedSize or mem|demand|recommendedSize.

**Table 1531: Capacity Metrics Group**

| Metric Name | Description |
|---|---|
| Time Remaining (Day(s)) | The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: timeRemaining |
| Capacity Remaining | Capacity remaining is the maximum point between the usable capacity now and the projected utilization for 3 days into the future. If the projected utilization is above 100% of the usable capacity, Capacity Remaining is 0.<br>Key: capacityRemaining |
| Capacity Remaining Percentage (%) | The percentage of Capacity Remaining of the most constrained resource with respect to the usable capacity.<br>Key: capacityRemainingPercentage |
| Recommended Size | The maximum projected utilization for the projection period from the current time to 30 days after the warning threshold value for time remaining. The warning threshold is the period during which the time remaining is green. Recommended Size excludes HA settings.<br>Key: recommendedSize |
| Recommended Total Capacity | The maximum projected utilization for the projection period from the current time to 30 days after the warning threshold value for time remaining. Recommended Total Capacity excludes HA settings.<br>Key: recommendedTotalCapacity |

## Capacity Analytics Generated Allocation Metrics

Capacity allocation metrics provide information about the allotment of capacity for Cluster Compute and Datastore Cluster Resources.

| Metric Name | Description |
|---|---|
| Capacity Analytics Generated\|CPU\|Allocation\|Capacity Remaining (vCPUs) | For vSphere objects published on Cluster Compute Resource only. Capacity Remaining based on overcommit ratio (if configured in effective policy).<br>Key: OnlineCapacityAnalytics\|cpu\|alloc\|capacityRemaining |
| Capacity Analytics Generated\|CPU\|Allocation\|Recommended Total Capacity (Cores) | For vSphere objects published on Cluster Compute Resource only. The recommended level of total capacity, to maintain a green state for time remaining for the given object.<br>Key: OnlineCapacityAnalytics\|cpu\|alloc\|recommendedTotalSize |
| Capacity Analytics Generated\|CPU\|Allocation\|Time Remaining (Day(s)) | For vSphere objects published on Cluster Compute Resource only. The number of days remaining is calculated for both group and container. It calculates the time remaining before the resources run out.<br>Key: OnlineCapacityAnalytics\|cpu\|alloc\|timeRemaining |
| CPU\|Allocation\|Usable Capacity after HA and Buffer (vCPUs) | For vSphere objects published on Cluster Compute Resource only. The usable capacity (total capacity - HA) based on configured overcommit ratio.<br>Key: cpu\|alloc\|usableCapacity |
| Capacity Analytics Generated\|CPU\|Allocation\|Recommended Size (Cores) | For vSphere objects published on Cluster Compute Resource only. The recommended level of usable capacity (total capacity - HA), to maintain a green state for time remaining for the given object.<br>Key: OnlineCapacityAnalytics\|cpu\|alloc\|recommendedSize |
| vRealize Operations Manager Generated Properties\|CPU\| Allocation\|Overcommit Ratio Setting | For vSphere objects published on Cluster Compute Resource only. This property shows the allocation overcommit ratio for CPU provided in effective policy.<br>Key: System Properties\|cpu\|alloc\|overcommitRatioSetting |
| vRealize Operations Manager Generated Properties\|CPU\| Allocation\|Buffer (%) | CPU buffer percent defined by policy setting for allocation based capacity computation.<br>Key: Properties\|cpu\|alloc\|bufferSetting |
| Capacity Analytics Generated\|Memory\|Allocation\|Capacity Remaining (KB) | For vSphere objects published on Cluster Compute Resource only. Capacity Remaining based on overcommit ratio (if configured in effective policy).<br>Key: OnlineCapacityAnalytics\|mem\|alloc\|capacityRemaining |
| Capacity Analytics Generated\|Memory\|Allocation\|Recommended Total Capacity (KB) | For vSphere objects published on Cluster Compute Resource only. The recommended level of total capacity, to maintain a green state for time remaining for the given object.<br>Key: OnlineCapacityAnalytics\|mem\|alloc\|recommendedTotalSize |
| Capacity Analytics Generated\|Memory\|Allocation\|Time Remaining (Day(s)) | For vSphere objects published on Cluster Compute Resource only. The number of days remaining is calculated for both group and container. It calculates the time remaining before the resources run out.<br>Key: OnlineCapacityAnalytics\|mem\|alloc\|timeRemaining |
| Memory\|Allocation\|Usable Capacity (KB) | For vSphere objects published on Cluster Compute Resource only. The usable capacity (total capacity - HA) based on configured overcommit ratio.<br>Key: mem\|alloc\|usableCapacity |

| Metric Name | Description |
|---|---|
| Capacity Analytics Generated\|Memory\|Allocation\|Recommended Size (KB) | For vSphere objects published on Cluster Compute Resource only. The recommended level of usable capacity (total capacity - HA), to maintain a green state for time remaining for the given object.<br>Key: OnlineCapacityAnalytics\|mem\|alloc\|recommendedSize |
| vRealize Operations Manager Generated Properties\|Memory\| Allocation\|Overcommit Ratio Setting | For vSphere objects published on Cluster Compute Resource only. This property shows the allocation overcommit ratio for Memory provided in effective policy.<br>Key: System Properties\|mem\|alloc\|overcommitRatioSetting |
| vRealize Operations Manager Generated Properties\|Memory\| Allocation\|Buffer (%) | Memory buffer percent defined by policy setting for allocation based capacity computation.<br>Key: System Properties\|mem\|alloc\|bufferSetting |
| Capacity Analytics Generated\|Disk Space\|Allocation\|Capacity Remaining (GB) | For vSphere objects published on Cluster Compute Resource and Datastore Cluster Resource. Capacity Remaining based on overcommit ratio (if configured in effective policy).<br>Key: OnlineCapacityAnalytics\|diskspace\|alloc\|capacityRemaining |
| Capacity Analytics Generated\|Disk Space\|Allocation\| Recommended Size (GB) | For vSphere objects published on Cluster Compute Resource and Datastore Cluster Resource. The recommended level of total capacity to maintain a green state for time remaining for the given object.<br>Key: OnlineCapacityAnalytics\|diskspace\|alloc\|recommendedSize |
| Capacity Analytics Generated\|Disk Space\|Allocation\|Time Remaining (Day(s)) | For vSphere objects published on Cluster Compute Resource and Datastore Cluster Resource. The number of days remaining is calculated for both group and container. It calculates the time remaining before the resources run out.<br>Key: OnlineCapacityAnalytics\|diskspace\|alloc\|timeRemaining |
| Disk Space\|Allocation\|Usable Capacity (GB) | For vSphere objects published on Cluster Compute Resource and Datastore Cluster Resource. Usable capacity based on overcommit ratio (if configured in effective policy).<br>Key: diskspace\|alloc\|usableCapacity |
| vRealize Operations Manager Generated Properties\|Disk Space\| Allocation\|Overcommit Ratio Setting | For vSphere objects published on Cluster Compute Resource and Datastore Cluster Resource. This property shows the allocation overcommit ratio for Disk Space provided in effective policy.<br>key: System Properties\|diskspace\|alloc\|overcommitRatioSetting |
| vRealize Operations Manager Generated Properties\|Disk Space\| Allocation\|Buffer (%) | Disk Space buffer percent defined by policy setting for allocation based capacity computation.<br>Key: System Properties\|diskspace\|alloc\|bufferSetting |

## Capacity Analytics Generated Profiles Metrics

Profiles metrics provide information about the profile specific capacity for Cluster Compute, Datastore Cluster, Data Center, Custom Data Center, and vCenter Server resources.

| Metric Name | Description |
|---|---|
| Capacity Analytics Generated\|Capacity Remaining (Profile) | Published on Cluster Compute Resource. Calculated as a minimum of all Profiles\|capacityRemainingProfile_<profile uuid> metrics.<br>Key: OnlineCapacityAnalytics\|capacityRemainingProfile |
| Capacity Analytics Generated\|Capacity Remaining (Profile) | Published on Datastore Cluster Resource. Calculated as a minimum of all Profiles\|capacityRemainingProfile_<profile uuid> metrics.<br>Key: OnlineCapacityAnalytics\|capacityRemainingProfile |
| Capacity Analytics Generated\|Capacity Remaining (Profile) | Published on Data Center, Custom Data Center and vCenter Server Resources. Computed as a sum of OnlineCapacityAnalytics\|capacityRemainingProfile metric of descendant Cluster Compute Resources.<br>Key: OnlineCapacityAnalytics\|capacityRemainingProfile |

## Capacity Demand Model Metrics

Demand model metrics provide information about the usable capacity and projected utilization of resources across VMs, Host Systems, Cluster Compute, Datastore Cluster, Data Center, Custom Data Center, and vCenter Server resources.

| Metric Name | Description |
|---|---|
| Capacity Analytics Generated\|CPU\|Capacity Remaining (MHz) | Published on Virtual Machine. The max point between the usable capacity and the projected utilization between now and three days.<br>Key: OnlineCapacityAnalytics\|cpu\|capacityRemaining |
| Capacity Analytics Generated\|CPU\|Recommended Size (MHz) | Published on Virtual Machine. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the remaining time.<br>Key: OnlineCapacityAnalytics\|cpu\|recommendedSize |
| Capacity Analytics Generated\|CPU\|Time Remaining (Day(s)) | Published on Virtual Machine. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|cpu\|timeRemaining |
| Capacity Analytics Generated\|Disk Space\|Capacity Remaining (GB) | Published on Virtual Machine. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|diskspace\|capacityRemaining |
| Capacity Analytics Generated\|Disk Space\|Recommended Size (GB) | Published on Virtual Machine. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the remaining time.<br>Key: OnlineCapacityAnalytics\|diskspace\|recommendedSize |
| Capacity Analytics Generated\|Disk Space\|Time Remaining (Day(s)) | Published on Virtual Machine. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|diskspace\|timeRemaining |

| Metric Name | Description |
|---|---|
| Capacity Analytics Generated\|Memory\|Capacity Remaining (KB) | Published on Virtual Machine. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|mem\|capacityRemaining |
| Capacity Analytics Generated\|Memory\|Recommended Size (KB) | Published on Virtual Machine. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the remaining time.<br>Key: OnlineCapacityAnalytics\|mem\|recommendedSize |
| Capacity Analytics Generated\|Memory\|Time Remaining (Day(s)) | Published on Virtual Machine. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|mem\|timeRemaining |
| Capacity Analytics Generated\|CPU\|Demand\|Capacity Remaining (MHz) | Published on Host System. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|capacityRemaining |
| vRealize Operations Manager Generated Properties\|CPU\|Demand\|Buffer (%) | CPU buffer percent defined by policy setting for demand based capacity computation.<br>Key: System Properties\|cpu\|demand\|bufferSetting |
| Capacity Analytics Generated\|CPU\|Demand\|Recommended Size (MHz) | Published on Host System. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the remaining time.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|recommendedSize |
| Capacity Analytics Generated\|CPU\|Demand\|Time Remaining (Day(s)) | Published on Host System. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|timeRemaining |
| Capacity Analytics Generated\|Disk Space\|Demand\|Capacity Remaining (GB) | Published on Host System. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|diskspace\|demand\|capacityRemaining |
| vRealize Operations Manager Generated Properties\|Disk Space\|Demand\|Buffer (%) | Disk Space buffer percent defined by policy setting for demand based capacity computation.<br>System Properties\|diskspace\|demand\|bufferSetting |
| Capacity Analytics Generated\|Disk Space\|Demand\|Recommended Size (GB) | Published on Host System. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the remaining time.<br>Key: OnlineCapacityAnalytics\|diskspace\|demand\|recommendedSize |
| Capacity Analytics Generated\|Disk Space\|Demand\|Time Remaining (Day(s)) | Published on Host System. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|diskspace\|demand\|timeRemaining |
| Capacity Analytics Generated\|Memory\|Demand\|Capacity Remaining (KB) | Published on Host System. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|capacityRemaining |
| vRealize Operations Manager Generated Properties\|Memory\|Demand\|Buffer (%) | Memory buffer percent defined by policy setting for demand based capacity computation.<br>Key: System Properties\|mem\|demand\|bufferSetting |

| Metric Name | Description |
|---|---|
| Capacity Analytics Generated\|Memory\|Demand\|Recommended Size (KB) | Published on Host System. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the remaining time.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|recommendedSize |
| Capacity Analytics Generated\|Memory\|Demand\|Time Remaining (Day(s)) | Published on Host System. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|timeRemaining |
| Capacity Analytics Generated\|Disk Space\|Usage\|Capacity Remaining (GB) | Published on Datastore. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|diskspace\|total\|capacityRemaining |
| Capacity Analytics Generated\|Disk Space\|Usage\|Recommended Size (GB) | Published on Datastore. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the remaining time.<br>Key: OnlineCapacityAnalytics\|diskspace\|total\|recommendedSize |
| Capacity Analytics Generated\|Disk Space\|Usage\|Time Remaining (Day(s)) | Published on Datastore. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|diskspace\|total\|timeRemaining |
| Capacity Analytics Generated\|CPU\|Demand\|Capacity Remaining (MHz) | Published on Cluster Compute Resource. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|capacityRemaining |
| Capacity Analytics Generated\|CPU\|Demand\|Recommended Size (MHz) | Published on Cluster Compute Resource. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the remaining time.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|recommendedSize |
| Capacity Analytics Generated\|CPU\|Demand\|Recommended Total Capacity (MHz) | Published on Cluster Compute Resource. The recommended level of total capacity to maintain a green state for the time remaining.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|<br>recommendedTotalSize |
| Capacity Analytics Generated\|CPU\|Demand\|Time Remaining (Day(s)) | Published on Cluster Compute Resource. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|timeRemaining |
| Capacity Analytics Generated\|Disk Space\|Demand\|Capacity Remaining (GB) | Published on Cluster Compute Resource. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|diskspace\|demand\|<br>capacityRemaining |
| Capacity Analytics Generated\|Disk Space\|Demand\|Recommended Size (GB) | Published on Cluster Compute Resource. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the time remaining.<br>Key: OnlineCapacityAnalytics\|diskspace\|demand\|<br>recommendedSize |
| Capacity Analytics Generated\|Disk Space\|Demand\|Time Remaining (Day(s)) | Published on Cluster Compute Resource. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|diskspace\|demand\|timeRemaining |

| Metric Name | Description |
|---|---|
| Capacity Analytics Generated\|Memory\|Demand\|Capacity Remaining (KB) | Published on Cluster Compute Resource. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|capacityRemaining |
| Capacity Analytics Generated\|Memory\|Demand\|Recommended Size (KB) | Published on Cluster Compute Resource. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the time remaining.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|recommendedSize |
| Capacity Analytics Generated\|Memory\|Demand\|Recommended Total Capacity (KB) | Published on Cluster Compute Resource. The recommended level of total capacity to maintain a green state for the time remaining.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|<br>recommendedTotalSize |
| Capacity Analytics Generated\|Memory\|Demand\|Time Remaining (Day(s)) | Published on Cluster Compute Resource. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|timeRemaining |
| Capacity Analytics Generated\|Disk Space\|Usage\|Capacity Remaining (GB) | Published on Datastore Cluster. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|diskspace\|total\|capacityRemaining |
| Capacity Analytics Generated\|Disk Space\|Usage\|Recommended Size (GB) | Published on Datastore Cluster. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the time remaining.<br>Key: OnlineCapacityAnalytics\|diskspace\|total\|recommendedSize |
| Capacity Analytics Generated\|Disk Space\|Usage\|Time Remaining (Day(s)) | Published on Datastore Cluster. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|diskspace\|total\|timeRemaining |
| Capacity Analytics Generated\|CPU\|Demand\|Capacity Remaining (MHz) | Published on Datacenter, Custom Datacenter, vCenter. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|capacityRemaining |
| Capacity Analytics Generated\|CPU\|Demand\|Recommended Size (MHz) | Published on Datacenter, Custom Datacenter, vCenter. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the time remaining.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|recommendedSize |
| Capacity Analytics Generated\|CPU\|Demand\|Recommended Total Capacity (MHz) | Published on Datacenter, Custom Datacenter, vCenter. The recommended level of total capacity to maintain a green state for the time remaining.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|<br>recommendedTotalSize |
| Capacity Analytics Generated\|CPU\|Demand\|Time Remaining (Day(s)) | Published on Datacenter, Custom Datacenter, vCenter. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|cpu\|demand\|timeRemaining |
| Capacity Analytics Generated\|Disk Space\|Demand\|Capacity Remaining (GB) | Published on Datacenter, Custom Datacenter, vCenter. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|diskspace\|demand\|<br>capacityRemaining |

| Metric Name | Description |
|---|---|
| Capacity Analytics Generated\|Disk Space\|Demand\|Recommended Size (GB) | Published on Datacenter, Custom Datacenter, vCenter. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the time remaining.<br>Key: OnlineCapacityAnalytics\|diskspace\|demand\|recommendedSize |
| Capacity Analytics Generated\|Disk Space\|Demand\|Time Remaining (Day(s)) | Published on Datacenter, Custom Datacenter, vCenter. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|diskspace\|demand\|timeRemaining |
| Capacity Analytics Generated\|Memory\|Demand\|Capacity Remaining (KB) | Published on Datacenter, Custom Datacenter, vCenter. The max point between the usable capacity and the projected utilization between now and three days into the future.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|capacityRemaining |
| Capacity Analytics Generated\|Memory\|Demand\|Recommended Size (KB) | Published on Datacenter, Custom Datacenter, vCenter. The recommended level of usable capacity (total capacity - HA) to maintain a green state for the time remaining.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|recommendedSize |
| Capacity Analytics Generated\|Memory\|Demand\|Recommended Total Capacity (KB) | Published on Datacenter, Custom Datacenter, vCenter. The recommended level of total capacity to maintain a green state for the time remaining.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|recommendedTotalSize |
| Capacity Analytics Generated\|Memory\|Demand\|Time Remaining (Day(s)) | Published on Datacenter, Custom Datacenter, vCenter. The number of days remaining till the projected utilization crosses the threshold for the usable capacity.<br>Key: OnlineCapacityAnalytics\|mem\|demand\|timeRemaining |

## Badge Metrics

Badge metrics provide information for badges in the user interface. They report the health, risk, and efficiency of objects in your environment.

VCF Operations 6.x analyzes badge metric data at five-minute averages, instead of hourly. As a result, you might find that efficiency and risk badge calculations are more sensitive than in previous versions. Badge metrics continue to be published nightly.

**Table 1532: Badge Metrics**

| Metric Name | Description |
|---|---|
| Badge\|Compliance | Badge\|Compliance(%) metric shows the compliance score for the given object based on the number of violated and total number of compliance symptoms calculated with the following formula `[Math.round(100 - (((double)triggeredSymptoms/totalSymptoms)*100))]`. So, this metric shows the compliance score per object based on the violated symptoms (which can be seen under the object's details Compliance tab). This metric should not be mixed up with the compliance score shown for the benchmark in the **Operations** > **Compliance** page which considers compliant/non-compliant vs total objects.Badge\|Compliance(%) metric is used in 4 views: - Compliance \ VM Distribution - Compliance \ vSphere Distributed Port Groups - Compliance \ vSphere ESX Hosts - Compliance \ vSphere VMs, as well as 1 deprecated dashboard's widget - vSphere Security Compliance dashboard's Compliance Summary widget. |
| Badge\|Efficiency | Overall score for efficiency. The final score is between 1-100. Where Green - 100, Yellow - 75, Orange - 50, Red - 25, Unknown: -1. The score is derived from the criticality of alerts in the Efficiency category. |
| Badge\|Health | Overall score for health. The final score is between 1-100. Where Green - 100, Yellow - 75, Orange - 50, Red - 25, Unknown: -1. The score is derived from the criticality of alerts in the Health category. |
| Badge\|Risk | Overall score for risk. The final score is between 1-100. Where Green - 0, Yellow - 25, Orange - 50, Red - 75, Unknown: -1. The score is derived from the criticality of alerts in the Risk category. |

## System Metrics

System metrics provide information used to monitor the health of the system. They help you to identify problems in your environment.

**Table 1533: System Metrics**

| Metric Name | Description |
|---|---|
| vRealize Operations Generated\|Self - Health Score | This metric displays the system health score of self resource. The value ranges from 0 to 100 depending on noise and the number of alarms.<br>Key: System Attributes\|health |
| vRealize Operations Generated\|Self - Metric Count | This metric displays the number of metrics that the adapter generates for the given object. This value does not include the number of metrics generated by VCF Operations, such as, Badge metrics, vRealize Operations Generated metrics and metrics generated by Capacity Engine<br>Key: System Attributes\|all_metrics |
| vRealize Operations Generated\|Total Anomalies | This metric displays the number of active anomalies (symptoms, events, DT violations) on the object and its children.<br>In previous versions of VCF Operations, this metric used to be named vRealize Operations Generated\| Self - Total Anomalies.<br>Key: System Attributes\|total_alarms |
| vRealize Operations Generated\|Full Set - Metric Count | This metric displays the number of metrics that the adapter of the children of the given object generates.<br>Key: System Attributes\|child_all_metrics |

| Metric Name | Description |
|---|---|
| vRealize Operations Generated\|Availability | This metric value is computed based on the adapter instance statuses monitoring the resource. Resource availability is displayed as 0-down, 1-Up, -1-Unknown.<br>Key: System Attributes\|availability |
| vRealize Operations Generated\|Alert Count Critical | This metric displays the number of critical alerts on the object and its children.<br>Key: System Attributes\|alert_count_critical |
| vRealize Operations Generated\|Alert Count Immediate | This metric displays the number of immediate alerts on the object and its children.<br>Key: System Attributes\|alert_count_immediate |
| vRealize Operations Generated\|Alert Count Warning | This metric displays the number of active warning alerts on the object and its children.<br>Key: System Attributes\|alert_count_warning |
| vRealize Operations Generated\|Alert Count Info | This metric displays the number of active info alerts on the object and its children.<br>Key: System Attributes\|alert_count_info |
| vRealize Operations Generated\|Total Alert Count | This metric displays the sum of all alert count metrics.<br>In previous versions of VCF Operations, this metric was named vRealize Operations Generated\|Full Set - Alert Count.<br>Key: System Attributes\|total_alert_count |
| vRealize Operations Generated\|Self-Alert Count | This metric displays the number of all alerts on the object.<br>Key: System Attributes\|self_alert_count |

### log management Generated Metrics

The metrics in the log management Generated group provide information that you can use to observe or troubleshoot VCF Operations for failures and to monitor performance.

When VCF Operations is integrated with log management and metric calculation is enabled, log management calculates the number of logs corresponding to different queries and sends them as metrics to VCF Operations. These metrics are calculated for vCenter objects, host objects, and virtual machine objects. The metrics can be mapped to a VCF Operations object based on the log management field *`vmw_vrops_id`*, which is constructed based on hostname or source fields.

**Table 1534: Log Insight Generated Metrics**

| Metric Name | Description |
|---|---|
| log management Generated\|Error Count | The number of error logs for the selected object.<br>Key: log_insight_generated\|error_count |
| log management Generated\|Total Log Count | The total number of logs for the selected object.<br>Key: log_insight_generated\|total_log_count |
| log management Generated\|Warning Count | The number of warning logs for the selected object.<br>Key: log_insight_generated\|warning_count |

## Self-Monitoring Metrics for VCF Operations

VCF Operations uses the VCF Operations adapter to collect metrics that monitor its own performance. These self-monitoring metrics drive capacity models for VCF Operations objects and are useful for diagnosing problems with VCF Operations.

## Analytics Metrics

VCF Operations collects metrics for the VCF Operations analytics service, including threshold checking metrics.

**Table 1535: Analytics Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| ActiveAlarms | Active DT Symptoms | Active DT Symptoms. |
| ActiveAlerts | Active Alerts | Active alerts. |
| PrimaryResourcesCount | Number of primary objects | Number of primary objects |
| LocalResourcesCount | Number of local objects | Number of local objects |
| PrimaryMetricsCount | Number of primary metrics | Number of primary metrics |
| LocalMetricsCount | Number of local metrics | Number of local metrics |
| ReceivedResourceCount | Number of received objects | Number of received objects |
| ReceivedMetricCount | Number of received metrics | Number of received metrics |
| LocalFDSize | Number of forward data entries | Number of locally stored primary and redundant entries in forward data region. |
| LocalPrimaryFDSize | Number of primary forward data entries | Number of locally stored primary entries in forward data region. |
| LocalFDAltSize | Number of alternative forward data entries | Number of locally stored primary and redundant entries in alternative forward data region. |
| LocalPrimaryFDAltSize | Number of alternative primary forward data entries | Number of locally stored primary entries in alternative forward data region. |
| CurrentHeapSize | Current heap size | Current heap size. |
| MaxHeapSize | Max heap size | Max heap size |
| CommittedMemory | Committed memory | Committed memory |
| CPUUsage | CPU usage | CPU usage |
| Threads | Threads | Threads |
| UpStatus | Threads | Threads |

### Overall Threshold Checking Metrics for the Analytics Service

Overall threshold checking captures various metrics for work items used to process incoming observation data. All metrics keys for the overall threshold checking metrics begin with OverallThresholdChecking, as in `OverallThresholdChecking|Count` or `OverallThresholdChecking|CheckThresholdAndHealth|OutcomeObservationsSize|TotalCount`.

**Table 1536: Overall Threshold Checking Metrics for the Analytics Service**

| Metric Key | Metric Name | Description |
|---|---|---|
| Count | Count | Count |
| Duration\|TotalDuration | Total | Total length of duration (ms) |
| Duration\|AvgDuration | Average | Average duration (ms) |
| Duration\|MinDuration | Minimum | Minimum duration (ms) |

| Metric Key | Metric Name | Description |
|---|---|---|
| Duration\|MaxDuration | Maximum | Maximum duration (ms) |
| IncomingObservationsSize\|TotalCount | Total | Total |
| IncomingObservationsSize\|AvgCount | Average | Average |
| IncomingObservationsSize\|MinCount | Minimal | Minimal |
| IncomingObservationsSize\|MaxCount | Maximal | Maximal |
| CheckThresholdAndHealth\|Count | Count | Count |
| CheckThresholdAndHealth\|Duration\|TotalDuration | Total | Total length of duration (ms) |
| CheckThresholdAndHealth\|Duration\|AvgDuration | Average | Average duration (ms) |
| CheckThresholdAndHealth\|Duration\|MinDuration | Minimum | Minimum duration (ms) |
| CheckThresholdAndHealth\|Duration\|MaxDuration | Maximum | Maximum duration (ms) |
| CheckThresholdAndHealth\| OutcomeObservationsSize\|TotalCount | Total | Total |
| CheckThresholdAndHealth\| OutcomeObservationsSize\|AvgCount | Average | Average |
| CheckThresholdAndHealth\| OutcomeObservationsSize\|MinCount | Minimal | Minimal |
| CheckThresholdAndHealth\| OutcomeObservationsSize\|MaxCount | Maximal | Maximal |
| SuperMetricComputation\|Count | Count | Count |
| SuperMetricComputation\|Duration\|TotalDuration | Total | Total length of duration (ms) |
| SuperMetricComputation\|Duration\|AvgDuration | Average | Average duration (ms) |
| SuperMetricComputation\|Duration\|MinDuration | Minimum | Minimum duration (ms) |
| SuperMetricComputation\|Duration\|MaxDuration | Maximum | Maximum duration (ms) |
| SuperMetricComputation\|SuperMetricsCount\| TotalCount | Total | Total |
| SuperMetricComputation\|SuperMetricsCount \| AvgCount | Average | Average |
| SuperMetricComputation\|SuperMetricsCount \| MinCount | Minimal | Minimal |
| SuperMetricComputation\|SuperMetricsCount \| MaxCount | Maximal | Maximal |
| StoreObservationToFSDB\|Count | Count | Count |
| StoreObservationToFSDB\|Duration\|TotalDuration | Total | Total length of duration (ms) |
| StoreObservationToFSDB\|Duration\|AvgDuration | Average | Average duration (ms) |
| StoreObservationToFSDB\|Duration\|MinDuration | Minimum | Minimum duration (ms) |
| StoreObservationToFSDB\|Duration\|MaxDuration | Maximum | Maximum duration (ms) |
| StoreObservationToFSDB\| StoredObservationsSize\|TotalCount | Total | Total |
| StoreObservationToFSDB\| StoredObservationsSize\|AvgCount | Average | Average |
| StoreObservationToFSDB\| StoredObservationsSize\|MinCount | Minimal | Minimal |
| StoreObservationToFSDB\| StoredObservationsSize\|MaxCount | Maximal | Maximal |

| Metric Key | Metric Name | Description |
|---|---|---|
| UpdateResourceCache\|Count | Count | Count |
| UpdateResourceCache\|Duration\|TotalDuration | Total | Total |
| UpdateResourceCache\|Duration\|AvgDuration | Average | Average |
| UpdateResourceCache\|Duration\|MinDuration | Minimum | Minimum |
| UpdateResourceCache\|Duration\|MaxDuration | Maximum | Maximum |
| UpdateResourceCache\| ModifcationEstimateCount\|TotalCount | Total | The number of estimated modifications done during each resource cache object update. |
| UpdateResourceCache\| ModifcationEstimateCount\|AvgCount | Average | Average |
| UpdateResourceCache\| ModifcationEstimateCount\|MinCount | Minimal | Minimal |
| UpdateResourceCache\| ModifcationEstimateCount\|MaxCount | Maximal | Maximal |
| ManageAlerts\|Count | Count | The total number of times the threshold checking work items perform alert updates. |
| ManageAlerts\|Duration\|TotalDuration | Total | The duration for the alert updates operations. |
| ManageAlerts\|Duration\|AvgDuration | Average | Average |
| ManageAlerts\|Duration\|MinDuration | Minimum | Minimum |
| ManageAlerts\|Duration\|MaxDuration | Maximum | Maximum |
| UpdateSymptoms\|Count | Count | The total number of times the threshold checking work items check and build symptoms. |
| UpdateSymptoms\|Duration\|TotalDuration | Total | The duration for the check and build symptoms operation. |
| UpdateSymptoms\|Duration\|AvgDuration | Average | Average |
| UpdateSymptoms\|Duration\|MinDuration | Minimum | Minimum |
| UpdateSymptoms\|Duration\|MaxDuration | Maximum | Maximum |

## Dynamic Threshold Calculation Metrics for the Analytics Service

All metrics keys for the dynamic threshold calculation metrics begin with DtCalculation, as in `DtCalculation|DtDataWrite|WriteOperationCount` or `DtCalculation|DtAnalyze|AnalyzeOperationCount`.

### Table 1537: Dynamic Threshold Calculation Metrics for the Analytics Service

| Metric Key | Metric Name | Description |
|---|---|---|
| DtDataWrite\|WriteOperationCount | Write operation count | Write operation count |
| DtDataWrite\|Duration\|TotalDuration | Total | Total length of duration (ms) |
| DtDataWrite\|Duration\|AvgDuration | Average | Average duration (ms) |
| DtDataWrite\|Duration\|MinDuration | Minimum | Minimum duration (ms) |
| DtDataWrite\|Duration\|MaxDuration | Maximum | Maximum duration (ms) |
| DtDataWrite\|SavedDtObjectCount\|TotalCount | Total | Total |

| Metric Key | Metric Name | Description |
|---|---|---|
| DtDataWrite\|SavedDtObjectCount\|AvgCount | Average | Average |
| DtDataWrite\|SavedDtObjectCount\|MinCount | Minimal | Minimal |
| DtDataWrite\|SavedDtObjectCount\|MaxCount | Maximal | Maximal |
| DtAnalyze\|AnalyzeOperationCount | Analyze Operation Count | Analyze Operation Count |
| DtAnalyze\|Duration\|TotalDuration | Total | Total length of duration (ms) |
| DtAnalyze\|Duration\|AvgDuration | Average | Average duration (ms) |
| DtAnalyze\|Duration\|MinDuration | Minimum | Minimum duration (ms) |
| DtAnalyze\|Duration\|MaxDuration | Maximum | Maximum duration (ms) |
| DtAnalyze\|AnalyzedMetricsCount\|TotalCount | Total | Total |
| DtAnalyze\|AnalyzedMetricsCount\|AvgCount | Average | Average |
| DtAnalyze\|AnalyzedMetricsCount\|MinCount | Minimal | Minimal |
| DtAnalyze\|AnalyzedMetricsCount\|MaxCount | Maximal | Maximal |
| DtDataRead\|ReadOperationsCount | Read Operation Count | Read Operation Count |
| DtDataRead\|Duration\|TotalDuration | Total | Total length of duration (ms) |
| DtDataRead\|Duration\|AvgDuration | Average | Average duration (ms) |
| DtDataRead\|Duration\|MinDuration | Minimum | Minimum duration (ms) |
| DtDataRead\|Duration\|MaxDuration | Maximum | Maximum duration (ms) |
| DtDataRead\|ReadDataPointsCount\|TotalCount | Total | Total |
| DtDataRead\|ReadDataPointsCount\|AvgCount | Average | Average |
| DtDataRead\|ReadDataPointsCount\|MinCount | Minimal | Minimal |
| DtDataRead\|ReadDataPointsCount\|MaxCount | Maximal | Maximal |

**Table 1538: Function Call Metrics for the Analytics Service**

| Metric Key | Metric Name | Description |
|---|---|---|
| FunctionCalls\|Count | Number of function calls | Number of function calls |
| FunctionCalls\|AvgDuration | Average execution time | Average execution time |
| FunctionCalls\|MaxDuration | Max execution time | Max execution time |

## Collector Metrics

VCF Operations collects metrics for the VCF Operations Collector service objects.

**Table 1539: Collector Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| ThreadpoolThreadsCount | Number of pool threads | Number of pool threads. |
| RejectedFDCount | Number of rejected forward data | Number of rejected forward data |
| RejectedFDAltCount | Number of rejected alternative forward data | Number of rejected alternative forward data |
| SentFDCount | Number of sent objects | Number of sent objects |
| SentFDAltCount | Number of alternative sent objects | Number of alternative sent objects |

| Metric Key | Metric Name | Description |
|---|---|---|
| CurrentHeapSize | Current heap size (MB) | Current heap size. |
| MaxHeapsize | Max heap size (MB) | Maximum heap size. |
| CommittedMemory | Committed memory (MB) | Amount of committed memory. |
| CPUUsage | CPU usage | CPU usage. |
| Threads | Threads | Number of threads. |
| UpStatus | Up Status | Up Status |

## Controller Metrics

VCF Operations collects metrics for the VCF Operations Controller objects.

**Table 1540: Controller Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| RequestedMetricCount | Number of requested metrics | Number of requested metrics |
| ApiCallsCount | Number of API calls | Number of API calls |
| NewDiscoveredResourcesCount | Number of discovered objects | Number of discovered objects |

## FSDB Metrics

VCF Operations collects metrics for the VCF Operations file system database (FSDB) objects.

**Table 1541: FSDB Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| StoragePoolElementsCount | Number of storage work items | Number of storage work items |
| FsdbState | Fsdb state | Fsdb state |
| StoredResourcesCount | Number of stored objects | Number of stored objects |
| StoredMetricsCount | Number of stored metrics | Number of stored metrics |

**Table 1542: Storage Thread Pool Metrics for FSDB**

| Metric Key | Metric Name | Description |
|---|---|---|
| StoreOperationsCount | Store operations count | Store operations count |
| StorageThreadPool\|Duration\|TotalDuration | Total | Total number of duration (ms) |
| StorageThreadPool\|Duration\|AvgDuration | Average | Average duration (ms) |
| StorageThreadPool\|Duration\|MinDuration | Minimum | Minimum duration (ms) |
| StorageThreadPool\|Duration\|MaxDuration | Maximum | Maximum duration (ms) |
| StorageThreadPool\|SavedMetricsCount\|TotalCount | Total | Total |
| StorageThreadPool\|SavedMetricsCount\|AvgCount | Average | Average |
| StorageThreadPool\|SavedMetricsCount\|MinCount | Minimal | Minimal |

| Metric Key | Metric Name | Description |
|---|---|---|
| StorageThreadPool\|SavedMetricsCount\|MaxCount | Maximal | Maximal |

## Product UI Metrics

VCF Operations collects metrics for the VCF Operations product user interface objects.

**Table 1543: Product UI Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| ActiveSessionsCount | Active sessions | Active sessions |
| CurrentHeapSize | Current heap size | Current heap size. |
| MaxHeapsize | Max heap size | Maximum heap size. |
| CommittedMemory | Committed memory | Amount of committed memory. |
| CPUUsage | CPU usage | Percent CPU use. |
| Threads | Threads | Number of threads. |
| SessionCount | Number of active sessions | Number of active sessions |
| SelfMonitoringQueueSize | Self Monitoring queue size | Self Monitoring queue size |

**Table 1544: API Call Metrics for the Product UI**

| Metric Key | Metric Name | Description |
|---|---|---|
| APICalls\|HTTPRequesterRequestCount | HTTPRequester request count | HTTPRequester request count |
| APICalls\|AvgHTTPRequesterRequestTime | HTTPRequester average request time | HTTPRequester average request time (ms) |
| APICalls\|FailedAuthenticationCount | Failed Authentication Count | Failed Authentication Count |
| APICalls\|AvgAlertRequestTime | Average alert request time | Average alert request time (ms) |
| APICalls\|AlertRequestCount | Alert request count | Alert request count |
| APICalls\|AvgMetricPickerRequestTime | Average metric-picker request time | Average metric-picker request time (ms) |
| APICalls\|MetricPickerRequestCount | Metric picker request count | Metric picker request count |
| APICalls\|HeatmapRequestCount | Heatmap request count | Heatmap request count |
| APICalls\|AvgHeatmapRequestTime | Average HeatMap request time | Average HeatMap request time (ms) |
| APICalls\|MashupChartRequestCount | Mashup Chart request count | Mashup Chart request count |
| APICalls\|AvgMashupChartRequestTime | Average Mashup Chart request time | Average Mashup Chart request time (ms) |
| APICalls\|TopNRequestCount | Top N request count | Top N request count |
| APICalls\|AvgTopNRequestTime | Average Top N request time | Average Top N request time (ms) |
| APICalls\|MetricChartRequestCount | Metric Chart request count | Metric Chart request count |
| APICalls\|AvgMetricChartRequestTime | Average MetricChart request time | Average MetricChart request time (ms) |

## Admin UI Metrics

VCF Operations collects metrics for the VCF Operations administration user interface objects.

**Table 1545: Admin UI Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| CurrentHeapSize | Current heap size | Current heap size (MB). |
| MaxHeapsize | Max heap size | Maximum heap size (MB). |
| CommittedMemory | Committed memory | Amount of committed memory (MB) . |
| CPUUsage | CPU usage | CPU usage (%). |
| Threads | Threads | Number of threads. |
| SessionCount | Number of active sessions | Number of active sessions |
| SelfMonitoringQueueSize | Self Monitoring queue size | Self Monitoring queue size |

**Table 1546: API Call Metrics for the Admin UI**

| Metric Key | Metric Name | Description |
|---|---|---|
| APICalls\|HTTPRequesterRequestCount | HTTPRequester request count | HTTPRequester request count |
| APICalls\|AvgHTTPRequesterRequestTime | HTTPRequester average request time | HTTPRequester average request time (ms) |

## Suite API Metrics

VCF Operations collects metrics for the VCF Operations API objects.

**Table 1547: Suite API Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| UsersCount | Number of users | Number of users |
| ActiveSessionsCount | Active sessions | Active sessions |
| GemfireClientReconnects | Gemfire Client Reconnects | Gemfire Client Reconnects |
| GemfireClientCurrentCalls | Gemfire Client Total Outstanding | Gemfire Client Total Outstanding |
| CurrentHeapSize | Current heap size | Current heap size (MB) . |
| MaxHeapsize | Max heap size | Maximum heap size (MB) . |
| CommittedMemory | Committed memory | Amount of committed memory (MB). |
| CPUUsage | CPU usage | CPU usage (%) . |
| CPUProcessTime | CPU process time | CPU process time (ms) |
| CPUProcessTimeCapacity | CPU process time capacity | CPU process time capacity (ms) |
| Threads | Threads | Number of threads. |

**Table 1548: Gemfire Client Call Metrics for the Suite API**

| Metric Key | Metric Name | Description |
|---|---|---|
| GemfireClientCalls\|TotalRequests | Total Requests | Total Requests |
| GemfireClientCalls\|AvgResponseTime | Average Response Time | Average Response Time (ms) |
| GemfireClientCalls\|MinResponseTime | Minimum Response Time | Minimum Response Time (ms) |
| GemfireClientCalls\|MaxResponseTime | Maximum Response Time | Maximum Response Time |

| Metric Key | Metric Name | Description |
|---|---|---|
| GemfireClientCalls\|RequestsPerSecond | Requests per Second | Requests per Second |
| GemfireClientCalls\|CurrentRequests | Current Requests | Current Requests |
| GemfireClientCalls\|RequestsCount | Requests Count | Requests Count |
| GemfireClientCalls\|ResponsesCount | Responses Count | Responses Count |

**Table 1549: API Call Metrics for the Suite API**

| Metric Key | Metric Name | Description |
|---|---|---|
| APICalls\|TotalRequests | Total Requests | Total Requests |
| APICalls\|AvgResponseTime | Average Response Time (ms) | Average Response Time (ms) |
| APICalls\|MinResponseTime | Minimum Response Time (ms) | Minimum Response Time (ms) |
| APICalls\|MaxResponseTime | Maximum Response Time | Maximum Response Time |
| APICalls\|ServerErrorResponseCount | Server Error Response Count | Server Error Response Count |
| APICalls\|FailedAuthenticationCount | Failed Authentication Count | Failed Authentication Count |
| APICalls\|FailedAuthorizationCount | Failed Authorization Count | Failed Authorization Count |
| APICalls\|RequestsPerSecond | Requests per Second | Requests per Second |
| APICalls\|CurrentRequests | Current Requests | Current Requests |
| APICalls\|ResponsesPerSecond | Responses per Second | Responses per Second |
| APICalls\|RequestsCount | Requests Count | Requests Count |
| APICalls\|ResponsesCount | Responses Count | Responses Count |

## Cluster and Slice Administration Metrics

VCF Operations collects metrics for VCF Operations Cluster and Slice Administration (CaSA) objects.

**Table 1550: Cluster and Slice Administration Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| CurrentHeapSize | Current heap size | Current heap size (MB). |
| MaxHeapsize | Max heap size | Maximum heap size (MB). |
| CommittedMemory | Committed memory | Amount of committed memory (MB). |
| CPUUsage | CPU usage | CPU usage (%) |
| Threads | Threads | Number of threads. |

**Table 1551: API Call Metrics for Cluster and Slice Administration**

| Metric Key | Metric Name | Description |
|---|---|---|
| API Calls\|TotalRequests | Total Requests | Total Requests |
| API Calls\|AvgResponseTime | Average Response Time | Average Response Time (ms) |
| API Calls\|MinResponseTime | Minimum Response Time | Minimum Response Time (ms) |
| API Calls\|MaxResponseTime | Maximum Response Time | Maximum Response Time (ms) |
| API Calls\|ServerErrorResponseCount | Server Error Response Count | Server Error Response Count |
| API Calls\|FailedAuthenticationCount | Failed Authentication Count | Failed Authentication Count |

| Metric Key | Metric Name | Description |
|---|---|---|
| API Calls\|FailedAuthorizationCount | Minimum Response Time | Minimum Response Time (ms) |

## Watchdog Metrics

VCF Operations collects watchdog metrics to ensure that the VCF Operations services are running and responsive.

### Watchdog Metrics

The watchdog metric provides the total service count.

**Table 1552: Watchdog Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| ServiceCount | Service Count | Service Count |

### Service Metrics

Service metrics provide information about watchdog activity.

**Table 1553: Metrics for the VCF Operations Watchdog Service**

| Metric Key | Metric Name | Description |
|---|---|---|
| Service\|Enabled | Enabled | Enabled |
| Service\|Restarts | Restarts | Number of times the process has been unresponsive and been restarted by Watchdog. |
| Service\|Starts | Starts | Number of times the process has been revived by Watchdog. |
| Service\|Stops | Stops | Number of times the process has been stopped by Watchdog. |

## Node Metrics

VCF Operations collects metrics for the VCF Operations node objects.

Metrics can be calculated for node objects. See Calculated Metrics.

**Table 1554: Node Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| Component Count | Component count | The number of VCF Operations objects reporting for this node |
| PrimaryResourcesCount | Number of primary objects | Number of primary objects |
| LocalResourcesCount | Number of local objects | Number of local objects |
| PrimaryMetricsCount | Number of primary metrics | Number of primary metrics |
| LocalMetricsCount | Number of local metrics | Number of local metrics |
| PercentDBStorageAvailable | Percent disk available /storage/db | Percent disk available /storage/db |
| PercentLogStorageAvailable | Percent disk available /storage/log | Percent disk available /storage/log |

| Metric Key | Metric Name | Description |
|---|---|---|
| FPing stats | Latency\|Average (ms) | |
| FPing stats | Latency\|Maximum (ms) | |
| FPing stats | Latency\|Minimum (ms) | |
| FPing stats | Packet Loss\|Average (%) | Percentage average packet loss between nodes. |
| FPing stats | Packet Loss\|Maximum (%) | Percentage maximum packet loss between nodes. |
| FPing stats | Packet Loss\|Minimum (%) | Percentage minimum packet loss between nodes. |

**Table 1555: Memory Metrics for the Node**

| Metric Key | Metric Name | Description |
|---|---|---|
| mem\|actualFree | Actual Free | Actual Free |
| mem\|actualUsed | Actual Used | Actual Used |
| mem\|free | Free | Free ) |
| mem\|used | Used | Used |
| mem\|total | Total | Total |
| mem\|demand_gb | Estimated memory demand | Estimated memory demand |

**Table 1556: Swap Metrics for the Node**

| Metric Key | Metric Name | Description |
|---|---|---|
| swap\|total | Total | Total |
| swap\|free | Free | Free |
| swap\|used | Used | Used |
| swap\|pageIn | Page in | Page in |
| swap\|pageOut | Page out | Page out |

**Table 1557: Resource Limit Metrics for the Node**

| Metric Key | Metric Name | Description |
|---|---|---|
| resourceLimit\|numProcesses | Number of processes | Number of processes |
| resourceLimit\|openFiles | Number of open files | Number of open files |
| resourceLimit\|openFilesMax | Number of open files maximum limit | Number of open files maximum limit |
| resourceLimit\|numProcessesMax | Number of processes maximum limit | Number of processes maximum limit |

**Table 1558: Network Metrics for the Node**

| Metric Key | Metric Name | Description |
|---|---|---|
| net\|allInboundTotal | All inbound connections | All inbound total |
| net\|allOutboundTotal | All outbound connections | All outbound total |
| net\|tcpBound | TCP bound | TCP bound |

| Metric Key | Metric Name | Description |
|---|---|---|
| net\|tcpClose | TCP state CLOSE | Number of connections in TCP CLOSE |
| net\|tcpCloseWait | TCP state CLOSE WAIT | Number of connections in TCP state CLOSE WAIT |
| net\|tcpClosing | TCP state CLOSING | Number of connections in TCP state CLOSING |
| net\|tcpEstablished | TCP state ESTABLISHED | Number of connections in TCP state ESTABLISHED |
| net\|tcpIdle | TCP state IDLE | Number of connections in TCP state IDLE |
| net\|tcpInboundTotal | TCP inbound connections | TCP inbound connections |
| net\|tcpOutboundTotal | TCP outbound connections | TCP outbound connections |
| net\|tcpLastAck | TCP state LAST ACK | Number of connections in TCP state LAST ACK |
| net\|tcpListen | TCP state LISTEN | Number of connections in TCP state LISTEN |
| net\|tcpSynRecv | TCP state SYN RCVD | Number of connections in TCP state SYN RCVD |
| net\|tcpSynSent | TCP state SYN_SENT | Number of connections in TCP state SYN_SENT |
| net\|tcpTimeWait | TCP state TIME WAIT | Number of connections in TCP state TIME WAIT |

**Table 1559: Network Interface Metrics for the Node**

| Metric Key | Metric Name | Description |
|---|---|---|
| net\|iface\|speed | Speed | Speed (bits/sec) |
| net\|iface\|rxPackets | Receive packets | Number of received packets |
| net\|iface\|rxBytes | Receive bytes | Number of received bytes |
| net\|iface\|rxDropped | Receive packet drops | Number of received packets dropped |
| net\|iface\|rxFrame | Receive packets frame | Number of receive packets frame |
| net\|iface\|rxOverruns | Receive packets overruns | Number of receive packets overrun |
| net\|iface\|txPackets | Transmit packets | Number of transmit packets |
| net\|iface\|txBytes | Transmit bytes | Number of transmit bytes |
| net\|iface\|txDropped | Transmit packet drops | Number of transmit packets dropped |
| net\|iface\|txCarrier | Transmit carrier | Transmit carrier |
| net\|iface\|txCollisions | Transmit packet collisions | Number of transmit collisions |
| net\|iface\|txErrors | Transmit packet errors | Number of transmit errors |
| net\|iface\|txOverruns | Transmit packet overruns | Number of transmit overruns |

### Table 1560: Disk Filesystem Metrics for the Node

| Metric Key | Metric Name | Description |
|---|---|---|
| disk\|fileSystem\|total | Total | Total |
| disk\|fileSystem\|available | Available | Available |
| disk\|fileSystem\|used | Used | Used |
| disk\|fileSystem\|files | Total file nodes | Total file nodes |
| disk\|fileSystem\|filesFree | Total free file nodes | Total free file nodes |
| disk\|fileSystem\|queue | Disk queue | Disk queue |
| disk\|fileSystem\|readBytes | Read bytes | Number of bytes read |
| disk\|fileSystem\|writeBytes | Write bytes | Number of bytes written |
| disk\|fileSystem\|reads | Reads | Number of reads |
| disk\|fileSystem\|writes | Writes | Number of writes |

### Table 1561: Disk Installation Metrics for the Node

| Metric Key | Metric Name | Description |
|---|---|---|
| disk\|installation\|used | Used | Used |
| disk\|installation\|total | Total | Total |
| disk\|installation\|available | Available | Available |

### Table 1562: Disk Database Metrics for the Node

| Metric Key | Metric Name | Description |
|---|---|---|
| disk\|db\|used | Used | Used |
| disk\|db\|total | Total | Total |
| disk\|db\|available | Available | Available |

### Table 1563: Disk Log Metrics for the Node

| Metric Key | Metric Name | Description |
|---|---|---|
| disk\|log\|used | Used | Used |
| disk\|log\|total | Total | Total |
| disk\|log\|available | Available | Available |

### Table 1564: CPU Metrics for the Node

| Metric Key | Metric Name | Description |
|---|---|---|
| cpu\|combined | Combined load | Combined load (User + Sys + Nice + Wait) |
| cpu\|idle | Idle | Idle time fraction of total available cpu (cpu load) |
| cpu\|irq | Irq | Interrupt time fraction of total available cpu (cpu load) |

| Metric Key | Metric Name | Description |
|---|---|---|
| cpu\|nice | Nice | Nice time fraction of total available cpu (cpu load) |
| cpu\|softIrq | Soft Irq | Soft interrupt time fraction of total available cpu (cpu load) |
| cpu\|stolen | Stolen | Stolen time fraction of total available cpu (cpu load) |
| cpu\|sys | Sys | Sys time fraction of total available cpu (cpu load) |
| cpu\|user | User (cpu load) | User time fraction of total available cpu (cpu load) |
| cpu\|wait | Wait (cpu load) | Wait time fraction of total available cpu (cpu load) |
| cpu\|total | Total available for a cpu | Total available for a cpu |
| cpu\|allCpuCombined | Total combined load for all cpus | Total combined load for all cpus (cpu load) |
| cpu\|allCpuTotal_ghz | Available | Available |
| cpu\|allCpuCombined_ghz | Used | Used |
| cpu\|allCpuCombined_percent | CPU usage | CPU usage (%) |

**Table 1565: Device Metrics for the Node**

| Metric Key | Metric Name | Description |
|---|---|---|
| device\|iops | Reads/Writes per second | Average number of read/write commands issued per second during the collection interval. |
| device\|await | Average transaction time | Average transaction time (milliseconds). |
| device\|iops_readMaxObserved | Maximum observed reads per second | Maximum observed reads per second. |
| device\|iops_writeMaxObserved | Maximum observed writes per second | Maximum observed writes per second. |

**Table 1566: Service Metrics for the Node**

| Metric Key | Metric Name | Description |
|---|---|---|
| service\|proc\|fdUsage | Total number of open file descriptors | Total number of open file descriptors. |

**Table 1567: NTP Metrics for the Node**

| Metric Key | Metric Name | Description |
|---|---|---|
| ntp\|serverCount | Configured server count | Configured server count |
| ntp\|unreachableCount | Unreachable server count | Unreachable server count |
| ntp\|unreachable | Unreachable | Is the NTP server unreachable. Value of 0 is reachable, 1 means the server was not reached or did not respond. |

**Table 1568: Heap Metrics for the Node**

| Metric Key | Metric Name | Description |
|---|---|---|
| heap\|CurrentHeapSize | Current heap size | Current heap size |
| heap\|MaxHeapSize | Max heap size | Max heap size |
| heap\|CommittedMemory | Committed Memory | Committed Memory |

## Cluster Metrics

VCF Operations collects metrics for the VCF Operations cluster objects including dynamic threshold calculation metrics and capacity computation metrics.

Metrics can be calculated for cluster objects. See Calculated Metrics.

### Cluster Metrics

Cluster metrics provide host, resource, and metric counts on the cluster.

**Table 1569: Cluster Metrics**

| Metric Key | Metric Name | Description |
|---|---|---|
| HostCount | Number of Nodes in Cluster | Number of Nodes in Cluster |
| PrimaryResourcesCount | Number of primary resources | Number of primary resources |
| LocalResourcesCount | Number of local resources | Number of local resources |
| PrimaryMetricsCount | Number of primary metrics | Number of primary metrics |
| ReceivedResourceCount | Number of received resources | Number of received resources |
| ReceivedMetricCount | Number of received metrics | Number of received metrics |
| Count (VM) | Usage Count | This metric displays how many units of the license capacity is currently used. |
| License Metrics for Cluster Object | | |
| Used (VM) | Usage (%) | This metric displays the percentage of the total license capacity currently used.<br>**Note:**<br>An alert is generated if the license threshold is in any of the following states:<br>• >= 80% - Warning<br>• >= 90% - Immediate<br>• =95% - Catastrophic |
| Days Remaining (day) | Days Remaining | This metric displays the days remaining before the license expires. |
| Capacity | Capacity | Displays the maximum number of units (of the given capacity type) that can be licensed by this license key. |
| Type | Type | Displays the license type for the cluster object. |
| Expiry | Expiration Date | Displays the date when the license expires. |

| Metric Key | Metric Name | Description |
|---|---|---|
| Capacity | Capacity | Displays the maximum number of units (of the given capacity type) that can be licensed by this license key. |
| Disbalance factor (%) | Disbalance factor (%) | Identifies the state of disbalance in a VCF Operations cluster and calculates the disbalance factor (when one or more nodes have a higher density among all the nodes in the cluster). Based on the disbalance percentage of the node, the following alerts are triggered:<br>• Warning: If the disbalance factor metric is equal to or greater than 5%.<br>• Immediate: If the disbalance factor metric is equal to or greater than 7%.<br>• Critical: If the disbalance factor metric is equal to or greater than 10%. |

## DT Metrics

DT metrics are dynamic threshold metrics for the cluster. Non-zero values appear only if metric collection occurs while the dynamic threshold calculations are running.

**Table 1570: DT Metrics for the Cluster**

| Metric Key | Metric Name | Description |
|---|---|---|
| dt\|isRunning | Running | Running |
| dt\|dtRunTime | Running duration | Running duration (ms) |
| dt\|StartTime | Running start time | Running start time |
| dt\|percentage | Percent | Percent (%) |
| dt\|executorCount | Executor Node Count | Executor Node Count |
| dt\|resourceCount | Resource Count | Resource Count |
| dt\|fsdbReadTime | FSDB Read Time | FSDB Read Time (ms) |
| dt\|dtObjectSaveTime | DT Object Save Time | DT Object Save Time (ms) |
| dt\|dtHistorySaveTime | DT History Save Time | DT History Save Time (ms) |
| dt\|executor\|resourceCount | Resource Count | Resource Count |

## Capacity Computation (CC) Metrics

CC metrics are capacity computation metrics for the cluster. Non-zero values appear only if metric collection occurs while the capacity computation calculations are running.

**Table 1571: CC Metrics for the Cluster**

| Metric Key | Metric Name | Description |
|---|---|---|
| cc\|isRunning | Running | Running |
| cc\|runTime | Total Run Time | Total Run Time |
| cc\|startTime | Start time | Start time |
| cc\|finishTime | Finish Time | Finish Time |

| Metric Key | Metric Name | Description |
|---|---|---|
| cc\|totalResourcesToProcess | Total Objects Count | Total Objects Count |
| cc\|progress | Progress | Progress |
| cc\|phase1TimeTaken | Phase 1 Computation Time | Phase 1 Computation Time |
| cc\|phase2TimeTaken | Phase 2 Computation Time | Phase 2 Computation Time |

## Gemfire Cluster Metrics

Gemfire metrics provide information about the Gemfire cluster.

**Table 1572: Gemfire cluster Metrics for the Cluster**

| Metric Key | Metric Name | Description |
|---|---|---|
| GemfireCluster\|System\|AvgReads | Average reads per second | The average number of reads per second for all members |
| GemfireCluster\|System\|AvgWrites | Average writes per second | The average number of writes per second for all members |
| GemfireCluster\|System\|DiskReadsRate | Disk reads rate | The average number of disk reads per second across all distributed members |
| GemfireCluster\|System\|DiskWritesRate | Disk writes rate | The average number of disk writes per second across all distributed members |
| GemfireCluster\|System\|GarbageCollectionCount | Total garbage collection count | The total garbage collection count for all members |
| GemfireCluster\|System\|GarbageCollectionCountDelta | New garbage collection count | The new garbage collection count for all members |
| GemfireCluster\|System\|JVMPauses | JVM pause count | The number of detected JVM pauses |
| GemfireCluster\|System\|JVMPausesDelta | New JVM pause count | The number of new detected JVM pauses |
| GemfireCluster\|System\|DiskFlushAvgLatency | Disk flush average latency | Disk flush average latency (msec) |
| GemfireCluster\|System\|NumRunningFunctions | Number of running functions | The number of map-reduce jobs currently running on all members in the distributed system |
| GemfireCluster\|System\|NumClients | Number of clients | The number of connected clients |
| GemfireCluster\|System\|TotalHitCount | Total hit count | Total number of cache hits for all regions |
| GemfireCluster\|System\|TotalHitCountDelta | New hit count | Number of new cache hits for all regions |
| GemfireCluster\|System\|TotalMissCount | Total miss count | The total number of cache misses for all regions |
| GemfireCluster\|System\|TotalMissCountDelta | New miss count | Number of new cache misses for all regions |
| GemfireCluster\|System\|Member\|FreeSwapSpace | Swap space free | Swap space free (MB) |
| GemfireCluster\|System\|Member\|TotalSwapSpace | Swap space total | Swap space total (MB) |
| GemfireCluster\|System\|Member\|CommittedVirtualMemorySize | Committed virtual memory size | Committed virtual memory size (MB) |
| GemfireCluster\|System\|Member\|SystemLoadAverage | System load average | System load average |

| Metric Key | Metric Name | Description |
|---|---|---|
| GemfireCluster\|System\|Member\|FreePhysicalMemory | Free physical memory | Free physical memory (MB) |
| GemfireCluster\|System\|Member\|TotalPhysicalMemory | Total physical memory | Total physical memory (MB) |
| GemfireCluster\|System\|Member\|CacheListenerCallsAvgLatency | Average cache listener calls latency | Average cache listener calls latency (msec) |
| GemfireCluster\|System\|Member\|CacheWriterCallsAvgLatency | Average cache writer calls latency | Average cache writer calls latency (msec) |
| GemfireCluster\|System\|Member\|DeserializationAvgLatency | Average deserialization latency | Average deserialization latency (msec) |
| GemfireCluster\|System\|Member\|FunctionExecutionRate | Function executions per second | Function executions per second |
| GemfireCluster\|System\|Member\|JVMPauses | Number of JVM pauses | Number of JVM pauses |
| GemfireCluster\|System\|Member\|NumRunningFunctions | Number of running functions | Number of running functions |
| GemfireCluster\|System\|Member\|PutsRate | Puts per second | Puts per second |
| GemfireCluster\|System\|Member\|GetsRate | Gets per second | Gets per second |
| GemfireCluster\|System\|Member\|GetsAvgLatency | Average gets latency | Average gets latency (msec) |
| GemfireCluster\|System\|Member\|PutsAvgLatency | Average puts latency | Average puts latency (msec) |
| GemfireCluster\|System\|Member\|SerializationAvgLatency | Average serialization latency | Average serialization latency (msec) |
| GemfireCluster\|System\|Member\|Disk\|DiskFlushAvgLatency | Flush average latency | Flush average latency (msec) |
| GemfireCluster\|System\|Member\|Disk\|DiskReadsRate | Average reads per second | Average reads per second |
| GemfireCluster\|System\|Member\|Disk\|DiskWritesRate | Average writes per second | Average writes per second |
| GemfireCluster\|System\|Member\|Network\|BytesReceivedRate | Average received bytes per second | Average received bytes per second |
| GemfireCluster\|System\|Member\|Network\|BytesSentRate | Average sent bytes per second | Average sent bytes per second |
| GemfireCluster\|System\|Member\|JVM\|GCTimeMillis | Garbage Collection time | Total amount of time spent on garbage collection |
| GemfireCluster\|System\|Member\|JVM\|GCTimeMillisDelta | New Garbage Collection time | New amount of time spent on garbage collection |
| GemfireCluster\|System\|Member\|JVM\|TotalThreads | Total threads | Total threads |
| GemfireCluster\|System\|Member\|JVM\|CommitedMemory | Committed Memory | Committed Memory (MB) |
| GemfireCluster\|System\|Member\|JVM\|MaxMemory | Max Memory | Max Memory (MB) |
| GemfireCluster\|System\|Member\|JVM\|UsedMemory | Used Memory | Used Memory (MB) |

| Metric Key | Metric Name | Description |
|---|---|---|
| GemfireCluster\|Region\|SystemRegionEntryCount | Entry Count | Entry Count |
| GemfireCluster\|Region\|DestroyRate | Destroys per second | Destroys per second |
| GemfireCluster\|Region\|CreatesRate | Creates per second | Creates per second |
| GemfireCluster\|Region\|GetsRate | Gets per second | Gets per second |
| GemfireCluster\|Region\|BucketCount | Bucket count | Bucket count |
| GemfireCluster\|Region\|AvgBucketSize | Average number of entries per bucket | Average number of entries per bucket |
| GemfireCluster\|Region\|Member\|ActualRedundancy | Actual redundancy | Actual redundancy |
| GemfireCluster\|Region\|Member\|BucketCount | Bucket count | Bucket count |
| GemfireCluster\|Region\|Member\|AvgBucketSize | Average number of entries per bucket | Average number of entries per bucket |
| GemfireCluster\|Region\|Member\|CreatesRate | Creates per second | Creates per second |
| GemfireCluster\|Region\|Member\|GetsRate | Gets per second | Gets per second |
| GemfireCluster\|Region\|Member\|DestroyRate | Destroys per second | Destroys per second |
| GemfireCluster\|Region\|Member\|MissCount | Number of misses count | Number of cache misses |
| GemfireCluster\|Region\|Member\|MissCountDelta | Number of new cache misses | Number of new cache misses |
| GemfireCluster\|Region\|Member\|HitCount | Number of hits count | Number of cache hits |
| GemfireCluster\|Region\|Member\|HitCountDelta | Number of new cache hits | Number of new cache hits |

## Threshold Checking Metrics

Threshold checking metrics check the processed and computed metrics for the cluster.

### Table 1573: Threshold Checking Metrics for the Cluster

| Metric Key | Metric Name | Description |
|---|---|---|
| ThresholdChecking\|ProcessedMetricCount | Number of processed metrics | Number of processed metrics |
| ThresholdChecking\|ProcessedMetricRate | Received metric processing rate (per second) | Received metric processing rate (per second) |
| ThresholdChecking\|ComputedMetricCount | Number of computed metrics | Number of computed metrics |
| ThresholdChecking\|ComputedMetricRate | Computed metric processing rate (per second) | Computed metric processing rate (per second) |

## Memory Metrics

Memory metrics provide memory CPU use information for the cluster.

### Table 1574: Memory Metrics for the Cluster

| Metric Key | Metric Name | Description |
|---|---|---|
| Memory\|AvgFreePhysicalMemory | Average free physical memory | Average free physical memory (GB) |
| Memory\|TotalFreePhysicalMemory | Free physical memory | Free physical memory (GB) |
| Memory\|TotalMemory | Total Available Memory | Total Available Memory (GB) |
| Memory\|TotalUsedMemory | Actual Used Memory | Actual Used Memory (GB) |

| Metric Key | Metric Name | Description |
|---|---|---|
| Memory\|TotalDemandMemory | Memory Demand | Memory Demand (GB) |

### Elastic Memory Metrics

Elastic memory metrics provide reclaimable memory CPU use information for the cluster.

**Table 1575: Memory Metrics for the Cluster**

| Metric Key | Metric Name | Description |
|---|---|---|
| ElasticMemory\|TotalMemory | Total Available Memory | Total Available Memory (GB) |
| ElasticMemory\|TotalUsedMemory | Actual Used Memory | Actual Used Memory (GB) |
| ElasticMemory\|TotalDemandMemory | Memory Demand | Memory Demand (GB) |

### CPU Metrics

CPU metrics provide CPU information for the cluster.

**Table 1576: CPU Metrics for the Cluster**

| Metric Key | Metric Name | Description |
|---|---|---|
| cpu\|TotalCombinedUsage | CPU Load | CPU Load |
| cpu\|TotalAvailable | CPU Available | CPU Available |
| cpu\|TotalAvailable_ghz | Available | Available (GHz) |
| cpu\|TotalUsage_ghz | Used | Used (GHz) |
| cpu\|TotalUsage | CPU usage | CPU usage (%) |

### Disk Metrics

Disk metrics provide available disk information for the cluster.

**Table 1577: Disk Metrics for the Cluster**

| Metric Key | Metric Name | Description |
|---|---|---|
| Disk\|DatabaseStorage\|AvgAvailable | Average node disk available | Average node disk available |
| Disk\|DatabaseStorage\|MinAvailable | Minimum node disk available | Minimum node disk available |
| Disk\|DatabaseStorage\|MaxAvailable | Maximum node disk available | Maximum node disk available |
| Disk\|DatabaseStorage\|TotalAvailable | Available | Available |
| Disk\|DatabaseStorage\|Total | Total | Total |
| Disk\|DatabaseStorage\|TotalUsed | Used | Used |
| Disk\|LogStorage\|AvgAvailable | Average node disk available | Average node disk available |
| Disk\|LogStorage\|MinAvailable | Minimum node disk available | Minimum node disk available |
| Disk\|LogStorage\|MaxAvailable | Maximum node disk available | Maximum node disk available |
| Disk\|LogStorage\|TotalAvailable | Available | Available |
| Disk\|LogStorage\|Total | Total | Total |
| Disk\|LogStorage\|TotalUsed | Used | Used |

## Persistence Metrics

VCF Operations collects metrics for various persistence resources or service groups.

### Activity Metrics

Activity metrics relate to the activity framework.

**Table 1578: Activity Metrics for Persistence**

| Metric Key | Metric Name | Description |
|---|---|---|
| Activity\|RunningCount | Number Running | Number Running |
| Activity\|ExecutedCount | Number Executed | Number Executed |
| Activity\|SucceededCount | Number Succeeded | Number Succeeded |
| Activity\|FailedCount | Number Failed | Number Failed |

### Controller XDB Metrics

Controller metrics relate to the primary database.

**Table 1579: Controller XDB Metrics for Persistence**

| Metric Key | Metric Name | Description |
|---|---|---|
| ControllerXDB\|Size | Size | Size (Bytes) |
| ControllerXDB\|TempDBSize | Temporary DB Size | Temporary DB Size (Bytes) |
| ControllerXDB\|TotalObjectCount | Total Object Count | Total Object Count |
| ControllerXDB\|AvgQueryDuration | Average Query Duration | Average Query Duration (ms) |
| ControllerXDB\|MinQueryDuration | Minimum Query Duration | Minimum Query Duration (ms) |
| ControllerXDB\|MaxQueryDuration | Maximum Query Duration | Maximum Query Duration (ms) |
| ControllerXDB\|TotalTransactionCount | Total Transaction Count | Total Transaction Count |
| ControllerXDB\|LockOperationErrorCount | Lock Operation Error Count | Lock Operation Error Count |
| ControllerXDB\|DBCorruptionErrorCount | DB Corruption Error Count | DB Corruption Error Count |
| ControllerXDB\|DBMaxSessionExceededCount | DB Maximum Sessions Exceeded Count | DB Maximum Sessions Exceeded Count |
| ControllerXDB\|NumberWaitingForSession | Number of operations waiting for a session | Number of operations waiting for a session from the session pool |
| ControllerXDB\|AvgWaitForSessionDuration | Average acquisition time from session pool | Average acquisition time from session pool |
| ControllerXDB\|MinWaitForSessionDuration | Minimum acquisition time from session pool | Minimum acquisition time from session pool |
| ControllerXDB\|MaxWaitForSessionDuration | Maximum acquisition time from session pool | Maximum acquisition time from session pool |
| ControllerXDB\|TotalGetSessionCount | Total requests for a session from the session pool | Total requests for a session from the session pool |
| ControllerXDB\|MaxActiveSessionCount | Maximum Concurrent Session Count | Maximum concurrent session count during the past collection interval. |

## Alarm SQL Metrics

Alarm metrics relate to the persistence of alerts and symptoms.

**Table 1580: Alarm XDB Metrics for Persistence**

| Metric Key | Metric Name | Description |
|---|---|---|
| AlarmSQL\|Size | Size (Bytes) | Size (Bytes) |
| AlarmSQL\|AvgQueryDuration | Average Query Duration (ms) | Average Query Duration (ms) |
| AlarmSQL\|MinQueryDuration | Minimum Query Duration (ms) | Minimum Query Duration (ms) |
| AlarmSQL\|MaxQueryDuration | Maximum Query Duration (ms) | Maximum Query Duration (ms) |
| AlarmSQL\|TotalTransactionCount | Total Transaction Count | Total Transaction Count |
| AlarmSQL\|TotalAlarms | Alarm Total Object Count | Alarm Total Object Count |
| AlarmSQL\|TotalAlerts | Alert Total Object Count | Alert Total Object Count |
| AlarmSQL\|AlertTableSize | Alert Table Size | Alert Table Size |
| AlarmSQL\|AlarmTableSize | Alarm Table Size | Alarm Table Size |

## Key Value Store Database (KVDB)

KVDB metrics relate to the persistence of storing key-value data.

| Metric Key | Metric Name | Description |
|---|---|---|
| KVDB\|AvgQueryDuration | Average Query Duration | Average Query Duration |
| KVDB\|MinQueryDuration | Minimum Query Duration | Minimum Query Duration |
| KVDB\|MaxQueryDuration | Maximum Query Duration | Maximum Query Duration |
| KVDB\|TotalTransactionCount | Total Transaction Count | Total Transaction Count |

## Historical Inventory Service XDB Metrics

Historical inventory service metrics relate to the persistence of configuration properties and their changes.

**Table 1581: Historical XDB Metrics for Persistence**

| Metric Key | Metric Name | Description |
|---|---|---|
| HisXDB\|FunctionCalls\|Count HisXDB\|<br>FunctionCalls | Number of Function calls | Number of Function calls |
| HisXDB\|FunctionCalls\|AvgDuration | Average execution time | Average execution time |
| HisXDB\|FunctionCalls\|MaxDuration | Max execution time | Max execution time |
| HisXDB\|Size | Size | Size (Bytes) |
| HisXDB\|TempDBSize | Temporary DB Size | Temporary DB Size (Bytes) |
| HisXDB\|TotalObjectCount | Total Object Count | Total Object Count |
| HisXDB\|AvgQueryDuration | Average Query Duration | Average Query Duration (ms) |
| HisXDB\|MinQueryDuration | Minimum Query Duration | Minimum Query Duration (ms) |
| HisXDB\|MaxQueryDuration | Maximum Query Duration | Maximum Query Duration (ms) |
| HisXDB\|TotalTransactionCount | Total Transaction Count | Total Transaction Count |
| HisXDB\|LockOperationErrorCount | Lock Operation Error Count | Lock Operation Error Count |
| HisXDB\|DBCorruptionErrorCount | DB Corruption Error Count | DB Corruption Error Count |

| Metric Key | Metric Name | Description |
|---|---|---|
| HisXDB\|DBMaxSessionExceededCount | DB Maximum Sessions Exceeded Count | DB Maximum Sessions Exceeded Count |
| HisXDB\|NumberWaitingForSession | Number of operations waiting for a session | Number of operations waiting for a session from the session pool |
| HisXDB\|AvgWaitForSessionDuration | Average acquisition time from session pool | Average acquisition time from session pool |
| HisXDB\|MinWaitForSessionDuration | Minimum acquisition time from session pool | Minimum acquisition time from session pool |
| HisXDB\|MaxWaitForSessionDuration | Maximum acquisition time from session pool | Maximum acquisition time from session pool |
| HisXDB\|TotalGetSessionCount | Total requests for a session from the session pool | Total requests for a session from the session pool |
| HisXDB\|HisActivitySubmissionCount | HIS activity submission count | Number of Historical Inventory Service activities submitted |
| HisXDB\|HisActivityCompletionCount | HIS activity completion count | Number of Historical Inventory Service activities completed |
| HisXDB\|HisActivityCompletionDelayAvg | HIS activity average completion delay | The average amount of time from activity submission to completion |
| HisXDB\|HisActivityCompletionDelayMax | HIS activity maximum completion delay | The maximum amount of time from activity submission to completion |
| HisXDB\|HisActivityAbortedCount | HIS activity abort count | Number of Historical Inventory Service activities stopped |

## VCF Automation Metrics

VCF Automation collects metrics for objects such as, cloud zone, project, deployment, blueprint, cloud account, user, and cloud automation services world Instance.

### Blueprint Metrics

VCF Automation collects metrics for objects such as blueprint object.

**Table 1582: Blueprint Metrics**

| Property Name | Metrics |
|---|---|
| Summary | VMCount |

### Project Metrics

VCF Automation collects metrics for objects such as project object.

**Table 1583: Project Metrics**

| Property Name | Metrics |
|---|---|
| Summary | VMCount |
| Summary | TotalDeployments |
| Summary | TotalCloudZones |
| Summary | TotalBlueprints |

| Property Name | Metrics |
|---|---|
| Summary | Metering\|Additional price |
| Summary | Metering\|CPU Price |
| Summary | Metering\|Memory price |
| Summary | Metering\|Storage Price |
| Summary | Metering\|Total price |

## Deployment Metrics

VCF Automation collects the metrics for the deployment object.

**Table 1584: Deployment Metrics**

| Property Name | Metrics |
|---|---|
| Summary | Metering\|Additional price |
| Summary | Metering\|CPU Price |
| Summary | Metering\|Memory price |
| Summary | Metering\|Storage Price |
| Summary | Metering\|Total price |
| Summary | Metering\|Partial price |

## Organization Metrics

VCF Automation collects the metrics for the organization object.

**Table 1585: Organization Metrics**

| Property Name | Metrics |
|---|---|
| Summary | TotalBlueprints |
| Summary | TotalProjects |
| Summary | VMCount |
| Summary | TotalDeployments |
| Summary | TotalCloudZones |

## VCF Automation Adapter Metrics

VCF Automation collects the metrics for the adapter object.

**Table 1586: VCF Automation Adapter Metrics**

| Property Name | Metrics |
|---|---|
| Summary | TotalCloudZones |
| Summary | VMCount |
| Summary | TotalDeployments |

| Property Name | Metrics |
|---|---|
| Summary | TotalBlueprints |
| Summary | TotalProjects |

## Cloud Automation Services World Metrics

VCF Automation collects the metrics for the Cloud Automation Services world object.

**Table 1587: Cloud Automation Services World Metrics**

| Property Name | Metrics |
|---|---|
| Summary | TotalDeployments |
| Summary | VMCount |
| Summary | TotalCloudZones |
| Summary | TotalProjects |
| Summary | TotalBlueprints |

## Cloud Automation Services Entity Status Metrics

VCF Automation collects the metrics for the Cloud Automation Services (CAS) entity status object.

**Table 1588: Cloud Automation Services Entity Status Metrics**

| Property Name | Metrics |
|---|---|
| Summary | TotalClusters |

## Cloud Zone Metrics

VCF Automation collects memory, storage, and vCPU limit related metrics at project level on per cloud zone basis.

### Cloud Zone Limits Metrics

You can view the memory, storage, and vCPU limit related metrics defined in VCF Automation in VCF Operations. VCF Operations alerts when the utilisation exceeds configured limits in any of the individual cloud zones.

> **Note:**
> The resource limits are configured in VCF Automation. For vCenter objects, limits for all resources - vCPU, memory, and storage - can be configured. However, for public clouds like AWS, Azure, and GCP only vCPU and memory limits can be configured.

**Table 1589: Cloud Zone Limits Metrics**

| Property Name | Metrics | Description |
|---|---|---|
| Cloud Zone Limits | Memory allocated (KB) | This metric displays the total utilized cloud zone memory. |
| | Memory Limit (KB) | This metric displays the limit set on the cloud zone memory usage. |

| Property Name | Metrics | Description |
|---|---|---|
| | Memory Utilized (%) | This metric displays the percentage of memory used out of the memory limit set. Formula ((Memory allocated (KB)/ Memory Limit (KB)) |
| | Storage allocated (GB) | This metric displays the total storage utilized by the cloud zone. |
| | Storage Limit (GB) | This metrics displays the limit set on the cloud zone storage usage. |
| | Storage Utilized (%) | This metric displays the percentage of storage used out of the storage limit set. Formula (Storage allocated (KB)/ Storage Limit (KB)) |
| | vCPU allocated | This metric displays the total vCPU utilized by the cloud zone. |
| | vCPU Limit | This metrics displays the limit set on the cloud zone vCPU usage. |
| | vCPU Utilized (%) | This metric displays the percentage of vCPU used out of the vCPU limit set. Formula (vCPU allocated (KB)/ vCPU Limit (KB)) |

**Summary Metrics for Cloud Zone Centers**

Summary metrics provide information about the VM migration as part of workload planning.

| Metric Name | Description |
|---|---|
| WLP | Displays the VM migration trend as part of workload optimization. These metrics are deactivated by default. You must activate them from policies.<br>• Fail Count: Number of failed VM move attempts in the last daily cycle.<br>• Number of runs: The total number of times the WLP was run during the last daily cycle.<br>• Success Count: The number of successful VM moves during the last daily cycle. |

## Metrics for vSAN

VCF Operations collects metrics for vSAN objects.

From the left menu, click **Inventory** > **Inventory Panel (Detailed View)** > **Integrations** > **All Objects** > **vSAN Adapter**, and then select one of the vSAN adapter objects listed and click the **Metrics** tab.

### Disk I/O and Disk Space Metrics for vSAN Disk Groups

The VCF Operations collects the metrics you use to monitor the performance of your vSAN disk groups.

Disk I/O metrics for the vSAN disk groups include:

- Disk I/O|Reads Per Second (IOPS)
- Disk I/O|Writes Per Second (IOPS
- Disk I/O|Max Observed Reads Per Second (IOPS)
- Disk I/O|Max Observed Writes Per Second (IOPS)

- Disk I/O|Throughput Read (bps)
- Disk I/O|Throughput Write (bps)
- Disk I/O|Average Read Latency (ms)
- Disk I/O|Average Write Latency (ms)
- Disk I/O|Total Bus Resets
- Disk I/O|Total Commands Aborted per second

The following Disk I/O metrics are disabled by default:

- Disk I/O|Read Count
- Disk I/O|Write Count
- Disk I/O|Average Device Latency
- Disk I/O|Average Device Read Latency
- Disk I/O|Average Device Write Latency
- Disk I/O|Total Number of Errors

Disk space metrics for vSAN disk groups include:

- Disk Space|Capacity (bytes)
- Disk Space|Used (bytes)
- Disk Space|Usage (%)

### Read Cache Metrics for vSAN Disk Groups

The VCF Operations collects metrics and performs capacity trend analysis on a hybrid vSAN read cache. Read Cache metrics are not collected for a vSAN all-flash configuration.

Read cache metrics for the vSAN disk group include:

- Read Cache|Hit Rate (%)
- Read Cache|Miss Rate Ratio
- Read Cache|Reads Per Second (IOPS)
- Read Cache|Read Latency (ms)
- Read Cache|Writes Per Second (IOPS)
- Read Cache|Write Latency (ms)

The following read cache metrics are disabled by default:

- Read Cache|Read I/O Count
- Read Cache|Write I/O Count

### Write Buffer Metrics for vSAN Disk Groups

The VCF Operations collects the metrics you use to monitor the write buffer capacity of your vSAN disk groups.

A reasonably balanced system consumes a significant amount of write buffer. Before placing additional workload on the vSAN, check the write buffer metrics for the vSAN disk group.

- Write Buffer|Capacity (bytes)
- Write Buffer|Free (%)
- Write Buffer|Usage (%)
- Write Buffer|Used (byte)
- Write Buffer|Reads Per Second (IOPS)
- Write Buffer|Read Latency (ms)
- Write Buffer|Writes Per Second (IOPS)
- Write Buffer|Write Latency (ms)

The following write buffer metrics are disabled by default:

- Write Buffer|Read I/O Count
- Write Buffer|Write I/O Count

### Congestion Metrics for vSAN Disk Groups

The VCF Operations collects congestion metrics for the vSAN disk group.

- Congestion| Memory Congestion - Favorite
- Congestion| SSD Congestion - Favorite
- Congestion| IOPS Congestion - Favorite
- Congestion| Slab Congestion
- Congestion| Log Congestion
- Congestion| Comp Congestion

### Cache De-stage Metrics for vSAN Disk Groups

The VCF Operations collects cache de-stage metrics for the vSAN disk groups.

Cache de-stage metrics include:

- Bytes De-stage from SSD
- Zero-bytes De-stage

### Resync Traffic Metrics for vSAN Disk Groups

The VCF Operations collects resync traffic metrics for the vSAN disk groups.

Resync traffic metrics include:

- Read IOPS for Resync Traffic
- Write IOPS for Resync Traffic
- Read Throughput for Resync Traffic
- Write Throughput for Resync Traffic
- Read Latency for Resync Traffic
- Write Latency for Resync Traffic

### Metrics for vSAN Cluster

The VCF Operations collects the metrics you use to monitor the performance of your vSAN cluster.

VCF Operations enhances the capacity calculation for vSAN, using the new slack space provided by the new vSAN API. Cost calculation is still done using the old way which reserves 30% memory for Slack Overhead.

Metrics for vSAN cluster include:

| Component | Metrics |
|---|---|
| Component Limit | • vSAN\|Component Limit\|Component Limit Used (%)<br>• vSAN\|Component Limit\|Total Component Limit<br>• vSAN\|Component Limit\|Used Component Limit |
| Disk Space | • vSAN\|Disk Space\|Disk Space Used (%)<br>• vSAN\|Disk Space\|Total Disk Space (GB)<br>• vSAN\|Disk Space\|Used Disk Space (GB)<br>• vSAN\|Disk Space\|Usable Capacity (GB)<br>• vSAN\|Disk Space\|Oversubscription Capacity (GB)<br>• vSAN\|Disk Space\|Oversubscription Ratio<br>**Note:**<br>The oversubscription metrics are applicable only for the vSAN OSA clusters. |
| Health | vSAN\|Health\|Score |
| Read Cache | • vSAN\|Read Cache\|Read Cache Reserved (%)<br>• vSAN\|Read Cache\|Reserved Read Cache Size (GB)<br>• vSAN\|Read Cache\|Total Read Cache Size (GB) |

## Metrics for vSAN Enabled Host

The VCF Operations collects the metrics you use to monitor the performance of your vSAN enabled host.

Metrics for a vSAN enabled host include:

| Component | Metrics |
|---|---|
| Component Limit | • vSAN\|Component Limit\|Component Limit Used (%)<br>• vSAN\|Component Limit\|Total Component Limit<br>• vSAN\|Component Limit\|Used Component Limit |
| Disk Space | • vSAN\|Disk Space\|Disk Space Used (%)<br>• vSAN\|Disk Space\|Total Disk Space (GB)<br>• vSAN\|Disk Space\|Used Disk Space (GB) |
| Read Cache | • vSAN\|Read Cache\|Read Cache Reserved (%)<br>• vSAN\|Read Cache\|Reserved Read Cache Size (GB)<br>• vSAN\|Read Cache\|Total Read Cache Size (GB) |
| Performance Metrics | |

| Component | Metrics |
|---|---|
| • Network | • vSAN\|Performance\|Network\|Inbound Packets Loss Rate<br>• vSAN\|Performance\|Network\|Outbound Packets Loss Rate<br>• vSAN\|Performance\|Network\|<vnic>\|Inbound Packets Loss rate (%)<br>• vSAN\|Performance\|Network\|<vnic>\|Outbound Packets Loss Rate (%)<br>• vSAN\|Performance\|Network\|<vnic>\|Inbound Packets Per second<br>• vSAN\|Performance\|Network\|<vnic>\|Outbound Packets Per second<br>• vSAN\|Performance\|Network\|<vnic>\|Throughput Inbound (KBps)<br>• vSAN\|Performance\|Network\|<vnic>\|Throughput Outbound (KBps) |
| • CPU Utilization | • vSAN \| Performance \| CPU \| Ready (%)<br>• vSAN \| Performance \| CPU \| Usage (%)<br>• vSAN \| Performance \| CPU \| Used (MHz)<br>• vSAN \| Performance \| CPU \| Core Utilization (%) (For Hyper-Threading Technology) |
| • PCPU Utilization | • vSAN \| Performance \| PCPU \| Ready (%)<br>• vSAN \| Performance \| CPU \| PCPU Usage (%) |
| • Memory | • vSAN \| Performance \| Memory \| Usage (%)<br>• vSAN \| Performance \| Memory \| Used (GB) |

### Metrics for vSAN Datastore

The VCF Operations collects the metrics you use to monitor the performance of your vSAN datastore.

Datastore I/O metrics for vSAN datastore include:

- Datastore I/O|Reads Per Second (IOPS)
- Datastore I/O|Read Rate (KBps)
- Datastore I/O|Read Latency (ms)
- Datastore I/O|Writes Per Second (IOPS)
- Datastore I/O|Write Rate (KBps)
- Datastore I/O|Write Latency (ms)
- Datastore I/O|Outstanding I/O requests
- Datastore I/O|Congestion
- Capacity | Usable Capacity

### Metrics for vSAN Cache Disk

The VCF Operations collects the metrics you use to monitor the performance of your vSAN cache disk.

Metrics for vSAN cache disk include:

| Component | Metrics |
|---|---|
| Performance | • Performance\|Bus Resets<br>• Performance\|Commands Aborted Per Second<br>The following performance metrics are disabled by default:<br>• Performance\|Device Latency (ms)<br>• Performance\|Device Read Latency (ms)<br>• Performance\|Device Write Latency (ms)<br>• Performance\|Read Requests Per Second<br>• Performance\|Average Reads Per Second<br>• Performance\|Write Requests Per Second<br>• Performance\|Average Writes Per Second<br>• Performance\|Read Rate<br>• Performance\|Write Rate<br>• Performance\|Usage<br>• Performance\|HDD Errors |
| SCSI SMART Statistics<br>**Note:** SMART data collection is disabled by default. To enable SMART data collection, ensure that the `Enable SMART data collection` instance identifier is set to true. For proper data collection, ensure that ESX hosts in your vCenter Server inventory have CIM service enabled and CIM providers for each SMART metric installed. | • SCSI SMART Statistics\|Health Status<br>• SCSI SMART Statistics\|Media Wearout Indicator<br>• SCSI SMART Statistics\|Write Error Count<br>• SCSI SMART Statistics\|Read Error Count<br>• SCSI SMART Statistics\|Power on Hours<br>• SCSI SMART Statistics\|Reallocated Sector Count<br>• SCSI SMART Statistics\|Raw Read Error Rate<br>• SCSI SMART Statistics\|Drive Temperature<br>• SCSI SMART Statistics\|Maximum Observed Drive Temperature<br>• SCSI SMART Statistics\|Drive Rated Max Temperature<br>• SCSI SMART Statistics\|Write Sectors TOT Count<br>• SCSI SMART Statistics\|Read Sectors TOT Count<br>• SCSI SMART Statistics\|Initial Bad Block Count<br>• SCSI SMART Statistics\|Worst Media Wearout Indicator<br>• SCSI SMART Statistics\|Worst Write Error Count<br>• SCSI SMART Statistics\|Worst Read Error Count<br>• SCSI SMART Statistics\|Worst Power-on Hours<br>• SCSI SMART Statistics\|Power Cycle Count<br>• SCSI SMART Statistics\|Worst Power Cycle Count<br>• SCSI SMART Statistics\|Worst Reallocated Sector Count<br>• SCSI SMART Statistics\|Worst Raw Read Error Rate<br>• SCSI SMART Statistics\|Worst Driver Rated Max Temperature<br>• SCSI SMART Statistics\|Worst Write Sectors TOT Count<br>• SCSI SMART Statistics\|Worst Read Sectors TOT Count<br>• SCSI SMART Statistics\|Worst Initial Bad Block Count |
| Capacity | • vSAN\|Health\|Capacity\|Total Disk Capacity (GB)<br>• vSAN\|Health\|Capacity\|Used Disk Capacity (GB) |
| Congestion Health | • vSAN\|Health\|Congestion Health\|Congestion Value |

| Component | Metrics |
| --- | --- |
| Performance | • vSAN\|Performance\|Physical Layer Reads Per Second<br>• vSAN\|Performance\|Physical Layer Writes Per Second<br>• vSAN\|Performance\|Physical Layer Read Throughput (KBps)<br>• vSAN\|Performance\|Physical Layer Write Throughput (KBps)<br>• vSAN\|Performance\|Physical Layer Read Latency (ms)<br>• vSAN\|Performance\|Physical Layer Write Latency (ms)<br>• vSAN\|Performance\|Physical Layer Read Count<br>• vSAN\|Performance\|Physical Layer Write Count<br>• vSAN\|Performance\|Device Average Latency (ms)<br>• vSAN\|Performance\|Guest Average Latency (ms) |

### Metrics for vSAN Capacity Disk

The VCF Operations collects the metrics you use to monitor the performance of your vSAN capacity disk.

Metrics for vSAN capacity disk include:

| Component | Metrics |
|---|---|
| Performance | • Performance\|Bus Resets<br>• Performance\|Commands Aborted Per Second<br>The following performance metrics are disabled by default:<br>•<br>• Performance\|Device Latency (ms)<br>• Performance\|Device Read Latency (ms)<br>• Performance\|Device Write Latency (ms)<br>• Performance\|Read Requests Per Second<br>• Performance\|Average Reads Per Second<br>• Performance\|Write Requests Per Second<br>• Performance\|Average Writes Per Second<br>• Performance\|Read Rate<br>• Performance\|Write Rate<br>• Performance\|Usage<br>• Performance\|HDD Errors |
| SCSI SMART Statistics<br>**Note:**<br>SMART data collection is disabled by default. To enable SMART data collection, ensure that the `Enable SMART data collection` instance identifier is set to true. For proper data collection, ensure that ESX hosts in your vCenter Server inventory have CIM service enabled and CIM providers for each SMART metric installed. | • SCSI SMART Statistics\|Health Status<br>• SCSI SMART Statistics\|Media Wearout Indicator<br>• SCSI SMART Statistics\|Write Error Count<br>• SCSI SMART Statistics\|Read Error Count<br>• SCSI SMART Statistics\|Power on Hours<br>• SCSI SMART Statistics\|Reallocated Sector Count<br>• SCSI SMART Statistics\|Raw Read Error Rate<br>• SCSI SMART Statistics\|Drive Temperature<br>• SCSI SMART Statistics\|Maximum Observed Drive Temperature<br>• SCSI SMART Statistics\|Drive Rated Max Temperature<br>• SCSI SMART Statistics\|Write Sectors TOT Count<br>• SCSI SMART Statistics\|Read Sectors TOT Count<br>• SCSI SMART Statistics\|Initial Bad Block Count<br>• SCSI SMART Statistics\|Worst Media Wearout Indicator<br>• SCSI SMART Statistics\|Worst Write Error Count<br>• SCSI SMART Statistics\|Worst Read Error Count<br>• SCSI SMART Statistics\|Worst Power-on Hours<br>• SCSI SMART Statistics\|Power Cycle Count<br>• SCSI SMART Statistics\|Worst Power Cycle Count<br>• SCSI SMART Statistics\|Worst Reallocated Sector Count<br>• SCSI SMART Statistics\|Worst Raw Read Error Rate<br>• SCSI SMART Statistics\|Worst Driver Rated Max Temperature<br>• SCSI SMART Statistics\|Worst Write Sectors TOT Count<br>• SCSI SMART Statistics\|Worst Read Sectors TOT Count<br>• SCSI SMART Statistics\|Worst Initial Bad Block Count |
| Capacity | • vSAN\|Health\|Total Disk Capacity (GB)<br>• vSAN\|Health\|Used Disk Capacity (GB)<br>• vSAN\|FileServices\|FileSharesUsedDiskSpace<br>• vSAN\|FileServices\|RootFsUsedDiskSpace |
| Congestion Health | vSAN\|Health\|Congestion Value |

| Component | Metrics |
|---|---|
| Performance | • vSAN\|Performance\|Physical Layer Reads Per Second<br>• vSAN\|Performance\|Physical Layer Writes Per Second<br>• vSAN\|Performance\|Physical Layer Read Throughput (KBps)<br>• vSAN\|Performance\|Physical Layer Write Throughput (KBps)<br>• vSAN\|Performance\|Physical Layer Read Latency (ms)<br>• vSAN\|Performance\|Physical Layer Write Latency (ms)<br>• vSAN\|Performance\|Physical Layer Read Count<br>• vSAN\|Performance\|Physical Layer Write Count<br>• vSAN\|Performance\|Device Average Latency (ms)<br>• vSAN\|Performance\|Guest Average Latency (ms)<br>• vSAN\|Performance\|vSAN Layer Reads Per Second<br>• vSAN\|Performance\|vSAN Layer Writes Per Second<br>• vSAN\|Performance\|vSAN Layer Read Latency (ms)<br>• vSAN\|Performance\|vSAN Layer Write Latency (ms)<br>• vSAN\|Performance\|vSAN Layer Read Count<br>• vSAN\|Performance\|vSAN Layer Write Count<br>• vSAN \| Performance \| vSAN Layer Total IOPS |

Properties for vSAN capacity disk include:

- Name
- Size
- Vendor
- Type
- Queue Depth

### Metrics for vSAN Fault Domain Resource Kind

The VCF Operations collects the metrics you use to monitor the performance of your vSAN stretched cluster with fault domain.

Metrics for vSAN fault domain resource kind includes:

- CPU
  - Demand
    - Demand (MHz)
    - Demand without overhead (MHz)
    - Overhead (MHz)
    - Reserved Capacity (MHz)
    - Total Capacity (MHz)
    - VM CPU Usage (MHz)
    - Workload (%)
- Disk Space
  - Demand
    - Workload (%)
- Memory
  - Contention (KB)
  - Demand
    - Host Usage (KB)
    - Machine Demand (KB)
    - Reserved Capacity (KB)
    - Total Capacity (KB)
    - Utilization (KB)

    - Workload (%)
- vSAN
  - Disk Space
    - Total Disk Space (GB)
    - Used Disk Space (GB)

### Metrics for vSAN World

The VCF Operations collects the metrics you use to monitor the performance of your vSAN world.

Metrics for vSAN world include:

- Summary|Total Number of VMs
- Summary|Total Number of Hosts
- Summary|Total IOPS
- Summary|Total Latency
- Summary|Total Number of Clusters
- Summary|Total Number of DiskGroups
- Summary|Total Number of Cache Disks
- Summary|Total Number of Capacity Disks
- Summary|Total Number of Datastores
- Summary|Total vSAN Disk Capacity (TB)
- Summary|Total vSAN Disk Capacity Used (TB)
- Summary|Remaining Capacity (TB)
- Summary|Remaining Capacity (%)
- Summary|Total Savings by Deduplication and Compression (GB)

### Metrics for vSAN File Server

The VCF Operations collects the metrics you use to monitor the performance of your vSAN File Server.

Metrics for vSAN File Server

| Component | Metrics |
|---|---|
| File Server | • vSAN \| Disk Space File Shares Used Disk Space (GB)<br>• vSAN \| Summary \| File Shares Count |

### Metrics for vSAN File Share

The VCF Operations collects the metrics you use to monitor the performance of your vSAN File Share.

Metrics for vSAN File Share

| Component | Metrics |
|---|---|
| Disk Space | • vSAN \| Disk Space \| Used Disk Space (GB) |
| Read Performance | • vSAN \| Performance \| Read Throughput Requested (MBps)<br>• vSAN \| Performance \| Read Throughput Transferred (MBps)<br>• vSAN \| Performance \| Read IOPS<br>• vSAN \| Performance \| Read Latency (ms) |

| Component | Metrics |
| --- | --- |
| Write Performance | • vSAN \| Performance \| Write Throughput Requested (MBps)<br>• vSAN \| Performance \| Write Throughput Transferred (MBps)<br>• vSAN \| Performance \| Write IOPS<br>• vSAN \| Performance \| Write Latency (ms) |

## Capacity Model for vSAN Objects

The capacity model introduced in VCF Operations 6.7 now extends the support for vSAN objects like, vSAN cluster, Fault domains, and Cache/Capacity disks. The Capacity tab provides Time Remaining data for the selected vSAN cluster, Fault domain, Cache/Capacity Disk objects. The information is presented in a graphical format.

### Where You Find the Capacity Tab

In the menu, click **Environment**, then select a group, custom data center, application, or inventory object. The Object details page appears. Click the **Capacity** tab.

The VCF Operations defines the capacity model for the following vSAN resource containers:

- vSAN Cluster
  - Disk Space
- vSAN Fault Domain
  - CPU
  - Memory
  - Disk Space
- vSAN Cache/Capacity Disk
  - Disk Space

### Understanding the Capacity Tab

For the selected vSAN resource, the capacity tab lists the capacity used and Time Remaining until the associated CPU, memory, and disk space resources, respectively, run out.

- If you select the vSAN cluster, the capacity tab lists the capacity used and time remaining until the associated disk space runs out.
- If you select the vSAN Fault Domain, the capacity tab lists the capacity used and time remaining until the associated CPU, memory, and disk space resources run out.
- If you select the vSAN Cache/Capacity Disk Space, the capacity tab lists capacity used and time remaining until the associated disk space runs out.

The available graph depicts - for your choice of CPU, memory, or disk space - the amount of resource used, plotted against time. A line on the graph shows 100 percent usable capacity and a trend line projects how swiftly resource use is approaching 100 percent. The time line shows when the selected resource is to reach capacity.

## Metrics for vSAN Storage Pool

The VCF Operations collects the metrics you use to monitor the performance of your vSAN storage pool.

| Component | Metrics |
|---|---|
| Disk I/O | • Disk I/O\|Physical Layer Read Latency (µs)<br>• Disk I/O\|Physical Layer Write Latency (µs)<br>• Disk I/O\|Physical Layer Read IOPS<br>• Disk I/O\|Physical Layer Write IOPS<br>• Disk I/O\|Physical Layer Read Throughput (KBps)<br>• Disk I/O\|Physical Layer Write Throughput (KBps)<br>• Disk I/O\|Total Bus Resets<br>• Disk I/O\|Total IOPS Aborted<br>• Disk I/O\|Number of Errors |
| Disk Space | • Disk Space\|Capacity (bytes)<br>• Disk Space\|Usage (%)<br>• Disk Space\|Used (bytes)<br>• Disk Space\|Workload(%) |

## Metrics for vSAN ESA Disk

The VCF Operations collects the metrics you use to monitor the performance of your vSAN ESA disk.

| Component | Metrics |
|---|---|
| vSAN Health\|Capacity | • vSAN\|Health\|Capacity\|Total Disk Capacity (GB)<br>• vSAN\|Health\|Capacity\|Used Disk Capacity (GB)<br>• vSAN\|Health\|Capacity\|Used Disk Capacity (%)<br>• Disk I/O\|Physical Layer Write IOPS<br>• Disk I/O\|Physical Layer Read Throughput (KBps)<br>• Disk I/O\|Physical Layer Write Throughput (KBps)<br>• Disk I/O\|Total Bus Resets<br>• Disk I/O\|Total IOPS Aborted<br>• Disk I/O\|Number of Errors |
| vSAN Health\|Congestion | vSAN Health\|Congestion Health\|Congestion Value |
| vSAN Performance | • vSAN\|Performance\|Physical Layer Read IOPS<br>• vSAN\|Performance\|Physical Layer Write IOPS<br>• vSAN\|Performance\|Physical Layer Read Throughput (KBps)<br>• vSAN\|Performance\|Physical Layer Write Throughput (KBps)<br>• vSAN\|Performance\|Physical Layer Read Latency (µs)<br>• vSAN\|Performance\|Physical Layer Write Latency (µs)<br>• vSAN\|Performance\|Physical Layer Read Count<br>• vSAN\|Performance\|Physical Layer Write Count<br>• vSAN\|Performance\|Device Latency (µs)<br>• vSAN\|Performance\|Guest Latency (µs)<br>• vSAN\|Performance\|vSAN Layer Read IOPS<br>• vSAN\|Performance\|vSAN Layer Write IOPS<br>• vSAN\|Performance\|vSAN Layer Total IOPS<br>• vSAN\|Performance\|vSAN Layer Average Read Latency (µs)<br>• vSAN\|Performance\|vSAN Layer Average Write Latency (µs)<br>• vSAN\|Performance\|vSAN Layer Read Throughput (KBps)<br>• vSAN\|Performance\|vSAN Layer Write Throughput (KBps) |

## Metrics in NSX Adapter

The NSX adapter collects metrics for objects within its plug-in.

**Table 1590: Metrics in the NSX On-Premise**

| Resource | Metrics | Metric Keys |
|---|---|---|
| Management Cluster | System Capacity<br>• Max Supported Count<br>• Max Threshold Percentage<br>• Min Threshold Percentage<br>• Usage Count<br>• Usage Count Percentage<br>• Severity | System Capacity Keys<br>• System Capacity\|<Object_Kind>\|MaxSupportedCount<br>• System Capacity\|<Object_Kind>\|MaxThresholdPercentage<br>• System Capacity\|<Object_Kind>\|MinThresholdPercentage<br>• System Capacity\|<Object_Kind>\|UsageCount<br>• System Capacity\|<Object_Kind>\|UsageCountPercentage<br>• System Capacity\|<Object_Kind>\|Severity |
| Transport Node | • CPU\|<br>– CPU Cores<br>– DPDK CPU Cores<br>– DPDK CPU Core Average Usage<br>– DPDK CPU Core Highest Usage<br>– Non-DPDK CPU Core Average Usage<br>– Non-DPDK CPU Core Highest Usage<br>• Memory<br>– Total<br>– Used<br>– Cache<br>– Total Swap<br>– Used Swap | • CPU Metric Keys<br>– Cpu\|Cores<br>– Cpu\|DPDKCores<br>– Cpu\|AvgDpdkCpuCoreUsage<br>– Cpu\|HighDpdkCpuCoreUsage<br>– Cpu\|AvgNonDpdkCpuCoreUsage<br>– Cpu\|HighNonDpdkCpuCoreUsage<br>• Memory metric keys<br>– Memory\|Total<br>– Memory\|Used<br>– Memory\|Cache<br>– Memory\|Total Swap<br>– Memory\|Used Swap |

| Logical Switch Group | Configuration Maximums<br>• Logical Segment Count<br>• Extended Network Count | Metric Keys<br>• configMax\|LogicalSegmentCount<br>• configMax\|ExtendedNetworkcount<br>**Note:**<br>The metric (configMax\|ExtendedNetworkcount) is only for NSX on VMware Cloud on AWS. For NSX on-premise, its value is zero. |

## Green Score Metrics

Green Score metrics are collected for virtual machine, host system, cluster compute resource, vSphere World, and Organization object types.

### Metric Names

| Metric Name | Object Type | Description |
|---|---|---|
| Power\|Total Energy (Wh) | Virtual Machine | Total energy used.<br>Formula:<br>Total Energy (Wh) = Sum(Power\|Energy (Joule))/3600 |
| Power\|Total Energy (Wh) | Host System | Total energy used.<br>Formula:<br>Total Energy (Wh) = Sum(Power\|Energy (Joule))/3600 |
| Sustainability\|$CO_2$ Emission (kg) | Cluster Compute Resource | Estimated carbon dioxide emissions. Calculated as power consumption* $CO_2$ Emission rate<br>Formula:<br>$CO_2$ Emission (kg) = Sum(Host System(Power\|Total Energy(Wh)))/1000 * 0.672 |
| Sustainability\|$CO_2$ Emission before Virtualization (kg) | Cluster Compute Resource | Estimated carbon dioxide emissions before virtualization, assuming that power consumption per physical server is 100W, reflecting a low end hardware specification.<br>Formula:<br>$CO_2$ Emission before Virtualization (kg) = Summary\|Number of Running VMs * 0.1 * 0.672 |
| Sustainability\|$CO_2$ Emission by Idle VMs (kg) | Cluster Compute Resource | Total estimated carbon dioxide emission from all idle VMs. Calculated as $CO_2$ emission rate * Power consumed by Idle VMs, where the rate is set at cluster property / 1000.<br>Formula:<br>$CO_2$ Emission by Idle VMs (kg) = Sum(VM(Power\|Total Energy (Wh)), If VM(Summary\|Reclaimable Idle = 1) * 0.672<br>OR<br>$CO_2$ Emission by Idle VMs (kg) = Power Wasted by Idle VMs (Wh) * 0.672 |

| Metric Name | Object Type | Description |
|---|---|---|
| Sustainability\|Electricity Cost Savings | Cluster Compute Resource | Estimated cost savings by virtualizing workloads. Calculated from the difference between power consumption before virtualization and after virtualization. The electricity cost is defined at the cluster custom property.<br>Formula:<br>Electricity Cost Savings = (Summary\|Number of Running VMs * 0.1 - Sum(Host System(Power\|Total Energy(Wh)))/1000) * 0.108<br>OR<br>Daily Electricity Cost Savings = (Summary\|Number of Running VMs * 0.1 - Power usage (kWh)) * 0.108 |
| Sustainability\|Power usage (kWh) | Cluster Compute Resource | Power usage calculated from all hosts in kWh.<br>Formula:<br>Power usage (kWh) = Sum(Host System(Power\|Total Energy(Wh))/1000 |
| Sustainability\|Power usage per GHz (Wh) | Cluster Compute Resource | Power used per GHz of processing power. This is a metric of how power-efficient your CPUs are.<br>Formula:<br>Power usage per GHz (Wh) = Sum(Host System(Power\|Total Energy(Wh))/CPU\|Usage (MHz)/1000 |
| Sustainability\|Power Wasted by Idle VMs (Wh) | Cluster Compute Resource | Sum of electricity power used by all VMs classified as idle by the system.<br>Formula:<br>Power Wasted by Idle VMs (Wh) = Sum(VM(Power\|Total Energy (Wh)), If VM(Summary\|Reclaimable Idle = 1) |
| Sustainability\|$CO_2$ Emission (kg) | vSphere World | Total estimated carbon dioxide emissions. Calculated as sum of carbon emission from all clusters.<br>Formula:<br>$CO_2$ Emission (kg) = Sum(Cluster(Sustainability\|$CO_2$ Emission (kg)) |
| Sustainability\|$CO_2$ Emission before Virtualization (kg) | vSphere World | Total estimated carbon dioxide emissions before virtualization. Calculated as the sum of $CO_2$ emission from all clusters.<br>Formula:<br>$CO_2$ Emission before Virtualization (kg) = Sum(Cluster(Sustainability\|$CO_2$ Emission before Virtualization (kg))) |
| Sustainability\|$CO_2$ Emission Avoided (t) | vSphere World | Estimated amount of carbon emissions avoided with virtualization. Calculated by difference in values of carbon emissions before and after virtualization and converting value in kg to Tonnes.<br>Formula:<br>$CO_2$ Emission Avoided (t) = ($CO_2$ Emission before Virtualization (kg) - $CO_2$ Emission (kg)) / 1000 |

| Metric Name | Object Type | Description |
|---|---|---|
| Sustainability\|Electricity Cost Savings | vSphere World | Total estimated cost savings by virtualizing workloads at vSphere World. Calculated as the sum of Electricity cost savings.<br>Formula:<br>Electricity Cost Savings = Sum(Cluster(Daily Electricity Cost Savings)) |
| Sustainability\|Power Savings with Virtualization (%) | vSphere World | Percentage of power savings achieved by virtualization. Calculated by Formula = (Power usage before Virtualization - Power usage after Virtualization)/Power usage before Virtualization *100.<br>Formula:<br>Power Savings with Virtualization (%) =( Power usage Before Virtualization (kWh) - Power usage (kWh) ) / Power usage Before Virtualization (kWh) * 100 |
| Sustainability\|Power usage (kWh) | vSphere World | Power usage calculated from all hosts in kWh.<br>Formula:<br>Power usage (kWh) = Sum(Host System(Power\|Total Energy(Wh)))/1000 |
| Sustainability\|Power usage Before Virtualization (kWh) | vSphere World | Power usage assuming that each low range server consumes 0.1 kWh.<br>Formula:<br>Power usage Before Virtualization (kWh) = Summary\|Number of Running VMs * 0.1 |
| Sustainability\|Power Wasted by Idle VMs (Wh) | vSphere World | Sum of electricity power used by all VMs classified as idle by the system.<br>Formula:<br>Power Wasted by Idle VMs (Wh) = Sum((VM(Power\|Total Energy (Wh)), If VM(Summary\|Reclaimable Idle = 1)) |
| Sustainability\|Adjusted Score\|Workload Efficiency (%) | Organization | Indicates efficiency based on resource wastage in the virtual environment.<br>Formula:<br>Workload Efficiency (%) = 100 - (Wastage/ Usage Ratio CPU + Wastage/Usage Ratio Memory + Wastage/Usage Ratio Disk) * 100 / 3 |
| Sustainability\|Adjusted Score\|Hardware Efficiency (%) | Organization | Indicates efficiency of hardware in the environment, based on the age of the hardware with the assumption that newer hardware is more energy efficient than older hardware.<br>Formula:<br>Hardware Efficiency (%) = ((10 - Average Age of Servers)/ 10 * 30%) +((10 - Average Age of Storage)/ 10 * 30%) + ((10 - Average Age of Network)/ 10 * 20%) + ((10 - Average Age of Desktop)/ 10 * 20%)<br>The Average age of hardware variables in the formula is provided in the **Organization Details** page. |

| Metric Name | Object Type | Description |
|---|---|---|
| Sustainability\|Adjusted Score\|Resource Utilization (%) | Organization | Indicates utilization levels of the physical resources in the environment.<br>Formula:<br>Resource Utilization (%) = (Virtualized Server (%) * 44.45%) + (Virtualized Storage (%) * 33.33%) + (Virtualized Network (%) * 22.22%) |
| Sustainability\|Adjusted Score\|Virtualization (%) | Organization | Indicates the extent of virtualization in the environment.<br>Formula:<br>Virtualization (%) = (Server Virtualization (%) * 0.4) + (Storage Virtualization (%) * 0.3) + (Network Virtualization (%) * 0.2) + (Desktop Virtualization (%) * 0.1) |
| Sustainability\|Adjusted Score\|Power Source (%) | Organization | Indicates the sources of power being used in the environment. Assumes usage of renewable energy sources leads to less carbon emissions.<br>Formula:<br>Power Source Efficiency (%) = Sum(Adjusted Scores of each Power Source)<br>Adjusted Scores of Power Source = Power Source Green Factor * Power Source Share in Organization |
| Sustainability\|Hardware Utilization\|Server (%) | Organization | Indicates server utilization levels.<br>Formula:<br>Virtualized Server (%) = ((Total ESX Hosts CPU Utilization (GHz) / Total ESX Hosts CPU Capacity (GHz)) + (Total ESX Hosts Memory Utilization (TB) / Total ESX Hosts Memory Capacity (TB))) / 2 |
| Sustainability\|Hardware Utilization\|Storage (%) | Organization | Indicates storage utilization levels.<br>Formula:<br>Virtualized Storage (%) = (Total datastores utilization + Total RDM) / (Total datastores capacity + Total RDM + Physical Disk Overhead) |
| Sustainability\|Green Score (%) | Organization | A score that indicates how energy efficient your data center is.<br>Formula:<br>Green Score (%) = (Workload Efficiency (%) * 22.5%) + (Resource Utilization (%) * 12.5%) + (Virtualization Adoption (%) * 15%) + (Power Source Efficiency (%) * 37.5%) + (Hardware Power Efficiency (%) * 12.5%) |
| Sustainability\|Power Usage (kWh) | Organization | Sum of the power usage across all the clusters in the environment.<br>Formula:<br>Power Consumption = Sum ( (Cluster) Sustainability\|Power Usage (kWh) ) |
| Sustainability\|$CO_2$ Emission (kg) | Organization | Total estimated carbon emissions in the environment based on power consumed.<br>Formula:<br>$CO_2$ Emission = Power Consumption * $CO_2$ Emission Ratio |

| Metric Name | Object Type | Description |
|---|---|---|
| Sustainability\|Workload Efficiency\|Idle VM Count | Organization | Number of Idle VMs, which are considered idle based on the Reclamation Idleness settings. |
| Sustainability\|Workload Efficiency\| Orphaned Disk Space (GB) | Organization | The aggregated size of all orphaned disks which are reclaimable based on the Orphaned Disk Reclamation settings. |
| Sustainability\|Workload Efficiency\| Oversized VM Count | Organization | Number of Oversized VMs, which are considered oversized by the capacity engine recommendation and are not in the Power Off state. |
| Sustainability\|Workload Efficiency\|Powered Off VM Count | Organization | The number of VMs which have been in the Powered Off state for the last 7 days. The number of days (7) can be configured from the Reclamation Settings. |
| Sustainability\|Workload Efficiency\|Snapshot Disk Space (GB) | Organization | The aggregated size of all snapshots which are reclaimable based on the Snapshot Reclamation settings. |

**Disclaimer:**

The conversion calculators and information shown in this documentation reference public information and have been provided to help translate abstract carbon emissions numbers into easily understandable terms solely for informational purposes. You should not rely on the calculators or information provided herein for any other purpose, including for any regulatory disclosure or diligence purposes. Broadcom may update, upgrade, revise, adjust or otherwise change the features and conversion methodologies at any time. Broadcom has not separately reviewed, approved, or endorsed the public information or third-party websites. No representation or warranty is made by Broadcom as to the accuracy, reasonableness or completeness of the calculations and related information herein.

## Metrics for Policies

Each policy is an object in VCF Operations. This allows you to track every change in the policy and create any dashboard, report, or alert on policy usage distribution.

VCF Operations collects metrics for the object type 'Policy'.

| Metric Key | Metric Name | Description |
|---|---|---|
| NumberOfEffectiveObjects | Number of Affected Objects | Represents the count of objects affected by the effective policy. |
| NumberOfVirtualMachines | Number of Affected vCenter Virtual Machines | Represents the number of vCenter Virtual Machines associated with a specific policy. |
| NumberOfCustomGroups | Number of Assigned Custom Groups | Represents the number of assigned custom groups for a specific policy. |
| NumberOfDefaultAssignedObjects | Number of Default Assigned Objects | Represents the number of objects that are assigned by default for a specific policy. This metric value is 0 for all policies except the default policy. |
| NumberOfDirectAssignedObjects | Number of Directly Assigned Objects | Represents the number of objects that are directly assigned for a specific policy. |
| NumberOfInheritedObjects | Number of Objects Assigned By Scope | Represents the count of inherited objects for a specific policy. |

# Property Definitions in VCF Operations

Properties are attributes of objects in the VCF Operations environment. You use properties in symptom definitions. You can also use properties in dashboards, views, and reports.

VCF Operations uses adapters to collect properties for target objects in your environment. Property definitions for all objects connected through the vCenter adapter are provided. The properties collected depend on the objects in your environment.

You can add symptoms based on properties to an alert definition so that you are notified if a change occurs to properties on your monitored objects. For example, disk space is a hardware property of a virtual machine. You can use disk space to define a symptom that warns you when the value falls below a certain numeric value.

You can add symptoms based on properties to an alert definition so that you are notified if a change occurs to properties on your monitored objects. For example, disk space is a hardware property of a virtual machine. You can use disk space to define a symptom that warns you when the value falls below a certain numeric value. See the *VCF Operations User Guide*.

VCF Operations generates Object Type Classification and Subclassification properties for every object. You can use object type classification properties to identify whether an object is an adapter instance, custom group, application, tier, or a general object with property values *ADAPTER_INSTANCE*, *GROUP*, *BUSINESS_SERVICE*, *TIER*, or *GENERAL*, respectively.

## Properties for vCenter Server Components

The VMware vSphere solution is installed with VCF Operationsand includes the vCenter adapter. VCF Operations uses the vCenter adapter to collect properties for objects in the vCenter system.

vCenter components are listed in the `describe.xml` file for the vCenter adapter. The following example shows the runtime property `memoryCap` or Memory Capacity for the virtual machine in the `describe.xml`.

```
<ResourceGroup instanced="false" key="runtime" nameKey="5300" validation="">
   <ResourceAttribute key="memoryCap" nameKey="1780" dashboardOrder="200" dataType="float"
                      defaultMonitored="true" isDiscrete="false" isRate="false" maxVal=""
                      minVal="" isProperty="true" unit="kb"/>
</ResourceGroup>
```

The `ResourceAttribute` element includes the name of the property that appears in the UI and is documented as a Property Key. `isProperty = "true"` indicates that `ResourceAttribute` is a property.

### vCenter Server Properties

VCF Operations collects summary and event properties for vCenter system objects.

**Table 1592: Summary Properties Collected for vCenter System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| summary\|version | Version | Version |
| summary\|vcuuid | VirtualCenter ID | Virtual Center ID |
| summary\|vcfullname | Product Name | Product Name |

**Table 1593: Event Properties Collected for vCenter System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| event\|time | Last VC Event Time | Last Virtual Center Event Time |
| event\|key | Last VC Event ID | Last Virtual Center Event ID |

**Table 1594: Custom Field Manager Property Collected for vCenter System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| CustomFieldManager\|CustomFieldDef | Custom Field Def | Custom Field Def for vCenter Tagging information at the Adapter level. |

**Table 1595: Compliance Configuration Related Properties for vCenter System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| vc_appliance\|hasAccessSSH | Appliance\|Access SSH | Access SSH |
| vc_appliance\|networkNICs | Appliance\|Number of NICs | NICs |

## Virtual Machine Properties

VCF Operations collects configuration, runtime, CPU, memory, network I/O, and properties about summary use for virtual machine objects. Properties are collected with the first cycle of data collection. Once collected, the next property collection occurs only when there is data change. In case of no data change, no property is collected.

**Table 1596: Properties Collected for Virtual Machines with vSAN Adapter**

| Property Key | Property Name | Description |
|---|---|---|
| **Note:**<br>The following Disk Space properties are displayed by the virtual machine object only when the vSAN adapter is configured with vCenter. | | |
| Virtual Disk:scsi0:0\|Storage Policy\|Cache Reservation | Storage Policy\|Cache Reservation | This property helps you with flash read cache reservation. |
| Virtual Disk:scsi0:0\|Storage Policy\| Checksum Disabled | Storage Policy\| Checksum Disabled | This property checks whether checksum is disabled for the disk object. |
| Virtual Disk:scsi0:0\|Storage Policy\| Encryption Service | Storage Policy\| Encryption Service | This property checks whether the encryption service is used or not. |
| Virtual Disk:scsi0:0\|Storage Policy\|Failures to Tolerate | Storage Policy\| Failures to Tolerate | This property gives the number of host or disk failures the storage object can tolerate. |
| Virtual Disk:scsi0:0\|Storage Policy\|Force Provisioning | Storage Policy\|Force Provisioning | This property checks whether force provisioning is disabled for the disk object. |
| Virtual Disk:scsi0:0\|Storage Policy\|Object Space Reservation | Storage Policy\|Object Space Reservation | This property helps you to check the object space reservation. |
| Virtual Disk:scsi0:0\|Storage Policy\|Replica Preference | Storage Policy\|Replica Preference | This property helps you to identify the fault tolerance method. |
| Virtual Disk:scsi0:0\|Storage Policy\|Site Disaster Tolerance | Storage Policy\|Site Disaster Tolerance | This property gives the number of fault domain failures, the storage object can tolerate. |
| Virtual Disk:scsi0:0\|Storage Policy\|Space Efficiency | Storage Policy\|Space Efficiency | This property helps you with the space efficiency method. |
| Virtual Disk:scsi0:0\|Storage Policy\|Storage Policy in Use | Storage Policy in Use | This property gives the storage policy associated with the virtual disk. |
| Virtual Disk:scsi0:0\|Storage Policy\|Stripe Width | Storage Policy\|Stripe Width | This property gives the number of disk stripes per object. |

### Table 1597: Properties Collected for System

| Property Key | Property Name | Description |
|---|---|---|
| system\|notes | System\|Notes | This property helps you to track the System notes defined in vCenter. |

### Table 1598: VCF Automation Properties Collected for Virtual Machine Objects

| Property Key | Property Name | Description |
|---|---|---|
| vRealize Automation\|Blueprint Name | Blueprint Name | Virtual machines deployed by VCF Automation to be excluded from workload placements. |

### Table 1599: Properties Collected for Virtual Machine Objects to Support VIN Adapter Localization

| Property Key | Property Name | Description |
|---|---|---|
| RunsOnApplicationComponents | Application components running on the Virtual Machine | Application components running on the Virtual Machine |
| DependsOnApplicationComponents | Application components the Virtual Machine depends on | Application components running on other machines that this Virtual Machine depends on. |

### Table 1600: Properties Collected for Guest File Systems

| Property Key | Property Name | Description |
|---|---|---|
| guestfilesystem\|capacity_property | Guest File System stats\|Guest File System Capacity Property | This property is disabled by default. |
| guestfilesystem\|capacity_property_total | Guest File System stats\|Total Guest File System Capacity Property(gb) | This property is disabled by default. |

### Table 1601: Properties Collected for Disk Space Objects

| Property Key | Property Name | Description |
|---|---|---|
| diskspace\|snapshot\|creator | Disk Space\|Snapshot\|Creator | This property is disabled by default. |
| diskspace\|snapshot\|description | Disk Space\|Snapshot\|Description | This property is disabled by default. |

### Table 1602: Configuration Properties Collected for Virtual Machine Objects

| Property Key | Property Name | Description |
|---|---|---|
| config\|ctkEnabled | Configuration\|Changed Block Tracking | This property displays if Change Block Tracking is enabled, if enabled, tracks changes on disk sectors. This helps in performing incremental backups on the VM. |
| Configuration\|Hardware\|Number of CPUs (vCPUs) | Number of CPUs (vCPUs) | This property displays the number of CPUs configured in the VM, the count includes both in the vSocket and the vCore. |

| Property Key | Property Name | Description |
|---|---|---|
| Configuration\|Number of RDMs | Number of RDMs | This property displays the number of RDMs configured in the VM. This property is enabled by default. |
| Configuration\|Number of Virtual Disks | Number of Virtual Disks | This property displays the number of virtual disks configured in the VM, the count includes the RDMs. |
| Configuration\|Hardware\|Number of VMDKs | Number of VMDKs | This property displays the number of VMDKs configured in the VM. This property is enabled by default. |
| Summary\|Is Horizon Managed | Is Horizon Managed | This property displays whether the selected object is managed by Horizon or not. |
| summary\|datastoreClusters | Summary\|Datastore Cluster(s) | This property is applicable only if the VM belongs to a datastore cluster.<br>**Note:**<br>A VM with multiple virtual disks can belong to multiple datastore clusters. |
| Summary\|Configuration\|Number of NICs | Number of NICs | his property displays the number of NICs configured in the VM. |
| config\|name | Name | This property displays the virtual object name |
| config\|guestFullName | Guest OS from vCenter | This property is set by the vCenter during the VM creation. It may differ from the value of the Guest/ |
| config\|hardware\|numCpu | Number of virtual CPUs | Number of virtual CPUs |
| config\|hardware\|memoryKB | Memory | Memory |
| config\|hardware\|thinEnabled | Thin Provisioned Disk | Indicates whether thin provisioning is enabled |
| config\|hardware\|diskSpace | Disk Space | Disk Space |
| config\|cpuAllocation\|reservation | Reservation | CPU reservation |
| config\|cpuAllocation\|limit | Limit | CPU limit |
| config\|cpuAllocation\|shares\|shares | Shares | CPU shares |
| config\|memoryAllocation\|reservation | Reservation | CPU reservation |
| config\|memoryAllocation\|limit | Limit | Limit |
| config\|memoryAllocation\|shares\|shares | Shares | Memory shares |
| config\|extraConfig\|mem_hotadd | Memory Hot Add | Memory Hot Add Configuration |
| config\|extraConfig\|vcpu_hotadd | VCPU Hot Add | VCPU Hot Add Configuration |
| config\|extraConfig\|vcpu_hotremove | VCPU Hot Remove | VCPU Hot Remove Configuration |
| config\|security\|disable_autoinstall | Disable tools auto install (isolation.tools.autoInstall.disable) | Disable tools auto install (isolation.tools.autoInstall.disable) |
| config\|security\|disable_console_copy | Disable console copy operations (isolation.tools.copy.disable) | Disable console copy operations (isolation.tools.copy.disable) |
| config\|security\|disable_console_dnd | Disable console drag and drop operations (isolation.tools.dnd.disable) | Disable console drag and drop operations (isolation.tools.dnd.disable) |

| Property Key | Property Name | Description |
|---|---|---|
| config\|security\|enable_console_gui_options | Enable console GUI operations (isolation.tools.setGUIOptions.enable) | Enable console GUI operations (isolation.tools.setGUIOptions.enable) |
| config\|security\|disable_console_paste | Disable console paste operations (isolation.tools.paste.disable) | Disable console paste operations (isolation.tools.paste.disable) |
| config\|security\|disable_disk_shrinking_shrink | Disable virtual disk shrink (isolation.tools.diskShrink.disable) | Disable virtual disk shrink (isolation.tools.diskShrink.disable) |
| config\|security\|disable_disk_shrinking_wiper | Disable virtual disk wiper (isolation.tools.diskWiper.disable) | Disable virtual disk wiper (isolation.tools.diskWiper.disable) |

| config\|security\| disable_unexposed_features_toporequest | Disable unexposed features - toporequest (isolation.tools.dispTopoRequest.disable) | Disable unexposed features - toporequest (isolation.tools.dispTopoRequest.disable) |
| config\|security\| disable_unexposed_features_trashfolderstate | Disable unexposed features - trashfolderstate (isolation.tools.trashFolderState.disable) | Disable unexposed features - trashfolderstate (isolation.tools.trashFolderState.disable) |
| config\|security\| disable_unexposed_features_trayicon | Disable unexposed features - trayicon (isolation.tools.ghi.trayicon.disable) | Disable unexposed features - trayicon (isolation.tools.ghi.trayicon.disable) |
| config\|security\| disable_unexposed_features_unity | Disable unexposed features - unity (isolation.tools.unity.disable) | Disable unexposed features - unity (isolation.tools.unity.disable) |

| Property Key | Property Name | Description |
|---|---|---|
| config\|security\|disable_unexposed_features_unity_interlock | Disable unexposed features - unity-interlock (isolation.tools.unityInterlockOperation.disable) | Disable unexposed features - unity-interlock (isolation.tools.unityInterlockOperation.disable) |
| config\|security\|disable_unexposed_features_unity_taskbar | Disable unexposed features - unity-taskbar (isolation.tools.unity.taskbar.disable) | Disable unexposed features - unity-taskbar (isolation.tools.unity.taskbar.disable) |
| config\|security\|disable_unexposed_features_unity_unityactive | Disable unexposed features - unity-unityactive (isolation.tools.unityActive.disable) | Disable unexposed features - unity-unityactive (isolation.tools.unityActive.disable) |
| config\|security\|disable_unexposed_features_unity_windowcontents | Disable unexposed features - unity-windowcontents (isolation.tools.unity.windowContents.disable) | Disable unexposed features - unity-windowcontents (isolation.tools.unity.windowContents.disable) |
| config\|security\|disable_unexposed_features_unitypush | Disable unexposed features - unitypush (isolation.tools.unity.push.update.disable) | Disable unexposed features - unitypush (isolation.tools.unity.push.update.disable) |
| config\|security\|disable_unexposed_features_versionget | Disable unexposed features - versionget (isolation.tools.vmxDnDVersionGet.disable) | Disable unexposed features - versionget (isolation.tools.vmxDnDVersionGet.disable) |
| config\|security\|disable_unexposed_features_versionset | Disable unexposed features - versionset (solation.tools.guestDnDVersionSet.disable) | Disable unexposed features - versionset (solation.tools.guestDnDVersionSet.disable) |
| config\|security\|disable_vix_messages | Disable VIX messages from the VM (isolation.tools.vixMessage.disable) | Disable VIX messages from the VM (isolation.tools.vixMessage.disable) |
| config\|security\|enable_vga_only_mode | Disable all but VGA mode on virtual machines (svga.vgaOnly) | Disable all but VGA mode on virtual machines (svga.vgaOnly) |
| config\|security\|limit_console_connection | Limit number of console connections (RemoteDisplay.maxConnection) | Limit number of console connections (RemoteDisplay.maxConnection) |
| config\|security\|limit_log_number | Limit number of log files (log.keepOld) | Limit number of log files (log.keepOld) |
| config\|security\|limit_log_size | Limit log file size (log.rotateSize) | Limit log file size (log.rotateSize) |
| config\|security\|limit_setinfo_size | Limit VMX file size (tools.setInfo.sizeLimit) | Limit VMX file size (tools.setInfo.sizeLimit) |
| config\|security\|enable_console_VNC | Enable access to VM console via VNC protocol (RemoteDisplay.vnc.enabled) | Enable access to VM console via VNC protocol (RemoteDisplay.vnc.enabled) |
| config\|security\|disable_device_interaction_connect | Disable unauthorized removal, connection of devices (isolation.device.connectable.disable) | Disable unauthorized removal, connection of devices (isolation.device.connectable.disable) |
| config\|security\|disable_device_interaction_edit | Disable unauthorized modification of devices (isolation.device.edit.disable) | Disable unauthorized modification of devices (isolation.device.edit.disable) |
| config\|security\|enable_host_info | Enable send host information to guests (tools.guestlib.enableHostInfo) | Enable send host information to guests (tools.guestlib.enableHostInfo) |
| config\|security\|network_filter_enable | Enable dvfilter network APIs (ethernetX.filterY.name) | Enable dvfilter network APIs (ethernetX.filterY.name) |
| config\|security\|vmsafe_cpumem_agentaddress | VMsafe CPU/memory APIs - IP address (vmsafe.agentAddress) | VMsafe CPU/memory APIs - IP address (vmsafe.agentAddress) |
| config\|security\|vmsafe_cpumem_agentport | VMsafe CPU/memory APIs - port number (vmsafe.agentPort) | VMsafe CPU/memory APIs - port number (vmsafe.agentPort) |
| config\|security\|vmsafe_cpumem_enable | Enable VMsafe CPU/memory APIs (vmsafe.enable) | Enable VMsafe CPU/memory APIs (vmsafe.enable) |
| config\|security\|disconnect_devices_floppy | Disconnect floppy drive | Disconnect floppy drive |
| config\|security\|disconnect_devices_cd | Disconnect CD-ROM | Disconnect CD-ROM |

| Property Key | Property Name | Description |
|---|---|---|
| config\|security\|disconnect_devices_usb | Disconnect USB controller | Disconnect USB controller |
| config\|security\|disconnect_devices_parallel | Disconnect parallel port | Disconnect parallel port |
| config\|security\|disconnect_devices_serial | Disconnect serial port | Disconnect serial port |
| config\|faultTolerant | config\|faultTolerant | |

**Note:**
Security properties not collected by default. They are collected only if the *vSphere Hardening Guide* policy is applied to the objects, or if the *vSphere Hardening Guide* alerts are manually enabled in the currently applied policy.

**Table 1603: Runtime Properties Collected for Virtual Machine Objects**

| Property Key | Property Name | Description |
|---|---|---|
| runtime\|memoryCap | Memory Capacity | Memory Capacity |

**Table 1604: CPU Usage Properties Collected for Virtual Machine Objects**

| Property Key | Property Name | Description |
|---|---|---|
| cpu\|limit | CPU limit | CPU limit |
| cpu\|reservation | CPU reservation | CPU reservation |
| cpu\|speed | CPU | CPU Speed |

**Table 1605: Memory Properties Collected for Virtual Machine Objects**

| Property Key | Property Name | Description |
|---|---|---|
| mem\|host_limit | VM Limit | Mem Machine Limit |
| mem\|host_reservation | Memory\|VM Reservation(kb) | This property is disabled by default. |

**Table 1606: Network Properties Collected for Virtual Machine Objects**

| Property Key | Property Name | Description |
|---|---|---|
| net:<vnic_id>\|portGroup | Network:<vnic_id>\|Port Group | This is a property at each virtual NIC level, not at the VM level. A VM with multiple NIC connects to different port groups, with this property you can identify to which port group the vnic blongs and has mapping with. |
| net:<nic_key>\|uptCompatibilityEnabled | Network:<nic_key>\|Direct Path I/O Status | If there is the VM, with cofigured direct path IO - IO directly comes to VM, bypassing the hypervisor. The property shows the status. |
| net\|mac_address | Mac Address | Mac Address |
| net\|ip_address | IP Address | IP Address |
| net\|vnic_label | Network:<ID>\|Label | This property is disabled by default. |
| net\|nvp_vm_uuid | Network I/O\|NVP VM UUID | This property is disabled by default. |
| net\|vnic_type | Network I/O\|Virtual NIC Type | This property is disabled by default. |
| net\|ipv6_address | Network\|IPv6 Address | This property is disabled by default. |

| Property Key | Property Name | Description |
|---|---|---|
| net\|ipv6_prefix_length | Network\|IPv6 Prefix Length | This property is disabled by default. |
| net\|default_gateway | Network\|Network I/O\|Default Gateway | This property is disabled by default. |
| net\|subnet_mask | Network\|Subnet Mask | This property is disabled by default. |

**Table 1607: Summary Properties Collected for Virtual Machine Objects**

| Property Key | Property Name | Description |
|---|---|---|
| summary\|customTag\|customTagValue | Value | Custom Tag Value |
| summary\|tag | vSphere Tag | vSphere Tag Name |
| summary\|parentCluster | Parent Cluster | Parent Cluster |
| summary\|parentHost | Parent Host | Parent Host |
| summary\|parentDatacenter | Parent data center | Parent data center |
| summary\|parentVcenter | Parent vCenter | Parent vCenter |
| summary\|guest\|fullName | Guest OS Full Name | This property is provided by the VMware Tools. It will differ to the value set in vCenter if the Guest OS was upgraded, or if a different Guest OS was installed. |
| summary\|guest\|ipAddress | Guest OS IP Address | Guest OS IP Address |
| summary\|guest\|toolsRunningStatus | Tools Running Status | Guest Tools Running Status |
| summary\|guest\|toolsVersionStatus2 | Tools Version Status | Guest Tools Version Status 2 |
| summary\|guest\|vrealize_operations_agent_id | vRealize Operations Agent ID | An ID to identify a VM in Agent Adapter's world. |
| summary\|guest\| vrealize_operations_euc_agent_id | vRealize Operations Euc Agent ID | An ID to identify a VM in Agent Adapter's world. |
| summary\|config\|numEthernetCards | Number of NICs | Number of NICs |
| summary\|config\|isTemplate | VM Template | Indicates whether it is a VM Template. |
| summary\|runtime\|powerState | Power State | Power State |
| summary\|runtime\|connectionState | Connection State | Connection State |
| summary\|config\|appliance | Appliance | Appliance |
| summary\|config\|productName | Product Name | Product Name |
| summary\|UUID | UUID | Unique UUID instance in vCenter that identifies all the virtual machine instances. |
| summary\|smbiosUUID | SMBIOS UUID | System Management BIOS UUID of a virtual machine. |

**Table 1608: Virtual Disk Properties Collected for Virtual Machine Objects**

| Property Key | Property Name | Description |
|---|---|---|
| virtualDisk:<scsi_id>\|encryptionStatus | Virtual Disk:<scsi_id>\|Encryption Status | This property provides encryption status on SCSI on VDMK layer. The property is per virtual disk and does not apply to RDM disk. |
| virtualDisk:<scsi_controller>\|iopsLimit | Virtual Disk:<scsi_controller>\|IOPS Limit | This property shows the set IOPS limit on virtual disk on SCSI level, when IOPS limit is set beyond the disk. This helps you to understand the current performance state, why the IOPS is not increasing and limited. |

| Property Key | Property Name | Description |
|---|---|---|
| Virtual Disk:scsi0:0\|Configuired Size(GB) | Configuired Size(GB) | This property displays the disk space configured for the virtual disk. |
| Virtual Disk:scsi0:0\|Datastore | Datastore | This property displays the name of the datastore where the scsi disk is present. If an RDM is present, only a pointer to the RDM is present in the datastore. |
| Virtual Disk:scsi0:0\|Disk Mode | Disk Mode | This property determines how a virtual disk is affected by snapshots. The disk mode acts on each individual VMDK, not on the whole VM. The available options are Independent persistent, Persistent, Non-persistent, this property is disabled by default. |
| Virtual Disk:scsi0:0\|SCSI Bus Sharing | SCSI Bus Sharing | This property sets the type of bus sharing for the VM and determines whether to share the bus or not. Depending on the type of bus sharing, the VM can access the same virtual disk simultaneously on the same server or any other server. The available options are None, Physical, Virtual, this property is disabled by default. |
| Virtual Disk:scsi0:0\|SCSI Controller Type | SCSI Controller Type | This virtual storage controller property connects the virtual and physical disks to the VM. The available options are LSI SAS/ PVSCSI, this property is disabled by default. |
| Virtual Disk:scsi0:0\|Virtual Disk Sharing | Virtual Disk Sharing | This property allows VMFS-backed disks to be shared by multiple VMs. The available options are Unspecified, No sharing, Multi-Writer. You can use this option to disable protection for certain cluster aware applications, where the applications ensures that simultaneous write operation from two VMs does not induce data loss. This property is disabled by default. |
| Virtual Disk:scsi0:0\|Virtual Device Node | Virtual Device Node | This property determines the virtual device bus location. The virtual disks are enumerated starting with the first controller. This property is disabled by default. |
| Virtual Disk:scsi0:0\|Is RDM | Is RDM | This property indicates whether the virtual disk is an RDM or not. This property is enabled by default. |
| | | |
| Virtual Disk\|File Name | File Name | This property is disabled by default. |
| Virtual Disk\|Label | Label | This property displays the device label. |
| Virtual Disk:scsi1:1\|Compatibility Mode | Compatibility Mode | This property displays the compatibility mode for the RDMs. The options are physical and virtual. Virtual mode specifies the full virtualization of the mapped device whereas physical mode specifies minimal SCSI virtualization of the mapped device. This property is disabled by default in the base policy. |

**Table 1609: Virtual Disk Properties Collected for POD Objects**

| Property Key | Property Name | Description |
|---|---|---|
| Virtual Disk:scsi0:0\|Virtual Device Node | Virtual Device Node | This property determines the virtual device bus location. The virtual disks are enumerated starting with the first controller. This property is disabled by default. |
| Virtual Disk:scsi0:0\|Virtual Disk Sharing | Virtual Disk Sharing | This property allows VMFS-backed disks to be shared by multiple VMs. The available options are Unspecified, No sharing, Multi-Writer. You can use this option to disable protection for certain cluster aware applications, where the applications ensures that simultaneous write operation from two PODs does not induce data loss. This property is disabled by default. |
| Virtual Disk:scsi0:0\|Disk Mode | Disk Mode | This property determines how a virtual disk is affected by snapshots. The disk mode acts on each individual VMDK, not on the whole POD. The available options are Independent persistent, Persistent, Non-persistent, this property is disabled by default. |
| Virtual Disk:scsi0:0\|SCSI Controller Type | SCSI Controller Type | This virtual storage controller property connects the virtual and physical disks to the POD. The available options are LSI SAS/PVSCSI, this property is disabled by default. |

**Table 1610: Datastore Properties Collected for Virtual Machine Properties**

| Property Key | Property Name | Description |
|---|---|---|
| datastore\|maxObservedNumberRead | Datastore I/O\|Highest Observed Number of Read Requests | |
| datastore\|maxObservedNumberWrite | Datastore I/O\|Highest Observed Number of Write Requests | |
| datastore\|maxObservedOIO | Datastore I/O\|Highest Observed Outstanding Requests | |
| datastore\|maxObservedRead | Datastore I/O\|Highest Observed Read Rate(kbps) | |
| datastore\|maxObservedWrite | Datastore I/O\|Highest Observed Write Rate(kbps) | |

**Table 1611: Compliance Configuration Related Properties for Virtual Machine Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|security\|disconnect_devices_virtualhd audiocard | Configuration\|Security\|Virtual HD Audio Card Disconnected | NIL |
| config\|security\|disconnect_devices_virtualah cicontroller | Configuration\|Security\|Virtual AHCI Controller Disconnected | NIL |
| config\|security\|disconnect_devices_virtualen soniq1371 | Configuration\|Security\|Virtual Ensoniq 1371 Disconnected | NIL |

Datastore properties collected for virtual machine objects have been disabled in this version of VCF Operations. This means that they do not collect data by default.

## Host System Properties

VCF Operations collects configuration, hardware, runtime, CPU, network I/O, and properties about summary use for host system objects.

**Table 1612: GPU properties collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| gpu\|<GPU-id>\|active_type | GPU\|<GPU-id>\|Active Type | Active Type |
| gpu\|<GPU-id>\|configured_type | GPU\|<GPU-id>\|Configured Type | Configured Type |
| gpu\|<GPU-id>\|device_name | GPU\|<GPU-id>\|Device Name | Device name |
| gpu\|<GPU-id>\|vendor_name | GPU\|<GPU-id>\|Vendor Name | Vendor name |
| gpu\|assignmentPolicy | GPU\|Assignment Policy | Assignment Policy |
| GPU:GPU-id\|GPU Slowdown Temperature (Celcius) | GPU Slowdown Temperature (Celsius) | The slowdown temperature is the thermal threshold at which a GPU starts reducing it's clock speed to lower power consumption and prevent overheating. |
| GPU:GPU-id\|GPU Shutdown Temperature (Celcius) | GPU Shutdown Temperature (Celsius) | The shutdown temperature is the thermal threshold at which a GPU automatically powers off, to protect itself from damage due to overheating. |
| GPU:GPU-id\|GPU Power limit (Max TDP) (W) | GPU Power limit (Max TDP) (Watts) | Maximum power in Watts that this GPU can draw. |

**Table 1613: Configuration Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|name | Name | Name |
| config\|diskSpace | Disk Space | Disk Space |
| config\|network\|nnic | Number of NICs | Number of NICs |
| config\|network\|linkspeed | Average Physical NIC Speed | Average Physical NIC Speed |
| config\|network\|dnsserver | DNS Server | List of DNS Servers |
| config\|product\|productLineId | Product Line ID | Product Line ID |
| config\|product\|apiVersion | API Version | API Version |
| config\|storageDevice\|plugStoreTopology\| numberofPath | Total number of Path | Total number of storage paths |
| config\|storageDevice\|multipathInfo\| numberofActivePath | Total number of Active Path | Total number of active storage paths |
| config\|storageDevice\|multipathInfo\| multipathPolicy | Multipath Policy | Multipath Policy |
| config\|hyperThread\|available | Available | Indicates whether hyperthreading is supported by the server |
| config\|hyperThread\|active | Active | Indicates whether hyperthreading is active |
| config\|ntp\|server | NTP Servers | NTP Servers |
| config\|security\|ntpServer | NTP server | NTP server |
| config\|security\|enable_ad_auth | Enable active directory authentication | Enable active directory authentication |

| Property Key | Property Name | Description |
|---|---|---|
| config\|security\|enable_chap_auth | Enable mutual chap authentication | Enable mutual chap authentication |
| config\|security\|enable_auth_proxy | Enable authentication proxy (UserVars.ActiveDirectoryVerifyCAMCertificate) | Enable authentication proxy (UserVars.ActiveDirectoryVerifyCAMCertificate) |
| config\|security\|syslog_host | Remote log host (Syslog.global.logHost) | Remote log host (Syslog.global.logHost) |
| config\|security\|dcui_access | Users who can override lock down mode and access the DCUI (DCUI.Access) | Users who can override lock down mode and access the DCUI (DCUI.Access) |
| config\|security\|shell_interactive_timeout | Shell interactive timeout (UserVars.ESXiShellInteractiveTimeOut) | Shell interactive timeout (UserVars.ESXiShellInteractiveTimeOut) |
| config\|security\|shell_timeout | Shell timeout (UserVars.ESXiShellTimeOut) | Shell timeout (UserVars.ESXiShellTimeOut) |
| config\|security\|dvfilter_bind_address | Dvfilter bind ip address (Net.DVFilterBindIpAddress) | Dvfilter bind ip address (Net.DVFilterBindIpAddress) |
| config\|security\|syslog_dir | Log directory (Syslog.global.logDir) | Log directory (Syslog.global.logDir) |
| config\|security\|firewallRule\|allowedHosts | Allowed hosts | Allowed hosts in the firewall configuration |
| config\|security\|service\|isRunning | Running | Indicates whether a service is running or not. Services are: Direct Console UI, ESX shell, SSH, or NTP Daemon. |
| config\|security\|service\|ruleSet | Ruleset | Ruleset for each service. |
| config\|security\|service\|policy | Policy | Policy for each service. |
| config\|security\|tlsdisabledprotocols | TLS Disabled Protocols | TLS Disabled Protocols |

**Note:**
Security properties not collected by default. They are collected only if the *vSphere Hardening Guide* policy is applied to the objects, or if the *vSphere Hardening Guide* alerts are manually enabled in the currently applied policy.

**Table 1614: Cost Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| Cost\|Energy Consumed (Joule) | Energy Consumed (Joule) | Displays the energy consumed in Joules. |
| Cost\|Number of Rack Units | Number of Rack Units | Displays the number of rack units in the host. |
| Cost\|OS Categories | OS Categories | Displays the operating system categories in the host. |
| Cost\|IsServerLeased | Is Server Leased | Displays whether the server is leased or not. |
| Cost\|RemainingDepreciationMonths | Remaining Depreciation Months | Displays the remaining number of depreciation months. |
| Cost\|ServerPurchaseCost | Server Purchase Cost | Server Purchase Cost is displayed in the currency format chosen. |
| Cost\|ServerPurchaseDate | Server Purchase Date | Server Purchase Date is displayed |

**Table 1615: Hardware Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| hardware\|bioisReleaseDate | Hardware\|BIOS Release Date | This property displays the release date corresponding to the version of the installed BIOS. |
| hardware\|memorySize | Memory Size | Memory Size |
| hardware\|cpuInfo\|numCpuCores | Number of CPU Cores | Number of CPU Cores |
| hardware\|cpuInfo\|hz | CPU Speed per Core | CPU Speed per Core |
| hardware\|cpuInfo\|numCpuPackages | Number of CPU Packages | Number of CPU Packages |
| hardware\|cpuInfo\|<br>powerManagementPolicy | Active CPU Power Management Policy | Active CPU Power Management Policy |
| hardware\|cpuInfo\|<br>powerManagementTechnology | Power Management Technology | Power Management Technology |
| hardware\|cpuInfo\|biosVersion | BIOS Version | BIOS Version |
| hardware\|vendor | Hardware\|Vendor | Indicates the hardware manufacturer |

**Table 1616: Runtime Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| runtime\|connectionState | Connection State | Connection State |
| runtime\|powerState | Power State | Power State |
| runtime\|maintenanceState | Maintenance State | Maintenance State |
| runtime\|memoryCap | Memory Capacity | Memory Capacity |

**Table 1617: Configuration Manager Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| configManager\|memoryManager\|<br>consoleReservationInfo\|<br>serviceConsoleReserved | Service Console Reserved | Service console reserved memory |

**Table 1618: CPU Usage Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| cpu\|speed | CPU | CPU Speed |
| cpu\|cpuModel | CPU Model | CPU Model |

**Table 1619: Network Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| net:<pnic>\|configuredSpeed | Network:<pnic>\|Configured Speed | This property displays the configured network speed of the network card. If this is higher than actual, the card is not operating at full capacity. |
| net:<pnic>\|speed | Network:<pnic>\|Actual Speed | This property displays the actual operating speed of the network card, which can be lower than its configured capacity due to auto-negotiation. The options are Enabled or Disabled. |
| net\|maxObservedKBps | Highest Observed Throughput | Highest Observed Throughput (KBps) |
| net\|mgmt_address | Management Address | Management Address |
| net\|ip_address | IP Address | IP Address |
| net\|discoveryProtocol\|cdp\|managementIpAddress | Management IP Address | Management IP Address |
| net\|discoveryProtocol\|cdp\|systemName | System Name | System Name |
| net\|discoveryProtocol\|cdp\|portName | Port Name | Port Name |
| net\|discoveryProtocol\|cdp\|vlan | VLAN | VLAN |
| net\|discoveryProtocol\|cdp\|mtu | MTU | Maximum Transmission Unit |
| net\|discoveryProtocol\|cdp\|hardwarePlatform | Hardware Platform | Hardware Platform |
| net\|discoveryProtocol\|cdp\|softwareVersion | Software Version | Software Version |
| net\|discoveryProtocol\|lldp\|systemDescription | System Description | System Description |
| net\|discoveryProtocol\|lldp\|mtu | MTU | Maximum Transmission Unit |
| net\|discoveryProtocol\|lldp\|portDescription | Port Description | Port Description |
| net\|discoveryProtocol\|lldp\|aggregationStatus | Aggregation Status | Aggregation Status |
| net\|discoveryProtocol\|lldp\|managementIpAddress | Management IP Address | Management IP Address |
| net\|discoveryProtocol\|lldp\|systemName | System Name | System Name |
| net\|discoveryProtocol\|lldp\|portName | Port Name | Port Name |
| net\|discoveryProtocol\|lldp\|vlan | VLAN | VLAN |

**Table 1620: System Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| sys\|build | Build number | VMWare build number |
| sys\|productString | Product String | VMWare product string |

**Table 1621: Summary Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| Summary\|Is Horizon Managed | Is Horizon Managed | This property displays whether the selected object is managed by Horizon or not. |
| summary\|version | Version | This property displays theVersion. |
| summary\|hostuuid | Host UUID | This property displays the Host UUID. |
| summary\|evcMode | Current EVC Mode | This property displays the Current EVC Mode. |
| summary\|customTag\|customTagValue | Value | This property displays the Custom Tag Value. |
| summary\|tag | vSphere Tag | This property displays the vSphere Tag Name. |
| summary\|parentCluster | Parent Cluster | This property displays the Parent Cluster. |
| summary\|parentDatacenter | Parent Datacenter | This property displays the Parent Datacenter. |
| summary\|parentVcenter | Parent Vcenter | This property displays the Parent Vcenter. |

**Table 1622: Datastore Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| datastore\|maxObservedNumberRead | Datastore I/O\|Highest Observed Number of Read Requests | |
| datastore\|maxObservedNumberWrite | Datastore I/O\|Highest Observed Number of Write Requests | |
| datastore\|maxObservedOIO | Datastore I/O\|Highest Observed Outstanding Requests | |
| datastore\|maxObservedRead | Datastore I/O\|Highest Observed Read Rate(kbps) | |
| datastore\|maxObservedWrite | Datastore I/O\|Highest Observed Write Rate(kbps) | |
| net\|discoveryProtocol\|cdp\|timeToLive | Network I/O\|Discovery Protocol\| Cisco Discovery Protocol\|Time to Live | |
| net\|discoveryProtocol\|lldp\|timeToLive | Network I/O\|Discovery Protocol\| Link Layer Discovery Protocol\| Time to Live | |

Datastore properties collected for host system objects have been disabled in this version of VCF Operations. This means that they do not collect data by default.

**Table 1623: Storage Path Properties Collected for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| storageAdapter\|port_WWN | Storage Adapter\|Port WWN | The port world wide name for storage adapter. Available for FC adapters only. |

**Table 1624: Compliance Configuration Related Properties for Host System Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|security\|password_max_days | Configuration\|Security\|Password Max Days | Password Max Days |
| config\|security\|welcome_message | Configuration\|Security\|Welcome Message Configured | Welcome Message Configured |
| config\|security\|issue | Configuration\|Security\|SSH Connection Banner Message Configured | SSH Connection Banner Message Configured |
| config\|security\|host_client_session_timeout | Configuration\|Security\|Host Client Session Timeout | Host Client Session Timeout |
| config\|security\|has_lockdown_exception_users | Configuration\|Security\|Has Lockdown exception users | Has Lockdown exception users |

## Cluster Compute Resource Properties

VCF Operations collects configuration and summary properties for cluster compute resource objects.

**Table 1625: License Properties for Cluster Objects**

| Property Key | Property Name | Description |
|---|---|---|
| License type | License Type | Displays the license type for the cluster object |
| Expiry | Expiry | Displays the number of days remaining before the license expires the cluster object<br>**Note:**<br>An alert is generated if the license threshold is<br>• >= 80% - Warning<br>• >= 90% - Immediate<br>• =95% - Catastrophic |

**Table 1626: Configuration Properties Collected for Cluster Compute Resource Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|name | Name | Name |

**Table 1627: Summary Properties Collected for Cluster Compute Resource Objects**

| Property Key | Property Name | Description |
|---|---|---|
| Summary\|Is Horizon Managed | Is Horizon Managed | This property displays whether the selected object is managed by Horizon or not. |
| summary\|parentDatacenter | Parent data center | This property displays the Parent data center. |
| summary\|parentVcenter | Parent vCenter | This property displays the Parent vCenter. |
| summary\|customTag\|customTagValue | Value | This property displays the Custom Tag Value. |

| Property Key | Property Name | Description |
|---|---|---|
| summary\|tag | vSphere Tag | This property displays the vSphere Tag Name. |

**Table 1628: DR, DAS, and DPM Configuration Properties Collected for Cluster Compute Resource Objects**

| Property Key | Property Name | Description |
|---|---|---|
| configuration\|drsconfig\|enabled | Enabled | Indicates whether DRS is enabled |
| configuration\|drsconfig\|defaultVmBehavior | Default DRS Behavior | Default DRS Behavior |
| configuration\|drsconfig\|affinityRules | Affinity Rules | DRS Affinity Rules |
| configuration\|dasconfig\|enabled | HA Enabled | HA Enabled |
| configuration\|dasconfig\| admissionControlEnabled | Admission Control Enabled | Admission Control Enabled |
| configuration\|dpmconfiginfo\|enabled | DPM Enabled | DPM Enabled |
| configuration\|dpmconfiginfo\| defaultDpmBehavior | Default DPM Behavior | Default DPM Behavior |
| configuration\|infraUpdateHaConfig\| remediation | Cluster Configuration\|HA Configuration\|Remediation | This property displays the Remediation mode taken by vSphere Cluster to deal with host failure. The options available are Quarantine mode, Maintenance mode, Mixed mode. |
| configuration\|drsConfig\| pctIdleMBInMemDemand | Cluster Configuration\|DRS Configuration\|Idle Consumed Memory | |
| configuration\|drsConfig\|targetBalance | Cluster Configuration\|DRS Configuration\|Tolerable imbalance threshold | |

DRS properties are collected for disaster recovery. DAS properties are collected for high availability service, formerly distributed availability service. DPM properties are collected for distributed power management.

## Resource Pool Properties

VCF Operations collects configuration, CPU, memory, and summary properties for resource pool objects.

**Table 1629: Configuration Properties Collected for Resource Pool Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|name | Name | Name |
| config\|cpuAllocation\|reservation | Reservation | CPU reservation |
| config\|cpuAllocation\|limit | Limit | CPU limit |
| config\|cpuAllocation\|expandableReservation | Expandable Reservation | CPU expandable reservation |
| config\|cpuAllocation\|shares\|shares | Shares | CPU shares |
| config\|memoryAllocation\|reservation | Reservation | Memory reservation |
| config\|memoryAllocation\|limit | Limit | Memory limit |
| config\|memoryAllocation\| expandableReservation | Expandable Reservation | Memory expandable reservation |
| config\|memoryAllocation\|shares\|shares | Shares | Memory shares |

**Table 1630: CPU Usage Properties Collected for Resource Pool Objects**

| Property Key | Property Name | Description |
|---|---|---|
| cpu\|limit | CPU Limit | CPU Limit |
| cpu\|reservation | CPU reservation | CPU Reservation |
| cpu\|expandable_reservation | CPU expandable reservation | CPU Expandable Reservation |
| cpu\|shares | CPU Shares | CPU Shares |
| cpu\|corecount_provisioned | Provisioned vCPU(s) | Number of CPUs. It counts both the vSocket and vCore. A VM with 2 vSockets x 4 vCores each has 8 vCPU. |

**Table 1631: Memory Properties Collected for Resource Pool Objects**

| Property Key | Property Name | Description |
|---|---|---|
| mem\|limit | Memory limit | Memory limit |
| mem\|reservation | Memory reservation | Memory reservation |
| mem\|expandable_reservation | Memory expandable reservation | Memory expandable reservation |
| mem\|shares | Memory Shares | Memory Shares |

**Table 1632: Summary Properties Collected for Resource Pool Objects**

| Property Key | Property Name | Description |
|---|---|---|
| summary\|customTag\|customTagValue | Value | Custom Tag Value |
| summary\|tag | vSphere Tag | vSphere Tag Name |

## Data Center Properties

VCF Operations collects configuration and summary properties for data center objects.

**Table 1633: Configuration Properties Collected for Data Center Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|name | Name | Name |

**Table 1634: Summary Properties Collected for Data Center Objects**

| Property Key | Property Name | Description |
|---|---|---|
| summary\|parentVcenter | Parent Vcenter | Parent Vcenter |
| summary\|customTag\|customTagValue | Value | Custom Tag Value |
| summary\|tag | vSphere Tag | vSphere Tag Name |

## Storage Pod Properties

VCF Operations collects configuration and summary properties for storage pod objects.

**Table 1635: Configuration Properties Collected for Storage Pod Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|name | Name | Name |
| config\|sdrsconfig\|vmStorageAntiAffinityRules | VM storage antiaffinity rules | Storage Distributed Resource Scheduler (SDRS) VM anti-affinity rules |
| config\|sdrsconfig\|vmdkAntiAffinityRules | VMDK antiaffinity rules | Storage Distributed Resource Scheduler (SDRS) Virtual Machine Disk (VMDK) anti-affinity rules |

## VMware Distributed Virtual Switch Properties

VCF Operations collects configuration and summary properties for VMware distributed virtual switch objects.

**Table 1636: Configuration Properties Collected for VMware Distributed Virtual Switch Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|networkResourceManagementEnabled | Configuration\|Network IO Control | This property shows the status of Network IO Control. Enabled means control over Network IO (using shares, limitations and reservation) are in place on each port group. |
| config\|name | Name | Name |

**Table 1637: Capability Properties Collected for VMware Distributed Virtual Switch Objects**

| Property Key | Property Name | Description |
|---|---|---|
| capability\|nicTeamingPolicy | NIC Teaming Policy | NIC Teaming Policy |

## Distributed Virtual Port Group Properties

VCF Operations collects configuration and summary properties for distributed virtual port group objects.

**Table 1638: Configuration Properties Collected for Distributed Virtual Port Group Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|portBinding | Configuration\|Port Binding | This property shows how ports are assigned to virtual machines connected to this distributed port group. Available values: earlyBinding, ephemeral, lateBinding. |
| config\|portAllocation | Configuration\|Port Allocation | This property shows the type of port allocation, such as elastic or fixed. Options are: true=Elastic, false=Fixed. |
| config\|name | Name | Name |
| Configuration\|Uplink | Uplink | Indicates whether the portgroup is uplink portgroup. |

**Table 1639: Summary Properties Collected for Distributed Virtual Port Group Objects**

| Property Key | Property Name | Description |
|---|---|---|
| summary\|active_uplink_ports | Active DV uplinks | Active DV uplinks |

## Datastore Properties

VCF Operations collects configuration, summary, and properties about datastore use for datastore objects.

**Table 1640: Configuration Properties of Datastore and Datastore Cluster Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|iormConfigStatus | Configuration\|Storage IO Control Status | Displays the status of Storage IO Control. If enabled control over Disk IO (using shares, limitations and reservation) is in place.Value: True or False. |
| summary\|total_number_datastores | Summary\|Total Number of Datastores | Displays the total number of member datastores in the cluster. |
| summary\|parentVcenter | Summary\|Parent vCenter | Displays the details of the parent vCenter. |
| summary\|parentDatacenter (GB) | Summary\|Parent Datacenter | Displays the details of the parent Datacenter. |

**Table 1641: Capacity Properties Collected for vSAN Datastore Objects**

| Property Key | Property Name | Description |
|---|---|---|
| Capacity\|Available Space (GB) | Available Space | Displays the available disk space in GB. |
| Capacity\|Provisioned (GB) | Provisioned (GB) | Displays the provisioned datastore size in GB. |
| Capacity\|Total Capacity (GB) | Total Capacity (GB) | Displays the total datastore capacity in GB. |
| Capacity\|Total Provisioned Consumer Space (GB) | Total Provisioned Consumer Space (GB) | Displays the total provisioned consumer space in GB. |
| Capacity\|Used Space (GB) | Used Space (GB) | Displays the used disk space in GB. |
| Capacity\|Used Space (%) | Used Space (%) | Displays the used disk space in percentage. |
| Capacity\|Usable Capacity (GB) | Usable Capacity (GB) | Displays the usable disk capacity in GB.<br>**Note:**<br>Earlier the vSAN Datastore base rate was calculated on the basis of Total Capacity of the disk, now the vSAN datastore base rate is calculated based on the usable capacity. |

**Table 1642: Summary Properties Collected for Datastore Objects**

| Property Key | Property Name | Description |
|---|---|---|
| summary\|vmfs_version | VMFS (Virtual Machine File System) Version | Displays the VMFS version number, contains both major version and minor version number.<br>**Note:**<br>The VMFS version property is visible, only when the datastore type is VMFS. |
| summary\|diskCapacity | Disk Capacity | Disk Capacity |
| summary\|isLocal | Is Local | Is local datastore |

| Property Key | Property Name | Description |
|---|---|---|
| summary\|customTag\|customTagValue | Value | Custom Tag Value |
| summary\|accessible | Datastore Accessible | Datastore Accessible |
| summary\|path | Summary\|Path | |
| summary\|scsiAdapterType | Summary\|SCSI Adapter Type | This property is disabled by default. |
| summary\|aliasOf | Summary\|Alias Of | Indicates whether the datastore is an alias of another. The published value is the container ID of the datastore for which it is an alias.<br>**Note:**<br>This property may have 2 values. It's either "none", that means the datastore is not an alias of another datastore, or datastore <containerID> that is the Container ID of the datastore for which this is an alias. |

**Table 1643: Datastore Properties Collected for Datastore Objects**

| Property Key | Property Name | Description |
|---|---|---|
| datastore\|hostcount | Host Count | Host Count |
| datastore\|hostScsiDiskPartition | Host SCSI Disk Partition | Host SCSI Disk Partition |
| * datastore\|maxObservedNumberRead | Datastore I/O\|Highest Observed Number of Read Requests | Disabled |
| * datastore\|maxObservedNumberWrite | Datastore I/O\|Highest Observed Number of Write Requests | Disabled |
| * datastore\|maxObservedOIO | Datastore I/O\|Highest Observed Outstanding Requests | Disabled |
| * datastore\|maxObservedRead | Datastore I/O\|Highest Observed Read Latency | Disabled |
| * datastore\|maxObservedReadLatency | Datastore I/O\|Highest Observed Read Latency | Disabled |
| * datastore\|maxObservedWrite | Datastore I/O\|Highest Observed Write Latency | Disabled |
| * datastore\|maxObservedWriteLatency | Datastore I/O\|Highest Observed Write Latency | Disabled |

**Table 1644: Datastore Properties Collected for vVol Datastore Objects**

| Property Key | Property Name | Description |
|---|---|---|
| storageArray\|modelId | Storage Array\|Model | Storage array model of VVol datastore.<br>**Note:**<br>This property is published for vVol datastores only and is available starting from vCenter version 6.0. |
| storageArray\|name | Storage Array\|Name | Storage array name of vVol datastore.<br>**Note:**<br>This property is published for vVol datastores only and is available starting from vCenter version 6.0. |
| storageArray\|id | Storage Array\|ID | Storage array ID of vVol datastore.<br>**Note:**<br>This property is published for vVol datastores only and is available starting from vCenter version 6.0. |
| storageArray\|vendorId | Storage Array\|Vendor | Storage array vendor of vVol datastore.<br>**Note:**<br>This property is published for vVol datastores only and is available starting from vCenter version 6.0. |
| protocolEndpoints\|name | Protocol Endpoints\|Name | Protocol endpoint's name of vVol datastore.<br>**Note:**<br>This is an instanced property that is published per protocol endpoint instance (e. g. eui.3362663138636633) for vVol datastores only. It is available starting from vCenter version 6.0. |
| protocolEndpoints\|type | Protocol Endpoints\|Type | Protocol endpoint's type of vVol datastore.<br>**Note:**<br>This is an instanced property that is published per protocol endpoint instance (e. g. eui.3362663138636633) for vVol datastores only. It is available starting from vCenter version 6.5. |
| protocolEndpoints\|hosts | Protocol Endpoints\|Hosts | Hosts associated with protocol endpoint of vVol datasore.<br>**Note:**<br>This is an instanced property that is published per protocol endpoint instance (e. g. eui.3362663138636633) for vVol datastores only. It is available starting from vCenter version 6.0. |

Datastore properties marked with an asterisk (*) have been disabled in this version of VCF Operations. This means that they do not collect data by default.

## vSphere Pod Properties

VCF Operations collects summary and event properties for vSphere Pods.

**Table 1645: Summary Properties Collected for vSphere Pod Objects**

| Property Key | Localized Name | Description |
|---|---|---|
| config\|name | Configuration\|Name | Resource name. |
| config\|guestFullName | Configuration\|Guest OS from vCenter | This is the value provided by vCenter. vCenter set it during VM creation. The value may not match the value inside the Guest. |
| config\|version | Configuration\|Version | Virtual Machine Version. |
| config\|createDate | Configuration\|Creation Date | Object Creation Date. |
| config\|numVMDKs | Configuration\|Number of Virtual Disks | Number of Virtual Disks. |
| config\|faultTolerant | Configuration\|Fault Tolerant | Fault tolerance enabled. |
| config\|ft_role | Configuration\|FT Role | Role of the VM in Fault Tolerance Group. |
| config\|ft_peer_vm | Configuration\|FT Peer VM | Peer of the VM in Fault Tolerance Group. |
| config\|hardware\|numCpu | Configuration\|Hardware\|Number of virtual CPUs | Number of virtual CPUs. |
| config\|hardware\|memoryKB | Configuration\|Hardware\|Memory | Memory. |
| config\|hardware\|thinEnabled | Configuration\|Hardware\|Thin Provisioned Disk | Thin Provisioned Disk. |
| config\|hardware\|numCoresPerSocket | Configuration\|Hardware\|Number of CPU cores per socket | Number of CPU cores per virtual socket. |
| config\|hardware\|numSockets | Configuration\|Hardware\|Number of virtual sockets | Number of virtual sockets. |
| config\|hardware\|diskSpace | Configuration\|Hardware\|Disk Space | Disk space metrics. |
| config\|cpuAllocation\|reservation | Configuration\|CPU Resource Allocation\|Reservation | N/A |
| config\|cpuAllocation\|limit | Configuration\|CPU Resource Allocation\|Limit | |
| config\|cpuAllocation\|shares\|shares | Configuration\|CPU Resource Allocation\|Shares\|Shares | |
| config\|memoryAllocation\|reservation | Configuration\|Memory Resource Allocation\|Reservation | |
| config\|memoryAllocation\|limit | Configuration\|Memory Resource Allocation\|Limit | |
| config\|memoryAllocation\|shares\|shares | Configuration\|Memory Resource Allocation\|Shares\|Shares | |
| config\|extraConfig\|mem_hotadd | Configuration\|Extra Configuration\|Memory Hot Add | Memory Hot Add Configuration. |
| config\|extraConfig\|vcpu_hotadd | Configuration\|Extra Configuration\|vCPU Hot Add | vCPU Hot Add Configuration. |
| config\|extraConfig\|vcpu_hotremove | Configuration\|Extra Configuration\|vCPU Hot Remove | vCPU Hot Remove Configuration. |

| Property Key | Localized Name | Description |
|---|---|---|
| config\|extraConfig\|mem_tps_share | Configuration\|Extra Configuration\| VM MEM TPS | N/A |
| config\|security\|disable_autoinstall | Configuration\|Security\| Disable tools auto install (isolation.tools.autoInstall.disable) | |
| config\|security\|disable_console_copy | Configuration\|Security\|Disable console copy operations (isolation.tools.copy.disable) | |
| config\|security\|disable_console_dnd | Configuration\|Security\|Disable console drag and drop operations (isolation.tools.dnd.disable) | |
| config\|security\|enable_console_gui_options | Configuration\|Security\|Enable console GUI operations (isolation.tools.setGUIOptions.enable) | |
| config\|security\|disable_console_paste | Configuration\|Security\|Disable console paste operations (isolation.tools.paste.disable) | |
| config\|security\|disable_disk_shrinking_shrink | Configuration\|Security\| Disable virtual disk shrink (isolation.tools.diskShrink.disable) | |
| config\|security\|disable_disk_shrinking_wiper | Configuration\|Security\| Disable virtual disk wiper (isolation.tools.diskWiper.disable) | |
| config\|security\|disable_hgfs | Configuration\|Security\| Disable HGFS file transfers (isolation.tools.hgfsServerSet.disable) | |
| config\|security\|disable_independent_nonpersistent | Configuration\|Security\|Avoid using independent nonpersistent disks (scsiX:Y.mode) | |
| config\|security\|enable_intervm_vmci | Configuration\|Security\| Enable VM-to-VM communication through VMCI (vmci0.unrestricted) | |
| config\|security\|enable_logging | Configuration\|Security\|Enable VM logging (logging) | |
| config\|security\|disable_monitor_control | Configuration\|Security\| Disable VM Monitor Control (isolation.monitor.control.disable) | |
| config\|security\|enable_non_essential_3D_features | Configuration\|Security\|Enable 3D features on Server and desktop virtual machines (mks.enable3d) | |
| config\|security\|disable_unexposed_features_autologon | Configuration\|Security\|Disable unexposed features - autologon (isolation.tools.ghi.autologon.disable) | |
| config\|security\|disable_unexposed_features_biosbbs | Configuration\|Security\|Disable unexposed features - biosbbs (isolation.bios.bbs.disable) | |

| Property Key | Localized Name | Description |
|---|---|---|
| config\|security\|disable_unexposed_features_getcreds | Configuration\|Security\|Disable unexposed features - getcreds (isolation.tools.getCreds.disable) | |
| config\|security\|disable_unexposed_features_launchmenu | Configuration\|Security\| Disable unexposed features - launchmenu (isolation.tools.ghi.launchmenu.change) | |
| config\|security\|disable_unexposed_features_memsfss | Configuration\|Security\|Disable unexposed features - memsfss (isolation.tools.memSchedFakeSampleStats.disable) | |
| config\|security\|disable_unexposed_features_protocolhandler | Configuration\|Security\| Disable unexposed features - protocolhandler (isolation.tools.ghi.protocolhandler.info.disable) | |
| config\|security\|disable_unexposed_features_shellaction | Configuration\|Security\|Disable unexposed features - shellaction (isolation.ghi.host.shellAction.disable) | |
| config\|security\|disable_unexposed_features_toporequest | Configuration\|Security\|Disable unexposed features - toporequest (isolation.tools.dispTopoRequest.disable) | |
| config\|security\|disable_unexposed_features_trashfolderstate | Configuration\|Security\| Disable unexposed features - trashfolderstate (isolation.tools.trashFolderState.disable) | |
| config\|security\|disable_unexposed_features_trayicon | Configuration\|Security\|Disable unexposed features - trayicon (isolation.tools.ghi.trayicon.disable) | |
| config\|security\|disable_unexposed_features_unity | Configuration\|Security\|Disable unexposed features - unity (isolation.tools.unity.disable) | |
| config\|security\|disable_unexposed_features_unity_interlock | Configuration\|Security\| Disable unexposed features - unity-interlock (isolation.tools.unityInterlockOperation.disable) | |
| config\|security\|disable_unexposed_features_unity_taskbar | Configuration\|Security\| Disable unexposed features - unity-taskbar (isolation.tools.unity.taskbar.disable) | |
| config\|security\|disable_unexposed_features_unity_unityactive | Configuration\|Security\| Disable unexposed features - unity-unityactive (isolation.tools.unityActive.disable) | |
| config\|security\|disable_unexposed_features_unity_windowcontents | Configuration\|Security\| Disable unexposed features - unity-windowcontents (isolation.tools.unity.windowContents.disable) | |
| config\|security\|disable_unexposed_features_unitypush | Configuration\|Security\|Disable unexposed features - unitypush (isolation.tools.unity.push.update.disable) | |

| Property Key | Localized Name | Description |
|---|---|---|
| config\|security\|disable_unexposed_features_versionget | Configuration\|Security\|Disable unexposed features - versionget (isolation.tools.vmxDnDVersionGet.disable) | |
| config\|security\|disable_unexposed_features_versionset | Configuration\|Security\|Disable unexposed features - versionset (solation.tools.guestDnDVersionSet.disable) | |
| config\|security\|disable_vix_messages | Configuration\|Security\|Disable VIX messages from the VM (isolation.tools.vixMessage.disable) | |
| config\|security\|enable_vga_only_mode | Configuration\|Security\|Disable all but VGA mode on virtual machines (svga.vgaOnly) | |
| config\|security\|limit_console_connection | Configuration\|Security\|Limit number of console connections (RemoteDisplay.maxConnection) | |
| config\|security\|limit_log_number | Configuration\|Security\|Limit number of log files (log.keepOld) | |
| config\|security\|limit_log_size | Configuration\|Security\|Limit log file size (log.rotateSize) | |
| config\|security\|limit_setinfo_size | Configuration\|Security\|Limit VMX file size (tools.setInfo.sizeLimit) | |
| config\|security\|enable_console_VNC | Configuration\|Security\| Enable access to VM console via VNC protocol (RemoteDisplay.vnc.enabled) | |
| config\|security\|disable_device_interaction_connect | Configuration\|Security\| Disable unauthorized removal, connection of devices (isolation.device.connectable.disable) | |
| config\|security\|disable_device_interaction_edit | Configuration\|Security\| Disable unauthorized modification of devices (isolation.device.edit.disable) | |
| config\|security\|enable_host_info | Configuration\|Security\|Enable send host information to guests (tools.guestlib.enableHostInfo) | |
| config\|security\|network_filter_enable | Configuration\|Security\| Enable dvfilter network APIs (ethernetX.filterY.name) | |
| config\|security\|vmsafe_cpumem_agentaddress | Configuration\|Security\|VMsafe CPU/memory APIs - IP address (vmsafe.agentAddress) | |
| config\|security\|vmsafe_cpumem_agentport | Configuration\|Security\|VMsafe CPU/memory APIs - port number (vmsafe.agentPort) | |
| config\|security\|vmsafe_cpumem_enable | Configuration\|Security\|Enable VMsafe CPU/memory APIs (vmsafe.enable) | |

| Property Key | Localized Name | Description |
|---|---|---|
| config\|security\|disconnect_devices_floppy | Configuration\|Security\|Disconnect floppy drive | |
| config\|security\|disconnect_devices_cd | Configuration\|Security\|Disconnect CD-ROM | |
| config\|security\|disconnect_devices_usb | Configuration\|Security\|Disconnect USB controller | |
| config\|security\|disconnect_devices_parallel | Configuration\|Security\|Disconnect parallel port | |
| config\|security\|disconnect_devices_serial | Configuration\|Security\|Disconnect serial port | |
| config\|security\|pci_device_configured | Configuration\|Security\|DCUI timeout | |
| runtime\|memoryCap | Runtime\|Memory Capacity | Memory Capacity. |
| cpu\|limit | CPU\|CPU Limit | CPU Limit. |
| cpu\|reservation | CPU\|CPU reservation | CPU Reservation. |
| cpu\|speed | CPU\|CPU | CPU Speed. |
| mem\|host_reservation | Memory\|Host Active | Machine Active. |
| mem\|host_active | Memory\|Host Usage | Machine Usage. |
| net\|mac_address | Network\|Mac Address | N/A |
| net\|ip_address | Network\|IP Address | |
| net\|subnet_mask | Network\|Subnet Mask | |
| net\|ipv6_address | Network\|IPv6 Address | IPv6 Address. |
| net\|ipv6_prefix_length | Network\|IPv6 Prefix Length | IPv6 Prefix Length. |
| net\|default_gateway | Network\|Default Gateway | N/A |
| net\|nvp_vm_uuid | Network\|NVP VM UUID | |
| net\|vnic_type | Network\|Virtual NIC Type | Virtual Machine's network adapter type. |
| net\|vnic_label | Network\|Label | Device label. |
| summary\|UUID | Summary\|UUID | Instance UUID in vCenter that uniquely identify all virtual machine instances. |
| summary\|MOID | Summary\|MOID | Managed object ID in vCenter. This is unique in scope of vCenter. |
| summary\|swapOnlyDatastore | Summary\|Datastore with only swap file | Datastore containing only the swap file and no other files from this VM. |
| summary\|customTag\|customTagValue | Summary\|Custom Tag\|Value | Custom Tag Value. |
| summary\|tag | Summary\|vSphere Tag | vSphere Tag Name. |
| summary\|tagJson | Summary\|vSphere Tag Json | vSphere Tag in Json format. |
| summary\|folder | Summary\|vSphere Folder | vSphere Folder Name. |
| summary\|parentCluster | Summary\|Parent Cluster | Parent Cluster. |
| summary\|parentHost | Summary\|Parent Host | Parent Host. |
| summary\|parentDatacenter | Summary\|Parent Datacenter | Parent Datacenter. |
| summary\|parentNamespace | Summary\|Parent Namespace | Parent Namespace. |
| summary\|parentVcenter | Summary\|Parent vCenter | Parent vCenter. |
| summary\|parentFolder | Summary\|Parent Folder | Parent Folder. |

| Property Key | Localized Name | Description |
|---|---|---|
| summary\|datastore | Summary\|Datastore(s) | Datastore(s). |
| summary\|guest\|fullName | Summary\|Guest Operating System\|Guest OS from Tools | This is the value provided by VMware Tools. This value will differ to the value set in vCenter if the Guest OS was upgraded, or a different Guest OS was installed. |
| summary\|guest\|ipAddress | Summary\|Guest Operating System\|Guest OS IP Address | Guest OS IP Address. |
| summary\|guest\|hostName | Summary\|Guest Operating System\|Hostname | Hostname of the guest operating system, if known. |
| summary\|guest\|toolsRunningStatus | Summary\|Guest Operating System\|Tools Running Status | Guest Tools Running Status. |
| summary\|guest\|toolsVersionStatus2 | Summary\|Guest Operating System\|Tools Version Status | Guest Tools Version Status 2. |
| summary\|guest\|toolsVersion | Summary\|Guest Operating System\|Tools Version | VM tools version installed on guest OS. |
| summary\|guest\|vrealize_operations_agent_id | Summary\|Guest Operating System\|vRealize Operations Agent ID | An ID to identify a VM in Agent Adapter's world. |
| summary\|guest\|vrealize_operations_euc_agent_id | Summary\|Guest Operating System\|vRealize Operations Euc Agent ID | An ID to identify a VM in Agent Adapter's world. |
| summary\|config\|numEthernetCards | Summary\|Configuration\|Number of NICs | Number of NICs. |
| summary\|config\|productName | Summary\|Configuration\|Product Name | Product Name. |
| summary\|config\|appliance | Summary\|Configuration\|Appliance | Appliance. |
| summary\|runtime\|isIdle | Summary\|Runtime\|Idleness indicator | This property indicates whether the monitored instance is idle or not. |
| summary\|runtime\|powerState | Summary\|Runtime\|Power State | Power State. |
| summary\|runtime\|connectionState | Summary\|Runtime\|Connection State | Connection State. |
| summary\|smbiosUUID | SMBIOS UUID | System Management BIOS UUID of a virtual machine.<br>**Note:**<br>The SMBIOS UUID metric for vSphere Pod is disabled by default. You have to enable the metric at the policy level. |
| guestfilesystem\|capacity_property | Guest File System\|Guest File System Capacity Property | Total capacity of guest file system as a property. |
| guestfilesystem\|capacity_property_total | Guest File System\|Total Capacity Property | Total capacity of guest file system as a property. |
| virtualDisk\|datastore | Virtual Disk\|Datastore | Datastore. |
| virtualDisk\|configuredGB | Virtual Disk\|Configured | Virtual Disk configured disk space. |
| virtualDisk\|label | Virtual Disk\|Label | Device Label. |
| virtualDisk\|fileName | Virtual Disk\|File Name | Virtual Disk file name. |

| Property Key | Localized Name | Description |
|---|---|---|
| diskspace\|snapshot\|mor | Disk Space\|Snapshot\|Managed Object Reference | Managed Object Reference. |
| diskspace\|snapshot\|name | Disk Space\|Snapshot\|Name | Snapshot name. |
| diskspace\|snapshot\|numberOfDays | Disk Space\|Snapshot\|Number of Days Old | Number of days since snapshot creation. |
| diskspace\|snapshot\|snapshotAge | Disk Space\|Snapshot\|Age (Days) | Virtual Machine's topmost snapshot age in days. |
| diskspace\|snapshot\|creator | Disk Space\|Snapshot\|Creator | Creator. |
| diskspace\|snapshot\|description | Disk Space\|Snapshot\|Description | Snapshot description. |
| vsan\|policy\|compliance | vSAN\|VM Storage Policies\| Compliance | Compliance status of the VM storage object. |
| datastore\|maxObservedNumberRead | Datastore\|Highest Observed Number of Read Requests | Highest Observed Number of Read Requests. |
| datastore\|maxObservedRead | Datastore\|Highest Observed Read Rate | Highest Observed Read Rate (KBps). |
| datastore\|maxObservedNumberWrite | Datastore\|Highest Observed Number of Write Requests | Highest Observed Number of Write Requests. |
| datastore\|maxObservedWrite | Datastore\|Highest Observed Write Rate | Highest Observed Write Rate (KBps). |
| datastore\|maxObservedOIO | Datastore\|Highest Observed Outstanding Requests | Highest Observed Outstanding Requests. |

**Table 1646: Compliance Configuration Related Properties for vSphere Pod Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|security\|disconnect_devices_virtualhd audiocard | Configuration\|Security\|Virtual HD Audio Card Disconnected | NIL |
| config\|security\|disconnect_devices_virtualah cicontroller | Configuration\|Security\|Virtual AHCI Controller Disconnected | NIL |
| config\|security\|disconnect_devices_virtualen soniq1371 | Configuration\|Security\|Virtual Ensoniq 1371 Disconnected | NIL |

## Namespace Properties

VCF Operations collects summary and event properties for Namespace.

**Table 1647: Summary Properties Collected for Namespace Objects**

| Property Key | Localized Name | Description |
|---|---|---|
| config\|name | Configuration\|Name | Resource name |
| config\|resourceLimits\|namespace\|cpu | Configuration\|Resource Limits\| Namespaces\|CPU | CPU |
| config\|resourceLimits\|namespace\|mem | Configuration\|Resource Limits\| Namespaces\|Memory | Memory |
| config\|resourceLimits\|namespace\|diskspace | Configuration\|Resource Limits\| Namespaces\|Disk Space | Disk space metrics |

| Property Key | Localized Name | Description |
|---|---|---|
| config\|resourceLimits\|containers\|cpu_request | Configuration\|Resource Limits\|Containers\|CPU Request | CPU Request Default |
| config\|resourceLimits\|containers\|cpu_limit | Configuration\|Resource Limits\|Containers\|CPU Limit | CPU Limit Default |
| config\|resourceLimits\|containers\|mem_request | Configuration\|Resource Limits\|Containers\|Memory Request | Memory Request Default |
| config\|resourceLimits\|containers\|mem_limit | Configuration\|Resource Limits\|Containers\|Memory Limit | Memory Limit Default |
| config\|objectLimits\|compute\|pod_count | Configuration\|Object Limits\|Compute\|Pods | Number of Pods |
| config\|objectLimits\|compute\|deployment_count | Configuration\|Object Limits\|Compute\|Deployments | Deployments |
| config\|objectLimits\|compute\|job_count | Configuration\|Object Limits\|Compute\|Jobs | Jobs |
| config\|objectLimits\|compute\|daemon_sets | Configuration\|Object Limits\|Compute\|Daemon Sets | Daemon Sets |
| config\|objectLimits\|compute\|replica_sets | Configuration\|Object Limits\|Compute\|Replica Sets | Replica Sets |
| config\|objectLimits\|compute\|replication_controllers | Configuration\|Object Limits\|Compute\|Replication Controllers | Replication Controllers |
| config\|objectLimits\|compute\|stateful_sets | Configuration\|Object Limits\|Compute\|Stateful Sets | Stateful Sets |
| config\|objectLimits\|storage\|config_maps | Configuration\|Object Limits\|Storage\|Config Maps | Config Maps |
| config\|objectLimits\|storage\|secret_count | Configuration\|Object Limits\|Storage\|Secrets | Secrets |
| config\|objectLimits\|storage\|persistent_volume_claim | Configuration\|Object Limits\|Storage\|Persistent Volume Claim | Persistent Volume Claim |
| config\|objectLimits\|network\|services | Configuration\|Object Limits\|Network\|Services | Services |
| summary\|parentDatacenter | Summary\|Parent Datacenter | Parent Datacenter |
| summary\|parentCluster | Summary\|Parent Cluster | Parent Cluster |
| summary\|parentVcenter | Summary\|Parent vCenter | Parent vCenter |
| mem\|limit | Memory\|Memory limit | Memory limit |
| mem\|reservation | Memory\|Memory reservation | Memory reservation |
| mem\|expandable_reservation | Memory\|Memory expandable reservation | Memory Expandable Reservation |
| mem\|shares | Memory\|Memory Shares | Memory Shares |
| cpu\|limit | CPU\|CPU Limit | CPU Limit |
| cpu\|reservation | CPU\|CPU Reservation | CPU Reservation |
| cpu\|expandable_reservation | CPU\|CPU expandable reservation | CPU expandable Reservation |
| cpu\|shares | CPU\|CPU Shares | CPU Shares |
| cpu\|corecount_provisioned | CPU\|Provisioned vCPU(s) | Number of CPUs. It counts both the vSocket and vCore. A VM with 2 vSockets x 4 vCores each has 8 vCPU. |

## Tanzu Kubernetes cluster Properties

VCF Operations collects summary and event properties forTanzu Kubernetes clusters.

**Table 1648: Summary Properties Collected for Tanzu Kubernetes cluster Objects**

| Property Key | Localized Name | Description |
|---|---|---|
| config\|name | Configuration\|Name | Resource name |
| config\|cpuAllocation\|reservation | Configuration\|CPU Resource Allocation\|Reservation | N/A |
| config\|cpuAllocation\|limit | Configuration\|CPU Resource Allocation\|Limit | N/A |
| config\|cpuAllocation\|expandableReservation | Configuration\|CPU Resource Allocation\|Expandable Reservation | N/A |
| config\|cpuAllocation\|shares\|shares | Configuration\|CPU Resource Allocation\|Shares\|Shares | N/A |
| config\|memoryAllocation\|reservation | Configuration\|Memory Resource Allocation\|Reservation | N/A |
| config\|memoryAllocation\|limit | Configuration\|Memory Resource Allocation\|Limit | N/A |
| config\|memoryAllocation\|expandableReservation | Configuration\|Memory Resource Allocation\|Expandable Reservation | N/A |
| config\|memoryAllocation\|shares\|shares | Configuration\|Memory Resource Allocation\|Shares\|Shares | N/A |
| cpu\|limit | CPU\|CPU Limit | CPU Limit |
| cpu\|reservation | CPU\|CPU Reservation | CPU Reservation |
| cpu\|expandable_reservation | CPU\|CPU expandable reservation | CPU expandable Reservation |
| cpu\|shares | CPU\|CPU Shares | CPU Shares |
| cpu\|corecount_provisioned | CPU\|Provisioned vCPU(s) | Number of CPUs. It counts both the vSocket and vCore. A VM with 2 vSockets x 4 vCores each has 8 vCPU. |
| mem\|limit | Memory\|Memory limit | Memory limit |
| mem\|reservation | Memory\|Memory reservation | Memory reservation |
| mem\|expandable_reservation | Memory\|Memory expandable reservation | Memory Expandable Reservation |
| mem\|shares | Memory\|Memory Shares | Memory Shares |
| summary\|parentDatacenter | Summary\|Parent Datacenter | Parent Datacenter |
| summary\|parentNamespace | Summary\|Parent Namespace | Parent Namespace |

## All Folder Properties

VCF Operations collects configuration and summary properties for All Folders.

**Table 1649: Summary Properties Collected for All Folder Objects**

| Property Key | Property Name | Description |
|---|---|---|
| summary\|parentDatacenter | Summary\|Parent Datacenter | This property shows the details of the parent datacenter. |
| summary\|parentVcenter | Summary\|Parent vCenter | This property shows the details of the parent vCenter. |
| summary\|tag | Summary\|vSphere Tag | This property shows the details of the vSphere tag name. |

## Self-Monitoring Properties for VCF Operations

VCF Operations uses the VCF Operations adapter to collect properties that monitor its own objects. These self-monitoring properties are useful for monitoring changes within VCF Operations.

### Analytics Properties

VCF Operations collects properties for the VCF Operations analytics service.

**Table 1650: Properties Collected for Analytics Service Objects**

| Property Key | Property Name | Description |
|---|---|---|
| HAEnabled | HA Enabled | Indicates HA is enabled with a value of 1, disabled with a value of 0. |
| ControllerDBRole | Role | Indicates persistence service role for the controller: 0 – Primary, 1 – Replica, 4 – Client.. |
| ShardRedundancyLevel | Shard redundancy level | The target number of redundant copies for Object data. |
| LocatorCount | Locator Count | The number of configured locators in the system |
| ServersCount | Servers Count | The number of configured servers in the system |

### Node Properties

VCF Operations collects properties for the VCF Operations node objects.

**Table 1651: Configuration Properties Collected for Node Objects**

| Property Key | Property Name | Description |
|---|---|---|
| config\|numCpu | Number of CPU | Number of CPUs |
| config\|numCoresPerCpu | Number of cores per CPU | Number of cores per CPU |
| config\|coreFrequency | Core Frequency | Core Frequency |

**Table 1652: Memory Properties Collected for Node Objects**

| Property Key | Property Name | Description |
|---|---|---|
| mem\|RAM | System RAM | System RAM |

**Table 1653: Service Properties Collected for Node Objects**

| Property Key | Property Name | Description |
|---|---|---|
| service\|proc\|pid | Process ID | Process ID |

## OS and Application Monitoring Properties

Properties are collected for operating systems, application services, remote checks, Linux processes, and Windows services which can be used to create reports, views, and dashboards.

### Guest Information Properties

VCF Operations displays the following guest information properties for all objects created by the OS and Application Monitoring management pack.

- Guest Info
  - Hostname
  - IP
  - OS Name
  - OS Version
  - Telegraf Version

## Service Discovery Properties

VCF Operations displays object properties for service discovery.

### Service Discovery Adapter Instance Properties

VCF Operations displays the following properties for the service discovery adapter instance.

**Table 1654: Service Discovery Adapter Instance Properties**

| Property Name | Description |
|---|---|
| Action Identifier | An FQDN and IP pair of the end point vCenter Server that is used to identify the adapter instance that has to run actions on the vCenter. |

### Virtual Machine Properties

VCF Operations displays the following properties for virtual machines.

**Table 1655: Virtual Machine Properties**

| Property Name | Description |
|---|---|
| Guest OS Services\|Authentication Method | Refers to the VM guest operating system authentication method. The guest operating system can be authenticated either via a common user/password or a guest alias. |
| Guest OS Services\|Discovery Status | Reflects the result of service discovery operation on the VM's guest operating system. |
| Guest OS Services\|Authentication Status | Guest operating system authentication status. |
| Guest OS Services\|Inbound Ports | List of VM inbound ports. These are the ports on which the discovered services are listening. |

| Property Name | Description |
|---|---|
| SRM Info\|Protection Group | Protection group to which the VM belongs. |
| SRM Info\|Recovery Plans | List of recovery plans covering the VM. |

### Services Properties

VCF Operations displays the following properties for services.

**Table 1656: Services Properties**

| Property Name | Description |
|---|---|
| Type | The name of the service type. |
| Install Path | The install path. |
| Ports | List of service listening ports. |
| Virtual Machine | The name of the parent VM. |
| Virtual Machine MOID | The MOID of the VM. |
| Version | Version of the discovered service. |
| Is Application Member | Indicates that the service is a member of the group of services forming an application. |
| Category | Category of the service. |
| Connection Type | If there is a remote process that was connected to one of the listening ports of the given service, then the property's value is set to Incoming. If not, it is set to Outgoing. If there is no connection to another service, then the value of the property is set to N/A. |
| Has Dynamic Port | Indicates whether the service has dynamic ports or not. |
| Status | Indicates the status of the service.<br>**Up:** The service is running.<br>**Down:** The service is unavailable on the monitored VM.<br>**Unavailable:** The service is unavailable on a VM that is not being monitored.<br>**None:** The service is not available within 7 days. |

## Properties for vSAN

VCF Operations displays object properties for vSAN.

### Properties for vSAN Disk Groups

VCF Operations displays the following property for vSAN disk groups:

- vSAN Disk Groups: Configuration|vSAN Configuration
- vSAN Disk Groups: Configuration | Number of Disks

## Properties for vSAN Cluster

The VCF Operations displays the following properties for vSAN cluster.

| Property Name | Description |
|---|---|
| Configuration\|vSAN\|vSAN ESA | Indicates whether vSAN ESA configuration is enabled on the vSAN cluster. |
| Configuration\|vSAN\|Deduplication and Compression Enabled | Indicates whether deduplication and compression is eanbled on the vSAN cluster. |
| Configuration\|vSAN\|Preferred fault domain | Indicates whether the preferred fault domain is not set for the witness host in a vSAN Stretched cluster. |
| Configuration\|vSAN\|Stretched Cluster | Indicates whehter vSAN stretch cluster is enabled or not. |
| Configuration\|vSAN\|vSAN Configuration | Indicates whether the vSAN cluster is configured or not. |
| Configuration\|vSAN\|Encryption | Indicates whether the vSAN cluster is encypted or not. |
| Configuration \| vSAN \| File Service | Indicates whether vSAN File Services is enabled or not. |
| Configuration \| vSAN \| File Service Domain:<domainName> \| DNS Servers | Indicates the IP addresses of DNS servers, which are used to resolve the host names within the DNS domain. |
| Configuration \| vSAN \| File Service Domain:<domainName> \| DNS Suffixes | Indicates the list of DNS suffixes which can resolved by the DNS servers. |
| Configuration \| vSAN \| File Service Domain:<domainName> \| Gateway | Indicated the default gateway IP address for the file service access point. |
| Configuration \| vSAN \| File Service Domain:<domainName> \| Primary IP | Indicates the primary IP address for the file service. |
| Configuration \| vSAN \| File Service Domain:<domainName> \| Subnet Mask | Indicates the subnet mask for the vSAN cluster. |
| Summary \| Type | vSAN Cluster Type |
| Configuration \| vSAN \| File Service Domain:<domainName> \| IP Address :<ipaddress> \| FQDN | Indicates the Full Qualified Domain name (FQDN) to be used with IP address for the vSAN File Server instance. |

## Properties for vSAN Enabled Host

VCF Operations displays the following property for vSAN enabled host.

- Configuration|vSAN Enabled
- Configuration|vSAN|Encryption

## Properties for vSAN Cache Disk

VCF Operations displays the following properties for the vSAN cache disk.

Properties for vSAN include:

| Component | Metrics |
|---|---|
| Configuration | • Configuration Properties\|Name<br>• Configuration Properties\|Size<br>• Configuration Properties\|Vendor<br>• Configuration Properties\|Type<br>• Configuration Properties\|Queue Depth<br>• Configuration\|vSAN\|Encryption<br>• Configuration \| Model |
| SCSI SMART Statistics | • SCSI SMART Statistics\|Media Wearout Indicator Threshold<br>• SCSI SMART Statistics\|Write Error Count Threshold<br>• SCSI SMART Statistics\|Read Error Count Threshold<br>• SCSI SMART Statistics\|Reallocated Sector Count Threshold<br>• SCSI SMART Statistics\|Raw Read Error Rate Threshold<br>• SCSI SMART Statistics\|Drive Temperature Threshold<br>• SCSI SMART Statistics\|Drive Rated Max Temperature Threshold<br>• SCSI SMART Statistics\|Write Sectors TOT Count Threshold<br>• SCSI SMART Statistics\|Read Sectors TOT Count Threshold<br>• SCSI SMART Statistics\|Initial Bad Block Count Threshold |

### Properties for vSAN Capacity Disk

VCF Operations displays the following properties for the vSAN capacity disk.

Properties for vSAN include:

| Component | Metrics |
|---|---|
| Configuration | • Configuration Properties\|Name<br>• Configuration Properties\|Size<br>• Configuration Properties\|Vendor<br>• Configuration Properties\|Type<br>• Configuration Properties\|Queue Depth<br>• Configuration\|vSAN\|Encryption |
| SCSI SMART Statistics | • SCSI SMART Statistics\|Media Wearout Indicator Threshold<br>• SCSI SMART Statistics\|Write Error Count Threshold<br>• SCSI SMART Statistics\|Read Error Count Threshold<br>• SCSI SMART Statistics\|Reallocated Sector Count Threshold<br>• SCSI SMART Statistics\|Raw Read Error Rate Threshold<br>• SCSI SMART Statistics\|Drive Temperature Threshold<br>• SCSI SMART Statistics\|Drive Rated Max Temperature Threshold<br>• SCSI SMART Statistics\|Write Sectors TOT Count Threshold<br>• SCSI SMART Statistics\|Read Sectors TOT Count Threshold<br>• SCSI SMART Statistics\|Initial Bad Block Count Threshold |

### Properties for vSAN File Server

VCF Operations displays the following properties for vSAN file server.

- Configuration | vSAN | Primary
- Configuration | vSAN | FQDN

### Properties for vSAN File Share

VCF Operations displays the following properties for vSAN file share.

- Configuration |vSAN| Domain Name
- Configuration | vSAN| Hard Quota
- Configuration |vSAN| Soft Quota
- Configuration |vSAN | Label|<key>
- Configuration |vSAN | Access Point|<key>
- Configuration | vSAN | Permission:<permission> | Client IP Range
- Configuration | vSAN | Permission:<permission> | Root Squash

### Properties for vSAN Storage Pool

VCF Operations displays the following properties for vSAN Storage Pool.

| Property Name | Description |
|---|---|
| Configuration\|Number of Disks | Displays the total number of vSAN ESA disks in the storage pool. |

### Properties for vSAN ESA Disk

VCF Operations displays the following properties for the vSAN ESA Disk.

| Property Name | Description |
|---|---|
| Configuration\|Model | Displays the model number of the SCSI device. |
| Configuration\|Name | Displays the user configurable name for the SCSI device. |
| Configuration\|Queue Depth | Displays the queue depth of the SCSI device. |
| Configuration\|Size (GB) | Displays the size of SCSI device using the Logial Block Addressing Scheme (number of blocks) x (size of blocks). |
| Configuration\|Type | Displays the type of the SCSI device. |
| Configuration\|Vendor | Displays the vendor for the SCSI device. |
| Configuration \| vSAN \| Encryption | Indicates whether data encryption is enable on vSAN disk. If enabled all the VM data residing on the vSAN disk is encrypted. |

## Properties for Certificate Monitoring

VCF Operations displays the following certificate summary properties.

**Table 1657: Adapter Instance Certificate Summary Properties, published on Adapter Instance Object**

| Property Name | Property Key | Description |
|---|---|---|
| End Date | Certificate Summary:endpointIdentifier\|End Date | End date of the adapter certificate. |
| Start Date | Certificate Summary: endpointIdentifier \| Start Date | Start date of the adapter certificate. |
| Issuer DN | Certificate Summary:endpointIdentifier\| Issuer DN | Distinguished name of the adapter certificate issuer. |
| No. of days to expire | Certificate Summary:endpointIdentifier\|No. of days to expire | Number of days left before the expiration of the adapter certificate. |

**Table 1658: Authentication Source Certificate Summary Properties, published on Universe Object**

| Property Name | Property Key | Description |
|---|---|---|
| End Date | Certificate Summary\|Authentication Sources:authenticationSourceId\|End Date | End date of the authentication source certificate. |
| Start Date | Certificate Summary\|Authentication Sources: authenticationSourceId\|Start Date | Start date of the authentication source certificate. |
| Issuer DN | Certificate Summary\|Authentication Sources:authenticationSourceId\|Issuer DN | Distinguished name of the authentication source certificate issuer. |
| No. of days to expire | Certificate Summary\|Authentication Sources:authenticationSourceId\|No. of days to expire | Number of days left before the expiration of the authentication source certificate |

**Table 1659: Outbound Plugin Certificate Summary Properties, published on Universe Object**

| Property Name | Property Key | Description |
|---|---|---|
| End Date | Certificate Summary\|Outbound Plugins:outboundPluginId\|End Date | End date of the outbound plugin certificate |
| Start Date | Certificate Summary\|Outbound Plugins : outboundPluginId \|Start Date | Start date of the outbound plugin certificate |
| Issuer DN | Certificate Summary\| Outbound Plugins : outboundPluginId \|Issuer DN | Distinguished name of the outbound plugin certificate issuer. |
| No. of days to expire | Certificate Summary\| Outbound Plugins : outboundPluginId \|No. of days to expire | Number of days left before the expiration of the outbound plugin certificate |

## Properties for VCF Automation

VCF Operations displays properties for VCF Automation objects.

Some of the useful properties for project objects deployed through VCF Automation are as follows:

- Project|CustomProperties: Custom properties defined for the project.
- Project|OrganizationID: Organization ID of the project.
- Project|userEmail: Email address of the user for the project.

One of the useful properties for the deployment object is:

- Deployment|User: User associated with the deployment.

One of the useful properties for the cloud zone object is:

- CloudAutomation|ResourceTags: Resource tags associated with the cloud zone.

One of the useful properties for the blueprint object is:

- Blueprint|User: User associated with the blueprint.

One of the useful properties for the CASworkd object is:

- CASWorld|metering|MeteringPolicyId: Metering policy ID associated with the CAS World object.

One of the useful properties for the virtual machine object is:

- Cloud Automation|CustomProperties: Custom properties associated with the virtual machine.

One of the useful properties for Cloud Zone is:

- Cloud Automation|Resource Tags: Resources tags associated with the cloud automation.

## Properties in the NSX

VCF Operations displays the following properties for the NSX adapter.

**Table 1660: Properties in the NSX Adapter**

| Resource | Properties common in NSX and NSX on VMware Cloud on AWS | Properties in NSX on-premise | Properties NSX on VMware Cloud on AWS |
|---|---|---|---|
| Management Cluster | | • NSXT Product Version<br>• Status Summary\|Cluster Status\| Management Cluster Status<br>• Status Summary\|Cluster Status\| Controller Cluster Status<br>• Status Summary\|vIDM Connection Status<br>• Status Summary\|Compute Managers\| <ComputeManagerName>\|Status<br>• Configuration Maximums<br>– Compute Manager count<br>– Prepared vC Cluster count | |
| Firewall Section | Summary<br>• Create Time<br>• Create User<br>• Last Modified Time<br>• Last Modified User<br>• Protection<br>• Revision<br>• System Owned<br>Configuration<br>• Firewall Rule Count Size | Configuration<br>• Firewall Stateful | Configuration<br>• Type<br>• Domain id<br>• Precedence<br>• Category |

| Resource | Properties common in NSX and NSX on VMware Cloud on AWS | Properties in NSX on-premise | Properties NSX on VMware Cloud on AWS |
|---|---|---|---|
| Transport Node<br>**Note:** This object is specific to NSX on-premise and is not available in NSX on VMware Cloud on AWS. | | • Summary<br>– Create Time<br>– Create User<br>– Last Modified Time<br>– Last Modified User<br>– Protection<br>– Revision<br>– System Owned<br>– Summary\|FQDN<br>• Status Summary<br>– Transport Node State<br>– Transport Node Deployment State<br>– LCA Connectivity Status<br>– Management Plane Connectivity Status<br>– Host Node Deployment Status<br>– Management connection Status<br>– Controller connection Status<br>• Load Balancer Usage<br>– Current Small LB services<br>– Current Medium LB services<br>– Current Large LB services<br>– Current Extra Large LB services<br>– Current LB Pools<br>– Current LB Pool Members<br>– Current LB Virtual Servers<br>– Remaining Small LB services<br>– Remaining Medium LB services<br>– Remaining Large LB services<br>– Remaining Extra Large LB services<br>– Remaining LB Pool Members<br>• Tunnels\|<Tunnel-Name>\|Status<br>• File Systems\|<FileSystemMount><br>– Total<br>– Type<br>– File System ID | |

## Placement Group Properties

The following properties are available for each Placement Group instance in your VCF Operations environment.

**Table 1661: Placement Group Properties**

| Service | Property |
|---|---|
| Placement Group | State |
| | Strategy |

## Properties for VeloCloud Gateway

VCF Operations displays properties of VeloCloud Gateway objects.

Some of the useful properties for VeloCloud Gateway are as follows:

- Summary | Core Count
- Summary | Gateway Activation Status
- Summary | Gateway Network Interface Errors
- Summary | Gateway Time Zone
- Summary | ICMP Status
- Summary | Is Eth0 DPDK Enabled
- Summary | is Eth1 DPDK Enabled
- Summary | Registration Status
- Summary | VCO IP
- Summary | Version

## Properties for VeloCloud Orchestrator

VCF Operations displays properties of VeloCloud Orchestrator objects.

Some of the useful properties for VeloCloud Orchestrator are as follows:

- General | DR SSH Tunnel Status

- General | Internet Connectivity
- General | IP Address
- General | NTP Time Zone

### Green Score Properties

In the computed metrics, constant values for carbon dioxide emissions and power consumption have been used.

The values are taken from the following links:

- $CO_2$ emission per kWh = 0.672 kg. Reference values from Greenhouse Gas Equivalencies Calculator
- Power consumption of a small server (1 socket, 10 cores, 32 GB RAM) = 0.1 kW (Assumption).

**Table 1662:**

| Property Name | Object Type | Type | Default Value |
|---|---|---|---|
| Electricity Rate | Cluster Compute Resource | Numeric | 0.108 |
| $CO_2$ Emission | Cluster Compute Resource | Numeric | 0.672 |

**Disclaimer:**

The conversion calculators and information shown in this documentation reference public information and have been provided to help translate abstract carbon emissions numbers into easily understandable terms solely for informational purposes. You should not rely on the calculators or information provided herein for any other purpose, including for any regulatory disclosure or diligence purposes. Broadcom may update, upgrade, revise, adjust or otherwise change the features and conversion methodologies at any time. Broadcom has not separately reviewed, approved, or endorsed the public information or third-party websites. No representation or warranty is made by Broadcom as to the accuracy, reasonableness or completeness of the calculations and related information herein.

### Properties for Policies

VCF Operations displays the following properties for the object type 'Policy'.

| Property Key | Property Name | Description |
|---|---|---|
| IsDefaultPolicy | Is Default Policy | This property indicates if a specific policy is the default policy. This property value is False for all policies except the default policy. |
| PolicyPriority | Policy Priority | This property indicates the priority of a specific policy. |

# Extending Monitoring Capabilities

## Installing and Configuring Management Packs in VMware Cloud Foundation Operations from the Solutions Catalog

Integrations in VMware Cloud Foundation Operations expand your ability to monitor and troubleshoot your software-defined data center and third-party products. You can install and configure management packs from the Solutions Catalog to connect physical and virtual layers, providing visibility into performance, capacity, and efficiency.Use these guides to install integrations in connected or disconnected environments. You can access configuration details for specific management packs, including AWS, Kubernetes, ServiceNow, and various databases. If you encounter problems, apply the troubleshooting steps to resolve adapter, installation, and data collection issues.

# Getting Started with Integrations for VMware Cloud Foundation Operations

Integrations in VMware Cloud Foundation (VCF) Operations provide an extensible capability for expanding the monitoring, troubleshooting, and restoring the functionality of your SDDC and other third-party solutions. Administrators can install and configure management packs in a VMware Cloud Foundation Operations instance.

VMware Cloud Foundation Operations natively provides an insight into the virtual layer of your data centers. The Integrations provide the flexibility and customization by allowing you to bring in data from different VMware systems and environments and see the performance, scalability, redundancy, and efficiency of your stack. To see the vertical in that stack, you can use management packs.

You can use management packs to relate the physical and application layer objects to the virtual components. This helps you prioritize visualization and alerts and view your environment in a holistic way. Installing management packs in VCF Operations enables you to have a logical and structured view of your environment where you can find data with ease. This allows for capacity planning, crisis management, cost calculations, and root cause analysis.

## VMware Cloud Foundation Operations for Integrations Index

You can access VCF Operations for Integrations User Guides and Release Notes by browsing through the list on this page. The User Guide provides information on how you can install, configure, and use the VCF Operations for Integrations. Release Notes provide details about new features, known issues, and resolved issues with every release.

### About VMware Cloud Foundation Operations for Integrations

Management packs in VMware Cloud Foundation Operations provide capability for expanding the monitoring, troubleshooting, and remediation functionality of SDDC and third party solutions. Administrators can install and configure management packs in a VMware Cloud Foundation Operations instance.

### Download and Installation

If VCF Operations is connected to Internet, you can install Integrations directly from within the product. Alternatively, you can also download Integrations for VCF Operations from the VCF Solutions Catalog.

### Release Notes

The VMware Cloud Foundation Operations for Integrations Release Notes provide details on what's new with every latest release.

## List of Management Packs

This page contains management packs which are currently supported by VCF Operations. You can also find the list of Knowledge base articles which provides details into Management Packs that have been announced End of Support by Broadcom.

### Supported Management Packs

| Management Pack for | User Guide |
|---|---|
| **Aggregator** | Management Pack for Aggregator |
| **Orchestrator** | Management Pack for Orchestrator |
| **HCX** | Management Pack for VCF Operations HCX |
| **Microsoft SQL Server** | Management Pack for Microsoft SQL Server |
| **MongoDB** | Management Pack for MongoDB |
| **MySQL** | Management Pack for MySQL |
| **Network Devices** | Management Pack for Network Devices |
| **Oracle Database** | Management Pack for Oracle Database |

| Management Pack for | User Guide |
|---|---|
| **PostgreSQL** | Management Pack for PostgreSQL |
| **ServiceNow** | Management Pack for ServiceNow |
| **Avi Load Balancer** | Management Pack for VMware Avi Load Balancer |
| **Telco Cloud Automation Platform** | Management Pack for VMware Telco Cloud Automation Platform |
| **vSphere Replication** | Management Pack for vSphere Replication |
| **SNMP** | Management Pack for SNMP |

**Important:**

**Mandatory Management Pack Upgrades in 9.1.1**

To enforce a stronger security posture, this release resolves critical vulnerabilities in third-party libraries. **All affected Management Packs must be upgraded immediately after product upgrade to ensure continued operations and compatibility.**

Affected Management Packs:

- VMware Cloud Foundation Management Pack for Microsoft SQL Server
- VMware Cloud Foundation Management Pack for MongoDB
- VMware Cloud Foundation Management Pack for MySQL
- VMware Cloud Foundation Management Pack for PostgreSQL
- VMware Cloud Foundation Management Pack for ServiceNow
- VMware Cloud Foundation Management Pack for Oracle Database
- VMware Cloud Foundation Management Pack for Network Devices
- SNMP Management Pack
- VCF Operations Management Pack for Orchestrator
- VMware Cloud Foundation Management Pack for Kubernetes
- VMware Cloud Foundation Management Pack for Aggregator
- VMware Cloud Foundation Management Pack for VCF Operations HCX

**Unsupported Management Packs**

See the management packs that have reached End of General Support.

- End of General Support (EOGS) for VCF Operations Management Packs, Effective September 30, 2025
- End of General Support (EOGS), for Aria Operations Management Pack for Horizon (MP4H), Effective March 28, 2025
- End of General Support (EOGS) for Aria Operations Management Packs, Effective October 1 2024
- End of General Support (EOGS) for Aria Operations Management Packs, Effective December 31, 2023

## Installing and Configuring Integrations in VMware Cloud Foundation Operations

Follow the respective procedure to install your management pack depending on whether your environment can connect to the Internet or not.

### Installing Integrations in a Connected Environment

Installing a Management Pack in a connected environment, can be done from VCF Operations. All integrations are available in Solutions Catalog. For information on compatibility between products, see Product Interoperability Matrix.

1. Log in to the VCF Operations user interface with administrator privileges.
2. In the menu, select **Administration** and in the left pane select **Integrations** > **Solutions Catalog**.
3. The **Available** tab shows all the Management Packs available to be downloaded and installed in VCF Operations.
4. Click **Download** on the specific Management Pack
5. Accept the EULA and download the Management Pack.
6. After successfull download, the Management Pack is available under the **Downloaded** tab.
7. Go to the **Downloaded** tab and click **Install** on the management pack tile.
8. Once the installation is complete, you can start using the management pack by adding Accounts.
9. In the menu, select **Administration** and in the left pane select **Integrations** > **Accounts**.
10. On the **Accounts** tab, click **Add Account**.
11. On the **Accounts Types** page, click the management pack you have installed.
12. Enter a display name and description for the cloud account.
    a) Enter the `Name` for the management pack instance as you want it to appear in VCF Operations.
    b) Enter the `Description` for the management packs with any additional information that helps you manage your instances.
13. Select the `Credential` you want to use to sign on to the environment from the drop-down menu. To add new credentials to access the management pack, click the plus sign and create a credential.
14. Enter `Credential/Group` to manage the management pack on VCF Operations. If you have only one account, select the Default collector group.
15. Enter the connection information as required to configure the instance of the management pack. Each management pack has unique settings, configure the settings as prompted to configure that instance of the management pack. For more information on individual management packs, see List of Management Packs.
16. Click **VALIDATE CONNECTION** to initiate the authentication request to the CSP authentication service.
17. Configure the Advanced Settings for the management pack.
18. Click **ADD**.

Verify that the adapter is configured and collecting data by viewing application-related data.

**Installing Integrations in a Disconnected Environment**
Integrations consist of a PAK file that contains default dashboards for the objects that the management pack identifies. After installation, configure the integration.

All integrations are available in VCF Solutions Catalog. For information on compatibility between products, see VMware Product Interoperability Matrix.

- Download the PAK file from VCF Solutions Catalog.
- Save that PAK file to a temporary folder on your local system.
- Before you install the PAK file or upgrade your VCF Operations instance, clone any customized content to preserve it. Customized content can include alert definitions, symptom definitions, recommendations, and views.

1. Log in to the VCF Operations user interface with administrator privileges.
2. In the menu, select **Administration** and in the left pane select **Integrations** > **Repository**.
3. On the **Repository** tab, click **Add**. The **Add Solution** wizard opens. The wizard includes three pages where you locate and upload a PAK file, accept the EULA and install, and review the installation.
4. Click **Browse** to locate the temporary folder and select the PAK file that you downloaded.
5. To upgrade to the latest version of the management pack:
   a) Select the **Install the PAK** file check box even if it is already installed to upgrade the management pack using the current PAK file even if an older version of the PAK file is already uploaded. Do not overwrite or update the solution alerts, symptoms, recommendations, and policies and leave all user customizations in place.
   b) Select the **Reset Default Content,** overwriting to a newer version provided by this update. User modifications to DEFAULT Alert Definitions, Symptoms, Recommendations, Policy Definitions, Views, Dashboards, Widgets, and Reports is overwritten. If you are installing a product software update, clone or backup the content before you proceed check box to upgrade the management pack using the current PAK file and overwrite the solution default alerts, symptoms, recommendations, and policies with the newer versions provided with the current PAK file.

      A reset overwrites customized content. Clone your customized content before the upgrade.
6. A warning, **The PAK file is unsigned** appears if the PAK file is not signed with a digital signature that VMware provides. The digital signature indicates the original developer or publisher and provides the authenticity of the management pack. If installing a PAK file from an untrusted source is a concern, check with the management pack distributor before proceeding with the installation.
7. Click **Upload**. The upload might take several minutes.
8. Read and accept the EULA, and click **Next**. Installation details appear in the window during the process.

   The installation starts only if all the nodes of the cluster are accessible.
9. Review the installation progress, including the VCF Operations nodes where the adapter was installed. When the installation is complete, click **Finish**.
10. In the menu, select **Administration** and in the left pane select **Integrations** > **Accounts**.
11. On the Accounts tab, click **Add Account**.
12. On the **Accounts Types** page, click the management pack that you have installed.
13. Enter a display name and description for the cloud account.
    a) Enter the `Name` for the management pack instance as you want it to appear in VCF Operations.
    b) Enter the `Description` for the management packs with any additional information that helps you manage your instances.
14. Select the Credential that you want to use to sign on to the environment from the drop-down menu. To add new credentials to access the management pack, click the plus sign and create a credential.
15. Enter `Collector/Group` to manage the management pack on VCF Operations. If you have only one account, select **Default collector group**.
16. Enter the connection information as required to configure the instance of the management pack. Each management pack has unique settings, configure the settings as prompted to configure that instance of the management pack. For more information on individual management packs, see List of Management Packs.
17. Click **VALIDATE CONNECTION** to initiate the authentication request to the CSP authentication service.
18. Configure the **Advanced Settings** for the management pack.
19. Click **ADD**.

Verify that the adapter is configured and collecting data by viewing application-related data.

# Troubleshooting

The troubleshooting section provides guidance on commonly performed activities to troubleshoot problems in VCF Operations Cloud. You can troubleshoot adapter, installation, data collection, cloud proxy and other issues related to VCF Operations Cloud.

## vSphere Management Pack Issues

You can troubleshoot general problems associated with vSphere and vCenter Management Packs, such as credential errors, connection errors, collector group errors that might occur when using VCF Operations Cloud.

### Wrong Credentials

You might be prompted with incorrect credentials error while accessing vCenter.

Solution: Ensure that the specified user credentials are correct and the user has required permissions to access the target vCenter.

> **Note:**
>
> The user credentials are case-sensitive. Ensure that you enter the correct values.

### No Collector Group Defined

Collector group is not defined for vCenter in VCF Operations Cloud.

Solution: In VCF Operations Cloud, deploy a Cloud Proxy and select it as the collector for the target vCenter. For details, refer to the Troubleshooting section in the *VCF Operations Cloud Getting Started Guide*.

### No Connection to Target vCenter

No connection is established between VCF Operations Cloud and vCenter.

Solution: Ensure that you validate the connection once you configure a Cloud account.

> **Note:**
>
> FQDN/IP of the target vCenter must be reachable from all the nodes be it VCF Operations on-prem or Cloud Proxy or VCF Operations Cloud.

### Plug-In not Registered

An error message indicates that the plug-in is not registered with vCenter.

Solution: In Management Pack configurations, navigate to **Manage Registrations**, then unregister and re-register the Management Pack.

### Management Pack Not Collecting Data

vCenter Management Pack might not be collecting all the required data, even though the connection between VCF Operations Cloud and Management Pack is valid.

Solution:

1. Verify minimum collection credentials. For more information, refer the Knowledge Base article.
2. Add `an account with administrative privileges` temporarily to verify the collection.

### Metrics Missing After vCenter Upgrade

You might notice that some of the metrics are missing, after you upgrade vCenter.

Solution: Please check vCenter documentation to verify if the statistic has moved to another level. If that is the case, you must increase the statistics level for said metric on vCenter.

## Management Pack Configuration Issues

You can troubleshoot Management Pack configuration issues like, connection errors, data collection errors, certificate errors and other issues which occur while using VCF Operations.

### Error When Validating Connection

When you try to validate a connection between VCF Operations Cloud and the Management Pack, an error message is displayed.

Solution:

1. Ensure port 443 is open between the collector and vCenter using telnet.
2. Ensure permissions are adequate. Use an account with administrator privileges.
3. Check `collector.log` file for test connection failures.
4. Use `openssl s_client -connect` to check whether the certificate is OK on vCenter.

### Test Connection Works but Collection Never Starts

You might notice that the test connection works but the Management Pack fails to collect the data.

Solution: Check the Management Pack logs for errors related to user permissions or vCenter session errors. Sometimes network or vCenter itself can have issues which prevents the Management Pack from starting.

### Test Connection Fails due to Multiple Certificates

You might observe that the test connection fails if there are multiple certificates.

Solution: Check for wild card certificates in **Administration** > **Certificates** page as VCF Operations Cloud will use these certificates as default.

### Data Collection is Inconsistent

You might observe that the Management Pack starts data collection, but the collected data is inconsistent. Confirm whether this happens to all vCenter instances or just one instance. If the issue occurs on all vCenter instances, the problem is with VCF Operations Cloud or network.

If the issue occurs only on one vCenter instance, check the following.

Solution:

1. Check vCenter query time at Management Pack level.
2. Check Tag query time to ensure tags are not causing delay.
3. Check Management Pack logs for hints as to why the collection might be slow.
4. Confirm latency between vCenter> Remote Collector / Cloud Proxy> VCF Operations Cloud is within supported limits.
5. Confirm vCenter itself is sized correctly and `/var/log/vmware/vapi` has no heap dumps on vCenter. Missing metrics.
6. Check the policy and ensure that the metric is enabled.
7. If looking for instanced metrics, ensure `instanced` is set to enabled for the metric in the policy.
8. Confirm advanced setting in the Management Pack has not disabled any collection type.
9. Ensure user has permissions.
10. Check vCenter MOB and confirm that the metric is available.

## General Management Pack Issues

You can troubleshoot generic Management Pack problems such as, connection errors, collector or collector group errors, certificate errors and other issues which occur while using VCF Operations Cloud.

#### Certificate Expired

VCF Operations Cloud might prompt you with a Certificate Expired or Renew Certificate message when you try to validate the connection.

Solution:

1. Validate the connection to import the new certificate.
2. You might have to remove the existing certificate.

#### Incorrect Credentials

You might be prompted with incorrect credentials error message when you validate the connection between VCF Operations Cloud and the Management Pack.

Solution: Acquire correct credentials for the endpoint.

#### Unreachable Error

Connection unreachable or connection timeout error is displayed when you try to validate the connection between VCF Operations and the Management Pack.

Solution: Validate the Operations/CP is responsive to ping and https requests through `ping <endpoint> and curl -v telnet://<endpoint>:443` to validate connectivity.

> **Note:**
>
> Most end points use port 443 for connection, for more information please refer VCF Operations Cloud documentation.

#### Collector or Collector Group Missing

The Management Pack might report collector or collector group missing error, if the collector is offline or the collector is not assigned to a Management Pack.

Solution: Verify that collector is online and is assigned to the Management Pack.

### Management Pack Collection Cycle Issues

You can troubleshoot vCenter Management Pack collection cycle issues such as high latency issue, end point not processing requests, and other issues which occur while using VCF Operations.

#### High Latency Issue

You might observe high latency between the collector and the end point.

Solution:

Add Remote Collector /Cloud Proxy on site where endpoint resides (Remote Collector max latency 200ms - Cloud Proxy max latency 500ms between Remote Collector /Cloud Proxy and analytics nodes). Ping can show latency between collector and endpoint. ~10-20ms max. This may depend on the amount of data that needs to be collected.

## Integrations Configuration Guides

### Management Pack for Aggregator

The *Management Pack for Aggregator* document provides information about the Aggregator feature that is introduced in VCF Operations.

## Intended Audience

This information is intended for anyone who wants to install the Aggregator. feature to manage distributed deployments of VCF Operations instances.

### Introduction

With Aggregator you can unify your multi-site VCF Operations deployment into a single pane of glass. This single pane of glass provides a holistic view of the child VCF Operations instance. You can instantiate a deployment of VCF Operations with the capability of receiving key metrics for specified objects from other VCF Operations deployment in your environment.

> **Important:**
>
> SDDC Health and Configuration Dashboard is not supported due to the EOGS of SDDC Health management pack and will be removed from the aggregator management pack in the future release.

The management pack allows you to unlock the following use cases:

- Provide a good set of Executive Dashboards for a worldwide company, without the need to have multiple browser tabs open for several VCF Operations instances.
- Provide a summary of performance, capacity, and configuration to Senior Executives and Virtual Infrastructure Administrators across all your vSphere environments.
- Provide a unified view of alerts triggered across the virtual environments into a single pane for making it easier for NOC or Helpdesk to initiate action.
- Ability to create a data warehouse where user selected set of metrics can be stored for data archiving and report use cases.
- Ability to provide summarized views of health and configuration of your Software Defined Data Center stack. This includes core applications such as VMware vCenter, VMware NSX, and VMware vSAN. The solution also covers the management applications such as VCF Operations, Log management, VCF Automation, VCF Business, and VMware Site Recovery Manager.

## Architecture

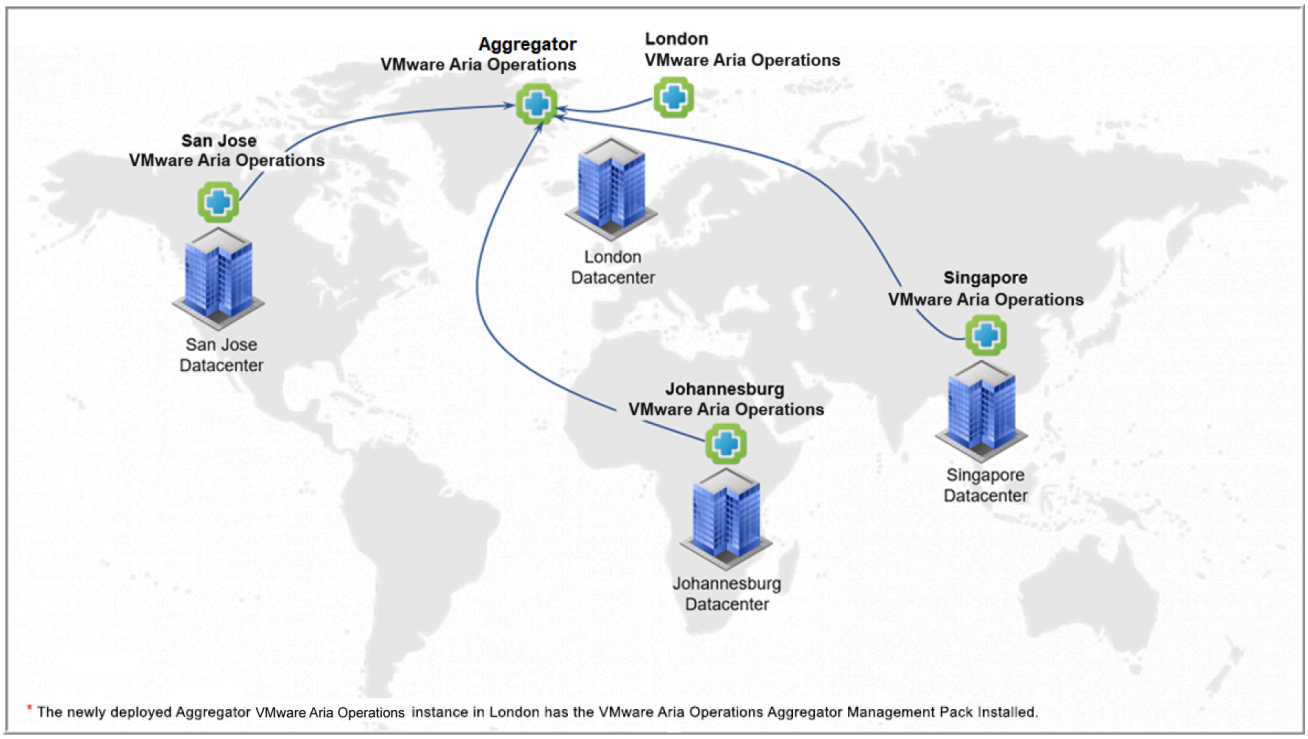
The Management Pack for Aggregator follows a simple server-client architecture. This management pack is installed on the VCF Operations instance, which you have identified as your unified single pane of glass instance. It is highly recommended that this instance is only used for Aggregator. After you deploy VCF Operations, you can use the management pack configuration page to add your existing VCF Operations instances to point to this Aggregator instance.

When configuring the management pack, enter the name of a configuration file that stores the information about the objects and metrics to be fetched from your existing VCF Operations instances into the newly deployed Aggregator instance.

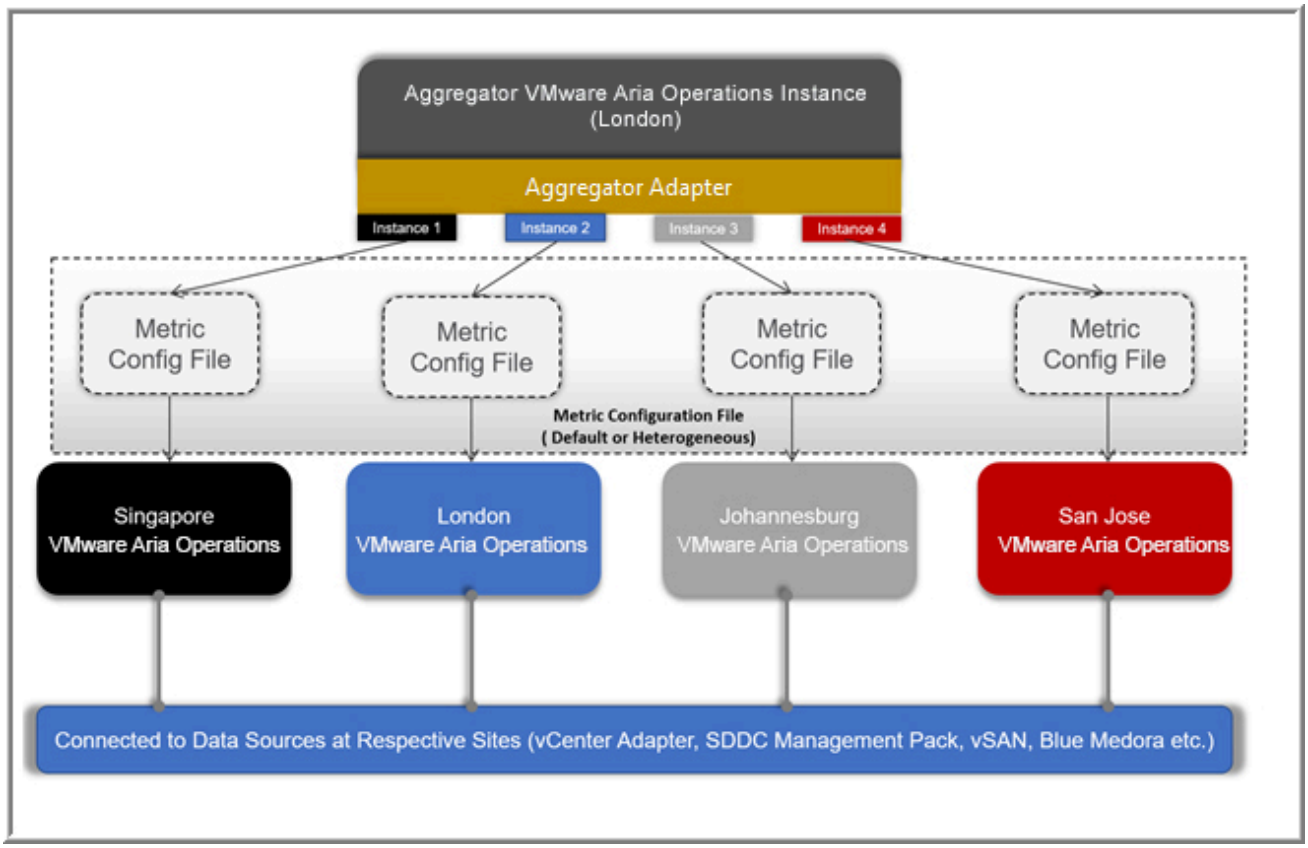
You can plan your architecture to apply the capabilities of Management Pack for Aggregator.

ACME Corp a Global Manufacturing company has virtual environments spanning across the globe to meet their regional business requirements. They are leveraging the VMware Software Defined data center to provide key IT services to line of business. They have an SDDC footprint in Singapore, London, Johannesburg, and San Jose. As a part of their Capacity Management and Performance Troubleshooting requirements they are leveraging VCF Operations to help their Operations and Procurement teams. They currently have an instance of VCF Operations deployed at each of these data center locations. ACME Corporation is looking to leverage the Management Pack for Aggregator to create a single pane of glass across all the data center locations. They want to leverage this single pane for their operations, capacity procurement, and senior executives to provide them with a unified view of their IT landscape. As their London data center has the largest footprint and low latency connectivity to other data centers, they want to host this unified instance in their London data center.

Based on the mentioned requirements, ACME Corp must deploy a new global standalone instance of VCF Operations with the Aggregator Management pack using the following deployment architecture:



Logical Architecture of the Management Pack for Aggregator for ACME Corp.



**Sizing and Collection Time Interval Considerations**
The VCF Operations instance hosting the Aggregator management pack should be sized just like any other VCF Operations instances.

For more information, see the KB article 324340. The following are the best practices.

- Out-of-the-box, Management Pack for Aggregator collects data for objects such as ESX hosts, clusters, datacenters, datastores, and so on. Virtual machine data is not collected. Based on this, most of the environments can be monitored with one Extra Large Node.
- The Aggregator instance of VCF Operations should be used only for collecting data from the Aggregator MP. No other MP on this VCF Operations instance should be configured to collect from any other data sources.
- If you add new objects and metrics to an existing deployment of your Aggregator VCF Operations instance, ensure to run the sizing calculator to meet the sizing requirements.
- With Management Pack for Aggregator, you can either collect data directly from child VCF Operations instances or use a remote collector to optimize the collection process. The default collection cycle of Management Pack for Aggregator is 5 minutes. This time interval works accurately for a centralized VCF Operations collecting data from other child VCF Operations instances that are located within a short distance. You can also use a remote collector for data collection. Otherwise, when centralized VCF Operations collects data directly without a remote collector and latency is long, you can set the collection interval to 15 minutes. This ensures data collection without any gaps.
- As most of the Aggregator use cases are met by collecting data for objects other than virtual machines from your environment, it is recommended to avoid the collection of virtual machine data as this drastically increases the sizing requirement for the Aggregator instance in a large-scale environment.

**Deploying the Standalone Global Instance**

Before you can configure Federation, you must deploy a dedicated VCF Operations instance to serve as the Global Ops Instance

- **Capacity:** Determine if you need a specific size. For most global views, a **Large** or **Extra Large** node is recommended to handle the object count from all child sites.
- **Network:** An IP address and DNS name (e.g., global-ops.corp.local).
- **Media:** The standard VCF Operations OVA file (same as used for Fleet Ops Instances).

This process converts a blank VCF Operations node into your Global Ops Instance.

1. Deploy the OVF/OVA
   a) Log in to your vSphere Client.
   b) Right-click the cluster/host and select **Deploy OVF Template.**
   c) Select the `VCF Operations .ova` file.
   d) **Select Deployment Configuration:** Choose **Large** or **Extra Large** (Federation nodes require significant memory to map objects from all sites).
   e) **Network Mapping:** Connect to a management network that can reach *all* regional VCF Operations instances.
   f) **Customize Template:**
      - Set the IP address, Gateway, DNS, and Timezone.
      - **Crucial:** Ensure the Timezone matches your Fleet Operations Instances (usually UTC is best practice for all).

g) Power on the appliance.

2. **Initial Cluster Setup**
   a) Navigate to https://<Global-IP>/admin in your browser.
   b) Select Add New Nodes"Master Node Configuration**:** You do not need to add Data Nodes or Remote Collectors immediately unless you have an immense environment (100k+ objects).
   c) **Set Admin Password:** Create a strong root and admin password.
   d) **Certificate:** Install a CA-signed certificate immediately to ensure secure HTTPS handshakes with Fleet Ops Instances
   e) **Finish:** Allow the cluster to come online (usually 10-20 minutes).
3. **"Empty State" Verification**
   a) **Do NOT** configure vCenter adapters on this instance.
   b) **Do NOT** install standard management packs (Storage, AWS, etc.).
   c) Why? The Global Ops Instance should be kept "clean." Its only job is to aggregate data from other Ops instances. If you start monitoring local vCenters with it, you will pollute the global view and waste resources.

**License your Global Operations Instance**
For VCF 9.0 and later, Broadcom introduced a centralized licensing model that replaces individual 25-character keys with a unified **License File**. This new workflow uses **VCF Operations** (formerly Aria Operations) as the "Licensing Anchor" for your environment

- **Version:** This procedure applies to **VCF 9.0+**. (VCF 5.x and older still use legacy SDDC Manager keys).
- **Account:** A Broadcom Support Portal account with valid VCF entitlement.
- **BSC Access:** Access to https://vcf.broadcom.com.

You must register your Global Operations instance with the **VCF Business Services Console (BSC)** to generate and apply this license file.

**Method A: Connected Mode (Recommended)**

*Best for environments where the Global Operations instance has direct Internet access.*

1. **Initiate Registration (Global Ops):**
   a) Log in to your Global Ops instance UI.
   b) Navigate to **Administration** > **ManagementLicensing**
   c) Select the **VCF Registration** tab (or "Subscription" depending on the patch level).
   d) Click **Register with BSC**.
   e) Enter your Broadcom Support Portal credentials when prompted.
2. **Assign Entitlements (BSC Portal):**
   a) The browser will redirect or open the **VCF Business Services Console** (vcf.broadcom.com).
   b) You will see your VCF Ops instance listed as "Pending" or "Registered.
   c) Select the instance and click **Manage Entitlements**.
   d) Select the License Entitlement. You must assign at least a 1-core license to the Global Operations Instance.
   e) Click **Save/Activate.**
3. Finalize: Return to the Global Operations UI.
   a) Click **Sync License.**
   b) Status should change to `Active.e`

**Method B: Disconnected Mode (Air-Gapped)**

*Best for high-security environments with no Internet access.*

1. Generate Registration File (On Global Ops)
   a) Log in to the Global Ops UI.
   b) Navigate to **Administration > Management > Licensing**.
   c) Select **Offline Registration**.
   d) Click **Generate Registration File**.
   e) Download the .json or .data file to your local computer.
2. Upload to BSC (On Internet-Connected PC)
   a) Log in to the **VCF Business Services Console** (vcf.broadcom.com).
   b) Go to **License Management > Offline Registration**.
   c) Click **Upload Registration File** and select the file you downloaded in Step 1.
   d) Once processed, select the Entitlements (Cores/TiBs) to assign to this file. You must assign at least a 1-core license.
   e) Click **Generate License File**.
   f) Download the resulting License File (e.g., license.enc or .lic).
3. Import License File (Back to Global Ops)
   a) Return to the Global Ops UI.
   b) In the Offline Registration window, click **Import License File**.
   c) Upload the file generated in Step 2.
   d) Click Activate.

**Install Management Pack for Aggregator**
The Management Pack for Aggregator requires a dedicated instance of VCF Operations on which this solution is installed. The dedicated instance applies the management pack to communicate to your other VCF Operations instances in your environment to collect key metrics.

- Download the Management Pack for Aggregator PAK file from VCF Solutions Catalog.
- Verify that you have at least one VCF Operations node deployed to install the Aggregator management pack.
- It is recommended to install the VMware SDDC Health Monitoring Solution on the child VCF Operations instances, to get an aggregated view of the health of all the SDDC core and management applications installed across your environment.
- Verify that each VCF Operations instance is communicating with the centralized instance and vice-versa.

  **Note:**
  The Aggregator adapter requires the same port to communicate as the web interface. There is no requirement of an additional open port.

1. Log in to the VCF Operations with administrator privileges.
2. In the menu, select **Administration** and in the left pane select **Solutions** > **Repository**.
3. On the **Repository** tab, click **Add/Upgrade**.
4. Browse to locate the temporary folder and select the PAK file.
5. Click **Upload.**
   The upload might take several minutes.
6. Read and accept the EULA, and click **Next**.
7. When the Aggregator management pack is installed, click **Finish**.

**Configure Management Pack for Aggregator**
You can configure adapter instances and add the VCF Operations instances you want to monitor.

- Verify that you have installed Management Pack for Aggregator.

1. On the menu, click **Administration** and in the left pane, click **Solutions** > **Other Accounts**.
2. Under Other Accounts, click **Add Account**.
3. On the Accounts Type page, click the **Aggregator Adapter**.
4. Enter the display name of the adapter.
5. Enter the source VCF Operations host name or IP address.

   **Note:**
   You can either use the host name of IP address of the primary node of your child VCF Operations deployment or use the Load Balancer Virtual IP or DNS Name. Use a short name and do not use FQDN.
6. Enter the **federation_config** in the **Configuration File Name**.

   `federation_config` is the default configuration file shipped with the management pack. For more information, see Configuration Configuration File in the Aggregator Management Pack.
7. Enter the Credential details.
8. Optionally, configure the **Advance Settings**.

   **Note:**

   - By default, the setting **Append 'vROps Host' to Resource name** is set to `True`. This setting appends the child VCF Operations IP name to the resource name. When the setting **Append 'vROps Host' to Resource name** is set to `False`, the suffix will not be appended to the resource name.
   - By default, the child VCF Operations Port is set to 443. The child VCF Operations is also used by the Aggregator adapter to retrieve resources and data.
9. Click **Add**.
10. Repeat the steps from step 1 through step 8 for multiple instances of VCF Operations.
11. You can view the collection status of all the multiple instances of VCF Operations under the solution page.

Configuration File in the Aggregator Management Pack

When you configure an Aggregator adapter instance, you must specify a config file. The config file specifies what kind of information an adapter instance must collect. Out-of-the-box, the Aggregator Management Pack is shipped with config file named as `federation_config`.

The config file retrieves the following information.

- Resources
- Metrics
- Properties

For example, if you want the adapter to collect information like host system and CPU metrics of that object, then this information has to be defined in the config file. When these parameters are added, then the adapter instance starts collecting information pertaining to the required specification. The changes are reflected in the config file only when the adapter instance is restarted.

With Management Pack for Aggregator, you can retrieve a subset of objects from an object type of a child VCF Operations. The adapter provides a mechanism to filter the subset by either using properties or tags.

The tag-based filter used is:

```
<Filter> <Tag category="SOME_CATEGORY" name="SOME_TAG" /> </Filter>
```

The property-based filter used is:

```
<Filter> <Property attrkey="SOME_KEY" value="SOME_VALUE"/> </Filter>
```

**Note:**
You can use only one filter for a given object type, otherwise, the configuration file validation fails.

To create filters for resource kinds, add the filtering element immediately after the resource kind element in the config file. For example:

```
<ResourceKind resourceKindKey="...">
        <Filter>
            <Property attrkey="..." value="..."/>
        </Filter>
        <Metric ..."/>
        <Property .../>
    </ResourceKind>
```

## Types of Config Files Used in the Management Pack for Aggregator

| | |
|---|---|
| **Default Config File** | Management Pack for Aggregator contains a default config file. The Management Pack for Aggregator dashboards are based on these config files. The default config file contains information of vCenter to host level and not VM level. The config file also provides information of vCenter operation adapter objects, VMware SDDC Health Monitoring Solution adapter, and VMware Site Recovery Manager adapter.<br><br>**Note:**<br>The default federation_config file is aligned with the latest VCF Operations. Ensure that the desired metrics/properties from the older versions (which no longer exist in the newer versions) are mentioned in the config file. |
| **Heterogeneous Config File** | You are not limited to using the same config file for all adapter instances when you are configuring multiple adapter instances for a separate child of VCF Operations instance. You can collect different data from different child VCF Operations instances. You can have different level of information in different config files. |

### Locate Configuration File

The default file has pre-defined objects and metrics, which are collected from the child VCF Operations instances.

Verify that you have installed the Management Pack for Aggregator on your environment.

1. Login to VCF Operations as an administrator.
2. In the menu, click **Administration**, and in the left pane click **Configuration** > **Metric Configurations.**
3. Under Metric Configurations, expand **ResskndMetric**.
   You can see the newly installed `federation_config` file in the list.
4. You can view the content of this file by selecting this file from the list.

### Best Practices for Configuration File Management

Follow certain best practices to ensure optimal performance of the Management Pack for Aggregator.

- Do not modify the out-of-the-box shipped configuration file. Create a file, copy the content of the out of the box file and make additions to this new file.
- Do not remove objects or metrics included in the out-of-the-box configuration file as it impacts the content of the out-of-the-box dashboards.
- Once you have created a configuration file, it is required to stop the collection on the Management Pack for Aggregator, change the configuration file name to reflect the newly created file and start the collection again. The Aggregator adapter will now start collecting the additional objects and metrics.
- Version control the configuration files with proper naming conventions and version numbers.
- Avoid adding objects and metrics which are not required to be collected.
- Test your newly created configuration file with a test instance of child VCF Operations instance before applying it to your production systems.
- The collection of Aggregated metrics from the child VCF Operations monitored by the Management Pack for Aggregator is not managed in policies. The addition and removal of metrics and properties is managed directly inside the configuration file. Only the metrics and properties configured in the federation_config file are collected. The collection of configured metrics and properties can be disabled and re-enabled from policy.

## Dashboards in the Management pack for Aggregator

Management pack for Aggregator caters to certain out-of- the-box use cases, which are delivered through dashboards. After the installation and configuration of the Cloud Federation Adapter management pack, you can access these out-of-the-box dashboards.

Verify that you have installed the Management pack for Aggregator.

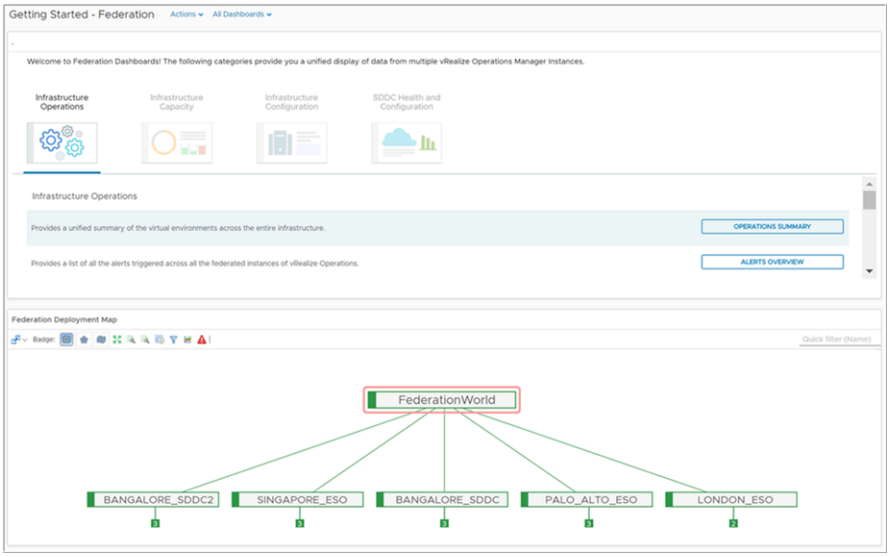
1. To access the dashboards, in the left pane of the VCF Operations, click **Dashboards**.
2. Click **Aggregator** to view all dashboards.
3. From the dashboard list, select **Getting Started- Aggregator** dashboard in the list of all the dashboards and associated use cases.

Getting Started - Aggregator Dashboard

The Getting Started - Aggregator dashboard displays the catalog of Aggregator dashboards and the Aggregator deployment map.

You can step through the multiple categories under Aggregator page to cater to specific use cases. The deployment map on this page provides a topology of your Aggregator Deployment with colors depicting the current health and collection status.

**Figure 475: Getting Started - Aggregator Dashboard**



## Infrastructure Operations

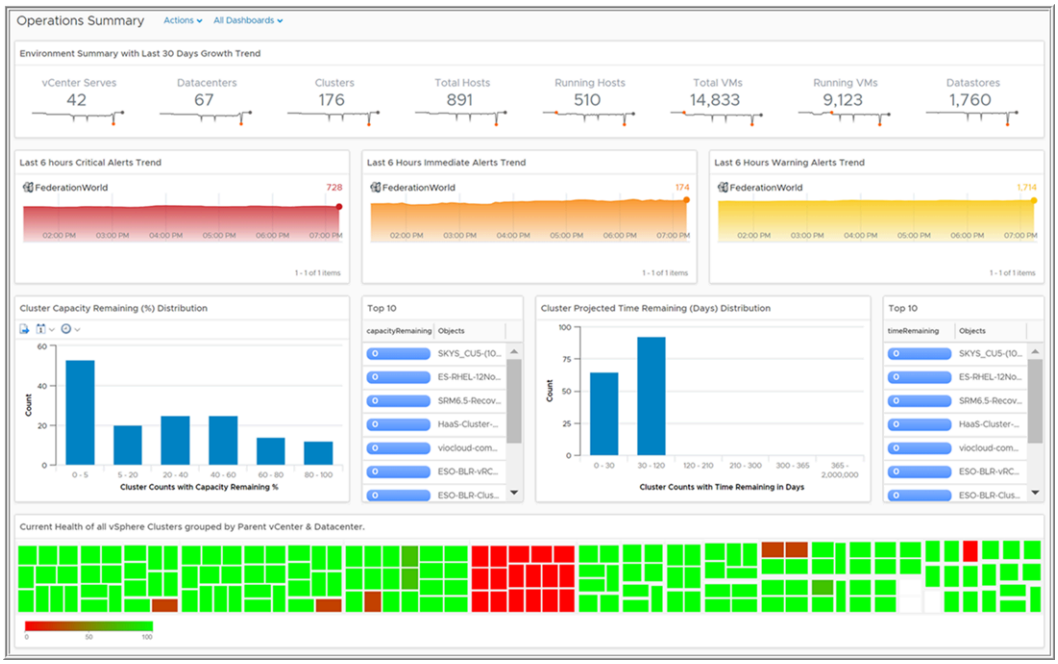
The Getting Started page provides access to the following OOTB categories. The infrastructure category caters to Senior Executives and NOC users by providing them an operations summary and alerts. The dashboards under this category are.

- Operations Summary
- Alerts Overview

Operations Summary Dashboard

The Operations Summary dashboard provides a count of your infrastructure inventory objects across all the VCF Operations instances being monitored by the Management Pack for Aggregator. It provides you the overall alert volume in these environment, along with a summarized view of health and capacity of the vSphere clusters in your environment.

**Figure 476: Operations Summary Dashboard**



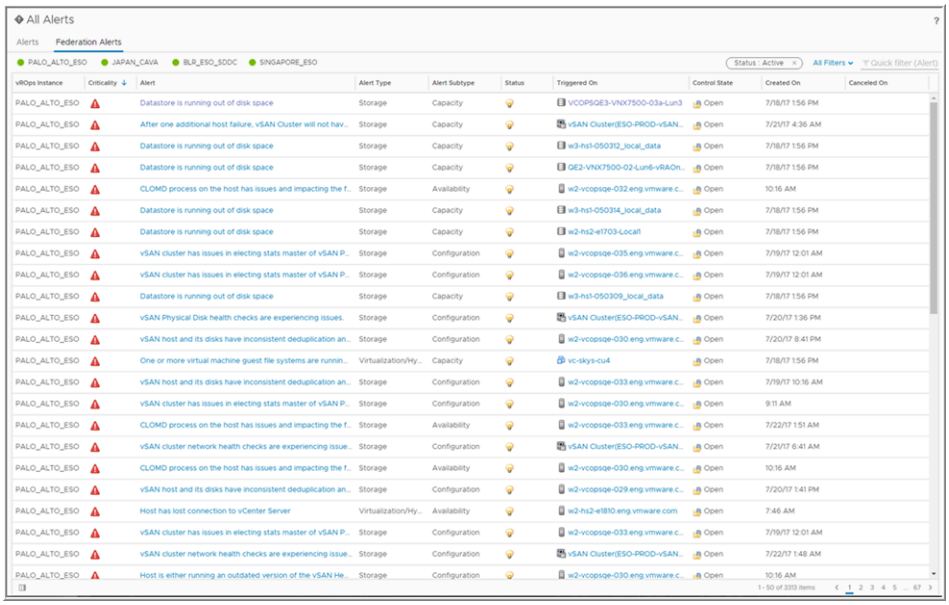
Alerts Overview

The Alerts Overview dashboard provides the alerts page of VCF Operations. On this page, you can not only view the alerts triggered on your VCF OperationsAggregator instance, but also view the alerts triggered in your child VCF Operations instances.

The overview page includes all the alerts triggered on the VCF Operations instance and is not dependent on the objects you are monitoring from the child VCF Operations instance.

This page can help your NOC teams to have a single pane for all the alerts across your environments. To view the details of a specific alert, click on that alert to get directed to the child VCF Operations instance where the alert was originally triggered for troubleshooting purposes.

**Figure 477: Alerts Overview**



Infrastructure Capacity

The Infrastructure Capacity category caters to Senior Executives and NOC users by providing them an overview of overall capacity and reclamation opportunities.

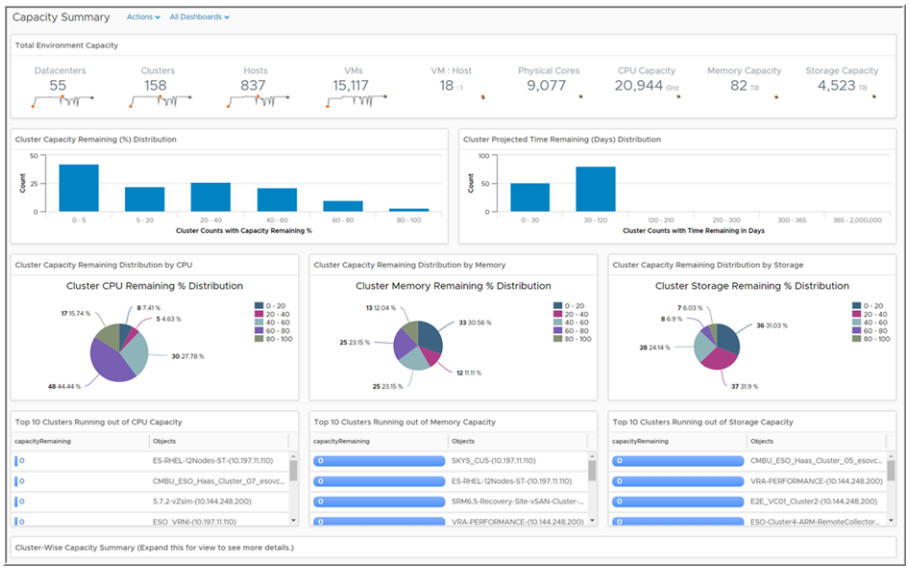
The following dashboards are under the Infrastructure Capacity:

- Capacity Summary
- Capacity Optimization

### Capacity Summary Dashboard

The Capacity Summary Dashboard provides you with a summary of the total physical capacity available across all your environments being monitored by multiple instances of VCF Operations. The dashboard also provides you a list view of all your clusters across your environment with details around inventory, capacity and utilization of those clusters. You can export this list into a CSV file for reporting purposes.

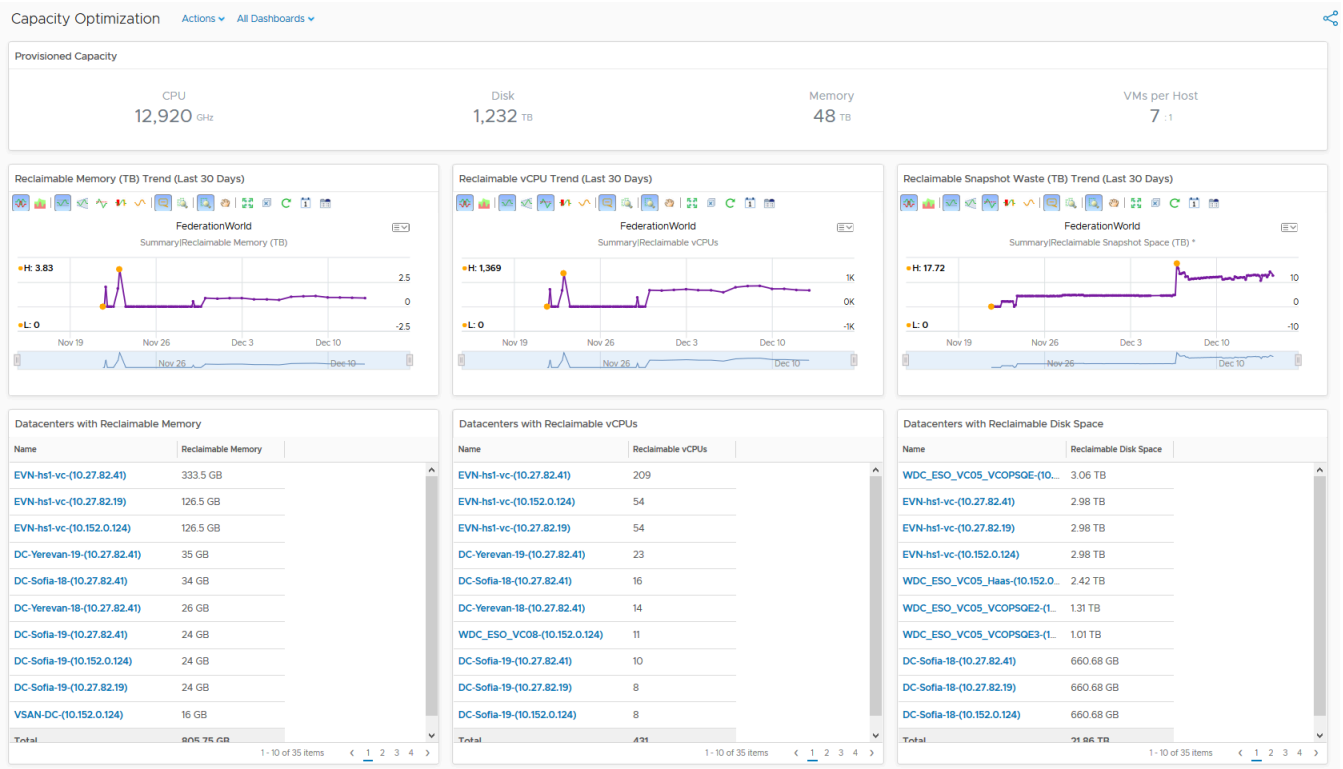
**Figure 478: Capacity Summary Dashboard**



### Capacity Optimization Dashboard

The Capacity Optimization dashboard provides you a quick view of resource optimization opportunities within your virtual infrastructure. This dashboard is focused on improving the efficiency of your multiple instances of VCF Operations environment by reducing the wastage of resources.

**Figure 479: Capacity Optimization Dashboard**



## Infrastructure Configuration

Infrastructure Configuration category caters to Senior Executives and virtual infrastructure admin by providing them the summary of ESX Host and cluster configurations.

The dashboards under Infrastructure Configuration category are:

- vSphere Cluster Configuration
- vSphere Host Configuration

## vSphere Cluster Configuration Dashboard

The vSphere Cluster Configuration dashboard provides a quick overview of your vSphere cluster configurations from various instances of VCF Operations. The dashboard highlights the areas that are important in delivering performance and availability to your virtual machines.

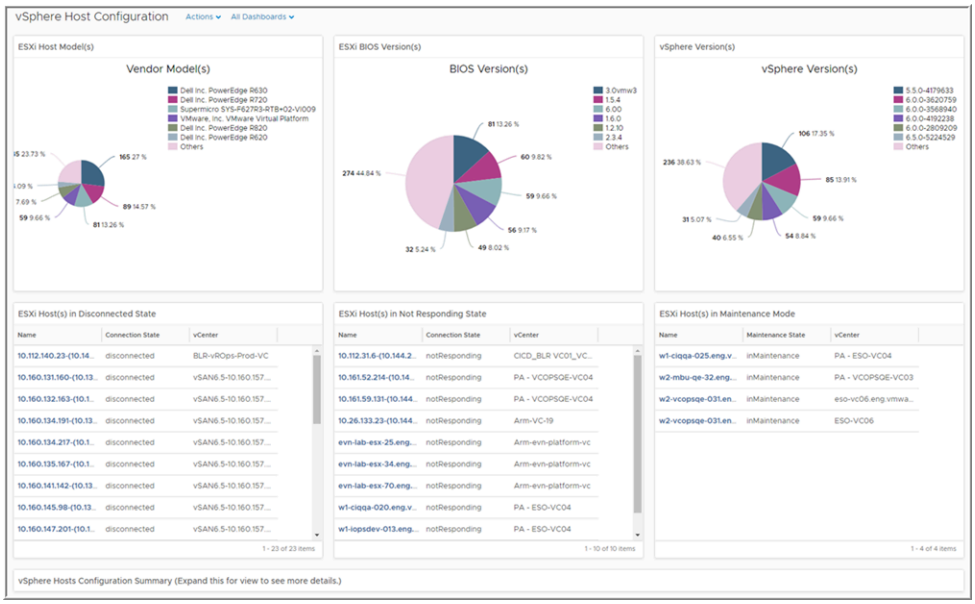
**Figure 480: vSphere Cluster Configuration Dashboard**

The dashboard also highlights if there are vSphere clusters which are not configured for DRS, High Availability (HA), or admission control to avoid any resource bottlenecks or availability issues when a host fails. The heat map in this dashboard helps you to identify if you have hosts where vMotion was not enabled as this may not allow the VMs to move from or to that host. This can cause potential performance issues for the VMs on that host if the host gets too busy.

### vSphere Host Configuration Dashboard

The vSphere Host Configuration dashboard provides an overview of your ESX host configurations, and displays inconsistencies so that you can take corrective action.

**Figure 481: vSphere Host Configuration Dashboard**



The dashboard also measures the ESX hosts against the vSphere best practices and indicates deviations that can impact the performance or availability of your virtual infrastructure. Although you can view this type of data in other dashboards, in this dashboard you can export the ESX configuration view and share it with other administrators.

### SDDC Health and Configuration

This category caters to Senior Executives and virtual infrastructure administrator by providing a summary of health and configuration of the SDDC Management Stack.

Health & Configuration dashboard is available under the SDDC Health and Configuration category.

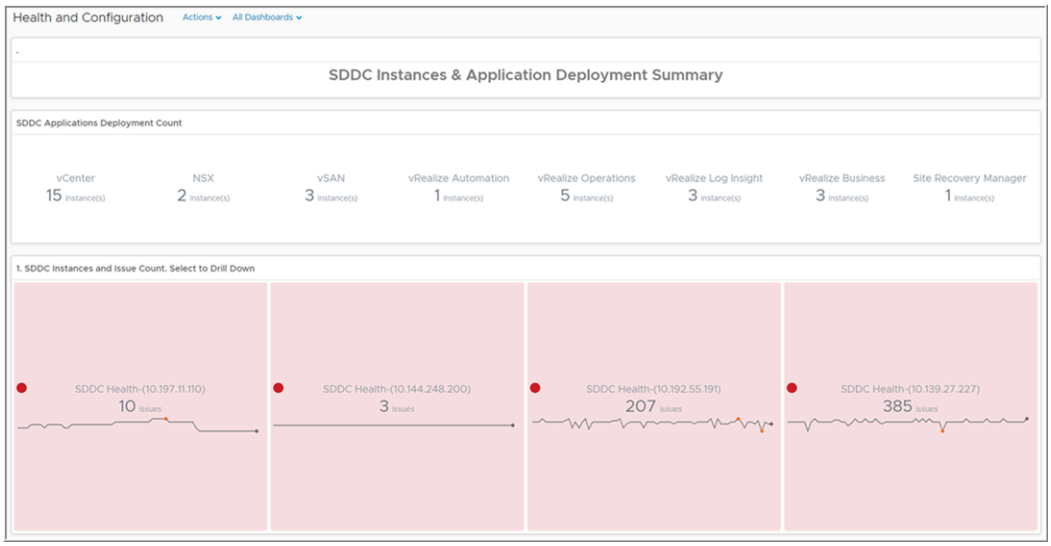
Health and Configuration Dashboard

This dashboard provides health of all the SDDC components. The Aggregator adapter monitors and displays the health of vCenter, VCF Operations health, VCF Automation and other stack components.

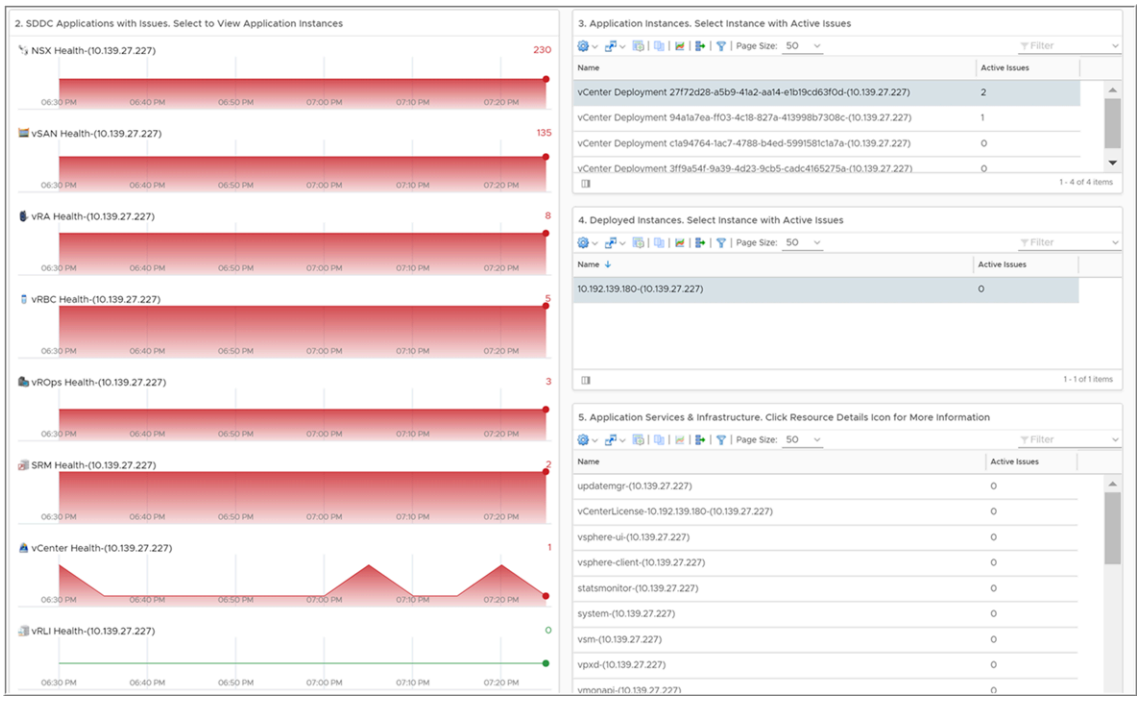
**Note:**

Verify to install and configure the SDDC health adapter installed on the child VCF operations instances to display the health and configuration information in this dashboard.

**Figure 482: Health and Configuration Dashboard**



This dashboard provides information of summary of the number of SDDC components, applications, deployments and its health status. The **SDDC instances and Issue count** widget in the dashboard displays detailed information of which object requires an immediate attention and from which instance the issue has occurred. When you click on the particular VCF Operations child instance, you can drill down to analyze the root cause of an issue.



### Customizing Icons in Management Pack for Aggregator

Every object or adapter in your environment has an icon representation. You can customize how the icon appears.

You can customize the appearance of the icons for your Aggregator objects.

#### Customize Icons

Every object or adapter in your environment has an icon representation. You can customize how the icon appears. You can use familiar or customized icons from vCenter, Management Pack for NSX for vSphere or VMware SDDC Health Monitoring Solution adapter for the Aggregator objects.

If you want to add new icons, then verify that you have an icon on your local machine.

1. In the menu, click **Administration**, and then in the left pane, click **Configuration** > **Icons**
2. Select the adapter type from the **Adapter type** drop-down.
3. Select the Object type and then click the **Assign Default Icons**
4. To assign default icons for a selected object type, click **Yes**.

## Management Pack for Orchestrator

The guide describes the steps to run Orchestrator workflows from VCF Operations.

The Management Pack for Orchestrator guide describes the process of deploying, configuring and managing the Management Pack for Orchestrator in your VCF Operations environment.

### Intended Audience

The information in this guide is intended for VCF Operations administrators.

### Introduction to Management Pack for Orchestrator

#### Introduction to the Orchestrator

You can run Orchestrator workflows from VCF Operations after you install and configure the Management Pack for Orchestrator. You can run workflows to remediate alerts in VCF Operations or automate tasks.

Management Pack for Orchestrator supports the following types of workflows:

- Custom vCenter package workflows.
- User defined vCenter workflows in Orchestrator
- Out of the box (OOTB) workflows which ship with the Management Pack for Orchestrator.

You can map these workflows as actions to alerts via recommendations. A **Run Action** button is displayed when VCF Operations displays the alerts. Using the **Run Action** button, you can execute the workflows.

You can map the user-defined workflows from the Orchestrator after you discover them in VCF Operations. If you have user-defined workflow packages, you can discover the package in VCF Operations and map each workflow in the package to actions. You can also map custom vCenter workflows.

Management Pack for Orchestrator ships with 15 out of the box workflows. This does not include the python based actions. They are automatically mapped to the alerts via recommendations.

You can create a new policy or modify an existing policy for automated workflow execution when the vSphere objects governed by the policy receives alerts. The Reconnect Host workflow is an out of the box workflow which supports automated execution. To automate the workflow execution, you must apply the policy to a custom group called Orchestrator Adapter Managed Objects. This group contains the vSphere objects.

Automated workflow execution is possible on workflows which have only one input parameter. The input parameter is the object name itself. To automate workflows which have more than one input parameter, you can add the input parameter data inside the action script of the workflow because automated workflow execution supports only one input parameter.

### Using the Orchestrator to Scale Up your Infrastructure

You can use the Orchestrator workflows to scale up your infrastructure and quickly act upon capacity related alerts.

For example, your VI Admin receives an alert that a VM is low on memory. If the alert is mapped to the Custom Reconfigure VM workflow with predefined values to increase the RAM in the VM, you can configure the workflow to be automatically executed. When the alert is received, VCF Operations triggers the action to reconfigure the VM and the memory is scaled up in the VM against which the alert is received.

#### Supported Configurations

The Management Pack for Orchestrator supports workflows that are in an external instance of Orchestrator or an instance of Orchestrator which is embedded in an instance of VCF Automation which is connected to VCF Operations.

The Management Pack for Orchestrator supports running of workflows on vCenter instances that are connected to VCF Operations. The instance of Orchestrator may be connected to more vCenter instances but you cannot execute workflows on those instances unless they are connected to VCF Operations.

The VCF Operations may be connected to an external VCF Automation which has an embedded Orchestrator. You can execute Management Pack for Orchestrator workflows from this instance of Orchestrator as well.

> **Note:**
> Since the standalone Management Pack for Orchestrator does not support the VMware Cloud on AWS authentication, you cannot execute the Management Pack for Orchestrator workflows on VMware Cloud on AWS vCenters using Management Pack for Orchestrator on VCF Operations.

#### Overview of Tasks

After you install the Management Pack for Orchestrator, you must perform the required tasks before you can run a workflow and remediate the alert.

| Task | Purpose |
|---|---|
| Configure Management Pack for Orchestrator | The workflows that help you remediate alerts are available in Orchestrator. You must configure the Management Pack for Orchestrator to connect to a external Orchestrator or an instance embedded in VCF Automation.<br>Using dynamic actions, Management Pack for Orchestrator automatically converts all the custom vCenter package workflows to alert actions. |
| Add a vCenter server instance to Orchestrator | You can optionally perform this task to add a vCenter server instance to Orchestrator from VCF Operations. |
| Discover additional Orchestrator packages. This task is optional. | After you configure the Orchestrator adapter, you can discover vCenter user-defined packages or workflows. |
| Map user defined workflows to resources as actions. | You can map user defined workflows to resources, or modify custom workflows that are already mapped to resources before you trigger them as actions.<br>If the user defined workflows are part of a package, you cannot map the package directly. You can only map workflows in the package. |
| Map workflows to alerts. | Map the custom workflows, user defined workflows and out of the box workflows to alerts via recommendations to see the **Run Action** button in an alert. |
| Apply a new policy or modify an existing policy to automate execution of workflows. | Automate the execution of workflows that have predefined parameters by using a policy on the management groups that contain the Orchestrator Adapter Managed Objects. |
| Run a workflow | You can run a workflow from an alert via the **Run Action** button, from the inventory explorer, or from the dashboard. |

## Installing and Configuring the Management Pack for Orchestrator

You can download the Management Pack for Orchestrator from the VMware Solution Exchange website.

### Install the Management Pack

The Management Pack for Orchestrator consists of a PAK file that contains out of the box workflows from the Orchestrator. You can install more than one Management Pack for Orchestrator .

The solution that you downloaded include a PAK file. Save that PAK file to a temporary folder on your local system.

1. Log in to the VCF Operations user interface with admin privileges.
2. From the left menu, click **Data Sources** > **Integrations**.
3. Go to the **Repository** tab in the right pane, and then click **Add**.
4. Browse to locate the temporary folder and select the PAK file.

   For example, `vmware-MPforAutomationOrchestrator-<version#-build#>.pak`.
5. Make the following choices:
   - Select the checkbox against, **Install the PAK file even if it is already installed.**
   - Select the checkbox against, **Reset Default Content, overwriting to a newer version provided by this update. User modifications to DEFAULT Alert Definitions, Symptoms, Recommendations, Policy Definitions, Views, Dashboards, Widgets and Reports will be overwritten. If you are installing a product software update, clone or backup the content before you proceed.**

     **Note:**

     Select these checkboxes if you are updating the Management Pack for Orchestrator from version 3.1 to version 3.2.
6. Click **Upload**.

   The upload might take several minutes.
7. Read and accept the EULA, and then click **Next**.

   Installation details appear in the window during the process.
8. When the installation is finished, click **Finish**.

Configure the Management Pack for Orchestrator to connect to an external Orchestrator or an instance embedded in VCF Automation.

### Configure the Management Pack for Orchestrator

After you install the management pack, add and configure an external Orchestrator or an instance embedded in VCF Automation from which you run workflows.

1. From the left menu, click **Administration** > **Integrations**, and then click **Add**.
2. Select the Management Pack for Orchestrator and click **Configure**.
3. Configure the adapter instance.

| Option | Description |
|---|---|
| Name | The name for the adapter instance. |
| Description | (Optional) The description of the adapter instance. |
| VCF Automation Orchestrator Host | The URL of Orchestrator or VCF Automation instance from where you run workflows. Specify the FQDN.<br>If a load balancer is present, the URL must use the load balancer's hostname. |
| Port | The default port is 443. |

| Option | Description |
|---|---|
| Auto Discovery | Discover objects automatically.<br>• To set automatic discovery for objects, select **True**.<br>• To set the automatic discovery off, select **False**. |
| Credential | To add new credentials click the plus (+) sign.<br>**Credential Kind**.<br>From the drop-down menu, select one of the below:<br>1. Orchestrator Credential<br>2. Automation Credential<br>3. Service Account Refresh Token<br>**Important:**<br>• For standalone Orchestrator, enable Basic Authentication in Orchestrator and use Orchestrator Credential kind.<br>• For Automation 8.x, enable Basic Authentication in Orchestrator and use Automation Credential.<br>• For VCFA 9.0 Provider Organization embedded Orchestrator, use Service Account Refresh Token credentials to configure the adapter.<br>• **Credential name**.<br>The name by which you are identifying the configured credentials.<br>While using Orchestrator Credential or Automation credential as 'Credential Kind', use below:<br>– Username. The username of an Orchestrator user or Automation user.<br>– Password. The password of an Orchestrator user or Automation user.<br>While using 'Service Account Refresh Token', enter the Refresh Token generated using steps mentioned on this topic/page:<br>Create a Service Account Refresh Token<br>**Note:**<br>Verify that you have API access to Orchestrator to execute the workflows. |
| Collectors/Groups | The collector on which the Management Pack for VCF Automation instance runs.<br>• For one collector instance, select default collector group.<br>• For multiple collectors, to distribute the workload and optimize performance, select the collector to manage the adapter process for this instance. |

4. Click **Test Connection** to validate the connection.
5. Click **Save Settings**.

   The adapter instance is added to the list.

Verify that the VCF Operations management pack is fetching workflows.

- In the **Solutions** page, verify that the **Collection State** column and **Collection Status** are green under **Configured Adapter Instances**. The **Collection Status** displays **Data Receiving** after the first collection cycle. The default time for a collection cycle is five minutes.
- From the left menu, click **Environment**, and then click **Inventory**. Verify that the VCF Operations workflows are displayed on the table and sort by the **Adapter Type** column or filter by name of the adapter instance if necessary.
- Optionally, discover additional packages to configure workflows.

Ensure that the instance of VCF Operations where you are configuring the Management Pack for Orchestrator has an instance of vCenter with Orchestrator configured. If this is not configured, an alert is displayed in VCF Operations. You can add a vCenter instance to Orchestrator to remediate this alert.

### Add a vCenter Instance to Management Pack for Orchestrator

An instance of vCenter must be available in the Orchestrator and the same instance must be configured in VCF Operations. If this is not available, you can add a vCenter Instance to Management Pack for Orchestrator from VCF Operations.

The Management Pack for Orchestrator must be configured.

1. From the left menu, click **Environment**, and then click **Inventory**.
2. Select **Adapter Instances**, and then select **VCF Automation Orchestrator Adapter Instance** from the list of adapter instances.
3. Select the Orchestrator adapter instance.

   A list of all the objects are displayed on the right pane.
4. From the right pane, select the Orchestrator to which you want to add a vCenter instance.
5. Click the **Action** icon, and then click **Add a vCenter Instance to VCF Automation Orchestrator**.
6. Configure the properties.
7. Click **Begin Action**.

   A task is added to the task list.

### Upgrade Management Pack

You can upgrade to a newer version of Management Pack for Orchestrator.

1. Log in to the VCF Operations user interface with admin privileges.
2. From the left menu, click **Data Sources** > **Integrations**.
3. Go to the **Repository** tab in the right pane, and then click **Add**.
4. Browse to locate the temporary folder and select the PAK file.
5. Select the **Install the PAK file even if it is already installed** check box.

   This selection reloads the PAK file but retains the custom preferences of the user. Also, this selection does not overwrite or update the solution alerts, symptoms, recommendations, and policies.
6. Select the **Reset Default Content, overwriting to a newer version provided by this update** check box.

   This selection reloads the PAK file and overwrites the existing solution alerts, symptoms, recommendations, and policies with newer versions provided with the current PAK file.
7. Click **Upload**.

   The upload might take several minutes.
8. Read and accept the EULA, and then click **Next**.
9. When the upgrade is complete, click **Finish**.
10. On the Manage Solutions page, click **Test Connection** to validate the connection.

Import the Apply Host Security Configuration Rules Out of the Box (OOTB) workflow to Orchestrator.

### Import Workflow

After you upgrade to the newer version of the Management Pack for Orchestrator, you have to manually import the new Apply Host Security Configuration Rules workflow to Orchestrator.

1. Log in to the VCF Operations instance.
2. From the left menu, click **Environment** > **Inventory**, and then click **Adapter Instances** > **VCF Automation Orchestrator Adapter Instance**.
3. Select the adapter instance.
4. Click **Action** icon, and then select **Import VMware Cloud Foundation Operations Remediation Package to vRO**.
5. Click **Overwrite Package**, and then click **Begin Action** to import the Apply Host Security Configuration Rules workflow to Orchestrator.

**Create a Service Account Refresh Token**
The user can create an Service Account Refresh Token.

1. Login to VCF Automation Provider Management portal.
2. Navigate to Access Control → Service Accounts → Click on New.
3. Enter the Name.
4. Select the required roles. You can create a new role just with Orchestrator Administrator privileges or use existing System Administrator with full access.
5. Generate the Software ID by clicking on the magic-wand icon.
6. Click NEXT. Review the information and click on Finish.
7. The Service Accounts table now reflects the newly created Service Account.
8. Edit the newly created Service account to **disable / deselect the Requires Rotation** Setting and save your changes
9. Expand the service account row to view the Client ID.
10. Create a curl command to perform device authorization by replacing VCFA_TENANT_MANAGER_FQDN and SERVICE_ACCOUT_CLIENT_ID. `curl -k 'https://<VCFA_TENANT_MANAGER_FQDN>/tm/oauth/provider/device_authorization' \ --header 'Content-Type: application/x-www-form-urlencoded' \ --data-urlencode 'client_id=<SERVICE_ACCOUNT_CLIENT_ID>'`
11. Execute the curl command and copy the value of user_code from the response. `{ "device_code": "k81ANxCMOjaRFxeVZL0gzXwS37LhYkSF2pwhH1IzSIA", "user_code": "5MX5-206H", "verification_uri": "https://vcfa.10.161.199.184.vcfd.example.com/provider/access-control/service-accounts", "expires_in": 3600, "interval": 60 }`
12. Under Service Accounts, Click on the Review Access Requests tab.
13. Paste the User Code copied from Step 11, and click on the LOOKUP button. Click on the GRANT button to approve the access request.
14. Copy the value of device_code from the response in Step 13.
15. Create a curl command to generate a Refresh Token by replacing VCFA_TENANT_MANAGER_FQDN, ORGANIZATION_SERVICE_ACCOUT_CLIENT_ID and DEVICE_CODE_FROM_DEVICE_AUTH_RESPONSE in `curl -k 'https://<VCFA_TENANT_MANAGER_FQDN>/tm/oauth/provider/token' \ --header 'Content-Type: application/x-www-form-urlencoded' \ --data-urlencode 'client_id=<ORGANIZATION_SERVICE_ACCOUNT_CLIENT_ID>' \ --data-urlencode 'grant_type=urn:ietf:params:oauth:grant-type:device_code' \ --data-urlencode 'device_code=<DEVICE_CODE_FROM_DEVICE_AUTH_RESPONSE>'`
16. Execute the curl command and copy the refresh_token from the response. `{ "access_token": "eyJraWQiOiJ1cm46dmNsbhcMqLveEA", "token_type": "Bearer", "expires_in": 3600, "refresh_token": "aJ4WNSZWmgwOZeg0M5cY9UUehjvicSRg"}`
17. Use the refresh_token from Step 16 to configure adapter instance.

**Configuring Orchestrator Workflows**

### Package Discovery

By default, Management Pack for Orchestrator discovers custom vCenter workflows and Management Pack for Orchestrator Out of the box (OOTB) workflows. You can extend the workflow capability of the Management Pack for Orchestrator by installing additional packages.

Install and configure the Management Pack for Orchestrator. The Management Pack for Orchestrator must connect to an external adapter before you install packages related to the adapter. In the **Solutions** page, verify that the **Collection State** column and **Collection Status** are green under **Configured Adapter Instances**. The **Collection Status** displays **Data Receiving** after the first collection cycle.

Install additional packages to support workflows related to different adapters.

1. Log in to the VCF Operations instance.
2. From the left menu, click **Environment** > **Inventory**, and then click **Adapter Instances** > **VCF Automation Orchestrator Adapter Instance**.
3. Select a Orchestrator adapter instance.
4. Next to the name of the Orchestrator adapter instance in the right pane, click **Configure Package Discovery** under **Actions**.
5. The **Configure Package Discovery** dialog box opens. Add a list of packages to be discovered in the following format: `<packageName>`
6. Click **Begin Action**.
7. The package discovery task starts. You can view the task ID in the **Configure Package Discovery** dialog box. Click **OK**.
8. To track the progress of the task, go to the **Recent Tasks** section in the **Administration** menu. Package discovery starts after the first content cycle.

### Mapping Workflows to Resources as Actions

You can map custom and user-defined workflows to actions. Repeat the task to add one workflow to more than one resource. You can perform this task for multiple workflows simultaneously within a package by running the same action on a package resource.

You must discover user-defined workflows them before you can add them as an action to a resource.

> **Note:**
>
> You can only map workflows to the supported target resources.

1. From the left menu, click **Environment**, and then click **Inventory**.
2. Click **Adapter Instances**, and then click **VCF Orchestrator Adapter Instance** from the list of adapter instances.
3. Select the Orchestrator adapter instance that contains the workflow that you want to run.

   A list of all the workflows are displayed on the right pane.

   > **Note:**
   >
   > This action is present at the Adapter instance level, package level, and workflow level. The most recommended is the package and workflow level.
4. From the right menu, select the workflow that you want to add to a resource.
5. Click the **Action** icon, and then click **Create/Modify Workflow Action on vCenter Resources**.

   > **Note:**
   >
   > Ensure that there is at least one input parameter in the workflow, otherwise the action fails when it is run.

6. Configure the following properties

| Property | Option |
|---|---|
| Workflow | Select a workflow from the drop-down menu.<br>**Note:**<br>Do not modify out-of-the-box workflows. |
| Available on Resource Type | If the workflow is already configured as an action in a resource type, it is displayed here. |
| Action Target Type | If the workflow is already configured as an action in the target resource type, it is displayed here. |
| Resource Type | Select a resource type from the drop-down menu. |
| Target Resource Type | Select a resource type. The resource type and the target resource type should be the same. |
| Operation | Choose to add or remove the workflow as an action. Options are **Add** and **Remove**. |

   With the Management Pack for Orchestrator 3.2, you can map any custom workflow to the parent resource. The parent object is the Resource Type and the Target Type is the actual vCenter object that the workflow is targeted for. The workflow accepts the target object as its input parameter. For example, if you want to map a workflow “Change Ram” to a host system and run the same workflow on multiple virtual machines under it, then select the Resource Type as **Host System** and the Target Type as **Virtual Machine**.

7. Click **Begin Action**.

   A task is added to the task list.

You can verify that the action is available by clicking the **Action** icon after you select the resource with the required **Adapter Type** and **Object Type** in the right pane. From the list displayed under the **Action** icon, verify that the workflow that you added to the resource is available as an action in the list. You must wait one collection cycle before you can verify. You can monitor the task list to see the status of the task.

### Mapping Actions to Alerts

After you install and configure the Management Pack for Orchestrator, you can map custom and user defined workflows (actions) to alerts via recommendations. After you perform this mapping, you can execute the Orchestrator workflow to remediate issues when VCF Operations displays alerts. Out of the box workflows are automatically mapped to alerts.

Before you map alerts to workflows, review the out of the box workflows and corresponding recommendations and alerts. See Out of the Box Workflows in the *Appendix*.

1. From the left menu, click **Troubleshoot**, and then click **Alert**.
2. Click **Actions**, and then select **Go to Alert Definition**.
3. Select an Alert that you want to modify, and then click **Edit**.

   The **Edit Alert Definition** dialog box opens.
4. Click the **Recommendations** tab.

   The available recommendation is displayed.

5. Click the **Create New Recommendation** icon to add a new recommendation.
6. Enter the description of what must be done to resolve the triggered alert.
7. Select an option from the drop-down list for **Adapter Type**.
8. Select an option from the drop-down list for **Action**, as a method to resolve a triggered symptom or a generated alert. Actions must already be configured in VCF Operations.
9. Click **Create**.
10. Drag and drop the recommendation that you created to the **Recommendations** section in the right pane.
11. Click **Update** to save the new alert definition.

### Viewing Workflows in Packages

View relationship between the Orchestrator and package to view the workflows. The **All Metrics** tab provides a map between the Orchestrator and the package.

Install and configure the Management Pack for Orchestrator and install a package before viewing the workflows in the packages.

1. Log in to the VCF Operations instance.
2. From the left menu, click **Environment** > **Inventory**, and then click **Adapter Instances**.
3. Select the instance of Orchestrator under **vRO Packages and Workflows**.
4. Click the **All Metrics** tab on the right pane.
5. Expand the **Show Object Relationship** section to view the relationship between the Orchestrator instance and packages.
6. Click a package to see a list of workflows in the package.

   By default, Management Pack for Orchestrator displays the following packages:

**Table 1663: Default Management Pack for Orchestrator Packages**

| Package Name | Workflows |
|---|---|
| com.vmware.library.vcenter | vCenter Workflows |
| com.vmware.vrops.oob_content | Default Management Pack for Orchestrator workflows |

### Configuring Automatic Remediation

A policy is a set of rules that you define for VCF Operations to use to analyze and display information about the objects in your environment. You can modify an existing policy or create a new policy and configure it for automatic alert remediation. To automate the workflow execution, you must apply the policy to a custom group called Orchestrator Adapter-Managed Objects. This group contains the vSphere objects.

Ensure that the following prerequisites are met:

- You have mapped custom and user-defined workflows to resources as actions. Automated workflow execution is possible on workflows which have only one input parameter. The only other input parameter is `vrops_alert_id` and it is used to fetch the ID of the alert that triggered the workflow. This input parameter should be of the type String. To automate workflows which have more than one input parameter, you must create a user-defined workflow and predefine the input parameters in the workflow.
- You have mapped the action to an alert through a recommendation.

1. From the left menu, click **Configure**, and then click **Policies**.
2. Select the current default policy. In the **More Actions** tab, click **Edit**.
3. Select **Groups and Objects** tab in the **Default Policy [Edit]** window.
4. Click **Save**.
5. Select the checkbox next to **VCF Orchestrator Adapter Managed Objects**.
6. Select **Alerts and Symptoms** tab in the **Default Policy [Edit]** window.
7. In the **Alert Definitions** pane, filter by the name of the alert to which you have mapped the action that you want to automate.
8. Select the alert from the filter results.
   a) In the **Automate** column, select **Local**.
   b) In the **State** column, select **Enabled**.
9. Click **Save**.

The default policy is modified to automatically run the configured action when mapped alerts are displayed.

### Import Remediation Package to Orchestrator

After you install and configure the Management Pack for Orchestrator, VCF Operations automatically imports the remediation package to Orchestrator after the first collection cycle. If you delete the remediation package in Orchestrator, you see an alert in VCF Operations. You can then re-import the remediation package to Orchestrator.

Verify that you have configured the Management Pack for Orchestrator

1. Log in to the VCF Operations instance.
2. From the left menu, click **Environment** > **Inventory**, and then click **Adapter Instances** > **VCF Orchestrator Adapter Instance**.
3. Select a Orchestrator adapter instance.
4. Next to the name of the Orchestrator adapter instance in the right pane, click **Import VMware Cloud Foundation Operations Remediation Package to vRO** under **Actions**.
5. Choose to overwrite package if required.
6. Click **Begin Action**.

Log on to Orchestrator to verify if the remediation package is available.

## Executing Orchestrator Worfklows

### Running a Workflow from an Alert

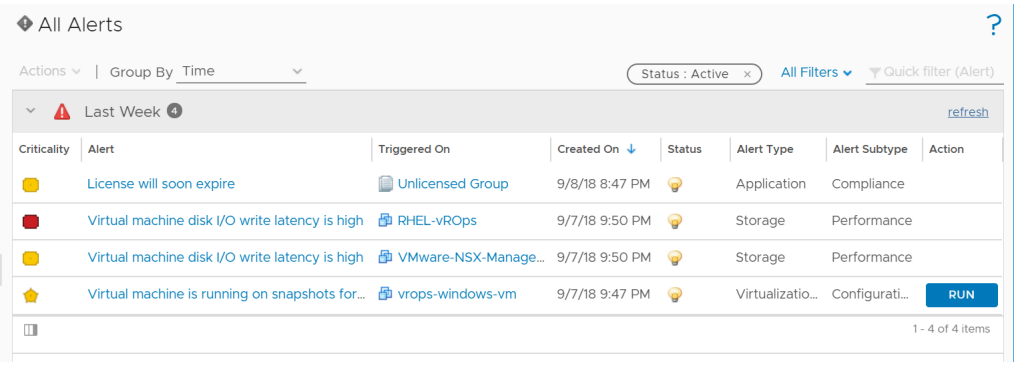
Run a Orchestrator workflow from an alert to resolve issues reported by VCF Operations.

Verify that you have configured the Management Pack for Orchestrator.

You can execute a Orchestrator workflow from VCF Operations.

1. From the left menu, click **Troubleshoot**, and then click **Alerts**.
   The alerts are displayed on the right pane. They may be grouped either by Time, Criticality, Definition, Object Type, or Scope.

2. Select an alert in the **All Alerts** page.
3. Click the **Show Columns** icon on the bottom left. Select the **Action** checkbox to show the actions column.
4. If the alert recommendation has an associated action, click the **Run** button.



You can check if the task has been completed to verify if the workflow has executed. To check the status of the task, go to the **Recent Tasks** section under the **Administration** menu in the left pane.

### Running a Workflow from the Inventory Explorer

Run a Orchestrator workflow from the Inventory Explorer to perform common management tasks.

Verify that you have configured the Management Pack for Orchestrator. You can run a workflow only on unique resource names. If two resources have the same name, the workflow may not run.

1. From the left menu, click **Administration**, and then click **Inventory** on the left pane.
2. Click **Adapter Instances**, and then click **VCF Orchestrator Adapter Instance** from the list of adapter instances.
3. Select the Adapter Instance that contains the workflow that you want to run.
   A list of all the workflows are displayed on the right pane.
4. Click the **Actions** icon and then **Execute Workflow Action** to run the workflow.
5. In the **Execute Workflow Action** dialog box, enter the input parameters to run the workflow. You must provide input parameters in the **Input parameter to run the Workflow** and **vCenter Server IP** columns.

**Table 1664: Input Format for the *Input parameter to run the Workflow* column**

| Workflow Data type | Format for Providing Input Values |
|---|---|
| String/Secure String/VC:XYZ (any String) | Resource name without single or double quotes |
| Number | Any numeric value. For example, you can provide the index number which corresponds to the VM's guest Operating System name for input parameter data type for the guest Operating System identifier. See Using the Input Parameter Data Type for Guest Operating System Identifier in the *Appendix* for more information. |
| Boolean | True or False |
| Array/XYZ (any string) | Input for the array in the following format:<br>`(input1, input2) or [input1, input2] or {input1, input2}` |
| Optional inputs | If you do not wish to specify for any value for an optional input, you just need to provide a comma (,) in place of the value. |

**Note:**
: User input should be ordered with respect to the data type of the workflow input parameter.

- For the **vCenter Server IP** column, select the vCenter server IP from the dropdown. This is only required for the workflows that you run in the vCenter.

6. Click **Begin Action**.

You can check if the task has been completed to verify if the workflow has executed.

### Running an Action from the vCenter Adapter Instance

You can run an action on multiple vCenter resources of the same type from the Inventory Explorer.

Verify that you have configured the Management Pack for Orchestrator.

1. From the left menu, click **Environment**, and then click **Inventory**.
2. Click **vCenter Server**, and then click **vCenter Adapter Instance** from the list of adapter instances.
3. Select the vCenter resources of type Virtual Machine.
4. Click the **Actions** icon, and then select the action that you want to run.
5. Enter the input parameters for the Virtual Machines and click **Begin Action**.

From the left menu, click **Administration**, and then click **Recent Tasks**, to check if the action has been successfully completed.

### Supported Parent Relationships for Workflows

When the workflow is targeted for a Virtual Machine object, the workflow is run for the supported VM parent object types. The following table describes the supported VM parent object types on which the workflow can be run.

| Parent Object | Object Type |
|---|---|
| VMFolder | VirtualMachine |
| ResourcePool | VirtualMachine |
| HostSystem | VirtualMachine |
| ClusterComputeResource | HostSystem |
| HostFolder | HostSystem |
| Datacenter | Datastore |
| HostSystem | Datastore |
| DatastoreFolder | Datastore |
| StoragePod | Datastore |
| ClusterComputeResource | ResourcePool |
| Datacenter | ClusterComputeResource |
| Datacenter | VmwareDistributedVirtualSwitch |
| NetworkFolder | VmwareDistributedVirtualSwitch |
| Datacenter | DistributedVirtualPortgroup |
| VmwareDistributedVirtualSwitch | DistributedVirtualPortgroup |
| NetworkFolder | DistributedVirtualPortgroup |
| VMwareAdapterInstance | Datacenter |
| Datacenter | VMFolder |
| Datacenter | HostFolder |
| Datacenter | NetworkFolder |
| Datacenter | DatastoreFolder |

### Determine the Status of a Workflow After Execution

Recent Tasks provide the status of a workflow after you execute it. View the recent tasks to see if the workflow executed correctly. If any workflow is in the failed/unknown state, you will get a notification in the alerts window with the details of

the resources for which the workflow failed. If there are multiple failures, they are combined, and the alert is cleared in the next collection cycle.

> **Note:**
> If a workflow which was triggered as part of automatic remediation fails, you must run the workflow manually to remediate the alert. Management Pack for VCF Operations will not execute the workflow that was triggered as part of automatic remediation if it fails the first time, even if the alert is still active.

1. From the left menu, click **Administration**, and then click **Recent Tasks**.
2. Select the workflow task from the list of recent tasks. You can view details of the selected task in the bottom pane.

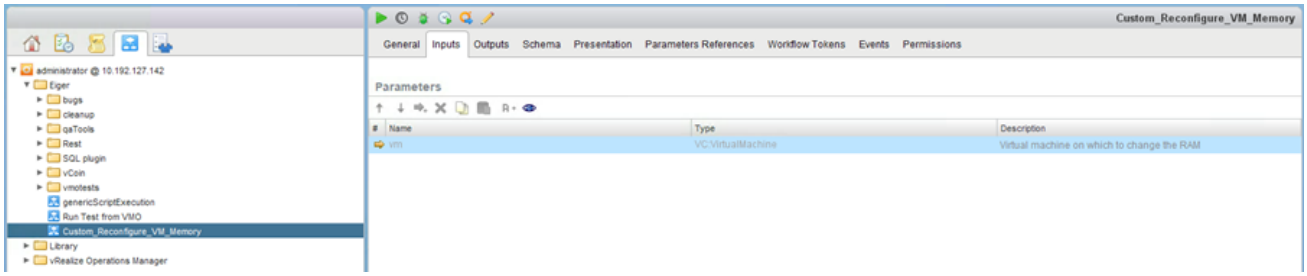
Example: Configuring and Executing Auto Remediation

This example describes the steps to define a custom workflow in Orchestrator and configure auto-remediation of an alert using the custom workflow.

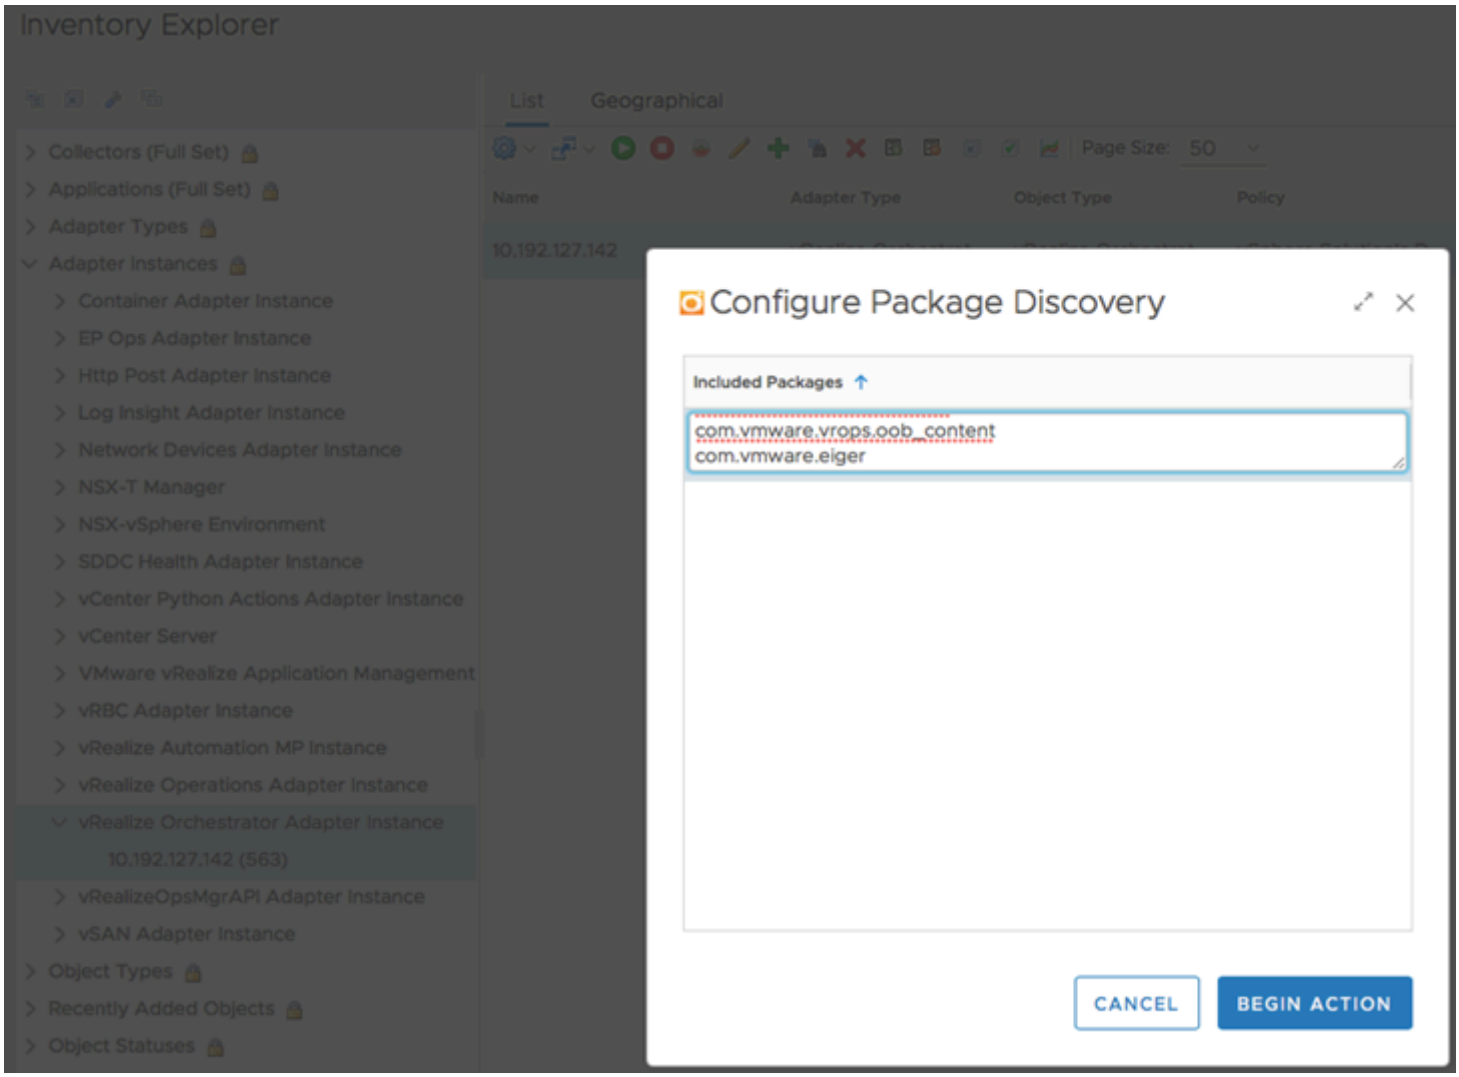
Automated workflow execution is possible on workflows which have only one input parameter. The input parameter should be of type `VC:<VC datatype>` in the Orchestrator workflows.

In this example, we will create a custom Orchestrator workflow where the input parameter name is `vm`.

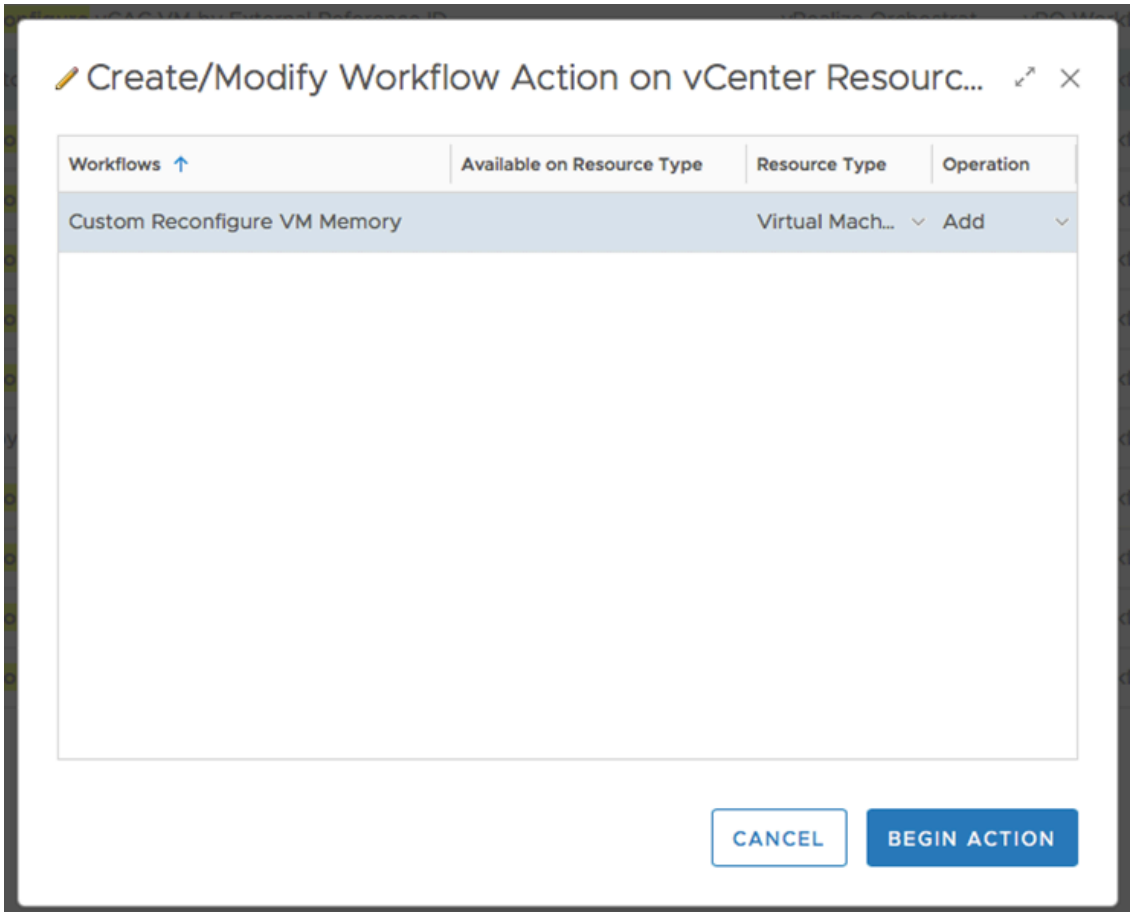
1. Create a custom workflow in Orchestrator. The custom workflow should have one input parameter of type `VC: <VC Datatype>`. In our example, the workflow **Custom Reconfigure VM Memory**, has one input parameter of type `VC:VirtualMachine`, and the name of the input parameter is `vm`.



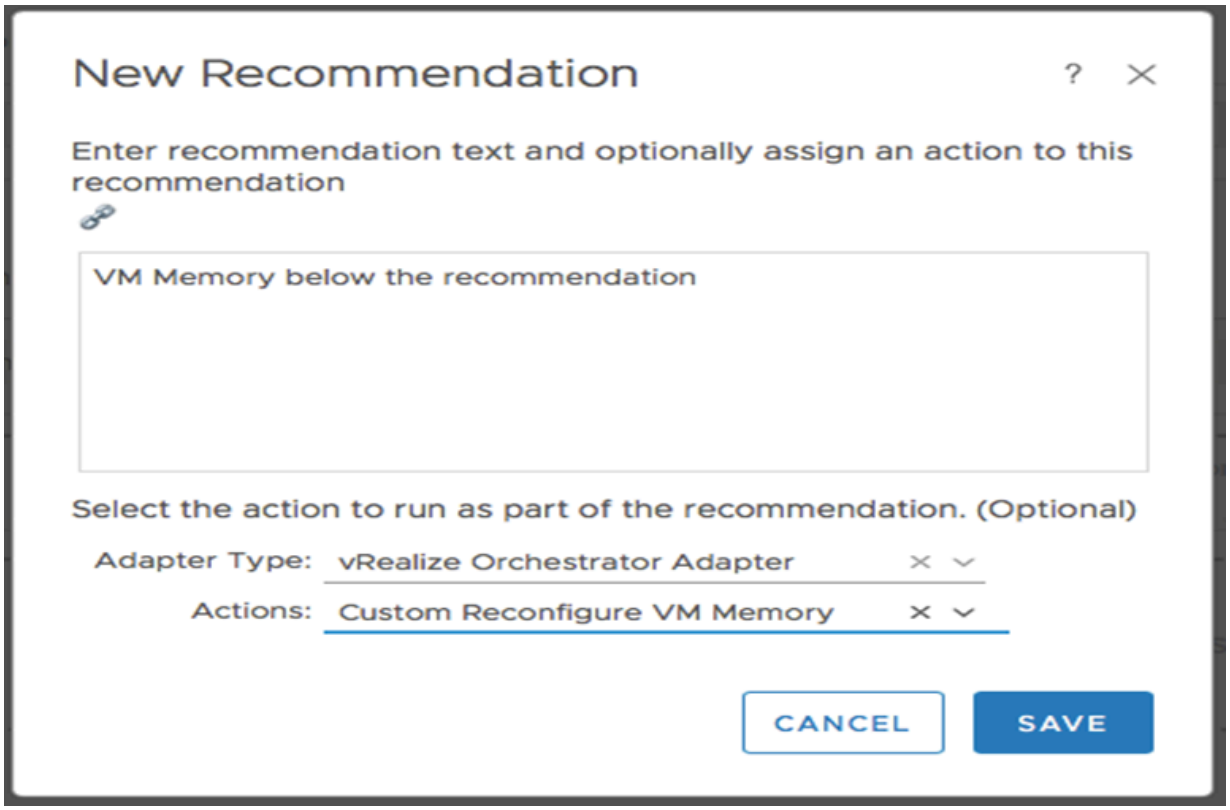
2. Import the custom workflow into VCF Operations.
   a) From the left menu, click **Environment** > **Inventory**, and then click **Adapter Instances** > **VCF Automation Orchestrator Adapter Instance**.
   b) Select a Orchestrator adapter instance.
   c) Next to the name of the Orchestrator adapter instance in the right pane, click **Configure Package Discovery** under **Actions**.
   d) The **Configure Package Discovery** dialog box opens. Add a list of packages to be discovered in the following format: `<packageName>`



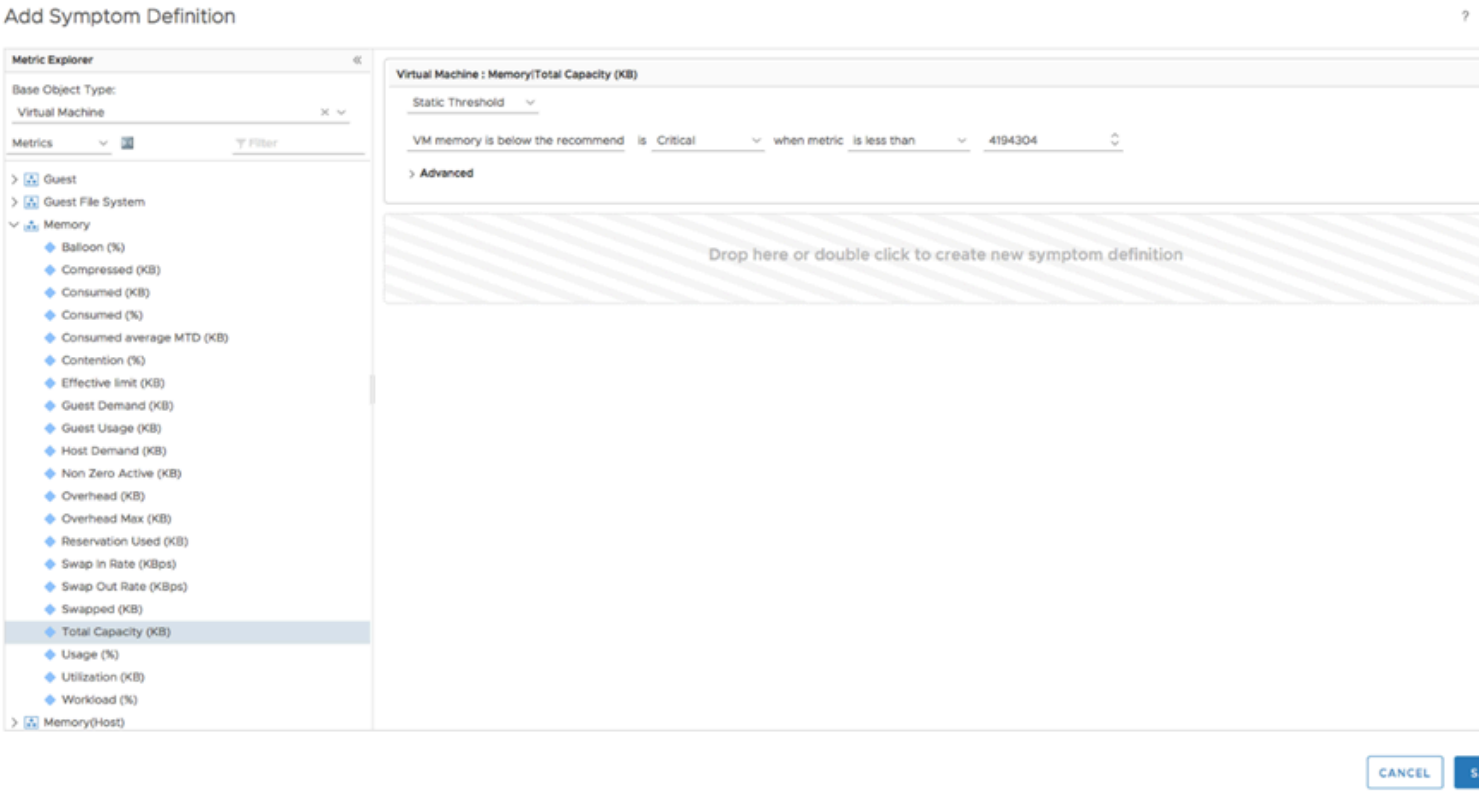
3. Map the custom workflow to a vCenter resource. Here the vCenter resource is of type `VC:VirtualMachine` which should match the Orchestrator workflow.
   a) From the left menu, select **Administration**, and then click **Configuration** > **Inventory Explorer** on the left pane.
   b) Select **Adapter Instances**, and then click **VCF Automation Orchestrator Adapter Instance** from the list of adapter instances.
   c) Select the Orchestrator adapter instance that contains the workflow that you want to run.
   d) From the right pane, select the workflow that you want to add to a resource.
   e) Click the **Action** icon, and then **Create/Modify Workflow Action on vCenter Resources**.



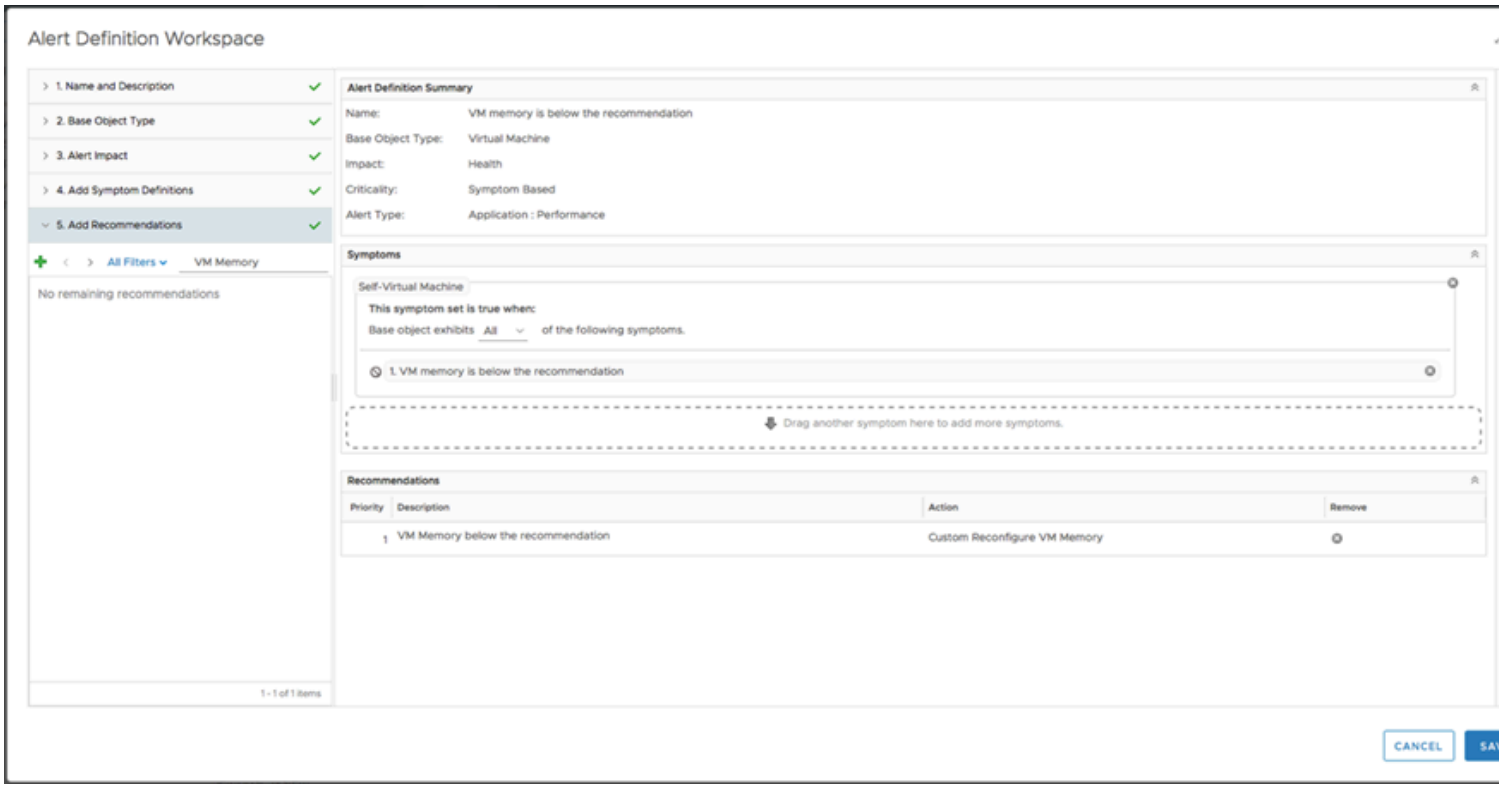
4. Create a custom recommendation. To define recommendations, in the menu, click **Alerts**, and then in the left pane, click **Alert Settings** > **Recommendations**.



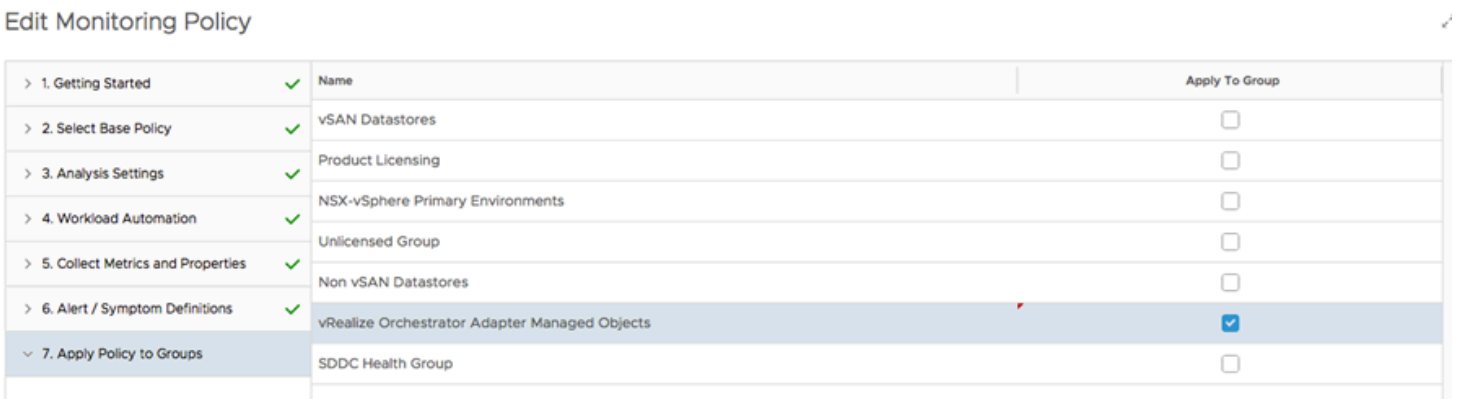
5. Create a symptom which looks for VMs that have memory below 64GB. In the menu, click **Alerts**, and then on the left pane, click **Alert Settings** > **Symptom Definitions**.

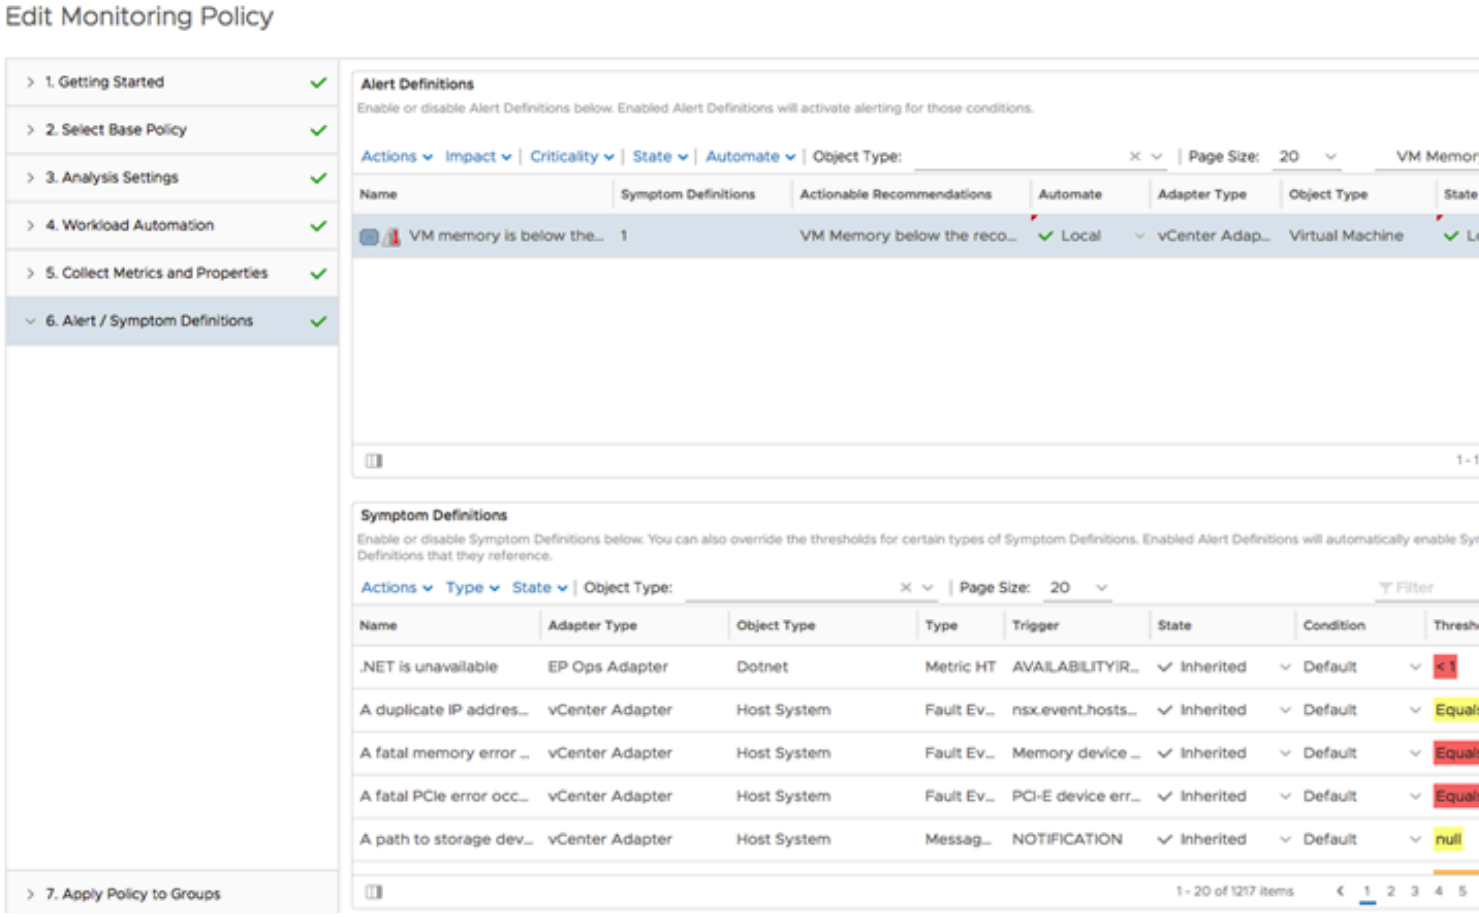


6. Create a custom alert which will invoke the Orchestrator workflow/action automatically. Map the symptom and recommendation to the alert. To create or edit your alert definitions, in the menu, click **Alerts** and then in the left pane, click **Alert Settings** > **Alert Definitions**.

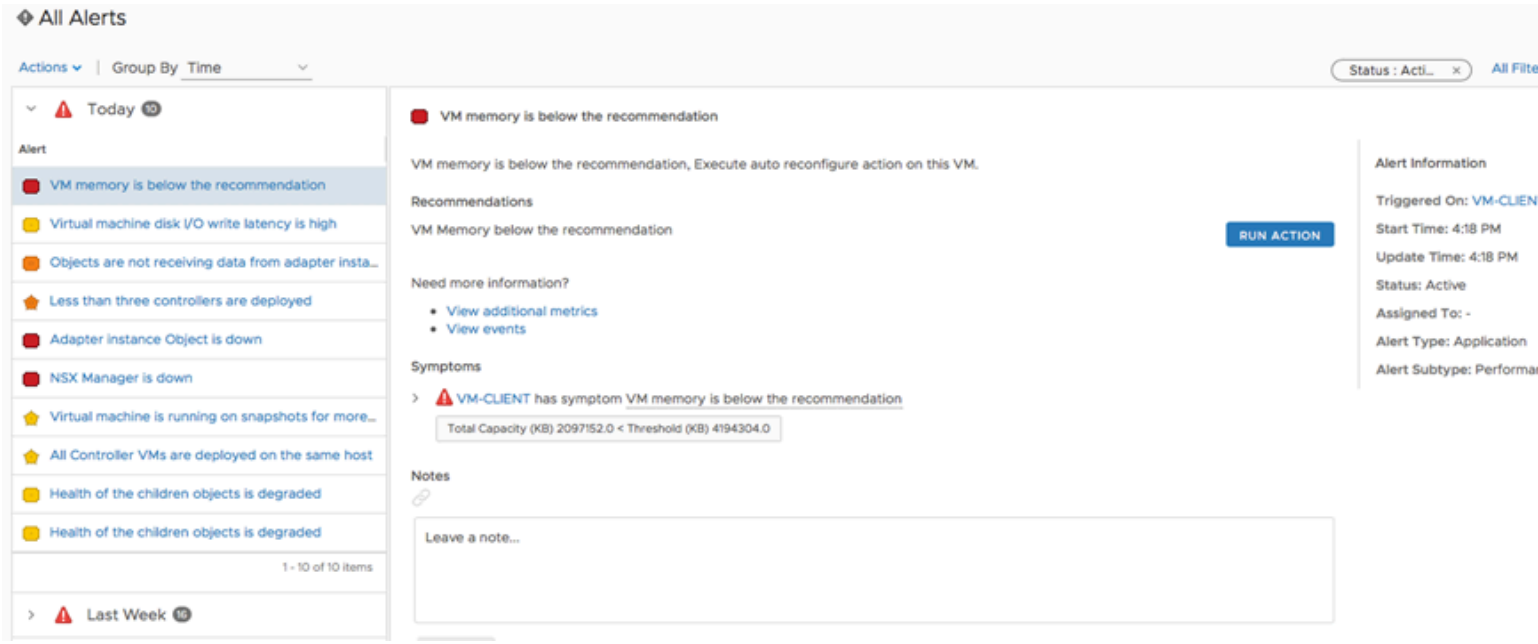


7. Create/Modify the policy and apply the Orchestrator Adapter group.
   a) From the left menu, click **Administration**, and then in the left pane, click **Policies**. Click the **Policy Library** tab, and then click the **Edit Selected Policy** icon to edit a policy.
   b) In the **Automate** and **State** columns, change the setting to **Local**.

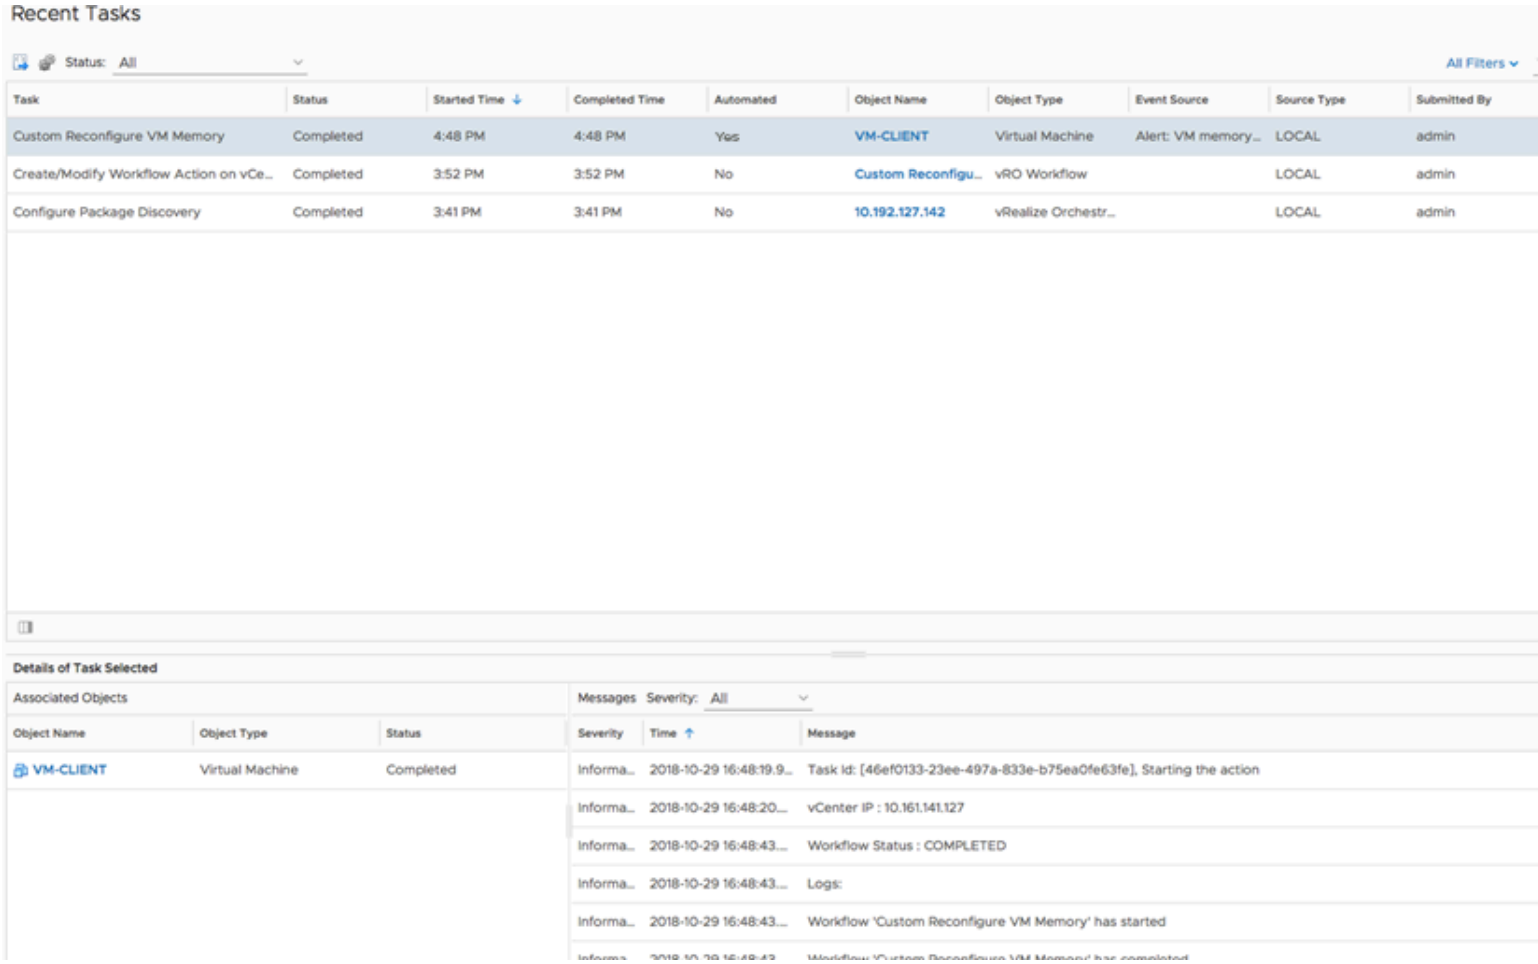




After configuring the custom workflow, VCF Operations will look for VMs that have RAM less than 64GB and generate an alert.



Based on the alert, Management Pack for Orchestrator invokes the custom workflow automatically. The alert remediated in next collection by executing the mapped recommendation. You can verify this in the **Recent Tasks**.

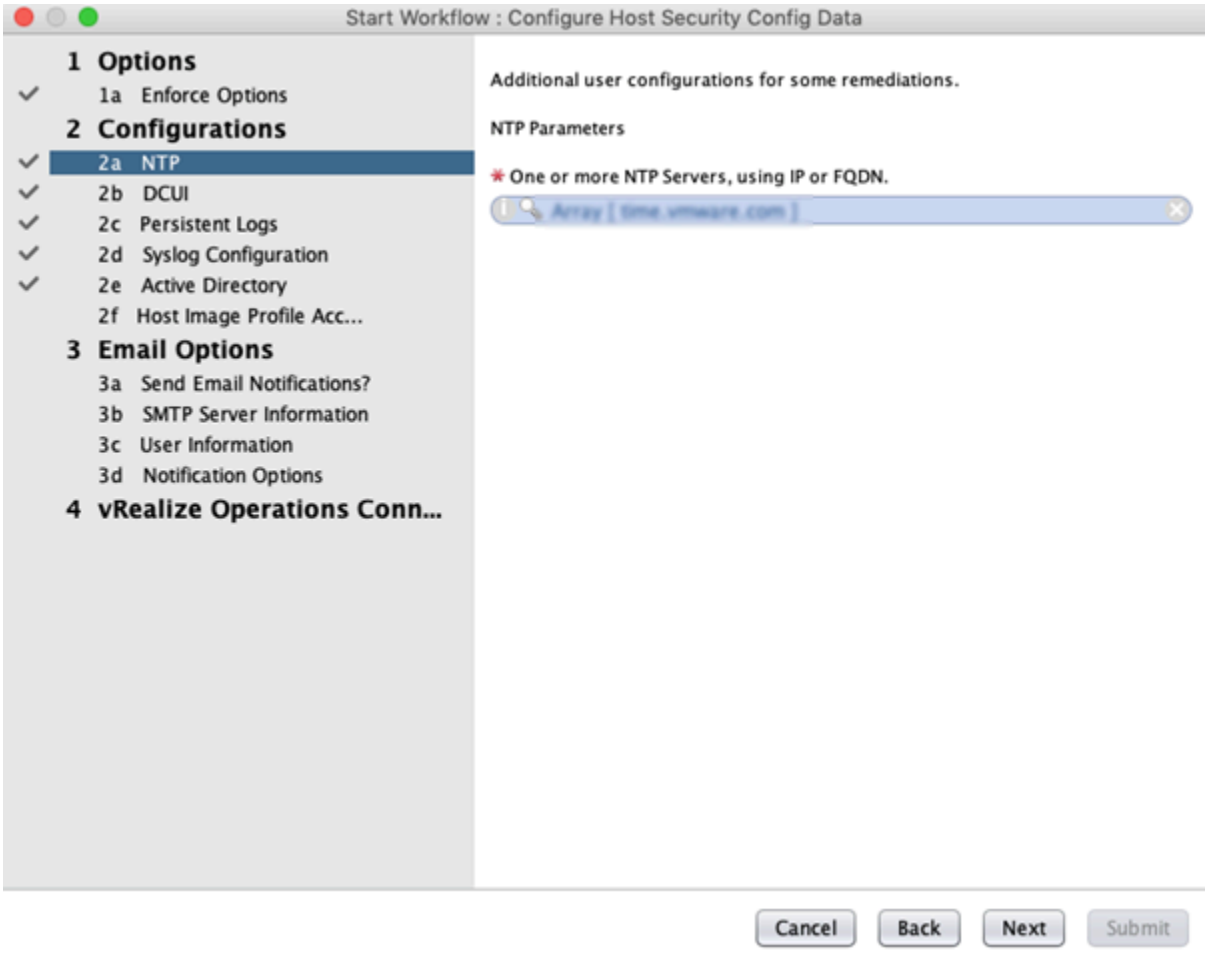


Example: Configuring Automated Compliance Remediation

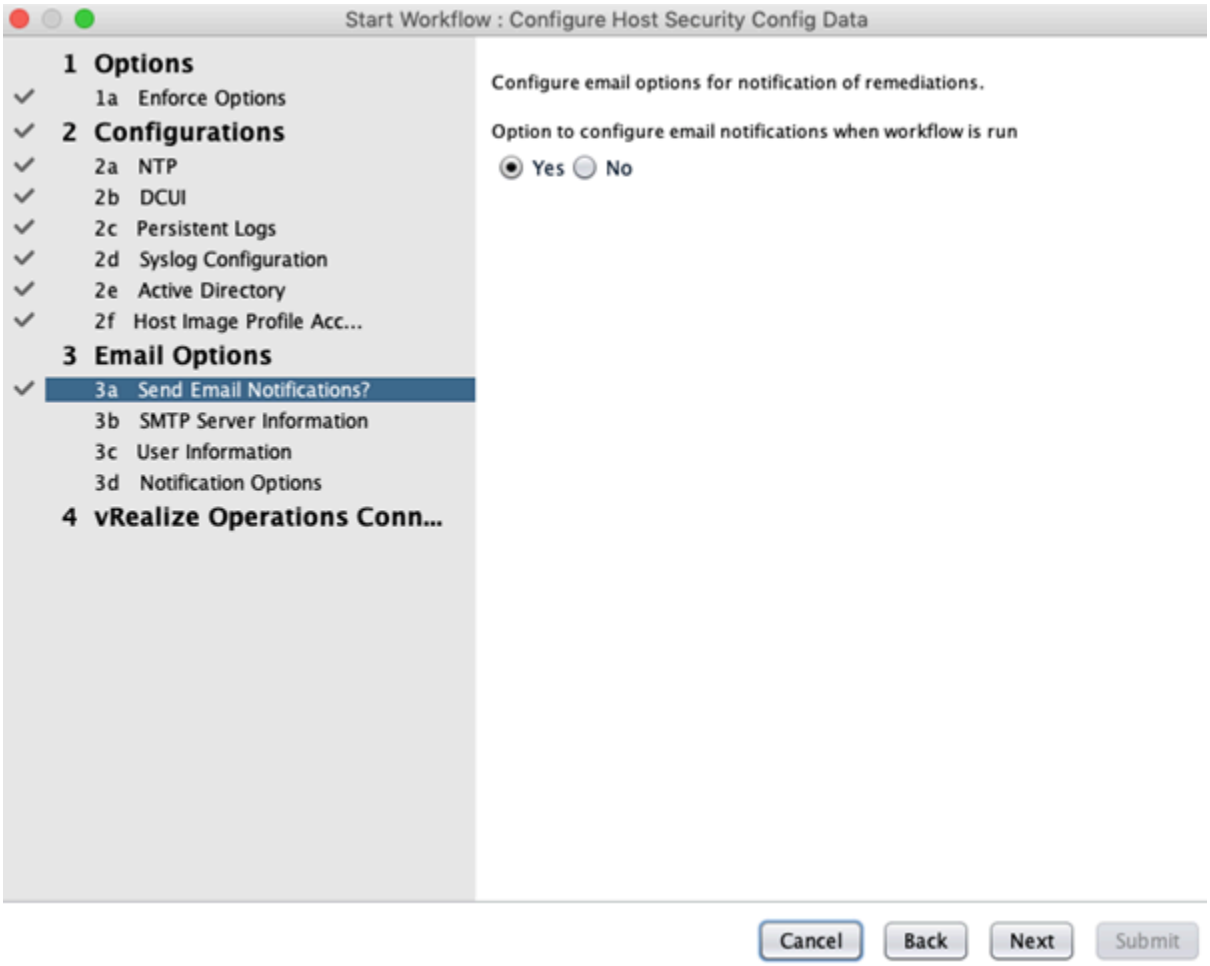
You can configure automated compliance remediation by applying host security configuration rules and setting options to enforce hardening rules.

Install or upgrade to Management Pack for Orchestrator version 3.2.

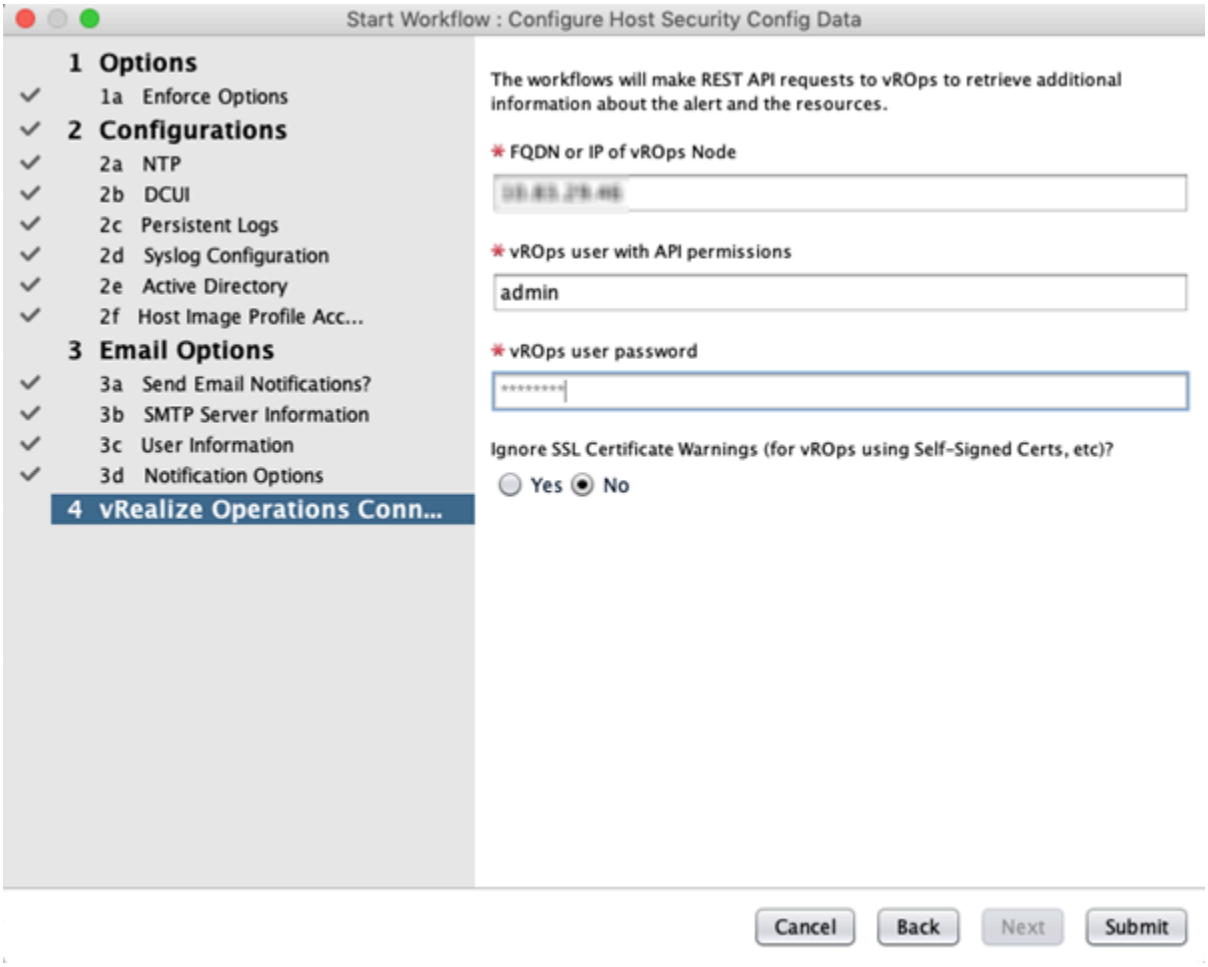
1. Add the *Apply Host Security Configuration Rules* out of the box workflow to the Orchestrator server. For more information, see Import Workflow.
2. Log in to Orchestrator to enforce the hardening rules in Orchestrator.
3. Run the *Configure Host Security Config Data* workflow to configure the **Host Security Hardening Configuration** and **Email Config** attributes.
4. In the **Enforce Options**, you can choose to selectively enforce rules by configuring the configuration elements.
   a) Under Configurations, set the NTP values.



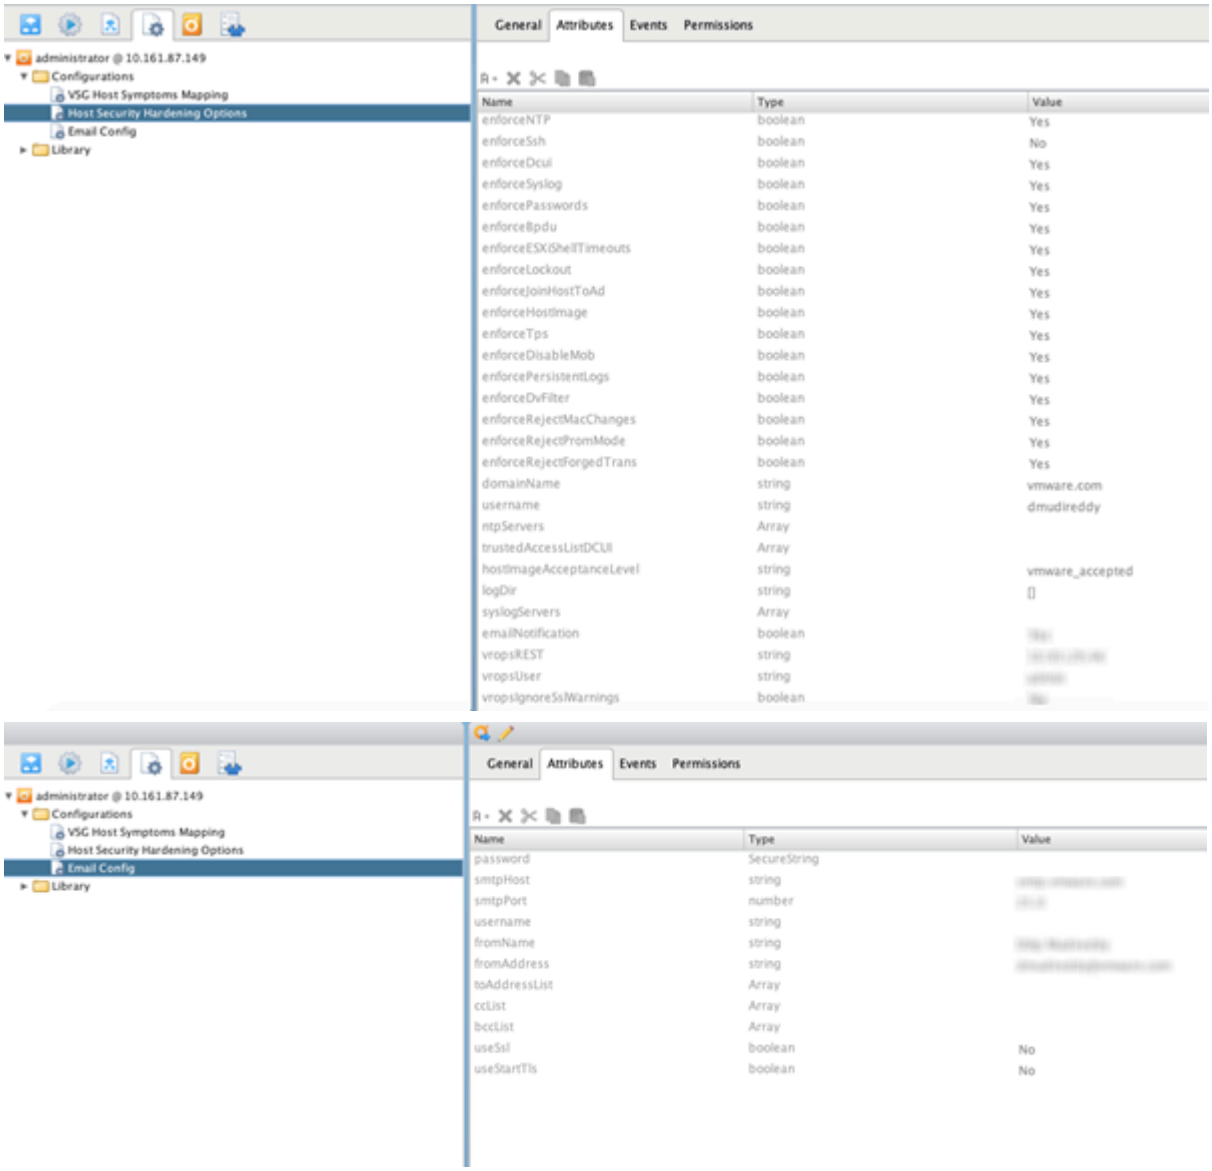
b) Under Email Options, configure **Send Email Notifications?**



c) Under VCF Operations Connections, configure the connection and login credentials.



After executing the workflow, both the **Host Security Hardening Options** and **Email Config** configurational elements are filled with attribute values that are enforced.



5. After setting the options to enforce hardening rules, enforce them automatically through auto remediation feature of Management Pack for Orchestrator
   a) Go to **Configure** > **Policies**.
   b) Select the policy currently active, and then click **Edit Policy** on the right pane.
   c) Select the **Alerts and Symptoms** tab, and then search for the alert, ESX *Host is violating VMware vSphere Security Configuration Guide for vCenter version 6.5 or 6.7*.
   d) Select the alert, and then in the **Automate** column, change the value to **Enabled**.
   e) Select the **Apply Policy to Groups** tab on the left pane, and then select the **VCF Automation Orchestrator Adapter Managed Objects** checkbox in the panel that appears on the right.

When any new ESX *Host is violating VMware vSphere Security Configuration Guide for vCenter version 6.5 or 6.7* alert is triggered, Management Pack for Orchestrator will automatically invoke the action mapped to it. If there is an existing alert, you can manually run the action against that alert. For any new alerts, the action automatically gets triggered in the next collection cycle. The recipient you configured earlier will receive an email after the action is successfully executed.

### Creating Workflow Actions on vCenter Resources for Custom Groups

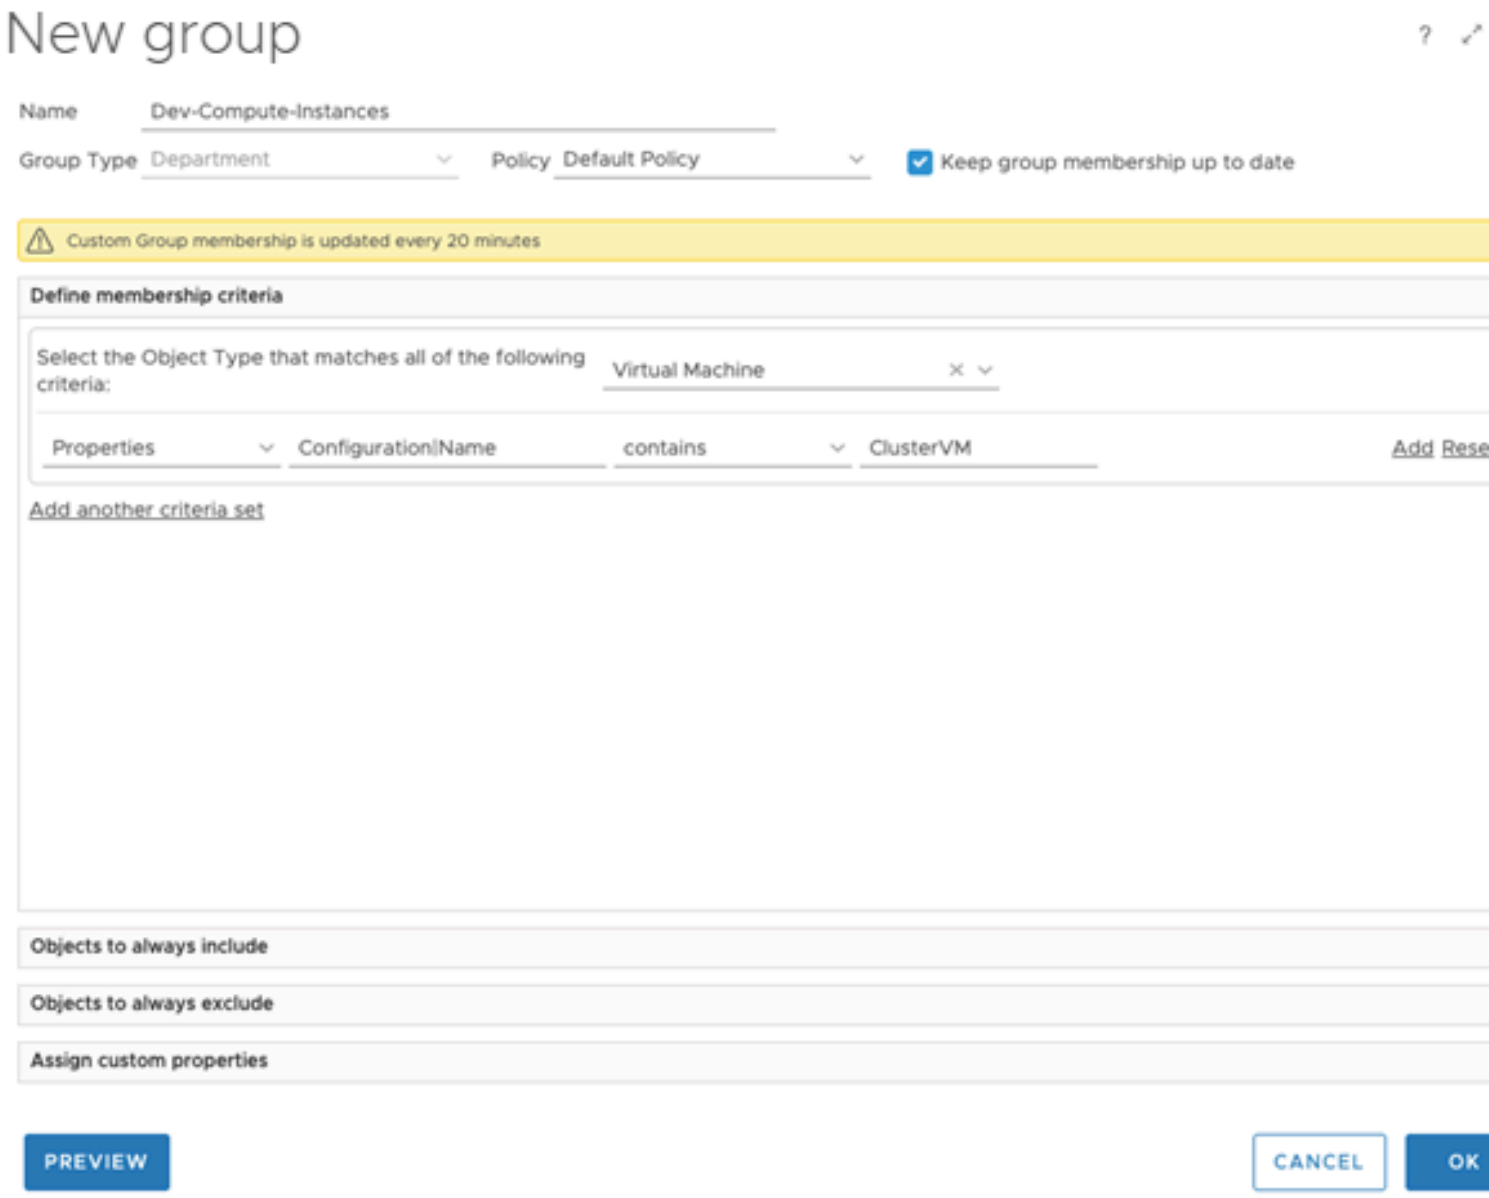
You can run a custom workflow as an action on custom groups. The custom groups can be Resource Type and Target Type which is the actual vCenter object the workflow is targeted for. This workflow accepts an array of vCenter objects as the input parameter.

Example: Scaling Out Group of Virtual Machine Memory

Create and import the custom workflow 'Scale VM Group Memory' in the Management Pack for Orchestrator. This workflow accepts an array of Virtual Machines as the input parameter (Array/VC: Virtual Machine).

The following example is to scale out the group of Virtual Machine memory that is part of the custom group 'Dev-Compute-Instances' and of the Group Type 'Department'.

1. Log in to VCF Operations.
2. Click **Environment**, and then click **Custom Groups**.
3. Click **Add**. Provide the following details to create a custom group.
   - **Name**: Provide a name for the group. For example, 'Dev-Compute-Instances'.
   - **Description**: Provide a description for the group name.
   - **Group Type**: Select the type as **Department**.
   - **Policy**: Select the policy as **Default Policy**.
   - **Select the Object Type that matches all of the following criteria**: Select **Virtual Machine** from the list.



**Note:**
All resources must be of the same Object Type and must belong to the same vCenter. In this example, Virtual Machine has to be the Object Type and you cannot select Virtual Machine from multiple vCenters.

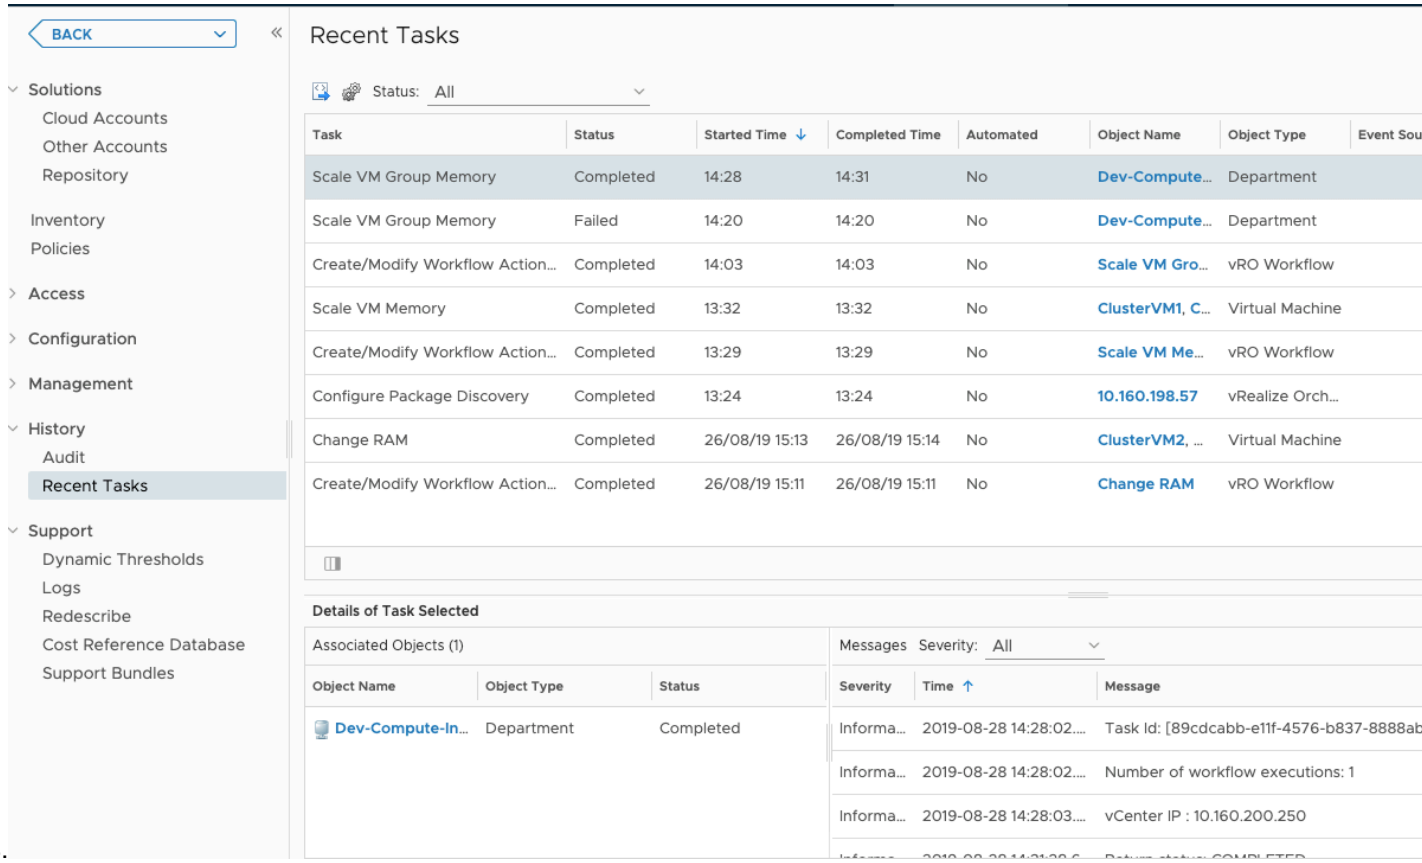
4. Click **OK** to create a custom group.
5. From the left menu, click **Environment**, and then click **Inventory**.
6. Select **Adapter Instances**, and then select **VCF Automation Orchestrator Adapter Instance** from the list of adapter instances.
7. Select the Orchestrator adapter instance that contains the workflow that you want to run.
   A list of all the workflows are displayed on the right pane.
8. From the right pane, select the workflow that you want to add to a resource.
9. Click the **Actions** icon and then **Create/Modify Workflow Action on vCenter Resources**.

   **Note:**
   Ensure that there is at least one input parameter in the workflow, otherwise the action fails when it is run.
10. Select the **Resource Type** as **Department** and **Target Resource Type** as **Virtual machine**.
11. Click **Begin Action**.
12. From the left menu, click **Environment**, and then in the right pane, select the custom group 'Dev-Compute-Instances' that you created.
13. Click the **Actions** icon, and then select the custom workflow **Scale VM Group Memory** from the list.

   The Virtual Machines are listed as comma-separated values.

14. Enter the memory that you want to scale and click **Begin Action**.

    The workflow is run for the array of Virtual Machines that are part of the listed group.
    To view the status of the workflow, click **Administration**, and then click **Recent**



**Tasks**.

Supported Combinations for Custom Groups

| Resource Type | Target Resource Type |
|---|---|
| Department | VirtualMachine |
| Department | HostSystem |
| Department | Datastore |
| Department | VmwareDistributedVirtualSwitch |
| Department | DistributedVirtualPortgroup |
| Environment | VirtualMachine |
| Environment | HostSystem |
| Environment | Datastore |
| Environment | VmwareDistributedVirtualSwitch |
| Environment | DistributedVirtualPortgroup |
| Function | VirtualMachine |
| Function | HostSystem |
| Function | Datastore |
| Function | VmwareDistributedVirtualSwitch |
| Function | DistributedVirtualPortgroup |
| Location | VirtualMachine |

| Resource Type | Target Resource Type |
|---|---|
| Location | HostSystem |
| Location | Datastore |
| Location | VmwareDistributedVirtualSwitch |
| Location | DistributedVirtualPortgroup |
| Security Zone | VirtualMachine |
| Security Zone | HostSystem |
| Security Zone | Datastore |
| Security Zone | VmwareDistributedVirtualSwitch |
| Security Zone | DistributedVirtualPortgroup |
| Service Level Objective | VirtualMachine |
| Service Level Objective | HostSystem |
| Service Level Objective | Datastore |
| Service Level Objective | VmwareDistributedVirtualSwitch |
| Service Level Objective | DistributedVirtualPortgroup |

### Management Pack for Orchestrator Dashboard

Access the Management Pack for Orchestrator Dashboard

The Management Pack for Orchestrator dashboard in the VCF Operations displays information that helps you monitor workflows.

1. From the left menu of VCF Operations, click Orchestrator Workflows Overview.

   The Orchestrator Workflows Overview dashboard displays the following widgets:

   - Orchestrator Adapter Instances
   - Orchestrator Instance Properties
   - vRO Health
   - Top-10 Workflows
   - Number of Successful and Failed Executions
   - Packages
   - Workflows
   - Number of Execution
   - Workflow Input Parameter

2. Click **Actions** > **Set as Home Page**, to set this dashboard as one of the default dashboards in the **Quick Start** page.

OrchestratorWorkflows Overview Dashboard

The Orchestrator Workflows Overview dashboard displays information about the Orchestrator adapter and workflows.

The Orchestrator Workflows Overview dashboard displays the following widgets by default.

#### Orchestrator Adapter Instances

You can view a list of Orchestrator adapters that you have configured in this widget. The widget displays the name of the adapter, adapter type, object type, policy applied, collection state, and collection status. Click on an adapter instance to view the properties of the adapter in the Orchestrator Instance Properties widget.

#### Orchestrator Instance Properties

Displays the properties of the Orchestrator adapter instances. You can view the adapter instance name and Orchestrator host settings.

**vRO Health**

Displays the status of the health-related alerts for the Orchestrator adapter instance. The state of the badge is based on your alert definitions. Click the badge to see the **Summary** tab for objects or groups configured in the widget. From the **Summary** tab you can begin determining what caused the current state. If the widget is configured for an object that has descendants, you should also check the state of descendants. Child objects might have alerts that do not impact the parent.

**Top 10 Executed Workflows**

Displays a count of the top 10 most frequently run workflows. This count includes workflows that have executed both successfully and unsuccessfully.

**Number of Successful and Failed Executions**

Displays the number of success and failed workflow executions. You can optionally modify the workflow execution metric collection time.

1. Log in to the VCF Operations instance.
2. Navigate to the properties file located in the path: `/usr/lib/vmware-vcops/user/plugins/inbound/VMwareAriaAutomationOrchestratorAdapter3/conf /Orchestrator.properties`.
3. Edit the Orchestrator.properties file and set the value for the key `WORKFLOW_EXEXCUTION_METRIC_COLLECTION_INTERVAL = 720`
   This value affects the **Number of Success and Failed Executions** widget in the Orchestrator Workflows Overview dashboard. The value you specify here decides the rate/frequency at which the workflow execution success/failure metrics will be updated in VCF Operations. The default value is 720 minutes.

**Packages**

Displays a data grid with objects in the inventory. The default configuration of the data grid appears in Object List Widget Options section. You can customize it by adding or removing default columns.

**Workflows**

Displays a data grid with list of Orchestrator workflows.

**Number of Execution**

Displays a metric chart of the workflow that you selected in the **Top-10 Executed Workflows** widget. You can use this information to monitor the workload of your workflows over time

**Workflow Input Parameters**

Displays the input parameters which was provided for executed workflows.

### Troubleshooting in Management Pack for Orchestrator

An Error Occurs When You Log In After Upgrading Orchestrator from 8.7 to 8.8

From Orchestrator 8.8 onwards, the basic authentication of your Orchestrator deployment is disabled by default. In certain use cases you must enable this authentication by setting the `com.vmware.o11n.sso.basic-authentication.enabled` system property.

You can enable basic authentication for your Orchestrator deployment by setting a system property.

1. Log in to the Control Center as **root**.
2. Select **System Properties**.
3. Click **New**.
4. Under **Key**, enter `com.vmware.o11n.sso.basic-authentication.enabled`.

5. Under **Value**, enter `true`.
6. (Optional) Enter a description for the new system property.
7. Click **Add**, and wait for the Orchestrator server to restart.

**Appendix**

## Out of the Box Orchestrator Workflows

The Management Pack for Orchestrator ships with out of the box Orchestrator workflows. These workflows help you remediate alerts in VCF Operations. They are mapped to alerts from recommendations. When an object displays an alert given here, you can run the workflow from the alert.

### Out of the Box Workflows for Custom Recommendations

Out of the box workflows for VM:

- VM Power Operations
- Reconfigure VM
- Move VM
- Manage Snapshots for VM
- Upgrade Guest Tools for VM
- Migrate Virtual Machine with vMotion
- Add a new vNIC to Virtual Machine
- Update CPU Reservation
- Update Memory Reservation
- Remove or Delete unused Template

Out of the box workflows for Host:

- Host Maintenance Mode
- Host Power Operations
- Decomission Host
- Reconnect Host. You can automate this workflow to run when an alert is displayed.
- Apply Host Security Configuration Rules

### Out of the Box Workflows for Default Recommendations

You can map out of the box workflows to recommendations already in VCF Operations. The following table lists the default recommendations and the alerts for which these recommendations are applicable:

| Out of the Box Workflow/Action Name | Alert in VCF Operations | Recommendation in VCF Operations |
|---|---|---|
| Upgrade Guest Tools for VM | Virtual Machine has unsupported VMware Tools. | If the VMware tools version is too new, downgrade it to a supported version. Otherwise, upgrade VMware Tools to the latest version. Select this virtual machine in the vSphere Client or Web Client, then right-click and select "Upgrade VMware Tools". |
| VM Power Operation | vSphere HA failed to restart a network isolated virtual machine | Manually power on the virtual machine. |
| VM Power Operation | vSphere HA cannot perform a failover operation for the virtual machine | You can also try to power on the virtual machine and investigate any returned errors. |

| Out of the Box Workflow/Action Name | Alert in VCF Operations | Recommendation in VCF Operations |
|---|---|---|
| Reconnect Host | Host has lost connection to vCenter Server | Click "Open Host in vSphere Web Client" in the Actions menu at the top of Alert details page to connect to the vCenter managing this host and manually reconnect the host to vCenter Server. After the connection to the host is restored by vCenter Server, the alert will be canceled. |
| Set CPU Count for VM | Virtual Machine CPU usage is at 100% for an extended period of time. | Add more CPU capacity to this virtual machine. |
| Migrate Virtual Machine using vMotion. | Virtual Machine has CPU contention due to memory page swapping in the host | Use vMotion to migrate this virtual machine to a different host or cluster |
| Migrate Virtual Machine using vMotion. | Virtual machine has memory contention due to memory compression, ballooning, or swapping | Use vMotion to migrate this virtual machine to a different host or cluster. |
| Move VM | Virtual machine is demanding more CPU than its entitlement | Move this virtual machine to a different host or cluster |
| Move VM | Virtual machine in a DRS cluster is demanding more CPU than its entitlement | Move this virtual machine to a different host or cluster |
| Move VM | Virtual machine in a cluster is demanding more CPU than its entitlement | Move this virtual machine to a different host or cluster |
| Manage Snapshots for VM | Datastore is running out of disk space. | Delete unused snapshots for datastore |
| Manage Snapshots for VM | Virtual machine disk I/O read latency is high | If the virtual machine has multiple snapshots, delete unused snapshots for VM |
| Manage Snapshots for VM | Virtual machine disk I/O write latency is high | If the virtual machine has multiple snapshots, delete unused snapshots for VM |
| Manage Snapshots for VM | Virtual machine has disk I/O latency problem caused by snapshots | If the virtual machine has multiple snapshots, delete unused snapshots for VM |
| Manage Snapshots for VM | Virtual machine is running on snapshots for more than 2 days | If the virtual machine has multiple snapshots, delete unused snapshots for VM |
| Host Maintenance Mode | Host is in maintenance mode for at least 72 hours | If the time period of maintenance window is expected, you can cancel this alert. Otherwise, investigate further and take the host out of maintenance mode. |
| Host Power Operation | N/A | N/A |
| Decommission Host | N/A | N/A |
| Add a new vNIC to Virtual Machine | N/A | Add an additional NIC to the VM to spread the packet load more evenly |
| Update CPU Reservation | N/A | If the virtual machine CPU reservation is set, Decrease the CPU reservation configuration |
| Update Memory Reservation | N/A | If the virtual machine Memory reservation is set, Decrease the Memory reservation configuration |
| Remove or Delete unused Template | N/A | N/A |

Using the Input Parameter Data Type for Guest Operating System Identifier

When you use a workflow which as an input parameter data type `vc:VirtualMachineGuestOSIdentifier(VMGuestOS)`, you can provide the index number which corresponds to the

VM's guest Operating System name. Use the index number from the table. For example, to execute the Create Custom Virtual Machine workflow to create a DOS Operating System, you provide the input parameter in the following format: `vc:VirtualMachineGuestOSIdentifier(1).`

**Index Numbers for Guest Operating System Identifier**

| Index | Virtual Machine Guest Operating System Name |
|---|---|
| 1 | win2000ProGuest |
| 2 | win2000ServGuest |
| 3 | win2000AdvServGuest |
| 4 | winXPProGuest |
| 5 | winXPPro64Guest |
| 6 | winNetEnterpriseGuest |
| 7 | winNetDatacenterGuest |
| 8 | winNetStandardGuest |
| 9 | winNetWebGuest |

Location of Log Files

Use the log files to view information about the Orchestrator adapter and workflows. You can access the log files from VCF Operations or by accessing the machine where you installed VCF Operations via SSH.

#### Access Log Files from Orchestrator

To access the log files for the collection cycle and status of the Orchestrator adapter, from the left menu, click **Administration**, and then in the left pane, click **Support** > **Logs**. Expand the node and the **COLLECTOR** folder. Expand the **adapters** folder and look for the VCF Automation Orchestrator Adapter_number.log file in the **VCF Automation OrchestratorAdapter** folder.

To access the log files for actions and workflows executed, open the VC Automation OrchestratorAdapter_0.log file.

#### Access Log Files via SSH

After you log in to the VCF Operations machine, access the log files in the following locations:

**Table 1665:**

| File | Location |
|---|---|
| Log location folder for Orchestrator adapter | /storage/log/vcops/log/adapters/VMware Aria Automation OrchestratorAdapter |
| Log for collection cycle and status of Orchestrator adapter | /storage/log/vcops/log/adapters/VMware Aria Automation OrchestratorAdapter/VMware Aria Automation OrchestratorAdapter_Number.log |
| Log for Orchestrator adapater actions and workflows executed | /storage/log/vcops/log/adapters/VMware Aria Automation OrchestratorAdapter/VMware Aria Automation OrchestratorAdapter_0.log |

## Management Pack for VMware Identity Manager

The *Management Pack for VMware Identity Manager* guide provides information about installing and configuring the Management Pack for VMware Identity Manager. The Management Pack for VMware Identity Manager allows you to retrieve alerts and findings from VMware Identity Manager to VCF Operations.

#### Intended Audience

The information in this guide is intended for anyone who wants to install and configure the Management Pack for VMware Identity Manager.

**Installing the Management Pack for VMware Identity Manager**

The Management Pack for VMware Identity Manager consists of a PAK file that contains default dashboards for the objects that the solution identifies.

To install the management pack, download the PAK file from VCF Solutions Catalog to a temporary folder on your local system. For more information, see **Installing and Configuring Integrations in VCF Operations**.

Configure an adapter instance for the management pack.

**Configuring Management Pack for VMware Identity Manager**

After you install the management pack, configure an instance for Management Pack for VMware Identity Manager.

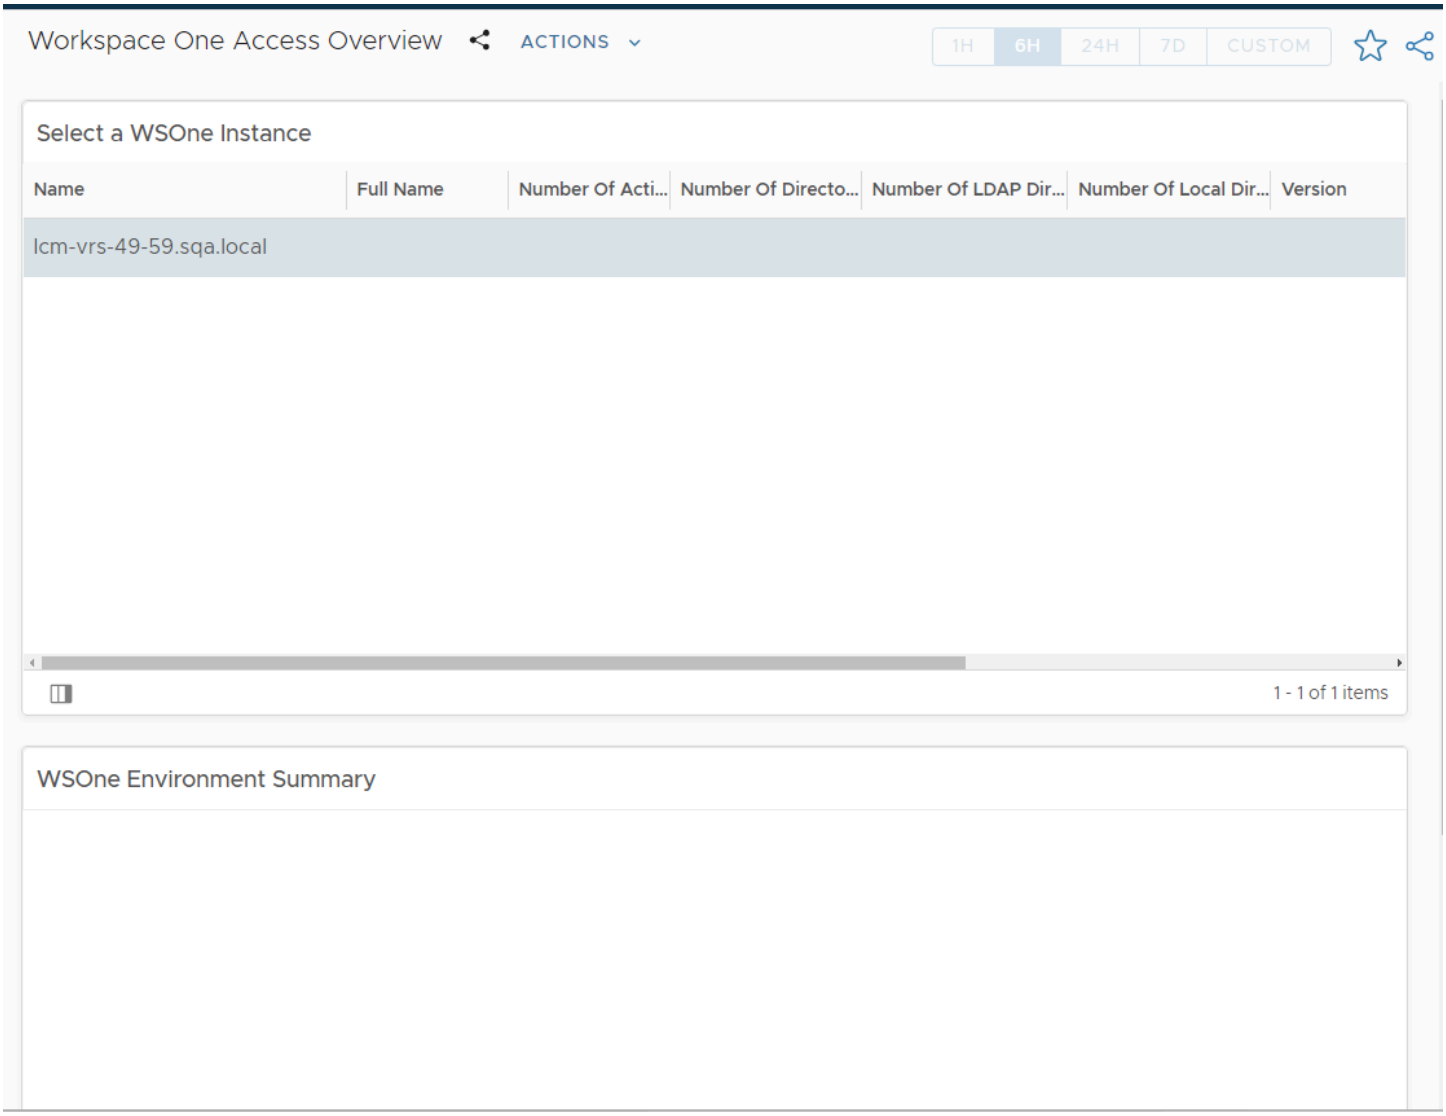
1. In the menu, select Data Sources, and in the left pane select **Integrations > Accounts**.
2. On the Accounts tab, click **Add**.
3. On the Accounts Types page, select **VMware Identity Manager Adapter**.
4. Configure the adapter instance.

| Option | Description |
|---|---|
| **Display Name** | The name for the adapter instance. |
| **Description** | (Optional) The description of the adapter instance. |
| **WSOne Host** | Enter the FQDN, or the IP address. |
| **Credential** | Select the credential you want to use to sign on to the environment from the drop-down menu. To add new credentials to access the VMware Identity Manager environment, click the plus sign.<br>• **Credential Name**. The name by which you are identifying the configured credentials.<br>• **User Name**. VMware Identity Manager local admin of system domain user name.<br>• **Password**. VMware Identity Manager local admin of system domain password. |

5. Enter **Collector/Group** to manage the management pack on VCF Operations. If you have only one account, select Default collector group.
6. Enter the connection information as required to configure the instance of the management pack. Each management pack has unique settings, configure the settings as prompted to configure that instance of the management pack. For more information on individual management packs, see List of Management Packs.
7. Click **VALIDATE CONNECTION** to initiate the authentication request to the CSP authentication service.
8. Click **ADD**.

Verify that the adapter is configured and collecting data by viewing application-related data.

**Dashboards in the Management Pack for VMware Identity Manager**
You can use the **Management Pack for VMware Identity Manager Overview** dashboard to view the environment summary for apps, groups, devices, users, activity, and health for your VMware Identity Manager instance.



**Metrics in the Management Pack for VMware Identity Manager**
The Management Pack for VMware Identity Manager collects metrics for objects within its plug-in.

**Table 1666: VMware Identity Manager Health Metrics**

| Resource | Metric Key | Metric Value |
|---|---|---|
| Workspace ONE Cluster Node | • Node Name Name<br>• Node UUID<br>• Version<br>• Node Status<br>• Node IP<br>• Time Zone<br>• Health | • String<br>• String<br>• String<br>• String<br>• String<br>• String<br>• String |

### Alerts in the Management Pack for VMware Identity Manager

The following alerts are triggered when any of the monitoring resources in VMware Identity Manager displays an unexpected behavior.

**Table 1667: Alerts in the Management Pack for VMware Identity Manager**

| Alert | Description |
|---|---|
| Health of WSOne Instance is degraded. | Triggered when the WSOne VM is down. |
| Health of WSOne ACSHealth-ApplicationDeployment is Low. | Triggered when the WSOne ACSHealth-ApplicationDeployment service is down. |
| Health of Application Deployment is Critically Low. | Triggered when the Application Deployment service is down. |
| WSOne Analytics Connection Test Connection failed. | Triggered when the Analytics service is down. |
| WSOne Database Test connection failed. | Triggered when the Database service is down. |
| Health of WSOne Disk Space is Critically Low. | Triggered when the Disk Space on WSOne VM is low. |
| WSOne Messaging Server Test Connection failed. | Triggered when the Messaging Server service is down. |
| Health of WSOne Application Manager-Application Deployment is Critically Low. | Triggered when the Application Manager-Application Deployment service is down. |
| Health of WSOne AirWatch API Server is Critically low. | Triggered when the Manager-Application service is down. |
| Health of WSOne Certificate is not good , look like it is Expired. | Triggered when WSOne Certificate has expired or deleted. |
| Health of WSOne RabbitMQ Service is Critically Low. | Triggered when the RabbitMQ service is down. |
| Health of WSOnePort Connectivity is Critically Low. | Triggered when the Port Connectivity service is down. |
| Health of FQDN WSOne Server is critically low. | Triggered when the FQDN service is down. |

| Alert | Description |
|---|---|
| Health of WSOne Configurator-ApplicationDeployment is Low. | Triggered when the Configurator-ApplicationDeployment service is down. |
| Health of WSOne Elasticsearch is Red. | Triggered when the Elasticsearch service is down. |
| Health of WSOne Connector-ApplicationDeployment is Critically Low. | Triggered when the Connector-ApplicationDeploymen service is down. |

## Management Pack for VCF Operations HCX

The Management Pack for VCF Operations HCX enables seamless monitoring and centralized management of your HCX Manager instances directly from VMware Cloud Foundation (VCF) Operations.

### Key Features and Benefits

- Simplified Administration: Streamlines daily administrative tasks, including certificate management, password updates, and password policy enforcement.
- Comprehensive Data Visualization: Collects and aggregates critical metrics, change events, and resource topology from across your fleet of HCX Manager instances, visualizing them directly within VCF Operations dashboards.
- Accelerated Troubleshooting: Empowers administrators to rapidly detect, isolate, and resolve performance bottlenecks within HCX Interconnects and active migration workloads.
- Unified User Experience: Delivers a consistent, end-to-end monitoring interface across both your source and destination vSphere environments.

### System Requirements

Before installing and configuring the Management Pack, ensure your system meets the following requirements.

For compatibility between products, please refer to:

VMware Cloud Foundation Operations Interoperability for HCX.

| | VCF Operations HCX Requirements |
|---|---|
| Connection | The Management Pack collects data via a REST API |
| Credentials | vCenter username and password |

### Installing the Management Pack

The Management Pack for VCF Operations HCX is an add-on integration that can be installed in one of the following ways:

- On top of the core VCF Operations platform using a PAK file available through Customer Connect. See, Installing Integrations in a Disconnected Environment.
- Through the the VCF Operations UI. See, Installing and Configuring Management Packs in VMware Cloud Foundation Operations from the Solutions Catalog.

Prerequisites

- Verify that you have access to the latest version of the management pack and the management pack is compatible with your version of VCF Operations.
- Ensure that you have the privileges to install a management pack.

### Configuring the Management Pack

#### Configure HCX Manager User and Privileges

Before registering with VCF Operations, you must create a user with the appropriate local permissions.

1. Log in to the corresponding vCenter Server and create a new user account for the deployed HCX Manager.

2. Add the user account to both the Migration Appliance Administrators and Migration Users groups in vCenter.
   This designated user account is responsible for password and certificate management, as well as the collection of migration metrics from the HCX Manager. Consequently, the assignment of both roles is mandatory.

Alternatively user privileges can be assigned by logging in to the Appliance Management UI, navigating to **Configuration** > **HCX Role Mapping and Edit**, and adding a user name or user groups to the Migration User and Migration Appliance Admin sections.

**Register HCX Manager in VCF Operations**

1. Log in to VCF Operations.
2. Navigate to **Operate** > **Administration** > **Integrations** and select **VCF Operations HCX**.
3. Click **Add Account**.
4. Enter the HCX Manager hostnam**e** and the appropriate user credentials created in the previous section, and click **Add**.
5. Select the appropriate Cloud Proxy.
6. Click **Add**.

After successful registration, the HCX instance should appear in the Certificates and Password screens under its specific domain.

While the Management Pack allows the registration of various HCX Managers, only those imported via VCF Operations are compatible with these automated password and certificate management tools.

**Validating Data Collection**

After you add an adapter instance, you will most likely want to validate the data that it collects in VCF Operations. Wait until one collection cycle is complete and the Collection Status for the adapter instance on the Solutions page shows as "Data Receiving".

1. Select the **Environment** navigation shortcut.
2. Under **Inventory Trees**, select **All Objects**, then expand the **HCX Adapter** objects list.
3. Select a resource from the list, then click the **All Metrics** tab to select metrics and validate values against the data source.

## Using the Management Pack

The Management Pack for VCF Operations HCX includes the following out-of-the-box features, harnessing the power of the VCF Operations user interface:

- Resource Kinds
- Dashboards
- Reports
- Alerts
- Metrics

## Resource Kinds

The Management Pack for VCF Operations HCX creates Resource Kinds and Relationships (associations) for critical resources in your VCF Operations HCX environment.

**Resource Kinds**

Performance, health, and availability data are collected for the following VCF Operations HCX resource kinds:

- Site Connection
- Migration
- vMotion
- Replication Assisted vMotion
- OS Assisted Migration

### Alerts

| Alert Name | Severity |
|---|---|
| Certificate has expired on HCX appliance | Critical |
| Certificate expiring in next 30 days on HCX appliance | Immediate |
| System Certificate expiring in next 30 days on HCX Interconnect (IX) Datapath Appliance / Network Extension (NE) Appliance | Automatic |
| System Certificate expired on HCX Interconnect (IX) Datapath Appliance / Network Extension(NE) Appliance | Automatic |
| Password has expired on HCX appliance | Critical |
| Password expiring in next 30 days on HCX appliance | Immediate |

## Management Pack for Microsoft SQL Server

The **Management Pack for Microsoft SQL Server** is an embedded adapter for VMware Cloud Foundation Operations, collecting performance data from your Microsoft SQL Server environment and providing predictive analytics and real-time information about problems in your infrastructure—all within the VCF Operations user interface.

### Notable Features

The Management Pack for Microsoft SQL Server includes the following notable features:

- **Comprehensive monitoring dashboards**
- **250+ collected metrics** for Microsoft SQL Server resources
- **30+**detailed alerts and notifications for critical and warning conditions
- **Capacity definitions** for connection limit, CPU demand, memory usage, and disk capacity
- **External relationships** from your VMware Virtual Machines to SQL Server Instance and Always On Availability Groups

### How the Management Pack Works

The Management Pack for Microsoft SQL Server connects to your **Microsoft SQL Server instance** via **JDBC** using the **jTDS driver.** SQL queries are executed in order to import health, performance, availability, capacity, and relationships data for your SQL server resources into VCF Operations.

### Getting Started

Wondering where to start? See System Requirements for details.

#### System Requirements for Management Pack for Microsoft SQL Server

Before installing and configuring the Management Pack, ensure your system meets the following requirements.

For compatibility between products, please refer to:

VMware Cloud Foundation Operations Interoperability for Microsoft SQL Server

-OR-

Third Party Solution Interoperability for Microsoft SQL Server

| | Microsoft SQL Server Requirements |
|---|---|
| Connection | **Standalone Configuration:**<br>• Hostname (or IPv4 address) of MS SQL Server instance<br>**Clustered Configuration:**<br>• **Virtual IP (VIP)**, or hostname for the VIP, of MS SQL Server instance<br>Default Instance Port: 1433 (TCP)<br>**Important:**<br>If using dynamic ports, you will want to change the default port to **SQL Server Browser Service UDP port 1434**. |
| Credentials | MS SQL User Name/Password (Active Directory or Local)<br>• See: Assigning MS SQL User Privileges for information about creating the least amount of permissions for a MS SQL monitoring user.<br>• If using SSL, see: Adding an SSL Certificate to the VMware Cloud Foundation Operations Truststore. |

**Important:**

The **CPU Usage** metric for **Microsoft SQL Server Instances** is not available on MS SQL Server **Standard** or **Express** editions.

Assigning MS SQL User Privileges

This topic contains the minimum MS SQL user permissions needed for an MS SQL Server Management Pack monitoring user. An automated script is provided below; it can help you create a local LPU user or can be modified for use with a domain user.

**Important:**

It is recommended to create your LPU prior to installing and configuring the Management Pack. You should use your own MS SQL credentials (login), user, and role names.

**Required Permissions and Role**

To create your MS SQL least-privileged user (LPU), you will need to complete the following general tasks:

1. Grant your MS SQL login credentials the following permissions:
   – **VIEW SERVER STATE**
   – **VIEW DATABASE STATE**
   – **VIEW ANY DEFINITION**
2. Next, to ensure all future-created databases are monitored, create a user that maps to your MS SQL credentials and has the**public** role on the following databases:
   – each**user**database
   – **msdb** database
   – **model** database

**Create Local LPU User Script**

Run the following script to automate creation of a local MS SQL Server LPU user with the permissions/role mentioned above:

```
use master;

CREATE LOGIN sql_lpu WITH PASSWORD = 'your-password';
CREATE USER sql_lpu FOR LOGIN sql_lpu;
```

```
GRANT CONNECT SQL to sql_lpu;
GRANT VIEW SERVER STATE to sql_lpu;
GRANT VIEW DATABASE STATE TO sql_lpu;
GRANT VIEW ANY DEFINITION TO sql_lpu;
GO

GRANT EXEC on [xp_readerrorlog] to sql_lpu
GO

use model;
CREATE USER sql_lpu FOR LOGIN sql_lpu;
GO

use msdb;
CREATE USER sql_lpu FOR LOGIN sql_lpu;
GRANT SELECT ON [dbo].[syssessions] TO sql_lpu
GRANT SELECT ON [dbo].[sysjobhistory] to sql_lpu
GRANT SELECT ON [dbo].[sysjobsteps] TO sql_lpu
GRANT SELECT ON [dbo].[sysjobs_view] TO sql_lpu
GRANT SELECT ON [dbo].[sysjobactivity] TO sql_lpu
ALTER ROLE [SQLAgentReaderRole] ADD MEMBER [sql_lpu]
-- For SQL Server 2008 R2, use: sp_addrolemember [SQLAgentReaderRole], [sql_lpu]

-- Goes through each user database and adds public permissions
DECLARE @name NVARCHAR(MAX)
DECLARE db_cursor CURSOR FOR
SELECT name
FROM MASTER.dbo.sysdatabases
WHERE name NOT IN ('master','model','msdb','tempdb')
OPEN db_cursor
FETCH NEXT FROM db_cursor INTO @name
WHILE @@FETCH_STATUS = 0
BEGIN
    EXECUTE('USE ' + @name + '; CREATE USER sql_lpu FOR LOGIN sql_lpu;' );
    FETCH NEXT FROM db_cursor INTO @name
END
CLOSE db_cursor
DEALLOCATE db_cursor
```

**Tables, Views, and Functions Used by Permission**

**What to do next**

Adding an SSL Certificate to the VMware Cloud Foundation Operations Truststore

Adding an SSL Certificate to the VMware Cloud Foundation Operations Truststore

For added security, we recommend adding an SSL certificate to the VCF Operations truststore for your MS SQL host server.

> **Note:**
>
> Different levels of security can be configured in the Management Pack. The **least secure configuration** is to set the **SSL Config** Advanced Setting to **No SSL.** The next level of security is to set **SSL Config** to **No Verify,** and the management pack will accept all SSL certificates. For the highest level of security, you can set **SSL Config** to **Verify,** and the Management Pack will have to verify the SSL certificate on your VCF Operations system. See: Creating an Adapter Instance .

**To add the SSL certificate to your VCF Operations truststore:**

1. Obtain the SSL certificate for your MS SQL host server from your Internet browser. Export the certificate as an X.509 Certificate (PEM).
2. Copy the certificate to your VCF Operations machine.
3. Use 'ssh' to log in to the VCF Operations machine as the root user, then run the following command:
   **Linux:**
   $VCOPS_BASE/jre/bin/keytool -import -alias <product_alias> -file /tmp/<certfile> -keystore "$VCOPS_DATA_VCOPS/user/conf/ssl/tcserver.truststore" -storepass `grep ssltruststorePassword /storage/vcops/user/conf/ssl/storePass.properties | sed s/ssltruststorePassword=//` -trustcacerts
   **Windows:**
   %VCOPS_BASE%\jre\bin\keytool -import -alias <product_alias> C:\path\to\certfile -keystore "%VCOPS_DATA_VCOPS%\user\conf\ssl\tcserver.truststore" -storepass <truststore_password> -trustcacerts
   **Parameter Descriptions:**
   – <product_alias> is a unique name for each key that you add (per host)
   – <certfile> is the location where the cert file was saved
4. Run the reboot command to re-start the VCF Operations machine for the changes to take effect.

**Troubleshooting the Management Pack**

Once you have finished Installing and Configuring the Management Pack , check the **Collection State** and **Collection Status** for the adapter instance on the **Solutions** page. If they show as **Not Collecting** or **No Data Receiving**, respectively, the following troubleshooting topics can help you diagnose and correct common problems with your adapter instance.

**Test Connection Errors**

When Creating an Adapter Instance , click **Test Connection** after entering all of your configuration settings to ensure VCF Operations can connect to the specified host.

The following errors are possible:

**Bad Microsoft SQL Server host name**

**Error Message**: Unable to establish a valid connection to the target system. Unknown server Host name "<hostname>". Check connection settings.

**Description:** Ensure the host name (or IPv4 address) provided when Creating an Adapter Instance is correct.

> **Important:**
>
> IPv6 addresses are not supported.

**Bad Microsoft SQL Server user name/password**

**Error Message**:Unable to establish a valid connection to the target system. Login failed for user "<username>". Check connection settings.

**Description:**Ensure the user name and password provided when Creating a Credential is correct.

**Instance/Port Mismatch**

**Error Message**: Unable to establish a valid connection to the target system. Instance on Default Port 1433 is MSSQLSERVER, does not match supplied Instance of NAMEDINSTANCE.

**Description:** Ensure the instance name and port are correct when Creating an Adapter Instance .

> **Note:**
>
> The default instance is MSSQLSERVER; default port is 1433.

**Collection Timeout**

**Error Message**: pollCompletionService method returned null or timed out before the result was returned with timeout set to <timeout length> seconds.

**Description**: The default **Thread Timeout** value of 30s may be insufficient for your environment. Raising it to 240s should resolve any collection issues due to this problem. Note also that raising the timeout does not cause collection to take any longer, it just gives it more time in which to complete. In addition, increasing the **Thread Pool Size** should help performance if you are running into collection timeout problems. You can find these parameters listed here: Creating an Adapter Instance .

## Adapter and Collector Log Files

You can review adapter errors in the adapter and collector log files, which can be viewed in the VCF Operations UI or in an external log viewer.

- **Adapter log files** are located in the $VCOPS_BASE/user/log/adapters/SqlServerAdapter/ folder.
- **Collector log files** are located in the $VCOPS_BASE/user/log/ folder.

To set the base log level for the collector in VMware Cloud Foundation Operations:

1. Navigate to **Administration** > **Support** > **Logs.**
2. Expand the **PRIMARY** folder, then select the **COLLECTOR** folder.
3. Click the **Edit Properties** icon.
4. In the **Root logger level** drop-down menu, select the desired option.

- The default logging level is **warning.**
- To troubleshoot issues, set the logging level to **info.**
- To view detailed messages, including micro steps, queries, and returned results, set the logging level to **debug.**

> **CAUTION:**
>
> If you set the logging level to **debug,** log files can become large very quickly. Set the logging level to **debug** only for short periods of time.

For more information about viewing log files and modifying levels, refer to the VMware Cloud Foundation Operations online help.

### Using the Management Pack

The Management Pack for Microsoft SQL Server includes the following out-of-the-box features, harnessing the power of the VCF Operations user interface:

- Inventory Tree (Traversal Spec)
- Dashboards
- Tags
- Views
- Reports
- Analysis Badges and Capacity Definitions
- Alerts
- Metrics

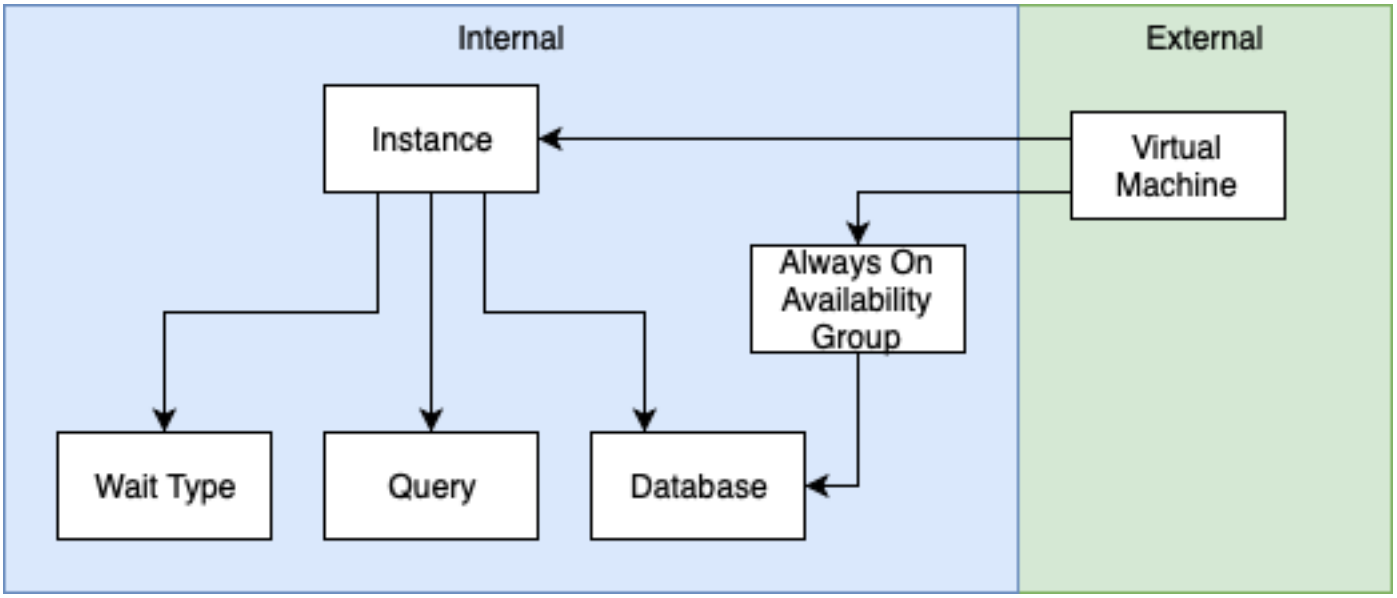
#### Inventory Tree (Traversal Spec), Resources and Relationsips

The Inventory Tree (Traversal Spec) feature in VCF Operations allows you to easily navigate your Microsoft SQL Server environment. The hierarchical structure implicitly shows relationships among resources and enables quick drill-downs to root-cause issues.

To access your Microsoft SQL Server Inventory Tree, select **Environment** from the top navigation bar, then select **Microsoft SQL Server** from the left panel.

**Resources and Relationships**

**Figure 483:**



#### Dashboards

Dashboards are the primary feature for monitoring and troubleshooting Microsoft SQL Server from within VCF Operations.

The following dashboards are included in this release of the Management Pack for Microsoft SQL Server:

- Microsoft SQL Database Drill Down
- Microsoft SQL Infrastructure Drill Down
- Microsoft SQL Server
- Microsoft SQL Query

### Tags

To further customize how your Management Pack dashboards are displayed, the following tags (containers) are currently available for filtering:

- **SQL Clusters** — all Microsoft SQL Servers being monitored that are Failover clusters
- **SQL Server Environment** — all Microsoft SQL Servers being monitored
- **SQL Server Instances** — SQL Server Instances to be used as the root object of the traversal
- **VMware Virtual Machines Hosting SQL Server** — all Virtual Machines on which Microsoft SQL Servers are running

To select a tag, perform the following steps:

> **Important:**
>
> Depending on the dashboard and version of VCF Operations you are using, the steps for selecting a tag may vary slightly.

1. Click the **Content** navigation shortcut.
2. Select **Dashboards** from the navigation pane.
3. Select the dashboard you want to filter, then click **Edit.**
4. Select **Edit Widget** for the specific dashboard widget you want to filter.
5. In the dialog that appears, under **Select which tags to filter**, expand the **Microsoft SQL Server Tag** option and select the desired tag(s).
6. To save your configuration and exit the Edit window, click **Save.**

> **Note:**
>
> If selecting multiple configurations, you can save each one without exiting the Edit window by clicking **Save Configuration.**

### Views

The Management Pack for Microsoft SQL Server creates views that allow the user to view statistics of metrics for various Microsoft SQL Server resources. The views help give a broad picture of the entire system, as opposed to a more in depth view.

The following views are available in the Management Pack:

| View | Type | Description |
|---|---|---|
| MS SQL Queries | List | Lists all metrics on SQL Query resources |
| MS SQL Query Text | Text | SQL Query Text used for Query Analysis dashboard |
| MS SQL Server Database Disk Access | List | Lists Microsoft SQL Server Disk Access Activity |
| MS SQL Server Database Locks | List | Lists Disk Delays for Microsoft SQL Server Databases |
| MS SQL Server Database Overview | List | Lists performance and activity for Microsoft SQL Server Databases |
| MS SQL Server Database Size | List | Lists space usage breakdowns for Microsoft SQL Server Databases |
| MS SQL Server Disk Access | List | Lists Disk Activity information for Microsoft SQL Servers |
| MS SQL Server Locks | List | Lists lock and wait time information for Microsoft SQL Servers |
| MS SQL Server Memory Breakdown | List | Lists breakdown of Microsoft SQL Server Memory |
| MS SQL Server Overview | List | Provides overview list of Microsoft SQL Servers |

| View | Type | Description |
|---|---|---|
| MS SQL Server Size Distribution | Distribution | Provides distribution view of database sizes |
| MS SQL Server Stress | List | Lists stress breakdown of Microsoft SQL Servers |

To access the Management Pack views:

1. Navigate to **Environment** > **All Objects** > **Microsoft SQL Server.**
2. Double-click on the desired object (resource).
3. Select the **Details** tab, then **Views.**

The available views for that resource are listed and can be selected.

### Reports

The Management Pack for Microsoft SQL Server contains out-of-the-box reports that you can easily export and share with key stakeholders in either .pdf or .csv formats.

The following reports are available in the Management Pack:

| Report | Description | Views Used |
|---|---|---|
| MS SQL Query Analysis | Provides a breakdown of query executions, as well as unique query plans and query text | MS SQL Queries |
| MS SQL Server Database Size Distribution | Provides a size distribution breakdown of databases on a server, along with a size distribution list for each database | MS SQL Server Size Distribution, MS SQL Server Database Size |
| MS SQL Server Environment Disk Access | Provides a look at server and database disk access operations | MS SQL Server Disk Access, MS SQL Server Database Disk Access |
| MS SQL Server Environment Locks | Provides a breakdown of server level lock requests and wait times, as well as database delays | MS SQL Server Locks, MS SQL Server Database Locks |
| MS SQL Server Environment Overview | Provides server and database overview and database size distribution | MS SQL Server Database Overview, MS SQL Server Overview, MS SQL Server Database Size |
| MS SQL Server Memory Breakdown | Provides a breakdown of physical memory used, recommended, stolen, as well as maximum and total physical memory | MS SQL Server Memory Breakdown |
| MS SQL Server Stress | Provides a server level stress assessment and resource usage | MS SQL Server Stress |

To access Management Pack reports:

1. Navigate to **Environment** > **All Objects** > **Microsoft SQL Server.**
2. Double-click on the desired object (resource).
3. Select the **Reports** tab, then **Report Templates**.

The available report(s) for the selected resource are listed and can be selected.

To run a selected report, click the **Run Template** icon.

### Analysis Badges and Capacity Definitions

Using the predictive analytics capabilities of VCF Operations Analysis Badges through capacity definitions, the Management Pack for Microsoft SQL Server populates capacities as listed in the table below.

### MS SQL Database Capacities

| Container | Use in Workload |
|---|---|
| **Database Disk Capacity** | |
| Reserved disk space* vs. Effective free disk space<br>*Database disk space usage (including allocated but unused) measured against free disk space on drives the database resides on | yes |

### MS SQL Server Instance Capacities

| Container | Use in Workload |
|---|---|
| **Connection Limit** | |
| Number of connections* vs. Number of possible connections<br>*Connection usage as reported by MS SQL Server (includes active and idle) | yes |
| **CPU Demand** | |
| CPU Usage* vs. Maximum CPU Usage<br>*Usage percent of Host CPU used by MS SQL Server application measured by MS SQL Server | yes |
| **Memory Usage** | |
| Effective Memory* vs. Total Server Memory<br>*Host RAM in use by MS SQL Server application measured by MS SQL Server | yes |
| **Disk Capacity** | |
| Used Disk Space* vs. Total Disk Space<br>*Aggregate Disk usage on all disks the MS SQL Server uses reported by MS SQL Server | yes |

Alerts

The Management Pack for Microsoft SQL Server creates alerts and provides recommended actions based on various symptoms (health status notifications and events) that it detects in your Microsoft SQL Server environment. See the table below for the list of alerts available in the Management Pack.

> **Important:**
>
> Alerts indicated with an asterisk (*) will **not** come through when the **Exclude All Events** Advanced Setting when Creating an Adapter Instance is set to **True.**

| Name | Description | Symptom | Recommendation |
|---|---|---|---|
| MS SQL Server Deprecated Feature* | This alert indicates a deprecated feature is being used on the MS SQL Server. | MS SQL Server Deprecated Feature | To avoid failures due to this feature in future updates, it is recommended to update the feature to the current implementation. |
| MS SQL Server Low Page Life Expectancy* | The actual page life expectancy is lower than the ideal page life expectancy. | MS SQL Server Low Page Life Expectancy | Increase the memory on the SQL Server to allow for a greater page life expectancy. |
| MS SQL Server Average Query CPU Time is High | This alert indicates that the average query CPU time has risen above normal. | Average Query CPU Time is High | |

| Name | Description | Symptom | Recommendation |
|---|---|---|---|
| MS SQL Server Number of Queries That End In Deadlock has Risen | This alert indicates that the number of queries that end in deadlocks has risen above normal. | Number of Queries That End In Deadlock has Risen | |
| MS SQL Server Cluster Owner Is Down | This alert indicates that the owning node of the cluster is down. | MS SQL Server Cluster Owner Is Down | |
| MS SQL Server Cluster Owner Is Paused | This alert indicates that the owning node of the cluster is paused. | MS SQL Server Cluster Owner Is Paused | |
| MS SQL Database Index: Never Accessed Indexes* | This alert indicates that there are indexes that have not been accessed since the SQL Server was started or the database was closed, whichever is shorter. | Never Accessed Indexes | Unused indexes can consume disk space through index storage and consume processing power during index maintenance. Determine if the index is necessary, and, if not, consider removing. |
| MS SQL Database file close to max capacity limit* | This alert indicates that there is a file on the database that is close to reaching its max capacity limit. | Database file close to max capacity limit | |
| MS SQL Database Index: Unused Maintained Indexes* | This alert indicates that there are indexes that are being maintained but have not been read. | MS SQL Database Index: Unused Maintained Indexes | Unused indexes can consume disk space through index storage and consume processing power during index maintenance. Determine if the index is necessary, and, if not, consider removing. |
| MS SQL Database Index: Potentially Inefficient Indexes* | This alert indicates that there are indexes that are being written to more than they are being read and are potentially inefficient. | Potentially Inefficient Indexes | Inefficient indexes have a maintenance cost in terms of space and processing power. Determine if the benefit of the index is greater than the cost of maintaining it. If not, consider removing the index. |
| MS SQL Database Index: Missing Beneficial Index* | This alert indicates that there is a missing beneficial index that is being recommended by MS SQL Server. | Missing Beneficial Index | Performing queries without indexes can be time consuming and cause poor query performance. Consider adding the recommended index. |
| MS SQL Database Index: Highly Fragmented Indexes* | This alert indicates there are indexes that are greater than 30% fragmented. | Highly Fragmented Indexes | Performing queries with fragmented indexes can be time consuming and cause poor query performance. Fragmentation can also cause more disk space to be consumed than is needed. Recommend rebuilding the fragmented index. |
| MS SQL Database Index: Mildly Fragmented Indexes* | This alert indicates there are indexes that are between 15% and 30% fragmented. | Mildly Fragmented Indexes | Performing queries with fragmented indexes can be time consuming and cause poor query performance. Fragmentation can also cause more disk space to be consumed than is needed. Recommend reorganizing the fragmented index. |

| Name | Description | Symptom | Recommendation |
|---|---|---|---|
| MS SQL Database Is In Emergency State | This alert indicates the MS SQL Database is in an Emergency State. | MS SQL Database Is In Emergency State | |
| MS SQL Database Is In Offline State | This alert indicates the MS SQL Database is in an Offline State. | MS SQL Database Is In Offline State | |
| MS SQL Database Is In Non-Critical Non-Online State | This alert indicates the MS SQL Database is in a non-critical non-online state. | MS SQL Database Is In Suspect State<br>MS SQL Database Is In Recovery Pending State<br>MS SQL Database Is In Recovery State<br>MS SQL Database Is In Restoring State | |
| MS SQL Always On Group Database Is In a Not Healthy State | This alert indicates the MS SQL Always On Group Database is in a Not Healthy State. | MS SQL Always On Group Database Is In a Not Healthy State | |
| MS SQL Always On Group Database Is In a Partially Healthy State | This alert indicates the MS SQL Always On Group Database is in a Partially Healthy State. | MS SQL Always On Group Database Is In a Partially Healthy State | |
| MS SQL Always On Group Database Is In a Suspended State | This alert indicates the MS SQL Always On Group Database is in a Suspended State. | MS SQL Always On Group Database Is In a Suspended State | |
| MS SQL Always on Availability Group in Non Healthy State | This alert indicates the MS SQL Always On Availability Group is in a non healthy synchronization state. | MS SQL Always on Availability Group in Non Healthy State | |
| MS SQL Always on Availability Group in Partially Healthy State | This alert indicates the MS SQL Always On Availability Group is in a partially healthy synchronization state. | MS SQL Always on Availability Group in Partially Healthy State | |
| Error reading database log | | An error occurred while processing the log for database <database-name>. If possible, restore from backup. If a backup is not available, it might be necessary to rebuild the log.<br>An error occurred while processing the log for database <database-name>. The log block version <log-version> is unsupported. This server supports log version <log-version> to <log-version>.<br>An error occurred while processing the log for database <database-name>. The log block could not be decrypted. | |
| Error Fetching Page | | Attempt to fetch logical page <#>_PGID in database <database-name> failed. It belongs to allocation unit <allocation-unit> not to <allocation-unit>. | |
| Cannot Find File | | Cannot find file ID <fileID-name> on device <device-name>. | |

| Name | Description | Symptom | Recommendation |
|---|---|---|---|
| Consistency Errors | | Database <database-name>: consistency errors in system catalogs prevent further DBCC processing. | |
| Recovery Error | | An error occurred during recovery, preventing the database <database_name> (<databaseID#>:<instanceID#>) from restarting. Diagnose the recovery errors and fix them, or restore from a known good backup. If errors are not corrected or expected, contact Technical Support. | |
| Recovery Failed | | Restore recovery failed because a problem was detected with data in a temporary file that is needed for recovery. This error can be caused because of a storage device failure or because the restore checkpoint restart file has been moved or deleted. Retry...(truncated). | |
| Invalid File ID | | Could not open File Control Block (FCB) for invalid file ID <file-ID> in database <database-name>. Verify the file location. Execute DBCC CHECKDB. | |
| Consistency-Base I/O Error | | SQL Server detected a logical consistency-based I/O error: <error-name>. It occurred during a <messageID>_MSG of page <page-number>_PGID in database ID <database-ID> at offset <offset> in file <filename> Additional messages in the SQL Server error log or operating system error log may provide more detail. | |
| Operating System Error | | The operating system returned error <error-name> to SQL Server during a <messageID>_MSG at offset <offset> in file <file-name>. Additional messages in the SQL Server error log and operating system error log may provide more detail. This is a severe system-level error condition hat threatens database integrity and must be corrected immediately. Complete a full database consistency check (DBCC CHECKDB). This error can be caused by many factors; for more information, see SQL Server Books Online. | |

| Name | Description | Symptom | Recommendation |
|---|---|---|---|
| Couldn't Allocate space | | Could not allocate space for object <object-name>. <Reason> in database <database-name> because the <file-group-name> filegroup is full. Create disk space by deleting unneeded files, dropping objects in the filegroup, adding additional files to the filegroup, or setting autogrowth on for existing files in the filegroup. | |
| Transaction Log Full | | The transaction log for database <database-name> is full due to <reason>. | |
| Backup Failed | | Backup failed to complete the command <command-name>. Check the backup application log for detailed messages. Backup failed because there is a mismatch in file metadata for file <file-name>. | |
| Could not open file | | Open Failed: Could not open file <file-name> for file number <file-#>. OS error: <error>. | |
| Operating System File Error | | <Error Prefix>: Operating system error <error> occurred while creating or opening file <file-name>. Diagnose and correct the operating system error, and retry the operation. | |
| Database Corruption | | Corruption in database ID <database-ID#>, object ID <object-ID#> possibly due to schema or catalog inconsistency. Run DBCC CHECKCATALOG. | |
| SQL Server Agent is not running | SQL Server Agent is currently not running. | SQL Server Agent is Stopped. | Install and/or start SQL Server Agent. |
| Job Failed | | A job has failed. | |

Metrics

The Management Pack for Microsoft SQL Server collects the following metrics, according to Microsoft SQL Server resource kind.

**Important:**

The CPU Usage metric for Microsoft SQL Server Instances is not available on MS SQL Server **Standard** or **Express** editions.

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Tag | Relationships | Virtual Machine Children | string | List of children Virtual Machine resources |
| Microsoft SQL Server Tag | Relationships | Instance Children | string | List of children Instance resources |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server | Relationships | Instance Children | string | List of children Instance resources |
| Microsoft SQL Server Always On Availability Group | General | Automated Backup Preference | string | Automated backup perference for availability group. |
| Microsoft SQL Server Always On Availability Group | General | Name | string | Name of availability group. |
| Microsoft SQL Server Always On Availability Group | General | Replica ID | string | Replica ID of availability group. |
| Microsoft SQL Server Always On Availability Group | General | Replicas | string | List of replicas being used by availability group. |
| Microsoft SQL Server Always On Availability Group | General | Group ID (Deprecated) | string | |
| Microsoft SQL Server Always On Availability Group | Status | Primary Recovery Health | string | Description of recovery health of the primary replica. |
| Microsoft SQL Server Always On Availability Group | Status | Primary Replica | string | Primary replica on availability group. |
| Microsoft SQL Server Always On Availability Group | Status | Secondary Recovery Health | string | Description of recovery health of the secondary replica. |
| Microsoft SQL Server Always On Availability Group | Status | Synchronization Health | float | Number represenation of rollup of synchronization health of all availability replicas in the availability group. |
| Microsoft SQL Server Always On Availability Group | Status | Synchronization Health Property | string | Description of rollup of synchronization health of all availability replicas in the availability group. |
| Microsoft SQL Server Always On Availability Group | Relationships | Database Children | string | List of child Database resources |
| Microsoft SQL Server Always On Availability Group | Relationships | Virtual Machine Parents | string | List of parent Virtual Machine resources |
| Microsoft SQL Server Always On Availability Group | HADR Replica Server | Availability Group Name | string | Name of availability group. |
| Microsoft SQL Server Always On Availability Group | HADR Replica Server | Group ID | string | Group ID of availability group. |
| Microsoft SQL Server Always On Availability Group | HADR Replica Server | Name | string | Name of replica server. |
| Microsoft SQL Server Always On Availability Group | HADR Replica Server | Availability Mode | string | Description of HADR replica server availablility mode. |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Always On Availability Group | HADR Replica Server | Failover Mode | string | Failover mode for HADR replica server. |
| Microsoft SQL Server Always On Availability Group | HADR Replica Server | Always On Availability Group Parents | string | List of parent Always On Availability Group resources |
| Microsoft SQL Server Database | Active Processes | Active Connections | float | Nubmer of active connections to database. |
| Microsoft SQL Server Database | Active Processes | Active Transactions | float | Number of active transactions on database. |
| Microsoft SQL Server Database | Availability States | Suspended Reason | string | If the database is suspended, the reason for the suspended state. |
| Microsoft SQL Server Database | Availability States | Synchronization Health | string | Description of the synchronization_health of the availability database. |
| Microsoft SQL Server Database | Availability States | Synchronization State | string | Description of the data-movement state. |
| Microsoft SQL Server Database | Capacity | Data Space | float | Database data space. |
| Microsoft SQL Server Database | Capacity | Disk Space Available | float | Amount of space available on database. |
| Microsoft SQL Server Database | Capacity | Index Space | float | Database index space |
| Microsoft SQL Server Database | Capacity | Log Size | float | Size of the log area in memory for database. |
| Microsoft SQL Server Database | Capacity | Reserved Space | float | Database reserved space. |
| Microsoft SQL Server Database | Capacity | Reserved Space Unused | float | Database unused reserved space. |
| Microsoft SQL Server Database | Capacity | Size Used | float | Database size. |
| Microsoft SQL Server Database | Capacity | Space Available | float | Percentage of space available on disk used by database. |
| Microsoft SQL Server Database | Capacity | Space Used | float | Percentage of space used on disk used by database. |
| Microsoft SQL Server Database | Capacity | Total Space | float | Total space of disk used by database. |
| Microsoft SQL Server Database | Capacity | Unallocated Space Available | float | Unallocated space available on database. |
| Microsoft SQL Server Database | Capacity | Usable Disk Space | float | The amount of space on disk that is usable by a database, this includes the free space of the entire disk, and any space being used by the database. |
| Microsoft SQL Server Database | Config | Auto Close | string | Shows whether auto close is enabled |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Database | Config | Auto Close Enabled | string | Shows whether auto close is enabled. |
| Microsoft SQL Server Database | Config | Auto Create Statistics | string | Shows whether auto create statistics is enabled. |
| Microsoft SQL Server Database | Config | Auto Shrink | string | Shows whether auto shrink is enabled. |
| Microsoft SQL Server Database | Config | Auto Shrink Enabled | string | Shows whether auto shrink is enabled. |
| Microsoft SQL Server Database | Config | Auto Update Statistics | string | Shows whether auto update statistics is enabled. |
| Microsoft SQL Server Database | Config | Read Only | string | Shows whether read only mode is enabled. |
| Microsoft SQL Server Database | Config | Single User Mode | string | Shows whether single user mode is enabled. |
| Microsoft SQL Server Database | Disk Access | Bytes Read | float | The Bytes Read of the Database. |
| Microsoft SQL Server Database | Disk Access | Bytes Written | float | The Bytes Written of the Database. |
| Microsoft SQL Server Database | Disk Access | IOPS | float | The IOPS of the Database. |
| Microsoft SQL Server Database | Disk Access | Read Delay | float | The Read Delay of the Database. |
| Microsoft SQL Server Database | Disk Access | Read Operations | float | The Read Operations of the Database. |
| Microsoft SQL Server Database | Disk Access | Total bytes | float | The Total bytes of the Database. |
| Microsoft SQL Server Database | Disk Access | Write Delay | float | The Write Delay of the Database. |
| Microsoft SQL Server Database | Disk Access | Write Operations | float | The Write Operations of the Database. |
| Microsoft SQL Server Database | General | Availability Group Name | string | Name of availability group. |
| Microsoft SQL Server Database | General | Creation Date | string | The database creation date. |
| Microsoft SQL Server Database | General | Recovery Model | string | The recovery model of the database. |
| Microsoft SQL Server Database | General | Resource Name | string | The Resource Name of the Database. |
| Microsoft SQL Server Database | General | Status | string | The current status of the database. |
| Microsoft SQL Server Database | General | Time Since Creation | float | Days since database was created. |
| Microsoft SQL Server Database | Growth | Smallest Fixed Size File Growth Increment | float | The Smallest Fixed Size File Growth Increment of the Database. |
| Microsoft SQL Server Database | Growth | Smallest Percent-based File Growth Increment | float | The Smallest Percent-based File Growth Increment of the Database. |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Database | Index Performance | User Lookups | float | The User Lookups of the Database. |
| Microsoft SQL Server Database | Index Performance | User Scans | float | The User Scans of the Database. |
| Microsoft SQL Server Database | Index Performance | User Seeks | float | The User Seeks of the Database. |
| Microsoft SQL Server Database | Index Performance | User Updates | float | The User Updates of the Database. |
| Microsoft SQL Server Database | Memory | Buffer Pool Size | float | The Buffer Pool Size of the Database. |
| Microsoft SQL Server Database | Memory | Effective Server Total | float | Total effective memory available to the SQL server. |
| Microsoft SQL Server Database | Memory | Effective Used | float | The amount of effective server memory in MB used by the database. |
| Microsoft SQL Server Database | Memory | Effective Used Pages | float | The number of effective server memory pages used by the database. |
| Microsoft SQL Server Database | Performance | Data File Size | float | Size of the data file on a database. |
| Microsoft SQL Server Database | Performance | Log Cache Hit Ratio | float | Database log cache hit ratio. |
| Microsoft SQL Server Database | Performance | Log Cache Hit Ratio Base | float | Database base log chache hit ratio. |
| Microsoft SQL Server Database | Performance | Log Cache Reads | float | Database log cache reads over time. |
| Microsoft SQL Server Database | Performance | Log File Size | float | Size of log file on database. |
| Microsoft SQL Server Database | Performance | Log File Used | float | Percentage of log file used on database. |
| Microsoft SQL Server Database | Performance | Log File Used Size | float | Log file size used on database. |
| Microsoft SQL Server Database | Performance | Log Pool Cache Misses | float | Database log cache misses over time. |
| Microsoft SQL Server Database | Performance | Log Pool Disk Reads | float | Number of disk reads due to log cache misses for a database. |
| Microsoft SQL Server Database | Performance | Log Pool Requests | float | Database log cache requests over time. |
| Microsoft SQL Server Database | Performance | Tracked Transactions | float | Database tracked transactions over time. |
| Microsoft SQL Server Database | Performance | Transactions | float | Database transactions over time. |
| Microsoft SQL Server Database | Performance | Write Transactions | float | Database write transactions over time. |
| Microsoft SQL Server Database | Size | Database Backup Size | float | Database backup size |
| Microsoft SQL Server Database | Size | Database Log Size | float | Database log size. |
| Microsoft SQL Server Database | Size | Database Row Size | float | Database row size. |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Database | Size | Total Used Disk Size | float | Total database file size on disk, this includes allocated but unused. |
| Microsoft SQL Server Database | Relationships | Always On Availability Group Parents | string | List of parent Always On Availability Group resources |
| Microsoft SQL Server Database | Relationships | File Children | string | List of child File resources |
| Microsoft SQL Server Database | Relationships | Instance Parents | string | List of parent Instance resources |
| Microsoft SQL Server Database | Object | Database Name | string | The Database Name of the Object. |
| Microsoft SQL Server Database | Object | Host | string | The Host of the Object. |
| Microsoft SQL Server Database | Object | Instance | string | The Instance of the Object. |
| Microsoft SQL Server Database | Object | Object Name | string | The Object Name of the Object. |
| Microsoft SQL Server Database | Object | Average Page Lock Wait Duration | float | Average page log wait time on database. |
| Microsoft SQL Server Database | Object | Average Row Lock Wait Duration | float | Average row lock wait time on database. |
| Microsoft SQL Server Database | Object | Page Locks | float | Number of page locks used by database. |
| Microsoft SQL Server Database | Object | Page Lock Waits | float | Number of page locks currently in waiting state on database. |
| Microsoft SQL Server Database | Object | Row Locks | float | Number of row locks on database. |
| Microsoft SQL Server Database | Object | Row Lock Waits | float | Number of row locks currently in waiting state on database. |
| Microsoft SQL Server Database | Object | Database Parents | string | List of parent Database resources |
| Microsoft SQL Server Instance | Buffer | Buffer Cache Hit Ratio | float | The Buffer Cache Hit Ratio of the Instance. |
| Microsoft SQL Server Instance | Buffer | Buffer Ideal Page Life Expectancy | float | The Buffer Ideal Page Life Expectancy of the Instance. |
| Microsoft SQL Server Instance | Buffer | Buffer Page Life Expectancy | integer | The Buffer Page Life Expectancy of the Instance. |
| Microsoft SQL Server Instance | Buffer | Buffer Pool Hit Ratio | float | The Buffer Pool Hit Ratio of the Instance. |
| Microsoft SQL Server Instance | Buffer | Buffer Pool Size | float | The Buffer Pool Size of the Instance. |
| Microsoft SQL Server Instance | Buffer | Checkpoint Pages | float | The Checkpoint Pages of the Instance. |
| Microsoft SQL Server Instance | Buffer | Database Pages | integer | The Database Pages of the Instance. |
| Microsoft SQL Server Instance | Buffer | Free List Stalls | float | The Free List Stalls of the Instance. |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Instance | Buffer | Lazy Writes | float | The Lazy Writes of the Instance. |
| Microsoft SQL Server Instance | Buffer | Page Lookups | float | The Page Lookups of the Instance. |
| Microsoft SQL Server Instance | Buffer | Page Reads | float | The Page Reads of the Instance. |
| Microsoft SQL Server Instance | Buffer | Page Splits | float | The Page Splits of the Instance. |
| Microsoft SQL Server Instance | Buffer | Page Writes | float | The Page Writes of the Instance. |
| Microsoft SQL Server Instance | Buffer | Procedure Cached Pages | integer | The Procedure Cached Pages of the Instance. |
| Microsoft SQL Server Instance | Buffer | Read Aheads | float | The Read Aheads of the Instance. |
| Microsoft SQL Server Instance | Buffer | Target Pages | integer | The Target Pages of the Instance. |
| Microsoft SQL Server Instance | CPU | CPU Usage | float | The CPU Usage of the Instance. |
| Microsoft SQL Server Instance | CPU | Max CPU Percent | float | This is a hard limit of 100% used for capacity calculations. |
| Microsoft SQL Server Instance | Cluster State | Cluster Owner Status | string | The status of the owner cluster node. |
| Microsoft SQL Server Instance | Cluster State | Cluster Status | string | The worst status across all nodes in the cluster. |
| Microsoft SQL Server Instance | Cluster State | Number of Healthy Cluster Nodes | integer | The number of nodes in a cluster in the up state. |
| Microsoft SQL Server Instance | Cluster State | Number of Unhealthy Cluster Nodes | integer | The number of nodes in a cluster in a down, paused, or unknown state. |
| Microsoft SQL Server Instance | Cluster State | Is Current Owner (Deprecated) | string | |
| Microsoft SQL Server Instance | Cluster State | Status Text (Deprecated) | string | |
| Microsoft SQL Server Instance | Cluster State | Status Value (Deprecated) | integer | |
| Microsoft SQL Server Instance | Connection Capacity | Active Connections | integer | The Active Connections of the Instance. |
| Microsoft SQL Server Instance | Connection Capacity | Connections | integer | The Connections of the Instance. |
| Microsoft SQL Server Instance | Connection Capacity | Possible Connections | integer | The Possible Connections of the Instance. |
| Microsoft SQL Server Instance | Connections | Connections Reset | float | The Connections Reset of the Instance. |
| Microsoft SQL Server Instance | Connections | Logins | float | The Logins of the Instance. |
| Microsoft SQL Server Instance | Connections | Logouts | float | The Logouts of the Instance. |
| Microsoft SQL Server Instance | Connections | User Connections | integer | The User Connections of the Instance. |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Instance | Database Performance | Data File Size | integer | The Data File Size of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Log Cache Hit Ratio | float | The Log Cache Hit Ratio of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Log Cache Hit Ratio Base | integer | The Log Cache Hit Ratio Base of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Log Cache Misses | float | The Log Cache Misses of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Log Cache Reads | float | The Log Cache Reads of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Log Cache Requests | float | The Log Cache Requests of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Log File Size | integer | The Log File Size of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Log File Usage | integer | The Log File Usage of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Log File Used Size | integer | The Log File Used Size of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Log Pool Disk Reads | float | The Log Pool Disk Reads of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Track Transactions | float | The Track Transactions of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Transaction Summary | float | SQL Instance Transaction Summary |
| Microsoft SQL Server Instance | Database Performance | Transactions | float | The Transactions of the Instance. |
| Microsoft SQL Server Instance | Database Performance | Write Transactions | float | The Write Transactions of the Instance. |
| Microsoft SQL Server Instance | Disk Access | Bytes Read | float | Disk read rate of MS SQL Server. |
| Microsoft SQL Server Instance | Disk Access | Bytes Written | float | Disk write rate of MS SQL Server. |
| Microsoft SQL Server Instance | Disk Access | IOPS | float | Total amount of disk write and read operations. |
| Microsoft SQL Server Instance | Disk Access | Read Operations | float | This metric represents the amount of disk read operations over time. |
| Microsoft SQL Server Instance | Disk Access | Total bytes | float | Total throughput on disk. |
| Microsoft SQL Server Instance | Disk Access | Write Operations | float | This metrice represents the amount of disk write operations over time. |
| Microsoft SQL Server Instance | Disk Capacity | Total Disk Space | integer | The Total Disk Space of the Instance. |
| Microsoft SQL Server Instance | Disk Capacity | Used Disk Space | integer | The Used Disk Space of the Instance. |
| Microsoft SQL Server Instance | General | AWE Enabled | string | AWE Enabled |
| Microsoft SQL Server Instance | General | CPU Count | integer | CPU Count |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Instance | General | Current Cluster Owner | string | The name of the node in the cluster that is the current owner. |
| Microsoft SQL Server Instance | General | MSSQL Architecture Type | string | MSSQL Architecture Type |
| Microsoft SQL Server Instance | General | Max Thread Count | integer | Max Thread Count |
| Microsoft SQL Server Instance | General | OS Architecture Type | string | OS Architecture Type |
| Microsoft SQL Server Instance | General | OS Memory | integer | OS Memory |
| Microsoft SQL Server Instance | General | Resource Name | string | The Resource Name of the Instance. |
| Microsoft SQL Server Instance | General | SQL Version | string | The SQL Version of the Instance. |
| Microsoft SQL Server Instance | General | Server Name | string | The Server Name of the Instance. |
| Microsoft SQL Server Instance | General | Service Name | string | The Service Name of the Instance. |
| Microsoft SQL Server Instance | General | Thread Size | integer | Thread Size |
| Microsoft SQL Server Instance | General | Type | string | The Type of the Instance. |
| Microsoft SQL Server Instance | General | Type | string | The Type of the Instance. |
| Microsoft SQL Server Instance | General | Windows Version | string | The Windows Version of the Instance. |
| Microsoft SQL Server Instance | History | Creation Date | string | The Creation Date of the Instance. |
| Microsoft SQL Server Instance | History | Days Since Last Start | integer | The Days Since Last Start of the Instance. |
| Microsoft SQL Server Instance | History | Most Recent Start Date | string | The Most Recent Start Date of the Instance. |
| Microsoft SQL Server Instance | History | Time Since Creation | integer | The Time Since Creation of the Instance. |
| Microsoft SQL Server Instance | Jobs | Failed Jobs | integer | The Failed Jobs of the Instance. |
| Microsoft SQL Server Instance | Jobs | Successful Jobs | integer | The Successful Jobs of the Instance. |
| Microsoft SQL Server Instance | Locks | Average Wait Time | integer | The Average Wait Time of the Instance. |
| Microsoft SQL Server Instance | Locks | Average Wait Time Base | integer | The Average Wait Time Base of the Instance. |
| Microsoft SQL Server Instance | Locks | Deadlocks | float | The Deadlocks of the Instance. |
| Microsoft SQL Server Instance | Locks | Instance Wait Time | float | The Instance Wait Time of the Instance. |
| Microsoft SQL Server Instance | Locks | Lock Requests | float | The Lock Requests of the Instance. |
| Microsoft SQL Server Instance | Locks | Lock Timeouts | float | The Lock Timeouts of the Instance. |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Instance | Locks | Lock Wait Time | integer | The Lock Wait Time of the Instance. |
| Microsoft SQL Server Instance | Locks | Lock Waits | float | The Lock Waits of the Instance. |
| Microsoft SQL Server Instance | MAC Addresses | Agent Running | string | Indicates whether or not the agent is running. Agent must run to retrieve MAC Address. |
| Microsoft SQL Server Instance | MAC Addresses | MAC Addresses | string | Connected MAC Addresses |
| Microsoft SQL Server Instance | Memory | Available Physical Memory | float | The Available Physical Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Connection Memory | integer | The Connection Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Database Cache Memory | integer | The Database Cache Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Effective Total Memory | float | The total amount of memory available between SQL Server and unused memory on the host. |
| Microsoft SQL Server Instance | Memory | Free Memory | integer | The Free Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Granted Workspace Memory | integer | The Granted Workspace Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Lock Memory | integer | The Lock Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Log Pool Memory | integer | The Log Pool Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Max Server Memory | integer | The Max Server Memory |
| Microsoft SQL Server Instance | Memory | Maximum Workspace Memory | integer | The Maximum Workspace Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Memory Usage | float | The percentage of memory that is being utilized by SQL Server. |
| Microsoft SQL Server Instance | Memory | Optimizer Memory | integer | The Optimizer Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Physical Memory Max | float | The Physical Memory Max of the Instance. |
| Microsoft SQL Server Instance | Memory | Physical Memory Recommended | float | The Physical Memory Recommended of the Instance. |
| Microsoft SQL Server Instance | Memory | Physical Memory Used | float | The Physical Memory Used of the Instance. |
| Microsoft SQL Server Instance | Memory | Reserved Server Memory | integer | The Reserved Server Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | SQL Cache Memory | integer | The SQL Cache Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Stolen Server Memory | float | The Stolen Server Memory of the Instance. |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Instance | Memory | Total Physical Memory | float | The Total Physical Memory of the Instance. |
| Microsoft SQL Server Instance | Memory | Total Server Memory | float | The Total System Memory |
| Microsoft SQL Server Instance | Process States | Background Processes | integer | The Background Processes of the Instance. |
| Microsoft SQL Server Instance | Process States | Blocked Processes | integer | The Blocked Processes of the Instance. |
| Microsoft SQL Server Instance | Process States | Dormant Processes | integer | The Dormant Processes of the Instance. |
| Microsoft SQL Server Instance | Process States | Preconnect Processes | integer | The Preconnect Processes of the Instance. |
| Microsoft SQL Server Instance | Process States | Runnable Processes | integer | The Runnable Processes of the Instance. |
| Microsoft SQL Server Instance | Process States | Running Processes | integer | The Running Processes of the Instance. |
| Microsoft SQL Server Instance | Process States | Sleeping Processes | integer | The Sleeping Processes of the Instance. |
| Microsoft SQL Server Instance | Process States | Suspended Processes | integer | The Suspended Processes of the Instance. |
| Microsoft SQL Server Instance | Queries | Average Query CPU | integer | The Average Query CPU of the Instance. |
| Microsoft SQL Server Instance | Queries | Average Query Executions | integer | The Average Query Executions of the Instance. |
| Microsoft SQL Server Instance | Queries | Dead Locked Queries | integer | The Dead Locked Queries of the Instance. |
| Microsoft SQL Server Instance | Queries | High Query CPU | integer | The High Query CPU of the Instance. |
| Microsoft SQL Server Instance | Queries | High Query Executions | integer | The High Query Executions of the Instance. |
| Microsoft SQL Server Instance | Queries | Total Query CPU | integer | The Total Query CPU of the Instance. |
| Microsoft SQL Server Instance | Queries | Total Query Executions | integer | The Total Query Executions of the Instance. |
| Microsoft SQL Server Instance | Statements | Batch Compilation Ratio | float | The Batch Compilation Ratio of the Instance. |
| Microsoft SQL Server Instance | Statements | Batch Requests | float | The Batch Requests of the Instance. |
| Microsoft SQL Server Instance | Statements | Forced Parameterizations | float | The Forced Parameterizations of the Instance. |
| Microsoft SQL Server Instance | Statements | SQL Compilations | float | The SQL Compilations of the Instance. |
| Microsoft SQL Server Instance | Statements | SQL Recompilation Ratio | float | The SQL Recompilation Ratio of the Instance. |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Instance | Statements | SQL Recompilations | float | The SQL Recompilations of the Instance. |
| Microsoft SQL Server Instance | Tasks | Runnable Tasks Count | integer | The Runnable Tasks Count of the Instance. |
| Microsoft SQL Server Instance | Threads | Threads | integer | The Threads of the Instance. |
| Microsoft SQL Server Instance | Relationships | Cluster Node Children | string | List of child Cluster Node resources |
| Microsoft SQL Server Instance | Relationships | Database Children | string | List of child Database resources |
| Microsoft SQL Server Instance | Relationships | Job Children | string | List of child Job resources |
| Microsoft SQL Server Instance | Relationships | Microsoft SQL Server Parents | string | List of parent Microsoft SQL Server resources |
| Microsoft SQL Server Instance | Relationships | Microsoft SQL Server Tag Parents | string | List of parent Microsoft SQL Server Tag resources |
| Microsoft SQL Server Instance | Relationships | Query Children | string | List of child Query resources |
| Microsoft SQL Server Instance | Relationships | Virtual Machine Parents | string | List of parent Virtual Machine resources |
| Microsoft SQL Server Instance | Relationships | Wait Type Children | string | List of child Wait Type resources |
| Microsoft SQL Server Instance | Disk | Drive ID | string | The Drive ID of the Disk. |
| Microsoft SQL Server Instance | Disk | Host | string | The Host of the Disk. |
| Microsoft SQL Server Instance | Disk | Instance | string | The Instance of the Disk. |
| Microsoft SQL Server Instance | Disk | Disk Size | integer | The Disk Size of the Disk. |
| Microsoft SQL Server Instance | Disk | Available Disk Space | integer | The Available Disk Space of the Disk. |
| Microsoft SQL Server Instance | Disk | Resource Name | string | The Resource Name of the Disk. |
| Microsoft SQL Server Instance | Disk | Instance Parents | string | List of parent Instance resources |
| Microsoft SQL Server Query | General | Average Execution Time | float | The Average Execution Time of the Query. |
| Microsoft SQL Server Query | General | Execution Count | float | The Execution Count of the Query. |
| Microsoft SQL Server Query | General | Execution Count Counter | float | Execution Count Counter |
| Microsoft SQL Server Query | General | Execution Delta | integer | Execution Delta |
| Microsoft SQL Server Query | General | Execution Time | float | Execution Time |
| Microsoft SQL Server Query | General | Last Execution | float | The Last Execution of the Query. |
| Microsoft SQL Server Query | General | Last Update | double | Last time query was last updated |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| Microsoft SQL Server Query | General | Query HTML | string | The HTML version of the SQL text of this query |
| Microsoft SQL Server Query | General | Query Name | string | The Query Name of the Query. |
| Microsoft SQL Server Query | General | Query Text | string | The Query Text of the Query. |
| Microsoft SQL Server Query | General | Total Elapsed Time | float | Total Elapsed Time |
| Microsoft SQL Server Query | General | Total Logical Reads | float | Total Logical Reads |
| Microsoft SQL Server Query | General | Total Logical Writes | float | Total Logical Writes |
| Microsoft SQL Server Query | General | Total Physical Reads | float | Total Physical Reads |
| Microsoft SQL Server Query | General | Total Worker Time | integer | Total Worker Time |
| Microsoft SQL Server Query | General | Unique Query Plans | integer | The Unique Query Plans of the Query. |
| Microsoft SQL Server Query | Relationships | Instance Parents | string | List of parent Instance resources |
| Microsoft SQL Server Wait Type | General | Last Update | double | Last time wait type was last updated |
| Microsoft SQL Server Wait Type | General | Wait Time | integer | Total wait time for this wait type in milliseconds. |
| Microsoft SQL Server Wait Type | General | Waiting Tasks Count | float | Number of waits on this wait type. This counter is incremented at the start of each wait. |
| Microsoft SQL Server Wait Type | Relationships | Instance Parents | string | List of parent Instance resources |
| Microsoft SQL Server Job | General | Description | string | Description |
| Microsoft SQL Server Job | General | Name | string | Name |
| Microsoft SQL Server Job | General | Next Scheduled Run | string | Next Scheduled Run |
| Microsoft SQL Server Job | General | Steps | integer | Number of steps in the job |
| Microsoft SQL Server Job | Relationships | Instance Parents | string | List of Parent Instance Resources |

## Metrics by Permission

The following table indicates the metrics collected for each required permission indicated in Assigning MS SQL User Privileges.

| Permission | Resource Group | Metric |
|---|---|---|

## Management Pack for MongoDB

The **Management Pack for MongoDB** is an embedded adapter for VCF Operations, collecting performance and capacity data from your MongoDB environment and providing predictive analytics and real-time information about problems in your infrastructure—all within the VCF Operations user interface.

### Notable Features

The Management Pack for MongoDB provides the following notable features:

- 8 comprehensive monitoring dashboards:
  - MongoDB Overview
  - MongoDB Environment
  - MongoDB Health Investigation
  - MongoDB IOPS
  - MongoDB Mongos Instances
  - MongoDB Databases
  - MongoDB Replica Sets
  - MongoDB Mongods
- **60 high-level views—and 10 exportable reports**— of MongoDB capacity, health, KPIs, and resource overviews (i.e., clusters, mongos, mongods, databases, config servers, replica sets, and shards)
- **450+ collected metrics** for a MongoDB resources
- **Key performance metrics** – such as read/write operations counters, replication operations counters, connections asserts, network, indexes, and extents.
- **Detailed alerts and recommendations** based on key metrics in MongoDB
- **Capacity definitions** for mongos and mongod resource connections
- **Relationship mapping** between the MongoDB and VMware virtual layers

### System Requirements for Management Pack for MongoDB

Before installing and configuring the Management Pack, ensure your system meets the following requirements.

For compatibility between products, refer to:

VMware Cloud Foundation Operations Interoperability for MongoDB

-OR-

Third Party Solution Interoperability for MongoDB

| | MongoDB Requirements |
|---|---|
| Connection | The Management Pack collects data from the **MongoDB database by way ofthe Mongo Client**.<br>Your **MongoDB hostnameorIPv4 address** is required. A comma-separated list of multiple hosts (mongos/mongod instances) in an environment is supported.<br>**Note:**<br>If using a port other than the default of 27017, you can append the non-standard port number to the hostname. |
| Credentials | **MongoDB User Name/Password** for the admin database<br>**Note:**<br>The same User Name/Password must exist for all mongos/mongods in your environment.<br>**Note:**<br>Your MongoDB configuration may not require authentication. When Creating a Credential for the Management Pack, there is an “Authentication Not Required” option to accommodate this scenario. For those configurations that **do** require authentication, the Management Pack for MongoDB requires a least-privileged MongoDB user account of **read-only**. |

Adding an SSL Certificate to the VMware Cloud Foundation Operations Truststore

**Note:**

Different levels of security can be configured in the Management Pack for MongoDB. The least secure configuration is to leave the default selection of **False** for the **Validate Certificate Against Truststore** Advanced Setting. In this configuration, the Management Pack will accept all SSL certificates. For added security, you can enable SSL by following the instructions below and selecting **True** for the **Validate Certificate Against Truststore** Advanced Setting.

1. Obtain the SSL certificate for your MongoDB host server from your Internet browser. Export the certificate as an **X.509 Certificate (PEM)**.
2. Copy the certificate to your VCF Operations machine.
3. Use ‘SSH’ to log in to the VCF Operations machine as the root user, then run the following command:
   **Linux**:
   $VCOPS_BASE/jre/bin/keytool -import -alias <product_alias> -file /tmp/<certfile> -keystore "$VCOPS_DATA_VCOPS/user/conf/ssl/tcserver.truststore" -storepass `grep ssltruststorePassword /storage/vcops/user/conf/ssl/storePass.properties | sed s/ssltruststorePassword=//` -trustcacerts
   **Windows**:
   %VCOPS_BASE%\jre\bin\keytool -import -alias <product_alias> C:\path\to\certfile -keystore “%VCOPS_DATA_VCOPS%\user\conf\ssl\tcserver.truststore” -storepass <truststore_password> -trustcacerts

   **Note:**

   The <truststore_password> is generated by VCF Operations and is located in/storage/vcops/user/conf/ssl/storePass.properties. Copy the password from the ssltruststorePassword=field and paste it in the <truststore_password> placeholder.

   **Parameter Descriptions**:
   – <product_alias> is a unique name for each key that you add (per host)
   – <certfile> is the location where the cert file was saved
4. Run the reboot command to re-start the VCF Operations machine for the changes to take effect.

### Troubleshooting the Management Pack

Once you have finished Installing and Configuring the Management Pack, check the **Collection State** and **Collection Status** for the adapter instance on the **Solutions** page. If they show as **Not Collecting** or **No Data Receiving**, respectively, the following troubleshooting topics can help you diagnose and correct common problems with your adapter instance.

- Test Connection Errors
- Adapter and Collector Log Files

#### Test Connection Errors

When Creating an Adapter Instance, click **Test Connection** after entering all of your configuration settings to ensure VCF Operations can connect to the specified host.

The following errors are possible:

Authentication Failed

**Error Message**: “Authentication failed. Check your credentials and/or SSL certificate.”

**Action:** Ensure that your MongoDB user name and password is correct the SSL certificate is valid if ‘Validate Certificate Against Truststore’ Advanced Settings configuration field is set to True.

SSL Authentication Required

**Error Message**: “SSL Authentication Required.”

**Action:** Ensure that SSL is enabled (set to True) in the appropriate Advanced Settings configuration field.

PKIX Path Building Failed

**Error Message**: “PKIX path building failed. Unable to find valid certification path to requested target.”

**Action:** Ensure that the SSL certificate is in the correct truststore.

Change Authentication Type to ‘Default’

**Error Message**: Change Authentication Type to ‘Default’. Unsupported mechanism PLAIN.”

**Action:** Change Authentication Type to ‘Default’ when adding your credential.

MongoClient does not have any server addresses

**Error Message**: “MongoClient does not have any server addresses.”

**Action:** Ensure that connections can be made to the hostnames listed in the Host configuration field.

Not authorized on admin to execute command

**Error Message**: “Not authorized on admin to execute command <command> with username=”<username>” to on <host>/admin>.”

**Action:** Make sure the user being used for this host has permissions to run the specified command.

Unable to find databases with server address

**Error Message**: “Unable to find databases with server address list <hosts>.”

**Action:** Make sure the specified host has databases.

Could not create any MongoClients

**Error Message**: “Could not create any MongoClients connecting to mongods.”

**Action:** Make sure the mongods are up.

#### Adapter and Collector Log Files

You can review adapter errors in the adapter and collector log files, which can be viewed in the VCF Operations UI or in an external log viewer.

- **Adapter log files** are located in the $VCOPS_BASE/user/log/adapters/mongodb_adapter3/ folder.
- **Collector log files** are located in the $VCOPS_BASE/user/log/ folder.

To set the base log level for the collector in VCF Operations:

1. Navigate to **Administration > Logs**.
2. Expand the **PRIMARY** folder, then select the **COLLECTOR** folder.
3. Click the **Edit Properties**icon.
4. In the **Root logger level** drop-down menu, select the desired option:
   - The default logging level is **warning.**
   - To troubleshoot issues, set the logging level to **info.**
   - To view detailed messages, including micro steps, queries, and returned results, set the logging level to **debug.**

     **Note:**

     If you set the logging level to **debug,** log files can become large very quickly. Set the logging level to **debug** only for short periods of time.

For more information about viewing log files and modifying levels, refer to the VCF Operations online help.

### Using the Management Pack

The Management Pack for MongoDB includes the following out-of-the-box features, harnessing the power of the VCF Operations user interface:

- Inventory Tree (Traversal Spec)
- Dashboards
- Views
- Reports
- Analysis Badges and Capacity Definitions
- Alerts
- Metrics

#### Inventory Tree (Traversal Spec)

The Inventory Tree (Traversal Spec) feature in VCF Operations allows you to easily navigate your MongoDB environment. The hierarchical structure implicitly shows relationships among resources and enables quick drill-downs to root-cause issues.

To access your MongoDB Inventory Tree, select **Environment** from the top navigation bar, then select **MongoDB** from the left panel. click a resource from the Inventory Tree to populate details about the resource on the right.

#### Dashboards

Dashboards are the primary feature for monitoring and troubleshooting MongoDB from within VCF Operations.

The following dashboards are included in the Management Pack for MongoDB:

- MongoDB Overview provides at-a-glance heatmaps depicting the overall health of your MongoDB resources (mongos instances, mongods, shards, databases, etc.).
- MongoDB Health Investigation displays the current active alerts in your MongoDB environment. When an alert is selected, health information and key performance indicators (KPIs) related to the affected resource are shown, along with a Topology (relationships) view of the resource and health information for its parent and child resources.
- MongoDB Environment depicts your MongoDB environment from your top-level resources, down through the hierarchy. Selecting any resource from the Environment Selector will populate health, KPIs, and properties information for that resource.
- MongoDB IOPS allows you to select a node to view IOPS metrics for that mongos/mongod resource. You can also select a related virtual machine or datastore view IOPS metrics for those resources.
- MongoDB Mongos Instances allows you to select a database and Mongos instance to drill-down into opcounters, asserts, memory, connections, network, and page faults information for that Mongos instance.

- MongoDB Databases allows you to select a Mongos instance and database to view health, KPIs, topology (relationships), and top alerts for the database.
- MongoDB Replica Setsallows you to select a replica set to view opcounters, network, memory, topology (relationships), cache, and connections information for the selected resource.
- MongoDB Mongods allows you to select a mongod resource to view opcounters, memory, topology (relationships), cache, connections, and network information for the selected resource.

### Views

The Management Pack for MongoDB creates views that allow the user to view statistics of metrics for MongoDB resources. The views help give a broad picture of the entire system, as opposed to a more in depth view.

The following views are available in the Management Pack:

- **MongoDB Cluster Overview – Asserts**
- **MongoDB Cluster Overview – Cache**
- **MongoDB Cluster Overview – Current Connections**
- **MongoDB Cluster Overview – Global Lock**
- **MongoDB Cluster Overview – Memory**
- **MongoDB Cluster Overview – Network**
- **MongoDB Cluster Overview – Opcounters**
- **MongoDB Cluster Overview – Page Faults**
- **MongoDB Cluster Overview – Replication Opcounters**
- **MongoDB Config Server Overview – Asserts**
- **MongoDB Config Server Overview – Cache**
- **MongoDB Config Server Overview – Current Connections**
- **MongoDB Config Server Overview – Global Lock**
- **MongoDB Config Server Overview – Memory**
- **MongoDB Config Server Overview – Network**
- **MongoDB Config Server Overview – Opcounters**
- **MongoDB Config Server Overview – Page Faults**
- **MongoDB Config Server Overview – Replication Opcounters**
- **MongoDB Databases Overview – Statistics**
- **MongoDB Health**
- **MongoDB Mongod Capacity**
- **MongoDB Mongod Overview – Asserts**
- **MongoDB Mongod Overview – Cache**
- **MongoDB Mongod Overview – Current Connections**
- **MongoDB Mongod Overview – Documents**
- **MongoDB Mongod Overview – Global Lock**
- **MongoDB Mongod Overview – Memory**
- **MongoDB Mongod Overview – Network**
- **MongoDB Mongod Overview – Opcounters**
- **MongoDB Mongod Overview – Page Faults**
- **MongoDB Mongod Overview – Replication Opcounters**
- **MongoDB Mongod Properties**
- **MongoDB Mongos Capacity**
- **MongoDB Mongos Overview – Asserts**
- **MongoDB Mongos Overview – Current Connections**
- **MongoDB Mongos Overview – Memory**
- **MongoDB Mongos Overview – Network**
- **MongoDB Mongos Overview – Opcounters**
- **MongoDB Mongos Overview – Page Faults**

- **MongoDB Mongos Properties**
- **MongoDB Replica Set Overview – Asserts**
- **MongoDB Replica Set Overview – Cache**
- **MongoDB Replica Set Overview – Current Connections**
- **MongoDB Replica Set Overview – Global Lock**
- **MongoDB Replica Set Overview – Memory**
- **MongoDB Replica Set Overview – Network**
- **MongoDB Replica Set Overview – Opcounters**
- **MongoDB Replica Set Overview – Page Faults**
- **MongoDB Replica Set Overview – Replication Opcounters**
- **MongoDB Replica Set Properties**
- **MongoDB Shard Overview – Asserts**
- **MongoDB Shard Overview – Cache**
- **MongoDB Shard Overview – Current Connections**
- **MongoDB Shard Overview – Global Lock**
- **MongoDB Shard Overview – Memory**
- **MongoDB Shard Overview – Network**
- **MongoDB Shard Overview – Opcounters**
- **MongoDB Shard Overview – Page Faults**
- **MongoDB Shard Overview – Replication Opcounters**
- **MongoDB Shard Properties**

To access the Management Pack views:

1. Navigate to **Environment > All Objects > MongoDB**.
2. Double-click on the desired object (resource).
3. Select the **Details** tab, then **Views.**

The available views for that resource are listed and can be selected.

### Reports

The Management Pack for MongoDB contains out-of-the-box reports—which contain one or more Views—that you can export and easily share with key stakeholders in either .pdf or .csv formats.

The following reports are available in the Management Pack:

- **MongoDB Capacity**
- **MongoDB Cluster Overview**
- **MongoDB Config Server Overview**
- **MongoDB Databases Overview**
- **MongoDB Health**
- **MongoDB KPIs**
- **MongoDB Mongod Overview**
- **MongoDB Mongos Overview**
- **MongoDB Replica Set Overview**
- **MongoDB Shard Overview**

To access Management Pack reports:

1. Navigate to **Environment > All Objects > MongoDB**.
2. Double-click on the desired object (resource).
3. Select the **Reports** tab, then **Report Templates**.

The available reports for the selected resource are listed and can be selected.

To run a selected report, click the **Run Template** icon.

Analysis Badges and Capacity Definitions

Using the predictive analytics capabilities of VCF Operations Analysis Badges through capacity definitions, the Management Pack for MongoDB populates capacities as indicated in the table below.

**Capacity Definitions List**

| Container | Use in Workload |
|---|---|
| **Mongod** | |
| VMware Cloud Foundation Operations Calculated Connections Capacity | yes |
| **Mongos** | |
| VMware Cloud Foundation Operations Calculated Connections Capacity | yes |

Alerts

The Management Pack for MongoDB creates alerts (and in some cases provides recommended actions) based on various symptoms it detects in your MongoDB Environment. See the table below for the list of alerts available in the Management Pack.

**Alerts List**

| Name | Description | Recommendation |
|---|---|---|
| Replica Set has even number of voters | This alert indicates that an Immediate alert was raised in MongoDB. | A replica set should always have an odd number of members so there is never a tie when voting for the primary host. Either add another replicated host, or add an arbiter to the replica set. |
| Replica Set Has Less than 3 Data Bearing Nodes | This alert indicates that an Immediate alert was raised in MongoDB. | Three data-bearing nodes are required for replica-set wide data durability. |
| Mongod Shares a Host | This alert indicates that an Immediate alert was raised in MongoDB. | Running multiple mongod instances on a single host increases the likelihood of having inaccessible data by reducing horizontal scaling. |
| Mongod Is Recovering From Delay | This alert indicates that an Immediate alert was raised in MongoDB. | This instance is in RECOVERING mode. |
| Mongod Has a Delay Behind the Primary | This alert indicates that an Immediate alert was raised in MongoDB. | This node has very high replication delays. Delayed nodes can cause out-of-date data to be presented. |
| Mongod Has a Delay Behind the Primary | This alert indicates that an Immediate alert was raised in MongoDB. | This node has very high replication delays. Delayed nodes can cause out-of-date data to be presented. |
| Mongod Journaling Disabled | This alert indicates that an Immediate alert was raised in MongoDB. | To get accurate snapshots of running mongod processes, journaling must be enabled. This is critical if using the MMAPv1 storage engine. |
| Mongos Total Connections Reaching Maxmimum | This alert indicates that an Immediate alert was raised in MongoDB. | Current connections approaching max connections. |
| Mongos Ratio of Page-Faults to Operations Greater than or Equal to 1 | This alert indicates that an Immediate alert was raised in MongoDB. | There are a large number of page faults. Consider increasing memory provisioning. |
| Mongos is Reaching a Congested Level of Connections | This alert indicates that an Immediate alert was raised in MongoDB. | Number of connections has greatly increased compared to normal. Large numbers of connections use large amounts of memory, so be sure to provision adequate memory on the host. |

| Name | Description | Recommendation |
|---|---|---|
| Config Server Has no Configured Replica Set | This alert indicates that an Immediate alert was raised in MongoDB. | A production config server should always be configured as a replica set; when configured as a single host, if that host goes down, the entire cluster becomes inaccessible. |
| Shard Has No Configured Replica Set | This alert indicates that an Immediate alert was raised in MongoDB. | If a shard is not configured with a replica set, then if the host it is configured with goes down, none of the data on that host will be available. Configuring the shard as a replica set provides better fallback, allowing for a system with higher-availability. |

Metrics

The Management Pack for MongoDB collects the metrics listed in the table below, according to MongoDB resource kinds.

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Mongos | Extra Info | Page Faults | Total number of page faults |
| MongoDB Mongos | Extra Info | Heap Used | Heap used by this resources database processes |
| MongoDB Mongos | Network | Network Traffic Out | Data sent from Mongos |
| MongoDB Mongos | Network | Network Traffic In | Data received by Mongos |
| MongoDB Mongos | Network | Number of Requests | Number of requests Mongos has received |
| MongoDB Mongos | Properties | PID | Process ID number on this resource |
| MongoDB Mongos | Properties | Advisory Host FQDNs | Advisory host fully qualified domain names of the machine hosting this resource |
| MongoDB Mongos | Properties | Process | Current MongoDB process on this resource |
| MongoDB Mongos | Properties | Version | Version of the current MongoDB process |
| MongoDB Mongos | Properties | Uptime | Time the current MongoDB process has been active |
| MongoDB Mongos | Properties | Host Name | Hostname of the machine hosting this resource |
| MongoDB Mongos | Connections | Total Connections Created | Count of all incoming connections created to this resource |
| MongoDB Mongos | Connections | Current Connections | Number of incoming connections to this resource |
| MongoDB Mongos | Connections | Available Connections | Number of unused incoming connections available to this resource |
| MongoDB Mongos | Asserts | Asserts: User | Number of user assertions that have occurred since the MongoDB process started |
| MongoDB Mongos | Asserts | Asserts: Rollovers | Number of rollovers since the MongoDB process started |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Mongos | Asserts | Asserts: Message | Number of message assertions raised since the MongoDB process started |
| MongoDB Mongos | Asserts | Asserts: Warning | Number of warnings raised since the MongoDB process started |
| MongoDB Mongos | Asserts | Asserts: Regular | Number of regular assertions raised since the MongoDB process started |
| MongoDB Mongos | Background Flushing | Background Flushing: Last | Time it took the last flush operation to complete |
| MongoDB Mongos | Background Flushing | Background Flushing: Average | Average time for each flush to disk |
| MongoDB Mongos | Background Flushing | Background Flushing: Total | Time the mongod processes have spent writing data to disk |
| MongoDB Mongos | Background Flushing | Background Flushing: Flushes | Number of times the databases on this resource has flushed all writes to disk |
| MongoDB Mongos | Opcounters | Command Operations | Database commands of Mongos |
| MongoDB Mongos | Opcounters | Insert Operations | Insert operations of Mongos |
| MongoDB Mongos | Opcounters | Update Operations | Update operations of Mongos |
| MongoDB Mongos | Opcounters | Get More Operations | Getmore operations of Mongos |
| MongoDB Mongos | Opcounters | Query Operations | Query operations of Mongos |
| MongoDB Mongos | Opcounters | Delete Operations | Delete operations of Mongos |
| MongoDB Mongos | Opcounters | Read Operations | Read operations of Mongos |
| MongoDB Mongos | Opcounters | Write Operations | Write operations of Mongos |
| MongoDB Mongos | Opcounters | Read/Write Operations | All read and write operations of Mongos |
| MongoDB Mongos | Memory | Extended Memory Supported | Indicates if the machine hosting this resource supports extended memory information |
| MongoDB Mongos | Memory | Resident Memory | Amount of RAM used by this resource's database processes |
| MongoDB Mongos | Memory | Memory Architecture | Architecture of the machine hosting this resource |
| MongoDB Mongos | Memory | Virtual Memory | Virtual memory being used by the mongod process |
| MongoDB Mongos | Memory | Mapped Memory with Journal | Amount of mapped memory with journal by this resource's databases |
| MongoDB Mongos | Memory | Mapped Memory | Amount of mapped memory by this resource's databases |
| MongoDB Mongos | Children | Database Children | Database resource names of Child resources. |
| MongoDB Mongos | Children | Config Server Children | Config Server resource names of Child resources. |
| MongoDB Mongos | Children | Shard Children | Shard resource names of Child resources. |
| MongoDB Mongos | Parents | Cluster Parents | Cluster resource names of Parent resources. |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Mongos | Alerts | Total Connections Reaching Maximum | The percent of connections being used. |
| MongoDB Mongos | Alerts | Ratio of Page Faults to Operations | The ratio of Page Faults to Operations. |
| MongoDB Mongos | Alerts | Ratio of Page Faults to Operations is Greater Than Or Equal to 1 | The ratio of Page Faults to Operations is greater than or equal to one. |
| MongoDB Cluster | Aggregated Mongod Metrics\| Opcounters | Delete Operations | Total delete operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Opcounters | Update Operations | Total update operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Opcounters | Get More Operations | Total getmore operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Opcounters | Query Operations | Total queries operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Opcounters | Command Operations | Total database commands of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Opcounters | Insert Operations | Total insert operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Opcounters | Read Operations | Total read operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Opcounters | Write Operations | Total write operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Opcounters | Read/Write Operations | All read and write operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Replication Opcounters | Replication Get More Operations | Total replicated getmore operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Replication Opcounters | Replication Delete Operations | Total replicated delete operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Replication Opcounters | Replication Command Operations | Total replicated database commands of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Replication Opcounters | Replication Insert Operations | Total replicated insert operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Replication Opcounters | Replication Query Operations | Total replicated query operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Replication Opcounters | Replication Update Operations | Total replicated update operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Replication Opcounters | Replication Read Operations | Total replicated read operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Replication Opcounters | Replication Write Operations | Total replicated write operations of related shards and config servers |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Cluster | Aggregated Mongod Metrics\| Replication Opcounters | Replication Read/Write Operations | Total replicated read and write operations of related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Network | Network Traffic Out | Data sent from related config servers and shards |
| MongoDB Cluster | Aggregated Mongod Metrics\| Network | Network Traffic In | Data received by related config servers and shards |
| MongoDB Cluster | Aggregated Mongod Metrics\| Network | Number of Requests | Number of requests related config servers and shards have received |
| MongoDB Cluster | Aggregated Mongod Metrics\| Cursor | Cursors Timed Out | Total number of cursors that have timed out for all related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Cursor | Cursors Open | Total number of cursors this environment maintains for related all shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Cache | Written Cache | Total data written from cache in related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Cache | Dirty Cache | Total dirty data in cache in related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Cache | Current Cache | Total data currently in cache in related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Cache | Read Cache | Total data read into cache in related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Extra Info | Page Faults | Total number of page faults from related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Asserts | Asserts: Message | Number of message assertions raised from related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Asserts | Asserts: Rollovers | Number of rollovers from related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Asserts | Asserts: Warning | Number of warnings raised from related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Asserts | Asserts: User | Number of user assertions from related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Asserts | Asserts: Regular | Number of regular assertions from related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Global Lock | Operations Waiting to Write | Total queued operations from related shards and config servers waiting for a write lock |
| MongoDB Cluster | Aggregated Mongod Metrics\| Global Lock | Total Operations Waiting | Total queued operations from related shards and config servers waiting for a lock |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Cluster | Aggregated Mongod Metrics\| Global Lock | Operations Waiting to Read | Total queued operations from related shards and config servers waiting for a read lock |
| MongoDB Cluster | Aggregated Mongod Metrics\| Connections | Current Connections | Current number of incoming connections to all related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Connections | Available Connections | Current number of unused incoming connections available to all related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Connections | Total Connections Created | Total incoming connections to all related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Tickets | Write Tickets Available | Total amount of write tickets available to the WiredTiger storage engine of all related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Tickets | Read Tickets Available | Total amount of read tickets available to the WiredTiger storage engine of all related shards and config servers |
| MongoDB Cluster | Aggregated Mongod Metrics\| Memory | Virtual Memory | Virtual memory being used by the related shards' and config servers' |
| MongoDB Cluster | Aggregated Mongod Metrics\| Memory | Resident Memory | Amount of RAM used by the related shards' and config servers' database processes |
| MongoDB Cluster | Aggregated Mongod Metrics\| Memory | Mapped Memory with Journal | Amount of mapped memory with journal by the related shards' and config servers' databases |
| MongoDB Cluster | Aggregated Mongod Metrics\| Memory | Mapped Memory | Amount of mapped memory by the related shards' and config servers' databases |
| MongoDB Cluster | Children | Mongos Children | Mongos resource names of Child resources. |
| MongoDB Config Server | Aggregated Mongod Metrics\| Opcounters | Delete Operations | Total delete operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Opcounters | Update Operations | Total update operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Opcounters | Get More Operations | Total getmore operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Opcounters | Query Operations | Total queries operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Opcounters | Command Operations | Total database commands of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Opcounters | Insert Operations | Total insert operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Opcounters | Read Operations | Total read operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Opcounters | Write Operations | Total write operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Opcounters | Read/Write Operations | All read and write operations of related Mongods |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Config Server | Aggregated Mongod Metrics\| Replication Opcounters | Replication Get More Operations | Total replicated getmore operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Replication Opcounters | Replication Delete Operations | Total replicated delete operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Replication Opcounters | Replication Command Operations | Total replicated database commands of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Replication Opcounters | Replication Insert Operations | Total replicated insert operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Replication Opcounters | Replication Query Operations | Total replicated query operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Replication Opcounters | Replication Update Operations | Total replicated update operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Replication Opcounters | Replication Read Operations | Total replicated read operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Replication Opcounters | Replication Write Operations | Total replicated write operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Replication Opcounters | Replication Read/Write Operations | Total replicated read and write operations of related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Network | Network Traffic Out | Data sent from related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Network | Network Traffic In | Data received by related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Network | Number of Requests | Number of requests related Mongod have received |
| MongoDB Config Server | Aggregated Mongod Metrics\| Cursor | Cursors Timed Out | Total number of cursors that have timed out for all related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Cursor | Cursors Open | Total number of cursors this environment maintains for all related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Cache | Written Cache | Total data written from cache in related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Cache | Dirty Cache | Total dirty data in cache in related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Cache | Current Cache | Total data currently in cache in related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Cache | Read Cache | Total data read into cache in related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Extra Info | Page Faults | Total number of page faults from related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Asserts | Asserts: Message | Number of message assertions raised from related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Asserts | Asserts: Rollovers | Number of rollovers from related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Asserts | Asserts: Warning | Number of warnings raised from related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Asserts | Asserts: User | Number of user assertions from related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Asserts | Asserts: Regular | Number of regular assertions from related Mongods |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Config Server | Aggregated Mongod Metrics\| Global Lock | Operations Waiting to Write | Total queued operations from related Mongods waiting for a write lock |
| MongoDB Config Server | Aggregated Mongod Metrics\| Global Lock | Total Operations Waiting | Total queued operations from related Mongods waiting for a lock |
| MongoDB Config Server | Aggregated Mongod Metrics\| Global Lock | Operations Waiting to Read | Total queued operations from related Mongods waiting for a read lock |
| MongoDB Config Server | Aggregated Mongod Metrics\| Connections | Current Connections | Current number of incoming connections to all related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Connections | Available Connections | Current number of unused incoming connections available to all related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Connections | Total Connections Created | Total incoming connections to all related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Tickets | Write Tickets Available | Total amount of write tickets available to the WiredTiger storage engine of all related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Tickets | Read Tickets Available | Total amount of read tickets available to the WiredTiger storage engine of all related Mongods |
| MongoDB Config Server | Aggregated Mongod Metrics\| Memory | Virtual Memory | Virtual memory being used by the related Mongods' |
| MongoDB Config Server | Aggregated Mongod Metrics\| Memory | Resident Memory | Amount of RAM used by the related Mongods' database processes |
| MongoDB Config Server | Aggregated Mongod Metrics\| Memory | Mapped Memory with Journal | Amount of mapped memory with journal by the related Mongods' databases |
| MongoDB Config Server | Aggregated Mongod Metrics\| Memory | Mapped Memory | Amount of mapped memory by the related Mongods' databases |
| MongoDB Config Server | Children | Replica Set Children | Replica Set resource names of Child resources. |
| MongoDB Config Server | Children | Mongod Children | Mongod resource names of Child resources. |
| MongoDB Config Server | Parents | Mongos Parents | Mongos resource names of Parent resources. |
| MongoDB Config Server | Parents | Database Parents | Database resource names of Parent resources. |
| MongoDB Config Server | Alerts | Config Server Has Child Replica Set | Config Server Has a Replica Set as a Child. |
| MongoDB Replica Set | Properties | Chaining Allowed | Indicated if chaining is supported on this resource |
| MongoDB Replica Set | Properties | Version | Version of MongoDB this resource has |
| MongoDB Replica Set | Properties | Protocol Version | Protocol version of this resource |
| MongoDB Replica Set | Properties | Primary Replication | Indicates this resource is a primary replication set |
| MongoDB Replica Set | Properties | State | State of this resource |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Replica Set | Properties | Replica Set Request Votes | Total request votes in a replica set |
| MongoDB Replica Set | Last Error | Last Error Default | Last error default of this resource |
| MongoDB Replica Set | Last Error | Last Error Modes | Last error modes of this resource |
| MongoDB Replica Set | Replication | Replication Rollback ID | Rollback ID of this resource |
| MongoDB Replica Set | Replication | Replication Hosts | List of hosts within this replication set |
| MongoDB Replica Set | Replication | Replication Arbiters | List of arbiters within this replication set |
| MongoDB Replica Set | Election | Election Timeout | Duration of this resource's election timeout |
| MongoDB Replica Set | Election | Election ID | Election ID of this resource |
| MongoDB Replica Set | Heartbeat | Heartbeat Timeout | Duration of this resource's heartbeat timeout |
| MongoDB Replica Set | Heartbeat | Heartbeat Interval | Frequency of this resource's heartbeats |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Opcounters | Delete Operations | Total delete operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Opcounters | Update Operations | Total update operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Opcounters | Get More Operations | Total getmore operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Opcounters | Query Operations | Total queries operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Opcounters | Command Operations | Total database commands of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Opcounters | Insert Operations | Total insert operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Opcounters | Read Operations | Total read operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Opcounters | Write Operations | Total write operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Opcounters | Read/Write Operations | All read and write operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Replication Opcounters | Replication Get More Operations | Total replicated getmore operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Replication Opcounters | Replication Delete Operations | Total replicated delete operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Replication Opcounters | Replication Command Operations | Total replicated database commands of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Replication Opcounters | Replication Insert Operations | Total replicated insert operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Replication Opcounters | Replication Query Operations | Total replicated query operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Replication Opcounters | Replication Update Operations | Total replicated update operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Replication Opcounters | Replication Read Operations | Total replicated read operations of related Mongods |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Replica Set | Aggregated Mongod Metrics\| Replication Opcounters | Replication Write Operations | Total replicated write operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Replication Opcounters | Replication Read/Write Operations | Total replicated read and write operations of related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Network | Network Traffic Out | Data sent from related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Network | Network Traffic In | Data received by related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Network | Number of Requests | Number of requests related Mongod have received |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Cursor | Cursors Timed Out | Total number of cursors that have timed out for all related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Cursor | Cursors Open | Total number of cursors this environment maintains for all related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Cache | Written Cache | Total data written from cache in related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Cache | Dirty Cache | Total dirty data in cache in related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Cache | Current Cache | Total data currently in cache in related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Cache | Read Cache | Total data read into cache in related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Extra Info | Page Faults | Total number of page faults from related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Asserts | Asserts: Message | Number of message assertions raised from related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Asserts | Asserts: Rollovers | Number of rollovers from related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Asserts | Asserts: Warning | Number of warnings raised from related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Asserts | Asserts: User | Number of user assertions from related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Asserts | Asserts: Regular | Number of regular assertions from related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Global Lock | Operations Waiting to Write | Total queued operations from related Mongods waiting for a write lock |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Global Lock | Total Operations Waiting | Total queued operations from related Mongods waiting for a lock |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Global Lock | Operations Waiting to Read | Total queued operations from related Mongods waiting for a read lock |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Connections | Current Connections | Current number of incoming connections to all related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Connections | Available Connections | Current number of unused incoming connections available to all related Mongods |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Replica Set | Aggregated Mongod Metrics\| Connections | Total Connections Created | Total incoming connections to all related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Tickets | Write Tickets Available | Total amount of write tickets available to the WiredTiger storage engine of all related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Tickets | Read Tickets Available | Total amount of read tickets available to the WiredTiger storage engine of all related Mongods |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Memory | Virtual Memory | Virtual memory being used by the related Mongods' |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Memory | Resident Memory | Amount of RAM used by the related Mongods' database processes |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Memory | Mapped Memory with Journal | Amount of mapped memory with journal by the related Mongods' databases |
| MongoDB Replica Set | Aggregated Mongod Metrics\| Memory | Mapped Memory | Amount of mapped memory by the related Mongods' databases |
| MongoDB Replica Set | Children | Mongod Children | Mongod resource names of Child resources. |
| MongoDB Replica Set | Parents | Config Server Parents | Config Server resource names of Parent resources. |
| MongoDB Replica Set | Parents | Database Parents | Database resource names of Parent resources. |
| MongoDB Replica Set | Parents | Shard Parents | Shard resource names of Parent resources. |
| MongoDB Replica Set | Alerts | Replica Set Even Votes | Replica Set even or odd total votes. |
| MongoDB Replica Set | Alerts | Replica Set Total Votes | Replica Set total votes. |
| MongoDB Replica Set | Alerts | Number of Data Bearing Nodes | Number of Data Bearing Mongods that are not Arbiters. |
| MongoDB Database | Statistics | Data Size | Data size of this resource |
| MongoDB Database | Statistics | Namespace File Size | Namespace file size for this resource |
| MongoDB Database | Statistics | Extents | Number of extents for this resource |
| MongoDB Database | Statistics | Index Size | Total index size for this resource |
| MongoDB Database | Statistics | Total Objects | Number of objects for this resource |
| MongoDB Database | Statistics | Total File Size | Total file size for this resource |
| MongoDB Database | Statistics | Total Indexes | Number of indexes for this resource |
| MongoDB Database | Statistics | Total Collections | Number of collections for this resource |
| MongoDB Database | Statistics | Average Object Size | Average object size of this resource |
| MongoDB Database | Statistics | Storage Size | Storage size of this resource |
| MongoDB Database | Properties | Data File Version | Data file version for this resource |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Database | Collection | Collections Size | Size of all records in this resource's collections |
| MongoDB Database | Collection | Collections Total Index Size | Total size of all in this resource's collections |
| MongoDB Database | Collection | Collections Total Indexes | Number of indexes on this resource's collections |
| MongoDB Database | Collection | Collections Count | Number of objects or documents in this resource's collections |
| MongoDB Database | Collection | Collections Max Size | Maximum size of this resource's capped collections |
| MongoDB Database | Collection | Collections Storage Size | Storage size of all records in this resource's collections |
| MongoDB Database | Collection | Collections Average Object Size | Average size of objects in this resource's collections |
| MongoDB Database | Collection | Collections Max | Maximum number of documents in this resource's collections |
| MongoDB Database | Freelist | Freelist Extents Size | Size of the extents on the freelist for this resource |
| MongoDB Database | Freelist | Freelist Extents | Number of extents in the freelist for this resource |
| MongoDB Database | Children | Shard Children | Shard resource names of Child resources. |
| MongoDB Database | Children | Mongod Children | Mongod resource names of Child resources. |
| MongoDB Database | Children | Config Server Children | Config Server resource names of Child resources. |
| MongoDB Database | Children | Replica Set Children | Replica Set resource names of Child resources. |
| MongoDB Database | Parents | Mongos Parents | Mongos resource names of Parent resources. |
| MongoDB Shard | Properties | Version | Shard version of this resource |
| MongoDB Shard | Alerts | Shard Has Replica Set Child | Shard Has a Replica Set Child |
| MongoDB Shard | Aggregated Mongod Metrics\| Opcounters | Delete Operations | Total delete operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Opcounters | Update Operations | Total update operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Opcounters | Get More Operations | Total getmore operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Opcounters | Query Operations | Total queries operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Opcounters | Command Operations | Total database commands of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Opcounters | Insert Operations | Total insert operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Opcounters | Read Operations | Total read operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Opcounters | Write Operations | Total write operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Opcounters | Read/Write Operations | All read and write operations of related Mongods |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Shard | Aggregated Mongod Metrics\| Replication Opcounters | Replication Get More Operations | Total replicated getmore operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Replication Opcounters | Replication Delete Operations | Total replicated delete operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Replication Opcounters | Replication Command Operations | Total replicated database commands of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Replication Opcounters | Replication Insert Operations | Total replicated insert operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Replication Opcounters | Replication Query Operations | Total replicated query operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Replication Opcounters | Replication Update Operations | Total replicated update operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Replication Opcounters | Replication Read Operations | Total replicated read operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Replication Opcounters | Replication Write Operations | Total replicated write operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Replication Opcounters | Replication Read/Write Operations | Total replicated read and write operations of related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Network | Network Traffic Out | Data sent from related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Network | Network Traffic In | Data received by related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Network | Number of Requests | Number of requests related Mongod have received |
| MongoDB Shard | Aggregated Mongod Metrics\| Cursor | Cursors Timed Out | Total number of cursors that have timed out for all related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Cursor | Cursors Open | Total number of cursors this environment maintains for all related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Cache | Written Cache | Total data written from cache in related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Cache | Dirty Cache | Total dirty data in cache in related Mongods |
| MongoDB Shard | Aggregated Mongod Metrics\| Cache | Current Cache | Total data currently in cache in related Mongods |

| MongoDB Mongod | Locks\|Collection | Collection Acquire Waits Intent Exclusive Locks | Number of lock acquisitions with this mode waits because locks were held in a conflicting mode |
| MongoDB Mongod | Locks\|Collection | Collection Deadlocks Intent Shared Locks | Number of times lock acquisitions with this mode encountered deadlocks |
| MongoDB Mongod | Locks\|Collection | Collection Acquire Waits Exclusive Locks | Number of lock acquisitions with this mode waits because locks were held in a conflicting mode |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Mongod | Locks\|Collection | Collection Deadlocks Intent Exclusive Locks | Number of times lock acquisitions with this mode encountered deadlocks |
| MongoDB Mongod | Locks\|Collection | Collection Cumulative Wait Time Shared Locks | Cumulative wait time for lock acquisitions with this mode |
| MongoDB Mongod | Locks\|Collection | Collection Deadlocks Exclusive Locks | Number of times lock acquisitions with this mode encountered deadlocks |
| MongoDB Mongod | Locks\|Collection | Collection Cumulative Wait Time Intent Exclusive Locks | Cumulative wait time for lock acquisitions with this mode |
| MongoDB Mongod | Locks\|Database | Database Acquire Waits Shared Locks | Number of lock acquisitions with this mode waits because locks were held in a conflicting mode |
| MongoDB Mongod | Locks\|Database | Database Cumulative Wait Time Intent Shared Locks | Cumulative wait time for lock acquisitions with this mode |
| MongoDB Mongod | Locks\|Database | Database Exclusive Locks | Number of times the lock was acquired in this mode |
| MongoDB Mongod | Locks\|Database | Database Acquire Waits Intent Exclusive Locks | Number of lock acquisitions with this mode waits because locks were held in a conflicting mode |
| MongoDB Mongod | Locks\|Database | Database Intent Exclusive Locks | Number of times the lock was acquired in this mode |
| MongoDB Mongod | Locks\|Database | Database Deadlocks Shared Locks | Number of times lock acquisitions with this mode encountered deadlocks |
| MongoDB Mongod | Locks\|Database | Database Deadlocks Intent Exclusive Locks | Number of times lock acquisitions with this mode encountered deadlocks |
| MongoDB Mongod | Locks\|Database | Database Cumulative Wait Time Shared Locks | Cumulative wait time for lock acquisitions with this mode |
| MongoDB Mongod | Locks\|Database | Database Cumulative Wait Time Exclusive Locks | Cumulative wait time for lock acquisitions with this mode |
| MongoDB Mongod | Locks\|Database | Database Deadlocks Exclusive Locks | Number of times lock acquisitions with this mode encountered deadlocks |
| MongoDB Mongod | Locks\|Database | Database Acquire Waits Exclusive Locks | Number of lock acquisitions with this mode waits because locks were held in a conflicting mode |
| MongoDB Mongod | Locks\|Database | Database Deadlocks Intent Shared Locks | Number of times lock acquisitions with this mode encountered deadlocks |
| MongoDB Mongod | Locks\|Database | Database Acquire Waits Intent Shared Locks | Number of lock acquisitions with this mode waits because locks were held in a conflicting mode |
| MongoDB Mongod | Locks\|Database | Database Cumulative Wait Time Intent Exclusive Locks | Cumulative wait time for lock acquisitions with this mode |
| MongoDB Mongod | Locks\|Database | Database Intent Shared Locks | Number of times the lock was acquired in this mode |
| MongoDB Mongod | Locks\|Database | Database Shared Locks | Number of times the lock was acquired in this mode |
| MongoDB Mongod | Locks\|Global | Global Deadlocks Intent Shared Locks | Number of times lock acquisitions with this mode encountered deadlocks |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Mongod | Locks\|Global | Global Deadlocks Intent Exclusive Locks | Number of times lock acquisitions with this mode encountered deadlocks |
| MongoDB Mongod | Locks\|Global | Global Shared Locks | Number of times the lock was acquired in this mode |
| MongoDB Mongod | Locks\|Global | Global Intent Exclusive Locks | Number of times the lock was acquired in this mode |
| MongoDB Mongod | Locks\|Global | Global Intent Shared Locks | Number of times the lock was acquired in this mode |
| MongoDB Mongod | Locks\|Global | Global Acquire Waits Intent Exclusive Locks | Number of lock acquisitions with this mode waits because locks were held in a conflicting mode |
| MongoDB Mongod | Locks\|Global | Global Exclusive Locks | Number of times the lock was acquired in this mode |
| MongoDB Mongod | Locks\|Global | Global Cumulative Wait Time Intent Exclusive Locks | Cumulative wait time for lock acquisitions with this mode |
| MongoDB Mongod | Locks\|Global | Global Cumulative Wait Time Exclusive Locks | Cumulative wait time for lock acquisitions with this mode |
| MongoDB Mongod | Locks\|Global | Global Cumulative Wait Time Intent Shared Locks | Cumulative wait time for lock acquisitions with this mode |
| MongoDB Mongod | Locks\|Global | Global Acquire Waits Shared Locks | Number of lock acquisitions with this mode waits because locks were held in a conflicting mode |
| MongoDB Mongod | Locks\|Global | Global Acquire Waits Intent Shared Locks | Number of lock acquisitions with this mode waits because locks were held in a conflicting mode |
| MongoDB Mongod | Locks\|Global | Global Deadlocks Exclusive Locks | Number of times lock acquisitions with this mode encountered deadlocks |
| MongoDB Mongod | Locks\|Global | Global Deadlocks Shared Locks | Number of times lock acquisitions with this mode encountered deadlocks |
| MongoDB Mongod | Locks\|Global | Global Acquire Waits Exclusive Locks | Number of lock acquisitions with this mode waits because locks were held in a conflicting mode |
| MongoDB Mongod | Locks\|Global | Global Cumulative Wait Time Shared Locks | Cumulative wait time for lock acquisitions with this mode |
| MongoDB Mongod | Storage Engine | Storage Engine Name | Name of the current storage engine |
| MongoDB Mongod | Storage Engine | Storage Engine Persistent | Indicates if the storage engine persists data to disk |
| MongoDB Mongod | Storage Engine | Storage Engine Supports Committed Reads | Indicates if the storage engine supports "majority" read concern |
| MongoDB Mongod | Global Lock | Active Clients Performing Reads | Number of active client connections performing read operations |
| MongoDB Mongod | Global Lock | Active Clients Performing Writes | Number of active client connections performing write operations |
| MongoDB Mongod | Global Lock | Operations Waiting to Write | Number of operations currently queued and waiting for the write lock |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Mongod | Global Lock | Total Operations Waiting | Number of operations queued waiting for the lock |
| MongoDB Mongod | Global Lock | Global Lock Total Time | Time since database last started and created the "globalLock" |
| MongoDB Mongod | Global Lock | Active Clients | Number of active client connections to the database |
| MongoDB Mongod | Global Lock | Operations Waiting to Read | Number of operations currently queued and waiting for the read lock |
| MongoDB Mongod | Properties | Slave Delay | Lag time behind the primary of this resource's replica set |
| MongoDB Mongod | Properties | Advisory Host FQDNs | Advisory host fully qualified domain names of the machine hosting this resource |
| MongoDB Mongod | Properties | ID | Name of this resource's replica set |
| MongoDB Mongod | Properties | Priority | Signifies eligibility of this resource to become primary |
| MongoDB Mongod | Properties | Version | Version of the current MongoDB process |
| MongoDB Mongod | Properties | Tags | Document that describe the replica sets settings |
| MongoDB Mongod | Properties | Is Primary | Indicates if this resource is writable |
| MongoDB Mongod | Properties | Arbiter Only | Indicates if this resource is an arbiter |
| MongoDB Mongod | Properties | Build Indexes | Indicates if the mongod builds indexes on this resource |
| MongoDB Mongod | Properties | Votes | Number of votes this resource will have in a replica set election |
| MongoDB Mongod | Properties | PID | Process ID number on this resource |
| MongoDB Mongod | Properties | Hidden | Indicates if this resource is hidden by its replica set |
| MongoDB Mongod | Properties | Process | Current MongoDB process on this resource |
| MongoDB Mongod | Properties | Uptime | Time the current MongoDB process has been active |
| MongoDB Mongod | Properties | Host Name | Hostname of the machine hosting this resource |
| MongoDB Mongod | Properties | State | Current state of the mongod in the replica set |
| MongoDB Mongod | Properties | Optime | Optime of the mongod |
| MongoDB Mongod | Cache | Written Cache | Amount of data written from cache |
| MongoDB Mongod | Cache | Dirty Cache | Amount of dirty data in cache |
| MongoDB Mongod | Cache | Current Cache | Amount of data currently in cache |
| MongoDB Mongod | Cache | Read Cache | Amount of data read into cache |
| MongoDB Mongod | Network | Network Traffic Out | Data sent from Mongod |
| MongoDB Mongod | Network | Network Traffic In | Data received by Mongod |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Mongod | Network | Number of Requests | Number of requests Mongod has received |
| MongoDB Mongod | Background Flushing | Background Flushing: Last | Time it took the last flush operation to complete |
| MongoDB Mongod | Background Flushing | Background Flushing: Total | Time the mongod processes have spent writing data to disk |
| MongoDB Mongod | Background Flushing | Background Flushing: Flushes | Number of times the databases on this resource has flushed all writes to disk |
| MongoDB Mongod | Background Flushing | Background Flushing: Average | Average time for each flush to disk |
| MongoDB Mongod | Asserts | Asserts: Message | Number of message assertions raised |
| MongoDB Mongod | Asserts | Asserts: Rollovers | Number of rollovers |
| MongoDB Mongod | Asserts | Asserts: Warning | Number of warnings raised |
| MongoDB Mongod | Asserts | Asserts: User | Number of user assertions |
| MongoDB Mongod | Asserts | Asserts: Regular | Number of regular assertions |
| MongoDB Mongod | Operations | Queries with ID Field | Number of queries that contain the "_id" field |
| MongoDB Mongod | Operations | Queries using Sort | Number of queries that return sorted numbers that cannot perform the sort operation using an index |
| MongoDB Mongod | Operations | Queries with Write Conflicts | Number of queries that encountered write conflicts |
| MongoDB Mongod | Operations | Fastmod Operations | Number of update operations that don't cause documents to grow nor require updates to the index |
| MongoDB Mongod | Connections | Current Connections | Number of incoming connections to this resource |
| MongoDB Mongod | Connections | Available Connections | Number of unused incoming connections available to this resource |
| MongoDB Mongod | Connections | Total Connections Created | Count of all incoming connections created to this resource |
| MongoDB Mongod | Memory | Memory Architecture | Architecture of the machine hosting the Mongod |
| MongoDB Mongod | Memory | Virtual Memory | Virtual memory being used by the Mongod |
| MongoDB Mongod | Memory | Extended Memory Supported | Indicates if the machine hosting Mongod supports extended memory information |
| MongoDB Mongod | Memory | Resident Memory | Amount of RAM used by this Mongod's database processes |
| MongoDB Mongod | Memory | Mapped Memory with Journal | Amount of mapped memory with journal by this Mongod's databases |
| MongoDB Mongod | Memory | Mapped Memory | Amount of mapped memory by this Mongod's databases |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Mongod | Replication Opcounters | Replication Get More Operations | Replicated getmore operations of Mongod |
| MongoDB Mongod | Replication Opcounters | Replication Delete Operations | Replicated delete operations of Mongod |
| MongoDB Mongod | Replication Opcounters | Replication Command Operations | Replicated database commands of Mongod |
| MongoDB Mongod | Replication Opcounters | Replication Insert Operations | Replicated insert operations of Mongod |
| MongoDB Mongod | Replication Opcounters | Replication Query Operations | Replicated query operations of Mongod |
| MongoDB Mongod | Replication Opcounters | Replication Update Operations | Replicated update operations of Mongod |
| MongoDB Mongod | Replication Opcounters | Replication Read Operations | Replicated read operations of Mongod |
| MongoDB Mongod | Replication Opcounters | Replication Write Operations | Replicated write operations of Mongod |
| MongoDB Mongod | Replication Opcounters | Replication Reads/Write Operations | All replicated read and write operations of Mongod |
| MongoDB Mongod | Journaling | Journaling Enabled | Signifies if Journaling is enabled |
| MongoDB Mongod | Journaling | Data Journaled | Data written to journal during latest journal group commit interval |
| MongoDB Mongod | Journaling | Commits | Transactions written to journal during latest journal group commit interval |
| MongoDB Mongod | Journaling | Compression Ratio | Compression Ratio of the data written to journal |
| MongoDB Mongod | Journaling | Commits In Write Lock | Commits that occurred while a write lock was held |
| MongoDB Mongod | Journaling | Written to Data Files | Data written from journal during latest journal group commit interval |
| MongoDB Mongod | Journaling | Early Commits | Requested commits before the scheduled journal group commit interval |
| MongoDB Mongod | Opcounters | Delete Operations | Delete operations of Mongod |
| MongoDB Mongod | Opcounters | Update Operations | Update operations of Mongod |
| MongoDB Mongod | Opcounters | Get More Operations | Getmore operations of Mongod |
| MongoDB Mongod | Opcounters | Query Operations | Query operations of Mongod |
| MongoDB Mongod | Opcounters | Command Operations | Database commands of Mongod |
| MongoDB Mongod | Opcounters | Insert Operations | Insert operations of Mongod |
| MongoDB Mongod | Opcounters | Read Operations | Read operations of Mongod |
| MongoDB Mongod | Opcounters | Write Operations | Write operations of Mongod |
| MongoDB Mongod | Opcounters | Read/Write Operations | All read and write operations of Mongod |
| MongoDB Mongod | Documents | Documents Moved | Number of times documents have moved in the on-disk representation of the MongoDB data set |
| MongoDB Mongod | Documents | Documents Deleted | Number of documents deleted |

| Resource Kind | Resource Group | Resource Attribute | Attribute Description |
|---|---|---|---|
| MongoDB Mongod | Documents | Documents Updated | Number of documents updated |
| MongoDB Mongod | Documents | Documents Inserted | Number of documents inserted |
| MongoDB Mongod | Documents | Documents Returned | Number of documents returned by queries |
| MongoDB Mongod | Security | Expiration Date | Expiration date of the TLS/SSL certificate |
| MongoDB Mongod | Security | Subject Name | Subject name associated with TLS/SSL certificate |
| MongoDB Mongod | Security | Has Certificate Authority | Indicates if the TLS/SSL certificate is associated with a certificate authority |
| MongoDB Mongod | Cursor | Cursors Timed Out | Total number of cursors that have timed out |
| MongoDB Mongod | Cursor | Cursors Open | Total number of cursors this environment maintains |
| MongoDB Mongod | Tickets | Write Tickets Available | Amount of write tickets available to the WiredTiger storage engine |
| MongoDB Mongod | Tickets | Read Tickets Available | Amount of read tickets available to the WiredTiger storage engine |
| MongoDB Mongod | Statistics | Write Backs Queued | Indicates if there are operations from a mongos instance queued for retrying |
| MongoDB Mongod | Parents | Replica Set Parents | Replica Set resource names of Parent resources. |
| MongoDB Mongod | Parents | Database Parents | Database resource names of Parent resources. |
| MongoDB Mongod | Parents | Config Server Parents | Config Server resource names of Parent resources. |
| MongoDB Mongod | Parents | Shard Parents | Shard resource names of Parent resources. |
| MongoDB Mongod | Alerts | Shares Host | Mongod Shares a Host with another Mongod. |
| MongoDB Mongod | Alerts | Mongod is Recovering | Mongod is recovering from a delay. |
| MongoDB Mongod | Alerts | Mongod Delay Begind the Primary | Mongod delay behind the primary not accounting for the secondary delay. |

## Management Pack for MySQL

The **Management Pack for MySQL** is an embedded adapter for VCF Operations, collecting performance data from your MySQL database management system and providing predictive analysis and real-time information about problems in your infrastructure—all within the VCF Operations user interface.

### Notable Features

The Management Pack harnesses powerful VCF Operations features such as:

- **Comprehensive monitoring dashboards**
- **800+ collected metrics** for MySQL resources
- **Key performance metrics** such as wait times, disk I/O, indexes, transactions, and connections

- **External relationships** to the VMware virtual layer
- **Detailed alerts and recommendations** for events such as high wait times, unused indexes, and aborted connections
- **VMware Cloud Foundation Operations Calculated Connection Capacity** for MySQL instances

### System Requirements for Management Pack for MySQL

Before installing and configuring the Management Pack, ensure your system meets the following requirements.

For compatibility between products, please refer to:

VMware Cloud Foundation Operations Interoperability for MySQL

-OR-

Third Party Solution Interoperability for MySQL

| | MySQL Requirements |
|---|---|
| Credentials | **MySQL User Name/Password**<br>**Note:**<br>For least-privileged user (LPU) requirements, see: Setting User Privileges |
| Connection | **Hostname** (or IPv4/IPv6 address) **of MySQL instance**<br>**Note:**<br>If using SSL, the SSL certificate must be copied to your VMware Cloud Foundation Operations system prior to configuring an adapter instance.<br>**Default Port**: 3306<br>**Optional**: Database name(s) to monitor (If specific databases are not specified, all databases on the MySQL instance will be returned.) |

#### Setting User Privileges

For the Management Pack to access and return certain metrics from your MySQL database system, different privileges must be granted to the MySQL user as outlined below.

**Note:**

The **REPLICATION CLIENT** permission is required for proper operation of the Management Pack. Even if you are not using replication, please note that if the **REPLICATION CLIENT** permission is not used, process data will not be collected, and an error will be listed in the log files.

| Metric(s) | Required Privileges |
|---|---|
| **MySQL Table & Database I/O** (only applicable on MySQL 5.7) | EXECUTE |
| **Slave Replication** | REPLICATION CLIENT |

| Metric(s) | Required Privileges |
| --- | --- |
| **MYSQL Instance**:<br>• Instance Adaptive Hash Index<br>• Buffer<br>• Buffer Page I/O<br>• Change Buffer<br>• Compression<br>• DDL<br>• DML<br>• File System<br>• ICP<br>• Index<br>• Lock<br>• Metadata<br>• OS<br>• Purge<br>• Recovery<br>• Server<br>• Transaction<br>• Tablespace | PROCESS |

### Upgrading the Management Pack

When upgrading to a newer version of the Management Pack, we recommend the following tasks:

- Delete existing MySQL dashboards
- Delete existing views
- Delete existing reports

#### Delete existing MySQL dashboards

If you do not remove the dashboards from a previous version of the Management Pack before installing the new version, you will see duplicate and/or deprecated MySQL dashboards in the **Dashboard List** drop-down menu after upgrading.

**To remove existing Management Pack dashboards:**

1. Navigate to **Content > Dashboards**.
2. Multi-select all MySQL dashboards.
3. Click **Delete Dashboard**.
4. Click **Yes** when the confirmation dialog box appears to delete the selected dashboards.

#### Delete existing views

We also recommend removing existing views from the previous version of the Management Pack.

**To remove existing Management Pack views:**

1. Navigate to **Content > Views**.
2. Multi-select all MySQL views.
3. **Click Delete View**.
4. Click **Yes** when the confirmation dialog box appears to delete the selected views.

#### Delete existing reports

We also recommend removing existing reports from the previous version of the Management Pack.

**To remove existing Management Pack reports:**

1. Navigate to **Content > Reports**.

2. Multi-select all MySQL reports.
3. Click **Delete template**.
4. Click **Yes** when the confirmation dialog box appears to delete the selected reports.

**What to do next**

Installing and Configuring the Management Pack

### Troubleshooting the Management Pack

Once you have finished Installing and Configuring the Management Pack , check the **Collection State** and **Collection Status** for the adapter instance on the **Solutions** page. If they show as **Not Collecting** or **No Data Receiving**, respectively, the following troubleshooting topics can help you diagnose and correct common problems with your adapter instance.

- Test Connection Errors
- Adapter and Collector Log Files

**Test Connection Errors**

When Creating an Adapter Instance , click **Test Connection** after entering all of your configuration settings to ensure VCF Operations can connect to the specified host.

The following errors are possible:

**Invalid Host**

**Error Message**: Unable to establish a valid connection to the target system. Unable to connect to the server. Verify your Host settings.

**Description:** Verify your host URL or port number are appropriate.

**Request Timed Out**

**Error Message**: Unable to establish a valid connection to the target system. Unable to connect to the server. Request timed out.

**Description:** Verify your host URL or port number are appropriate.

**User Authorization**

**Error Message**: User Authentication error. Please check your user credentials or SSL settings.

**Description:** Verify the user credentials and SSL settings are appropriate.

**Invalid Port Number**

**Error Message**: "Port number specified contains invalid characters." – OR – "Invalid port number." Check your port number.

**Description:** Verify the port number is the correct database port for the server.

**Invalid Connection Settings**

**Error Message**: Unable to connect to the server. Verify your host settings.

**Description:** Verify the hostname/IP address for MySQL server is correct.

**Invalid Database**

**Error Message**: The database ‘<DatabaseName>’ not exist.

**Description:** Verify the correct database name was entered in the Database field.

**Invalid SSL Certificate**

**Error Message**: The given SSL certificate is invalid or does not exist.

**Description:** Verify the file path is correct and is the correct certificate for the MySQL server.

### SSL Connection Error

**Error Message**: SSL Mode currently set is not supported by the server. Verify your SSL settings.

**Description:** The **Use SSL** field is set to **True,** but the server does not support SSL. Set the field to **False.**

## Adapter and Collector Log Files

You can review adapter errors in the adapter and collector log files, which can be viewed in the VCF Operations UI or in an external log viewer.

- **Adapter log files** are located in the $ALIVE_BASE/user/log/adapters/MySQLAdapter/ folder.
- **Collector log files** are located in the $ALIVE_BASE/user/log/ folder.

To set the base log level for the collector in VMware Cloud Foundation Operations:

1. Navigate to **Administration > Logs**.
2. Expand the **Primary** folder, then select the **COLLECTOR** folder.
3. Click the **Edit Properties** icon.
4. In the **Root logger level** drop-down menu, select the desired option.

- The default logging level is **warning.**
- To troubleshoot issues, set the logging level to **info.**
- To view detailed messages, including micro steps, queries, and returned results, set the logging level to **debug.**

> **Note:**
>
> If you set the logging level to **debug,** log files can become large very quickly. Set the logging level to **debug** only for short periods of time.

For more information about viewing log files and modifying levels, refer to the VCF Operations online help.

### Using the Management Pack

The Management Pack for MySQL includes the following out-of-the-box features, harnessing the power of the VCF Operations user interface:

- Inventory Tree (Traversal Spec)
- Dashboards
- Views
- Reports
- Analysis Badges and Capacity Definitions
- Alerts
- Metrics

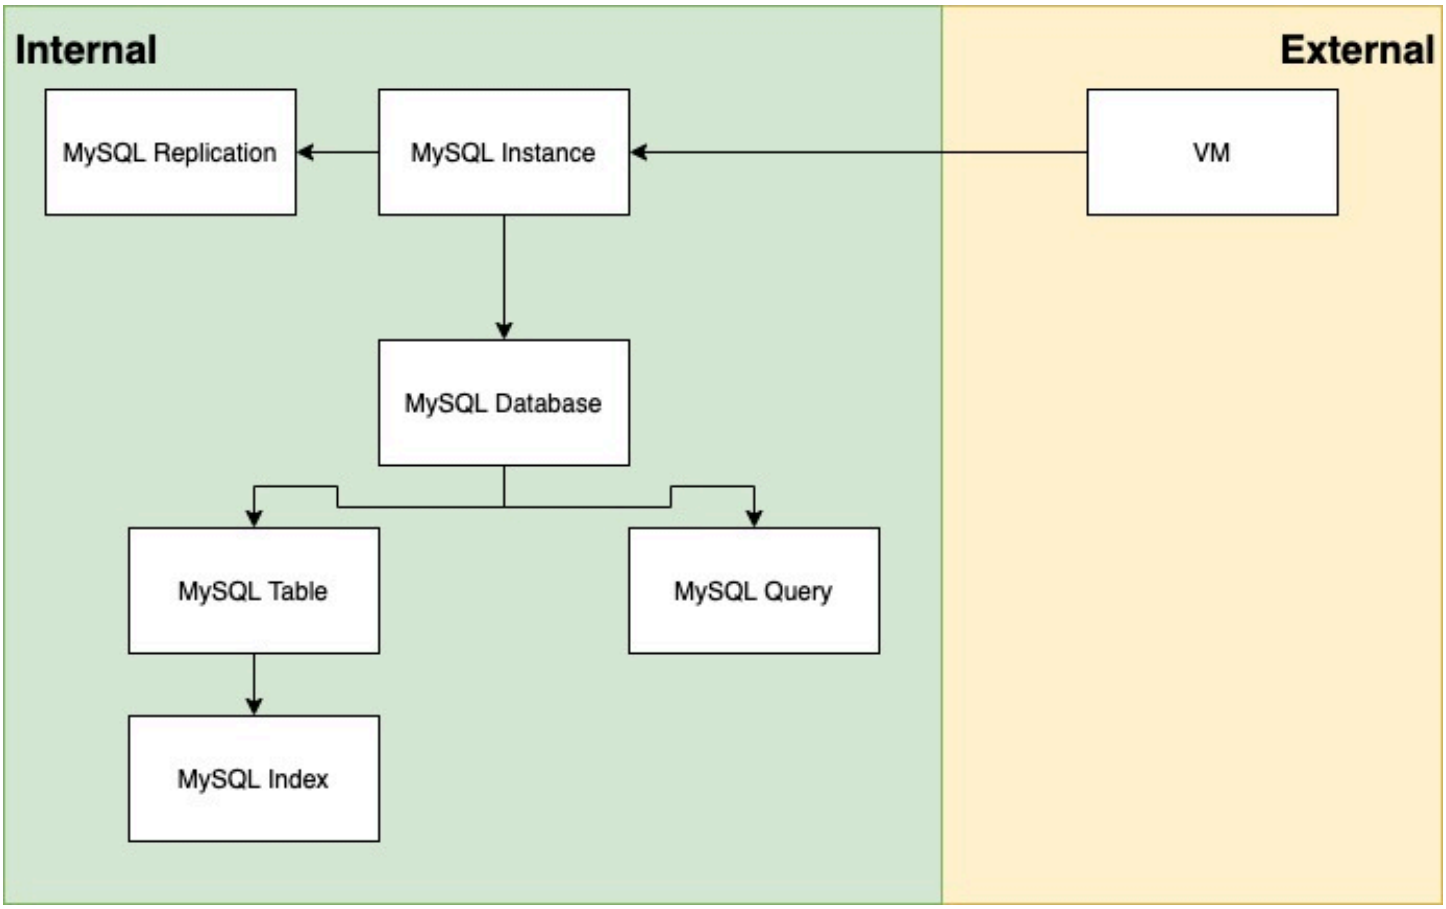
#### Inventory Tree (Traversal Spec), Resources and Relationships

The Inventory Tree (Traversal Spec) feature in VCF Operations allows you to easily navigate your MySQL environment. The hierarchical structure implicitly shows relationships among resources and enables quick drill-downs to root-cause issues.

To access your MySQL Inventory Tree, navigate to **Home > Environment > Inventory Trees**.

## Resources and Relationships

**Figure 484:**



### Dashboards

Dashboards are the primary feature for monitoring and troubleshooting MySQL data problems from within VCF Operations.

The following dashboards are included in the Management Pack for MySQL:

- MySQL Database Drill Down
- MySQL Infrastructure Drill Down

### Views

The Management Pack for MySQL creates views that allow the user to view statistics of metrics for MySQL resources. The views help give a broad picture of the entire system, as opposed to a more in depth view.

The following views are available in the Management Pack:

| View | Type | Description |
|---|---|---|
| **MySQL Adapter Active Alerts** | List | Shows active alerts for MySQL adapter resources and their descendants |
| **MySQL Adapter Database KPIs** | List | Shows all KPIs for MysQL adapter database |
| **MySQL Adapter Health** | List | Shows health and availability for MySQL adapter resources |
| **MySQL Adapter Instance KPIs** | List | Shows all KPIs for MySQL adapter instance |

| View | Type | Description |
|---|---|---|
| **MySQL Adapter Instance Properties** | List | Shows properties for MySQL adapter instance |
| **MySQL Adapter Query KPIs** | List | Shows all KPIs for MySQL adapter query |
| **MySQL Adapter Query Properties** | List | Shows properties for MySQL adapter query |
| **MySQL Adapter Replication Primary Properties** | List | Shows properties for MySQL adapter replication Primary |
| **MySQL Adapter Replication Slave Properties** | List | Shows properties for MySQL adapter replication slave |
| **MySQL Adapter Table KPIs** | List | Shows all KPIs for MySQL adapter table |
| **MySQL Adapter Tablespace Properties** | List | Shows properties for MySQL adapter tablespace |
| **MySQL Database Overview** | List | Shows an overview of MySQL databases |
| **MySQL Database Usage (Historic Data)** | Trend | Shows the trends in the number of rows inserted, updated, and deleted for a given database |
| **MySQL Instance Overview** | List | Shows an overview of MySQL instances |
| **MySQL Instance Usage (Historic Data)** | Trend | Shows the number of rows that have been inserted, updated, deleted, or selected for a given MySQL instance |
| **MySQL Primary** | List | Shows Primary properties |
| **MySQL Primary Stats** | List | Shows Primary stats |
| **MySQL Query** | List | Shows details for MySQL queries |
| **MySQL Query Text** | Text | Shows the query text for the selected MySQL query |
| **MySQL Slave** | List | Shows slave properties |
| **MySQL Slowest Queries** | List | Shows details for the slowest queries in a MySQL system |
| **MySQL Table Usage (Historic Data)** | Trend | Shows the number of rows inserted, updated, and deleted for a given MySQL table as a trend |
| **MySQL Throughput** | List | Shows I/O related information for MySQL systems |

To access the Management Pack views:

1. Navigate to **Environment > All Objects > MySQL**.
2. Double-click on the desired object (resource).
3. Select the **Details** tab, then **Views.**

The available views for that resource are listed and can be selected.

### Reports

The Management Pack for MySQL contains out-of-the-box reports that you can easily export and share with key stakeholders in either .pdf or .csv formats.

The following reports are available in the Management Pack:

| Report | Description |
|---|---|
| **MySQL Adapter Health and Availability** | Includes details on the overall health and availability of MySQL adapter resources |
| **MySQL Adapter KPIs** | Includes KPIs for MySQL adapter resources |

| Report | Description |
|---|---|
| **MySQL Adapter Properties** | Includes properties for MySQL adapter resources |
| **MySQL Databases Report** | Includes overview stats of MySQL databases |
| **MySQL Instances Report** | Includes overview stats of MySQL instances |
| **MySQL Replication Report** | Includes overview stats of MySQL replication resources |
| **MySQL Queries Report** | Includes overview stats of MySQL queries |
| **MySQL Throughput Report** | Includes I/O stats for a MySQL system |

To access Management Pack reports:

1. Navigate to **Environment > All Objects > MySQL**.
2. Double-click on the desired object (resource).
3. Select the **Reports** tab, then **Report Templates**.

The available report(s) for the selected resource are listed and can be selected.

To run a selected report, click the **Run Template**

### Analysis Badges and Capacity Definitions

Using the predictive analytics capabilities of the VCF Operations Analysis Badges through capacity definitions, the Management Pack populates Connection Capacity for MySQL instances.

**Capacity Definitions List**

| Container | Use in Workload |
|---|---|
| **MySQL Instance** | |
| VMware Cloud Foundation Operations Calculated Connection Capacity | yes |

### Alerts

The Management Pack for MySQL pulls MySQL database health indicators and displays them in VMware Cloud Foundation Operations as alerts. The critical levels of each alert are closely mapped from MySQL to VCF Operations. See the table below for the list of alerts available in the Management Pack.

| Name | Description | Recommendation |
|---|---|---|
| Buffer Pool Wait Free is Higher than Normal | The number of times waiting for a free buffer is higher than normal. | Make sure that the memory buffer is correctly configured for the number of writes being performed. |
| Number of Aborted Connections is Higher than Normal | The number of aborted connections are higher than normal. It is possible that clients are trying to connect and failing. | Ensure that clients have the right privileges/ credentials, and look into possible external attacks on the server. |
| Number of Spin Loop Rounds are Higher than Normal | rwlock spin loop rounds from exclusive latch request are higher than normal. It is possible that significant CPU resources are being wasted. | Consider reducing the spin delay. |
| Number of Unused Indexes are Higher than Normal | There are a large number of unused indexes. This can hurt the overall database performance. | Consider removing some of the unused indexes. |
| Total Wait Times of All Operations Higher than Normal | Total Wait Times of All Operations Higher than Normal | Verify table indexes are appropriate for the current operations. |

| Name | Description | Recommendation |
|---|---|---|
| Read Wait Times are Higher than Normal | Read Wait Times are Higher than Normal | Verify table indexes are appropriate for the current operations. |
| Write Wait Times are Higher than Normal | Write Wait Times are Higher than Normal | Verify table indexes are appropriate for the current operations. |
| Fetch Wait Times are Higher than Normal | Fetch Wait Times are Higher than Normal | Verify table indexes are appropriate for the current operations. |
| Insert Wait Times are Higher than Normal | Insert Wait Times are Higher than Normal | Verify table indexes are appropriate for the current operations. |
| Update Wait Times are Higher than Normal | Update Wait Times are Higher than Normal | Verify table indexes are appropriate for the current operations. |
| Delete Wait Times are Higher than Normal | Delete Wait Times are Higher than Normal | Verify table indexes are appropriate for the current operations. |

Metrics

The Management Pack for MySQL collects the metrics listed in the table below, according to MySQL resource kinds.

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Tag | Relationships | Replication Primary Children | string | List of children Replication Primary resources |
| MySQL Tag | Relationships | Database Children | string | List of children Database resources |
| MySQL Tag | Relationships | Index Children | string | List of children Index resources |
| MySQL Tag | Relationships | Instance Children | string | List of children Instance resources |
| MySQL Tag | Relationships | Query Children | string | List of children Query resources |
| MySQL Tag | Relationships | Children | string | List of childrenresources |
| MySQL Tag | Relationships | Table Children | string | List of children Table resources |
| MySQL Tag | Relationships | Tablespace Children | string | List of children Tablespace resources |
| MySQL Tag | Relationships | Replication Slave Children | string | List of children Replication Slave resources |
| MySQL Replication Primary | Details | Primary Host | string | The Primary host that the slave is connected to |
| MySQL Replication Primary | Details | Primary Port | integer | The port used to connect to the Primary |
| MySQL Replication Primary | Details | Primary UUID | string | The Universally Unique Identifier from the Primary |
| MySQL Replication Primary | Primary | Last I/O Error Message | string | The error message of the most recent error that caused the I/O thread to stop |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Replication Primary | Primary | Last I/O Error Number | integer | The error number of the most recent error that caused the I/O thread to stop. 0 means no error has been recorded |
| MySQL Replication Primary | Primary | Last I/O Error Timestamp | string | A timestamp in YYMMDD HH:MM:SS format that shows when the most recent I/O error took place |
| MySQL Replication Primary | Primary | Last SQL Error Message | string | The error message of the most recent error that caused the SQL thread to stop |
| MySQL Replication Primary | Primary | Last SQL Error Number | integer | The error number of the most recent error that caused the SQL thread to stop. 0 means no error has been recorded |
| MySQL Replication Primary | Primary | Last SQL Error Timestamp | string | A timestamp in YYMMDD HH:MM:SS format that shows when the last SQL error occurred |
| MySQL Replication Primary | Slave | Slave I/O Running | string | Whether the I/O thread is started and has connected successfully to the Primary |
| MySQL Replication Primary | Slave | Slave I/O State | string | A copy of the State field of the SHOW PROCESSLIST output for the slave I/O thread. This tells you what the thread is doing: trying to connect to the Primary, waiting for events from the Primary, reconnecting to the Primary, and so on |
| MySQL Replication Primary | Slave | Slave SQL Running | string | Whether the SQL thread is started |
| MySQL Replication Primary | Slave | Slave SQL Running State | string | The state of the SQL thread |
| MySQL Replication Primary | User Configuration | Auto Positioning | integer | Whether or not auto-positioning is in use |
| MySQL Replication Primary | User Configuration | Connect Retry Durations | integer | The number of seconds between connect retries |
| MySQL Replication Primary | User Configuration | Primary Retry Count | integer | The number of times the slave can attempt to reconnect to the Primary in the event of a lost connection |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Replication Primary | User Configuration | Primary SSL Allowed | string | Whether or not an SSL connection to the Primary is permitted. This value will report as 'Ignored' if an SSL connection is permitted but the slave server does not have SSL support enabled |
| MySQL Replication Primary | User Configuration | Primary SSL Verify Server Certificate | string | Whether or not SSL server certificates must be validated |
| MySQL Replication Primary | User Configuration | Primary User | string | The user name of the account used to connect to the Primary |
| MySQL Replication Primary | User Configuration | SQL Delay | integer | The number of seconds that the slave must lag the Primary |
| MySQL Replication Primary | Relationships | Instance Children | string | List of child Instance resources |
| MySQL Replication Primary | Relationships | MySQL Tag Parents | string | List of parent MySQL Tag resources |
| MySQL Database | Capacity | Database Data Size | integer | The size of the database's data |
| MySQL Database | Capacity | Database Index Size | integer | The size of the database's indexes |
| MySQL Database | Capacity | Database Total Size | integer | The total size of the database |
| MySQL Database | I/O | I/O Misc Latency | integer | The average latency of miscellaneous I/O |
| MySQL Database | I/O | I/O Misc Requests | float | The number of I/O miscellaneous requests |
| MySQL Database | I/O | I/O Read Latency | integer | The average latency of I/O reads |
| MySQL Database | I/O | I/O Read Requests | float | The number of I/O read requests |
| MySQL Database | I/O | I/O Reads | float | The number of I/O reads |
| MySQL Database | I/O | I/O Write Latency | integer | The average latency of I/O writes |
| MySQL Database | I/O | I/O Write Requests | float | The number of I/O write requests |
| MySQL Database | I/O | I/O Writes | float | The number of I/O writes |
| MySQL Database | Index | Unused Indexes | integer | The number of unused indexes |
| MySQL Database | Row Operations | Rows Deleted | float | The number of rows deleted |
| MySQL Database | Row Operations | Rows Fetched | float | The number of rows fetched |
| MySQL Database | Row Operations | Rows Inserted | float | The number of rows inserted |
| MySQL Database | Row Operations | Rows Read | float | The number of rows read |
| MySQL Database | Row Operations | Rows Read/Written | float | The total number of rows read and written |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Database | Row Operations | Rows Updated | float | The number of rows updated |
| MySQL Database | Row Operations | Rows Written | float | The number of rows written |
| MySQL Database | Threads | Binlog Dump Threads | integer | The number of Binlog Dump threads |
| MySQL Database | Threads | Change User Threads | integer | The number of Change User threads |
| MySQL Database | Threads | Close Statement Threads | integer | The number of Close Statement threads |
| MySQL Database | Threads | Connect Out Threads | integer | The number of Connect Out threads |
| MySQL Database | Threads | Connect Threads | integer | The number of Connect threads |
| MySQL Database | Threads | Connected Threads | integer | The number of Connected threads |
| MySQL Database | Threads | Create DB Threads | integer | The number of Create DB threads |
| MySQL Database | Threads | Daemon Threads | integer | The number of Daemon threads |
| MySQL Database | Threads | Debug Threads | integer | The number of Debug threads |
| MySQL Database | Threads | Delayed Insert Threads | integer | The number of Delayed Insert threads |
| MySQL Database | Threads | Drop DB Threads | integer | The number of Drop DB threads |
| MySQL Database | Threads | Error Threads | integer | The number of Error threads |
| MySQL Database | Threads | Execute Threads | integer | The number of Execute threads |
| MySQL Database | Threads | Fetch Threads | integer | The number of Fetch threads |
| MySQL Database | Threads | Field List Threads | integer | The number of Field List threads |
| MySQL Database | Threads | Init DB Threads | integer | The number of Init DB threads |
| MySQL Database | Threads | Kill Threads | integer | The number of Kill threads |
| MySQL Database | Threads | Long Data Threads | integer | The number of Long Data threads |
| MySQL Database | Threads | Misc Threads | integer | The number of Misc threads |
| MySQL Database | Threads | Ping Threads | integer | The number of Ping threads |
| MySQL Database | Threads | Prepare Threads | integer | The number of Prepare threads |
| MySQL Database | Threads | Processlist Threads | integer | The number of Processlist threads |
| MySQL Database | Threads | Query Threads | integer | The number of Query threads |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Database | Threads | Quit Threads | integer | The number of Quit threads |
| MySQL Database | Threads | Refresh Threads | integer | The number of Refresh threads |
| MySQL Database | Threads | Register Slave Threads | integer | The number of Register Slave threads |
| MySQL Database | Threads | Reset Statement Threads | integer | The number of Reset Statement threads |
| MySQL Database | Threads | Set Option Threads | integer | The number of Set Option threads |
| MySQL Database | Threads | Shutdown Threads | integer | The number of Shutdown threads |
| MySQL Database | Threads | Sleep Threads | integer | The number of Sleep threads |
| MySQL Database | Threads | Statistics Threads | integer | The number of Statistics threads |
| MySQL Database | Threads | Table Dump Threads | integer | The number of Table Dump threads |
| MySQL Database | Wait Time | Average Delete Wait Time | integer | The average Delete wait time |
| MySQL Database | Wait Time | Average Fetch Wait Time | integer | The average Fetch wait time |
| MySQL Database | Wait Time | Average Insert Wait Time | integer | The average Insert wait time |
| MySQL Database | Wait Time | Average Read Wait Time | integer | The average Read wait time |
| MySQL Database | Wait Time | Average Read/Write Wait Time | integer | The average R/W wait time |
| MySQL Database | Wait Time | Average Update Wait Time | integer | The average Update wait time |
| MySQL Database | Wait Time | Average Write Wait Time | integer | The average Write wait time |
| MySQL Database | Wait Time | Maximum Delete Wait Time | integer | The maximum Delete wait time |
| MySQL Database | Wait Time | Maximum Fetch Wait Time | integer | The maximum Fetch wait time |
| MySQL Database | Wait Time | Maximum Insert Wait Time | integer | The maximum Insert wait time |
| MySQL Database | Wait Time | Maximum Read Wait Time | integer | The maximum Read wait time |
| MySQL Database | Wait Time | Maximum Read/Write Wait Time | integer | The maximum R/W wait time |
| MySQL Database | Wait Time | Maximum Update Wait Time | integer | The maximum Update wait time |
| MySQL Database | Wait Time | Maximum Write Wait Time | integer | The maximum Write wait time |
| MySQL Database | Wait Time | Minimum Delete Wait Time | integer | The minimum Delete wait time |
| MySQL Database | Wait Time | Minimum Fetch Wait Time | integer | The minimum Fetch wait time |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Database | Wait Time | Minimum Insert Wait Time | integer | The minimum Insert wait time |
| MySQL Database | Wait Time | Minimum Read Wait Time | integer | The minimum Read wait time |
| MySQL Database | Wait Time | Minimum Read/Write Wait Time | integer | The minimum R/W wait time |
| MySQL Database | Wait Time | Minimum Update Wait Time | integer | The minimum Update wait time |
| MySQL Database | Wait Time | Minimum Write Wait Time | integer | The minimum Write wait time |
| MySQL Database | Wait Time | Total Delete Wait Time | float | The total Delete wait time |
| MySQL Database | Wait Time | Total Fetch Wait Time | float | The total Fetch wait time |
| MySQL Database | Wait Time | Total Insert Wait Time | float | The total Insert wait time |
| MySQL Database | Wait Time | Total Read Wait Time | float | The total Read wait time |
| MySQL Database | Wait Time | Total Read/Write Wait Time | float | The total R/W wait time |
| MySQL Database | Wait Time | Total Update Wait Time | float | The total Update wait time |
| MySQL Database | Wait Time | Total Write Wait Time | float | The total Write wait time |

| MySQL Database | | I/O Misc Latency (Deprecated) | integer | |
| MySQL Index | Activity | Is Used | string | Whether or not the index is used |
| MySQL Index | Row Operations | Rows Deleted | float | The total number of rows deleted from the index |
| MySQL Index | Row Operations | Rows Inserted | float | The total number of rows inserted into the index |
| MySQL Index | Row Operations | Rows Selected | float | The total number of rows read using the index |
| MySQL Index | Row Operations | Rows Updated | float | The total number of rows updated in the index |
| MySQL Index | Wait Time | Delete Latency | float | The total wait time of timed deletes from the index |
| MySQL Index | Wait Time | Insert Latency | float | The total wait time of timed inserts into the index |
| MySQL Index | Wait Time | Select Latency | float | The total wait time of timed reads using the index |
| MySQL Index | Wait Time | Update Latency | float | The total wait time of timed updates in the index |
| MySQL Index | Relationships | MySQL Tag Parents | string | List of parent MySQL Tag resources |
| MySQL Index | Relationships | Table Parents | string | List of parent Table resources |
| MySQL Instance | Activity | ALTER TABLE's, CREATE INDEX's, DROP INDEX's In Progress | integer | Number of ALTER TABLE, CREATE INDEX, DROP INDEX in progress |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Activity | Indexes Being Created Online | integer | Number of indexes being created online |
| MySQL Instance | Activity | Indexes Waiting To Drop | integer | Number of indexes waiting to be dropped after failed index creation |
| MySQL Instance | Activity | Table Handles Closed | float | The number of table handles closed |
| MySQL Instance | Activity | Table Handles Opened | float | The number of table handles opened |
| MySQL Instance | Activity | Table Reference Count | float | The number of table references |
| MySQL Instance | Activity | Tables Waiting To Drop | integer | Number of tables in background drop table list |
| MySQL Instance | Adaptive Hash Index | Adaptive Hash B-tree Searches | float | The number of searches using B-tree on an index search |
| MySQL Instance | Adaptive Hash Index | Adaptive Hash Pages Added | float | The number of index pages on which the Adaptive Hash Index is built |
| MySQL Instance | Adaptive Hash Index | Adaptive Hash Pages Removed | float | The number of index pages whose corresponding Adaptive Hash Index entries were removed |
| MySQL Instance | Adaptive Hash Index | Adaptive Hash Rows Added | float | The number of Adaptive Hash Index rows added |
| MySQL Instance | Adaptive Hash Index | Adaptive Hash Rows Deleted With No Hash Entry | float | The number of rows deleted that did not have corresponding Adaptive Hash Index entries |
| MySQL Instance | Adaptive Hash Index | Adaptive Hash Rows Removed | float | The number of Adaptive Hash Index rows removed |
| MySQL Instance | Adaptive Hash Index | Adaptive Hash Rows Updated | float | The number of Adaptive Hash Index rows updated |
| MySQL Instance | Adaptive Hash Index | Adaptive Hash Searches | float | The number of successful searches using Adaptive Hash Index |
| MySQL Instance | Buffer | Buffer Data Reads | float | The amount of data read in bytes |
| MySQL Instance | Buffer | Buffer Data Written | float | The amount of data written in bytes |
| MySQL Instance | Buffer | Buffer Flush Adaptive | float | The number of adaptive batches |
| MySQL Instance | Buffer | Buffer Flush Adaptive Pages | float | The pages queued as an adaptive batch |
| MySQL Instance | Buffer | Buffer Flush Adaptive Total Pages | float | The total pages flushed as part of adaptive flushing |
| MySQL Instance | Buffer | Buffer Flush Average Page Rate | float | The average number of pages at which flushing is happening |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Buffer | Buffer Flush Background | float | The number of background batches |
| MySQL Instance | Buffer | Buffer Flush Background Pages | float | The number of pages queued as a background batch |
| MySQL Instance | Buffer | Buffer Flush Background Total Pages | float | The total pages flushed as part of background batches |
| MySQL Instance | Buffer | Buffer Flush Batch Num Scan | float | The number of times buffer flush list flush is called |
| MySQL Instance | Buffer | Buffer Flush Batch Pages | float | The number of pages queued as a flush batch |
| MySQL Instance | Buffer | Buffer Flush Batch Rescan | float | The number of times rescan of flush list forced |
| MySQL Instance | Buffer | Buffer Flush Batch Scanned | float | The total pages scanned as part of flush batch |
| MySQL Instance | Buffer | Buffer Flush Batch Scanned Per Call | float | The number of pages scanned per flush batch scan |
| MySQL Instance | Buffer | Buffer Flush Batch Total Pages | float | The total pages flushed as part of flush batch |
| MySQL Instance | Buffer | Buffer Flush Batches | float | The number of flush batches |
| MySQL Instance | Buffer | Buffer Flush LSN Average Rate | float | The average redo generation rate |
| MySQL Instance | Buffer | Buffer Flush Neighbor | float | The number of times neighbors flushing is invoked |
| MySQL Instance | Buffer | Buffer Flush Neighbor Pages | float | The number of pages queued as a neighbor batch |
| MySQL Instance | Buffer | Buffer Flush Neighbor Total Pages | float | The total neighbors flushed as part of neighbor flush |
| MySQL Instance | Buffer | Buffer Flush Number To Flush Requested | float | The number of pages requested for flushing |
| MySQL Instance | Buffer | Buffer Flush Percent For Dirty | float | The percent of I/O capacity used to avoid max dirty page limit. |
| MySQL Instance | Buffer | Buffer Flush Percent For LSN | float | The percent of I/O capacity used to avoid reusable redo space limit |
| MySQL Instance | Buffer | Buffer Flush Sync | float | The number of sync batches |
| MySQL Instance | Buffer | Buffer Flush Sync Pages | float | The pages queued as a sync batch |
| MySQL Instance | Buffer | Buffer Flush Sync Total Pages | float | The total pages flushed as part of sync batches |
| MySQL Instance | Buffer | Buffer Flush Sync Waits | float | The number of times a wait happens due to sync flushing |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Buffer | Buffer LRU Batch Evict Pages | float | The number of pages queued as a LRU evict batch |
| MySQL Instance | Buffer | Buffer LRU Batch Evict Total Pages | float | The total pages evicted as part of LRU evict batch |
| MySQL Instance | Buffer | Buffer LRU Batch Flush Pages | float | The number of pages queued as a LRU flush batch |
| MySQL Instance | Buffer | Buffer LRU Batch Flush Total Pages | float | The total pages flushed as part of LRU flush batch |
| MySQL Instance | Buffer | Buffer LRU Batch Number Scanned | float | The number of times LRU batch is called |
| MySQL Instance | Buffer | Buffer LRU Batch Pages | float | The number of pages queued as an LRU batch |
| MySQL Instance | Buffer | Buffer LRU Batch Scanned | float | The total pages scanned as part of LRU batch |
| MySQL Instance | Buffer | Buffer LRU Batch Scanned Per Call | float | The number of pages scanned per LRU batch call |
| MySQL Instance | Buffer | Buffer LRU Batch Total Pages | float | The total pages flushed as part of LRU batches |
| MySQL Instance | Buffer | Buffer LRU Batches | float | The number of LRU batches |
| MySQL Instance | Buffer | Buffer LRU Batches Evict | float | The number of LRU evict batches |
| MySQL Instance | Buffer | Buffer LRU Batches Flush | float | The number of LRU flush batches |
| MySQL Instance | Buffer | Buffer LRU Get Free Search | float | The number of searches performed for a clean page |
| MySQL Instance | Buffer | Buffer LRU Search Number Scan | float | The number of times LRU search is performed |
| MySQL Instance | Buffer | Buffer LRU Search Scanned | float | The total pages scanned as part of LRU search |
| MySQL Instance | Buffer | Buffer LRU Search Scanned Per Call | float | The number of pages scanned per single LRU search |
| MySQL Instance | Buffer | Buffer LRU Single Flush Failure Count | float | The number of attempts to flush a single page from LRU failed |
| MySQL Instance | Buffer | Buffer LRU Single Flush Number Scan | float | The number of times single page LRU flush is called |
| MySQL Instance | Buffer | Buffer LRU Single Flush Scanned | float | The total pages scanned as part of single page LRU flush |
| MySQL Instance | Buffer | Buffer LRU Single Flush Scanned Per Call | float | The number of pages scanned per single LRU flush |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Buffer | Buffer LRU Unzip Search Number Scan | float | The number of times LRU unzip search is performed |
| MySQL Instance | Buffer | Buffer LRU Unzip Search Scanned | float | The total pages scanned as part of LRU unzip search |
| MySQL Instance | Buffer | Buffer LRU Unzip Search Scanned Per Call | float | The number of pages scanned per single LRU unzip search |
| MySQL Instance | Buffer | Buffer Pages Created | float | The number of pages created |
| MySQL Instance | Buffer | Buffer Pages Read | float | The number of pages read |
| MySQL Instance | Buffer | Buffer Pages Written | float | The number of pages written |
| MySQL Instance | Buffer | Buffer Pool Bytes Data | integer | The number of buffer bytes containing data |
| MySQL Instance | Buffer | Buffer Pool Bytes Dirty | integer | The number of buffer bytes currently dirty |
| MySQL Instance | Buffer | Buffer Pool Pages Data | integer | The number of buffer pages containing data |
| MySQL Instance | Buffer | Buffer Pool Pages Dirty | integer | The number of buffer pages currently dirty |
| MySQL Instance | Buffer | Buffer Pool Pages Free | integer | The buffer pages currently free |
| MySQL Instance | Buffer | Buffer Pool Pages Miscellaneous | integer | The number of buffer pages for miscellaneous use such as row locks or the adaptive hash index |
| MySQL Instance | Buffer | Buffer Pool Pages Total | integer | The total buffer pool size in pages |
| MySQL Instance | Buffer | Buffer Pool Read Ahead | float | The number of pages read as read ahead |
| MySQL Instance | Buffer | Buffer Pool Read Ahead Evicted | float | The read-ahead pages evicted without being accessed |
| MySQL Instance | Buffer | Buffer Pool Read Requests | float | The number of logical read requests |
| MySQL Instance | Buffer | Buffer Pool Reads | float | The number of reads directly from disk |
| MySQL Instance | Buffer | Buffer Pool Size | integer | The server buffer pool size (all buffer pools) in bytes |
| MySQL Instance | Buffer | Buffer Pool Wait Free | float | The number of times waited for free buffer |
| MySQL Instance | Buffer | Buffer Pool Write Requests | float | The number of write requests |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Extent Descriptor | float | The number of Extent Descriptor Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read File Space Header | float | The number of File Space Header Pages read |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Buffer Page I/O | Buffer Page Read First Compressed BLOB | float | The number of First Compressed BLOB Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Index Inode | float | The number of Index Inode Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Index Insert Buffer Leaf | float | The number of Insert Buffer Index Leaf Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Index Insert Buffer Non Leaf | float | The number of Insert Buffer Index Non-Leaf Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Index Leaf | float | The number of Index Leaf Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Index Non Leaf | float | The number of Index Non-leaf Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Insert Buffer Bitmap | float | The number of Insert Buffer Bitmap Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Insert Buffer Free List | float | The number of Insert Buffer Free List Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Other | float | The number of other/ unknown (old version of InnoDB) Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Subsequent Compressed BLOB | float | The number of Subsequent Compressed BLOB Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read System Page | float | The number of System Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Transaction System | float | The number of Transaction System Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Uncompressed BLOB | float | The number of Uncompressed BLOB Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Read Undo Log | float | The number of Undo Log Pages read |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Extent Descriptor | float | The number of Extent Descriptor Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written File Space Header | float | The number of File Space Header Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written First Compressed BLOB | float | The number of First Compressed BLOB Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Index Inode | float | The number of Index Inode Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Index Insert Buffer Leaf | float | The number of Insert Buffer Index Leaf Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Index Insert Buffer Non Leaf | float | The number of Insert Buffer Index Non-Leaf Pages written |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Buffer Page I/O | Buffer Page Written Index Leaf | float | The number of Index Leaf Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Index Non Leaf | float | The number of Index Non-leaf Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Insert Buffer Bitmap | float | The number of Insert Buffer Bitmap Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Insert Buffer Free List | float | The number of Insert Buffer Free List Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Other | float | The number of other/ unknown (old version InnoDB) Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Subsequent Compressed BLOB | float | The number of Subsequent Compressed BLOB Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written System Page | float | The number of System Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Transaction System | float | The number of Transaction System Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Uncompressed BLOB | float | The number of Uncompressed BLOB Pages written |
| MySQL Instance | Buffer Page I/O | Buffer Page Written Undo Log | float | The number of Undo Log Pages written |
| MySQL Instance | Change Buffer | Change Buffer Deleted Merged Operations Discarded | float | The number of delete merged operations discarded |
| MySQL Instance | Change Buffer | Change Buffer Deleted Records Merged | float | The number of deleted records merged by change buffering |
| MySQL Instance | Change Buffer | Change Buffer Insert Merged Operations Discarded | float | The number of insert merged operations discarded |
| MySQL Instance | Change Buffer | Change Buffer Inserted Records Merged | float | The number of inserted records merged by change buffering |
| MySQL Instance | Change Buffer | Change Buffer Number Merges | float | The number of change buffer merges |
| MySQL Instance | Change Buffer | Change Buffer Purge Merged Records Discarded | float | The number of purge merged operations discarded |
| MySQL Instance | Change Buffer | Change Buffer Purge Records Merged | float | The number of purge records merged by change buffering |
| MySQL Instance | Change Buffer | Change Buffer Size | integer | The change buffer size in pages |
| MySQL Instance | Compression | Number of Padding Decrements Due To Compression | float | The number of times padding is decremented due to good compressibility |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Compression | Number of Padding Increments Due To Compression | float | The number of times padding is incremented to avoid compression failures |
| MySQL Instance | Compression | Number of Pages Compressed | float | The number of pages compressed |
| MySQL Instance | Compression | Number of Pages Decompressed | float | The number of pages decompressed |
| MySQL Instance | Connection | Aborted Connections | float | The number of failed attempts to connect to the MySQL server |
| MySQL Instance | Connection | Connections | float | The number of connection attempts (successful or not) to the MySQL server |
| MySQL Instance | Connection | Max Used Connections | integer | The maximum number of connections that have been in use simultaneously since the server started |
| MySQL Instance | Connection | SSL Client Connections | float | The number of SSL connection attempts to an SSL-enabled Primary |
| MySQL Instance | Connection | SSL Connection Renegotiates | float | The number of negotiates needed to establish the connection to an SSL-enabled Primary |
| MySQL Instance | Connection | SSL Finished Connections | float | The number of successful slave connections to an SSL-enabled Primary |
| MySQL Instance | Connection | Threads Connected | integer | The number of currently open connections |
| MySQL Instance | Details | Hostname | string | The Hostname |
| MySQL Instance | Details | Instance Name | string | The Instance Name |
| MySQL Instance | Details | Instance Total Disk Size | integer | The total size of all databases for this instance |
| MySQL Instance | Details | Port | integer | The Port |
| MySQL Instance | Details | Server ID | integer | The Identifier of the MySQL Instance |
| MySQL Instance | Details | Server UUID | string | The Universally Unique Identifier of the MySQL Instance |
| MySQL Instance | Details | Version | string | The Version |
| MySQL Instance | Index | Index Page Discards | float | The number of index pages discarded |
| MySQL Instance | Index | Index Page Merge Attempts | float | The number of index page merge attempts |
| MySQL Instance | Index | Index Page Merge Successes | float | The number of successful index page merges |
| MySQL Instance | Index | Index Page Reorganization Attempts | float | The number of index page reorganization attempts |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Index | Index Page Reorganization Successes | float | The number of successful index page reorganizations |
| MySQL Instance | Index | Index Page Splits | float | The number of index page splits |
| MySQL Instance | Locking | Deadlocks | float | The number of deadlocks |
| MySQL Instance | Locking | Lock Timeouts | float | The number of lock timeouts |
| MySQL Instance | Locking | Record Lock Requests | float | The number of record locks requested |
| MySQL Instance | Locking | Record Lock Waits | float | The number of record locks requested |
| MySQL Instance | Locking | Record Locks | integer | The current number of record locks on tables |
| MySQL Instance | Locking | Record Locks Created | float | The number of record locks created |
| MySQL Instance | Locking | Record Locks Removed | float | The number of record locks removed from the lock queue |
| MySQL Instance | Locking | Row Lock Current Waits | integer | Number of row locks currently being waited for |
| MySQL Instance | Locking | Row Lock Time | float | Time spent in acquiring row locks |
| MySQL Instance | Locking | Row Lock Time Average | float | The average time to acquire a row lock |
| MySQL Instance | Locking | Row Lock Time Max | float | The maximum time to acquire a row lock |
| MySQL Instance | Locking | Row Lock Waits | float | Number of times a row lock had to be waited for |
| MySQL Instance | Locking | Table Lock Waits | float | The number of record locks requested |
| MySQL Instance | Locking | Table Locks | float | The number of tables locks |
| MySQL Instance | Locking | Table Locks Created | float | The number of table locks created |
| MySQL Instance | Locking | Table Locks Removed | float | The number of table locks removed from the lock queue |
| MySQL Instance | Memory | Memory Pool Size | integer | Size of a memory pool InnoDB uses to store data dictionary and internal data structures in bytes |
| MySQL Instance | Memory | Total Allocated Memory | integer | The total allocated memory |
| MySQL Instance | Operating System | Data Reads | float | The number of reads initiated |
| MySQL Instance | Operating System | Data Writes | float | The number of writes initiated |
| MySQL Instance | Operating System | Files Currently Open | integer | The number of files currently open |
| MySQL Instance | Operating System | Log Bytes Written | float | The bytes of log written |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Operating System | Log Pending Writes | float | The number of pending log file writes |
| MySQL Instance | Operating System | Log Pending fsync Writes | float | The number of pending fsync writes |
| MySQL Instance | Operating System | Log fsync Writes | float | The number of fsync log writes |
| MySQL Instance | Operating System | Pending Reads | integer | The number of reads pending |
| MySQL Instance | Operating System | Pending Writes | integer | The number of writes pending |
| MySQL Instance | Operating System | fsync() Calls Count | float | The number of fsync() calls |
| MySQL Instance | Purge | Purge DML Delay Time | integer | The microseconds DML to be delayed due to purge lagging |
| MySQL Instance | Purge | Purge Delete Marked Records | float | The number of delete-marked rows purged |
| MySQL Instance | Purge | Purge Invoked | float | The number of times purge was invoked |
| MySQL Instance | Purge | Purge Resume Count | integer | The number of times purge was resumed |
| MySQL Instance | Purge | Purge Stop Count | integer | The number of times purge was stopped |
| MySQL Instance | Purge | Purge Undo Log Pages | float | The number of undo log pages handled by the purge |
| MySQL Instance | Purge | Purge Update Existing Or External Records | float | The number of purges on updates of existing records and updates on delete marked record with externally stored field |
| MySQL Instance | Recovery | Log Checkpoints | float | The number of checkpoints |
| MySQL Instance | Recovery | Log Current LSN | integer | The current log sequence number value |
| MySQL Instance | Recovery | Log LSN Checkpoint Age | float | The current log sequence number value minus log sequence number at last checkpoint |
| MySQL Instance | Recovery | Log LSN at Last Checkpoint | integer | The log sequence number at last checkpoint |
| MySQL Instance | Recovery | Log LSN of Last Flush | integer | The log sequence number of Last flush |
| MySQL Instance | Recovery | Log Number Log IO | float | The number of log I/Os |
| MySQL Instance | Recovery | Log Oldest LSN in Buffer Pool | integer | The oldest modified block log sequence number in the buffer pool |
| MySQL Instance | Recovery | Log Pending Checkpoint Writes | float | The pending checkpoints |
| MySQL Instance | Recovery | Log Pending Log Writes | float | The pending log writes |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Recovery | Log Waits | float | The number of log waits due to small log buffer |
| MySQL Instance | Recovery | Log Write Requests | float | The number of log write requests |
| MySQL Instance | Recovery | Log Writes | float | The number of log writes |
| MySQL Instance | Recovery | Max Modified LSN Age For ASYNC Preflush | integer | The maximum log sequence number difference; when exceeded, start asynchronous preflush |
| MySQL Instance | Recovery | Max Modified LSN Age For SYNC Preflush | integer | The maximum log sequence number difference; when exceeded, start synchronous preflush |
| MySQL Instance | Row Operations | Rows Deleted | float | The number of rows deleted |
| MySQL Instance | Row Operations | Rows Inserted | float | The number of rows inserted |
| MySQL Instance | Row Operations | Rows Read | float | The number of rows read |
| MySQL Instance | Row Operations | Rows Updated | float | The number of rows updated |
| MySQL Instance | Server | Background Drop Table Time | float | The time spent to process drop table list |
| MySQL Instance | Server | Change Buffer Merge Time | float | The time spent to process change buffer merge |
| MySQL Instance | Server | Checkpoint Time | float | The time spent by Primary thread to do checkpoint |
| MySQL Instance | Server | DICT LRU Processing Time | float | The time spent to process DICT LRU list |
| MySQL Instance | Server | Doublewrite Operation Pages Written | float | The number of pages that have been written for doublewrite operations (innodb_dblwr_pages_written) |
| MySQL Instance | Server | Doublewrite Writes | float | The number of doublewrite operations that have been performed (innodb_dblwr_writes) |
| MySQL Instance | Server | Log Flush Time | float | The time spent to flush log records |
| MySQL Instance | Server | Primary Active Loops | float | The number of times Primary thread performs its tasks when server is active |
| MySQL Instance | Server | Primary Idle Loops | float | The number of times Primary thread performs its tasks when server is idle |
| MySQL Instance | Server | Primary Purge Time | float | The time spent by Primary thread to purge records |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Server | Primary Thread Sleep Time | float | The amount of time Primary thread has slept |
| MySQL Instance | Server | Memory Validation Time | float | The time spent to do memory validation |
| MySQL Instance | Server | OS Waits From Exclusive Latch Request | float | The number of rwlock OS waits due to exclusive latch request |
| MySQL Instance | Server | OS Waits From Shared Latch Request | float | The number of rwlock OS waits due to shared latch request |
| MySQL Instance | Server | Server Activity Count | integer | The current server activity count |
| MySQL Instance | Server | rwlock Spin Loop Rounds From Exclusive Latch Request | float | The number of rwlock spin loop rounds due to exclusive latch request |
| MySQL Instance | Server | rwlock Spin Loop Rounds From Shared Latch Request | float | The number of rwlock spin loop rounds due to shared latch request |
| MySQL Instance | Server | rwlock Spin Waits From Exclusive Latch Request | float | The number of rwlock spin waits due to exclusive latch request |
| MySQL Instance | Server | rwlock Spin Waits From Shared Latch Request | float | The number of rwlock spin waits due to shared latch request |
| MySQL Instance | Transaction | Active Transactions | integer | The number of active transactions |
| MySQL Instance | Transaction | Active Transactions Rolled Back | float | The number of resurrected active transactions rolled back |
| MySQL Instance | Transaction | Current Rollback Size | integer | The current rollback segment size |
| MySQL Instance | Transaction | Insert And Update Commits | float | The number of transactions committed with inserts and updates |
| MySQL Instance | Transaction | Non-Locking Auto-Commit Read Only Commits | float | The number of non-locking auto-commit read-only transactions committed |
| MySQL Instance | Transaction | Read Only Transaction Commits | float | The number of read-only transactions committed |
| MySQL Instance | Transaction | Read Write Transaction Commits | float | The number of read-write transactions committed |
| MySQL Instance | Transaction | TRX_RSEG_HISTORY List Length | integer | The length of the TRX_RSEG_HISTORY list |
| MySQL Instance | Transaction | Transaction Rollbacks | float | The number of transactions rolled back |
| MySQL Instance | Transaction | Transactions Rolled Back To Savepoint | float | The number of transactions rolled back to savepoint |
| MySQL Instance | Transaction | Undo Slots Cached | float | The number of undo slots cached |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | Transaction | Undo Slots Used | float | The number of undo slots used |
| MySQL Instance | Uncategorized | Index Push-Down Condition Check Attempts | float | The number of Index Push-Down Condition check attempts |
| MySQL Instance | Uncategorized | Index Push-Down Conditions Match | float | The number of Index Push-Down Conditions with a match |
| MySQL Instance | Uncategorized | Index Push-Down Conditions No Match | float | The number of Index Push-Down Conditions with no match |
| MySQL Instance | Uncategorized | Index Push-Down Conditions Out Of Range | float | The number of Index Push-Down Conditions out of range |
| MySQL Instance | User Configuration | Max Connections | integer | The Max Connections |
| MySQL Instance | User Configuration | Page Size | integer | The Page Size |
| MySQL Instance | Relationships | AIX Parents | string | List of parent AIX resources |
| MySQL Instance | Relationships | Database Children | string | List of child Database resources |
| MySQL Instance | Relationships | HPUX Parents | string | List of parent HPUX resources |
| MySQL Instance | Relationships | Linux Parents | string | List of parent Linux resources |
| MySQL Instance | Relationships | MySQL Tag Parents | string | List of parent MySQL Tag resources |
| MySQL Instance | Relationships | Query Children | string | List of child Query resources |
| MySQL Instance | Relationships | Replication Primary Parents | string | List of parent Replication Primary resources |
| MySQL Instance | Relationships | Replication Slave Children | string | List of child Replication Slave resources |
| MySQL Instance | Relationships | Solaris Parents | string | List of parent Solaris resources |
| MySQL Instance | Relationships | Tablespace Children | string | List of child Tablespace resources |
| MySQL Instance | Relationships | Virtual Machine Parents | string | List of parent Virtual Machine resources |
| MySQL Instance | Relationships | Windows Parents | string | List of parent Windows resources |
| MySQL Instance | | Hostname (Deprecated) | string | |
| MySQL Instance | | Port (Deprecated) | integer | |
| MySQL Instance | | Instance Name (Deprecated) | string | |
| MySQL Instance | | Total Allocated Memory (Deprecated) | integer | |
| MySQL Instance | | Version (Deprecated) | string | |
| MySQL Instance | | Max Connections (Deprecated) | integer | |
| MySQL Instance | | Instance Total Disk Size (Deprecated) | integer | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | | System Memory (Deprecated) | integer | |
| MySQL Instance | | Adaptive Hash Pages Added (Deprecated) | integer | |
| MySQL Instance | | Adaptive Hash Pages Removed (Deprecated) | integer | |
| MySQL Instance | | Adaptive Hash Rows Added (Deprecated) | integer | |
| MySQL Instance | | Adaptive Hash Rows Deleted With No Hash Entry (Deprecated) | integer | |
| MySQL Instance | | Adaptive Hash Rows Removed (Deprecated) | integer | |
| MySQL Instance | | Adaptive Hash Rows Updated (Deprecated) | integer | |
| MySQL Instance | | Adaptive Hash Searches (Deprecated) | integer | |
| MySQL Instance | | Adaptive Hash B-tree Searches (Deprecated) | integer | |
| MySQL Instance | | Buffer Pages Read (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Read Ahead (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Bytes Dirty (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Reads (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Pages Misc (Deprecated) | integer | |
| MySQL Instance | | Buffer Pages Written (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Wait Free (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Pages Dirty (Deprecated) | integer | |
| MySQL Instance | | Buffer Data Written (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Pages Total (Deprecated) | integer | |
| MySQL Instance | | Buffer Pages Created (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Write Requests (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Bytes Data (Deprecated) | integer | |
| MySQL Instance | | Buffer Data Reads (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Read Ahead Evicted (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Pages Free (Deprecated) | integer | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | | Buffer Pool Read Requests (Deprecated) | integer | |
| MySQL Instance | | Buffer Pool Pages Data (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Batch Scanned (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Batch Num Scan (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Batch Scanned Per Call (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Batch Rescan (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Batch Total Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Batches (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Batch Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Neighbor Total Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Neighbor (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Neighbor Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Num To Flush Requested (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Average Page Rate (Deprecated) | float | |
| MySQL Instance | | Buffer Flush LSN Average Rate (Deprecated) | float | |
| MySQL Instance | | Buffer Flush Percent For Dirty (Deprecated) | float | |
| MySQL Instance | | Buffer Flush Percent For LSN (Deprecated) | float | |
| MySQL Instance | | Buffer Flush Sync Waits (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Adaptive Total Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Adaptive (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Adaptive Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Sync Total Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Background (Deprecated) | integer | |
| MySQL Instance | | Buffer Flush Background Pages (Deprecated) | integer | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | | Buffer LRU Batch Scanned (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batch Number Scan (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batch Scanned Per Call (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batch Total Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batch Evict Total Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batch Flush Total Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batches (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batches Evict (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batches Flush (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batch Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batch Evict Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Batch Flush Pages (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Single Flush Scanned (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Single Flush Number Scan (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Single Flush Scanned Per Call (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Get Free Search (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Search Scanned (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Search Number Scan (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Search Scanned Per Call (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Unzip Search Scanned (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Unzip Search Number Scan (Deprecated) | integer | |
| MySQL Instance | | Buffer LRU Unzip Search Scanned Per Call (Deprecated) | integer | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | | Buffer Page Read Index Leaf (Deprecated) | integer | |
| MySQL Instance | | Buffer Page Read Index Non Leaf (Deprecated) | integer | |
| MySQL Instance | | Buffer Page Read Index Insert Buffer Leaf (Deprecated) | integer | |
| MySQL Instance | | Buffer Page Read Index Insert Buffer Non Leaf (Deprecated) | integer | |
| MySQL Instance | | Buffer Page Read Undo Log (Deprecated) | integer | |
| MySQL Instance | | Buffer Page Read Index Inode (Deprecated) | integer | |
| MySQL Instance | | Buffer Page Read Insert Buffer Free List (Deprecated) | integer | |
| MySQL Instance | | Buffer Page Read Insert Buffer Bitmap (Deprecated) | integer | |

| MySQL Instance | | DICT LRU Processing Time (Deprecated) | integer | |
| MySQL Instance | | Checkpoint Time (Deprecated) | integer | |
| MySQL Instance | | TRX_RSEG_HISTORY List Length (Deprecated) | integer | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Instance | | Read Write Transaction Commits (Deprecated) | integer | |
| MySQL Instance | | Read Only Transaction Commits (Deprecated) | integer | |
| MySQL Instance | | Non-Locking Auto-Commit Read Only Commits (Deprecated) | integer | |
| MySQL Instance | | Insert And Update Commits (Deprecated) | integer | |
| MySQL Instance | | Transaction Rollbacks (Deprecated) | integer | |
| MySQL Instance | | Transactions Rolled Back To Savepoint (Deprecated) | integer | |
| MySQL Instance | | Active Transactions Rolled Back (Deprecated) | integer | |
| MySQL Instance | | Active Transactions (Deprecated) | integer | |
| MySQL Instance | | Undo Slots Used (Deprecated) | integer | |
| MySQL Instance | | Undo Slots Cached (Deprecated) | integer | |
| MySQL Instance | | Current Rollback Size (Pages) (Deprecated) | integer | |
| MySQL Instance | | Connections (Deprecated) | integer | |
| MySQL Instance | | Aborted Connections (Deprecated) | integer | |
| MySQL Instance | | Max Used Connections (Deprecated) | integer | |
| MySQL Instance | | Threads Connected (Deprecated) | integer | |
| MySQL Instance | | SSL Client Connections (Deprecated) | integer | |
| MySQL Instance | | SSL Connection Renegotiates (Deprecated) | integer | |
| MySQL Instance | | SSL Finished Connections (Deprecated) | integer | |
| MySQL Query | Activity | Average Errors | integer | The total number of errors produced by occurrences of the statement |
| MySQL Query | Activity | Average Sort Merge Passes | float | The average number of sort merge passes per occurrence of the statement |
| MySQL Query | Activity | Average Temporary Tables Created In-Memory | integer | The average number of internal in-memory temporary tables created per occurrence of the statement |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Query | Activity | Average Temporary Tables Created On-Disk | integer | The average number of internal on-disk temporary tables created per occurrence of the statement |
| MySQL Query | Activity | Average Warnings | integer | The average number of warnings produced by occurrences of the statement |
| MySQL Query | Activity | Error Count | float | The total number of errors produced by occurrences of the statement |
| MySQL Query | Activity | Execution Count | float | The total number of times the statement has executed |
| MySQL Query | Activity | First Seen | string | The first time at which the statement was seen |
| MySQL Query | Activity | Last Seen | string | The most recent time at which the statement was seen |
| MySQL Query | Activity | Rank | integer | The rank of this query, according to the way queries are ordered (usually by average latency) |
| MySQL Query | Activity | Sort Merge Passes | float | The total number of sort merge passes by occurrences of the statement |
| MySQL Query | Activity | Temporary Tables Created In-Memory | float | The total number of internal in-memory temporary tables created by occurrences of the statement |
| MySQL Query | Activity | Temporary Tables Created On-Disk | float | The total number of internal on-disk temporary tables created by occurrences of the statement |
| MySQL Query | Activity | Warning Count | float | The total number of warnings produced by occurrences of the statement |
| MySQL Query | Details | SQL HTML | string | The HTML version of the SQL text of this query |
| MySQL Query | Details | SQL Text | string | The normalized statement string |
| MySQL Query | Row Operations | Average Rows Affected | integer | The average number of rows affected per occurrence of the statement |
| MySQL Query | Row Operations | Average Rows Examined | integer | The average number of rows read from storage engines per occurrence of the statement |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Query | Row Operations | Average Rows Sent | integer | The average number of rows returned per occurrence of the statement |
| MySQL Query | Row Operations | Average Rows Sorted | integer | The average number of rows sorted per occurrence of the statement |
| MySQL Query | Row Operations | Rows Affected | float | The total number of rows affected by occurrences of the statement |
| MySQL Query | Row Operations | Rows Examined | float | The total number of rows read from storage engines by occurrences of the statement |
| MySQL Query | Row Operations | Rows Sent | float | The total number of rows returned by occurrences of the statement |
| MySQL Query | Row Operations | Rows Sorted | float | The total number of rows sorted by occurrences of the statement |
| MySQL Query | Wait Time | Average Latency | integer | The average wait time per timed occurrence of the statement |
| MySQL Query | Wait Time | Average Lock Latency | integer | The average time waiting for locks per timed occurrence of the statement |
| MySQL Query | Wait Time | Lock Latency | float | The total time waiting for locks by timed occurrences of the statement |
| MySQL Query | Wait Time | Max Latency | integer | The maximum single wait time of timed occurrences of the statement |
| MySQL Query | Wait Time | Total Latency | float | The total wait time of timed occurrences of the statement |
| MySQL Query | Relationships | Database Parents | string | List of parent Database resources |
| MySQL Query | Relationships | Instance Parents | string | List of parent Instance resources |
| MySQL Query | Relationships | MySQL Tag Parents | string | List of parent MySQL Tag resources |
| MySQL Query | | Hostname (Deprecated) | string | |
| MySQL Query | | Port (Deprecated) | integer | |
| MySQL Query | | Rank (Deprecated) | integer | |
| MySQL Query | | SQL Text (Deprecated) | string | |
| MySQL Query | | Database (Deprecated) | string | |
| MySQL Query | | Calls (Deprecated) | integer | |
| MySQL Query | | Average Rows Sent (Deprecated) | float | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Query | | Average Rows Examined (Deprecated) | float | |
| MySQL Query | | Average Time (Deprecated) | float | |
| MySQL Query | | Total Time (Deprecated) | integer | |
| MySQL Query | | Average Lock Time (Deprecated) | float | |
| MySQL Query | | Total Lock Time (Deprecated) | integer | |
| MySQL Table | Capacity | Table Data Size | integer | The size of the table's data |
| MySQL Table | Capacity | Table Index Size | integer | The size of the table's indexes |
| MySQL Table | Capacity | Table Total Size | integer | The total size of the table |
| MySQL Table | I/O | I/O Misc Latency | float | The total wait time of miscellaneous I/O requests for the table |
| MySQL Table | I/O | I/O Misc Requests | float | The total number of miscellaneous I/O requests for the table |
| MySQL Table | I/O | I/O Read | float | The total number of bytes read from the table |
| MySQL Table | I/O | I/O Read Latency | float | The total wait time of reads from the table |
| MySQL Table | I/O | I/O Read Requests | float | The total number of read requests for the table |
| MySQL Table | I/O | I/O Write | float | The total number of bytes written to the table |
| MySQL Table | I/O | I/O Write Latency | float | The total wait time of writes to the table |
| MySQL Table | I/O | I/O Write Requests | float | The total number of write requests for the table |
| MySQL Table | Row Operations | Delete Average Wait Time | integer | The average wait time of deletes |
| MySQL Table | Row Operations | Delete Max Wait Time | integer | The maximum wait time of deletes |
| MySQL Table | Row Operations | Delete Min Wait Time | integer | The minimum wait time of deletes |
| MySQL Table | Row Operations | Delete Total Wait Time | integer | The total wait time of deletes |
| MySQL Table | Row Operations | Fetch Average Wait Time | integer | The average wait time of fetches |
| MySQL Table | Row Operations | Fetch Max Wait Time | integer | The maximum wait time of fetches |
| MySQL Table | Row Operations | Fetch Min Wait Time | integer | The minimum wait time of fetches |
| MySQL Table | Row Operations | Fetch Total Wait Time | integer | The total wait time of fetches |
| MySQL Table | Row Operations | Full Rows Scanned | integer | The number of times the table has been fully scanned |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL Table | Row Operations | Insert Average Wait Time | integer | The average wait time of inserts |
| MySQL Table | Row Operations | Insert Max Wait Time | integer | The maximum wait time of inserts |
| MySQL Table | Row Operations | Insert Min Wait Time | integer | The minimum wait time of inserts |
| MySQL Table | Row Operations | Insert Total Wait Time | integer | The total wait time of inserts |
| MySQL Table | Row Operations | R/W Average Wait Time | integer | The average wait time of reads and writes |
| MySQL Table | Row Operations | R/W Max Wait Time | integer | The maximum wait time of reads and writes |
| MySQL Table | Row Operations | R/W Min Wait Time | integer | The minimum wait time of reads and writes |
| MySQL Table | Row Operations | R/W Total Wait Time | integer | The total wait time of reads and writes |
| MySQL Table | Row Operations | Read Average Wait Time | integer | The average wait time of reads |
| MySQL Table | Row Operations | Read Max Wait Time | integer | The maximum wait time of reads |
| MySQL Table | Row Operations | Read Min Wait Time | integer | The minimum wait time of reads |
| MySQL Table | Row Operations | Read Total Wait Time | integer | The total wait time of reads |
| MySQL Table | Row Operations | Rows Deleted | float | The number of rows deleted |
| MySQL Table | Row Operations | Rows Fetched | float | The number of rows fetched |
| MySQL Table | Row Operations | Rows Inserted | float | The number of rows inserted |
| MySQL Table | Row Operations | Rows Read | float | The number of rows read |
| MySQL Table | Row Operations | Rows Read/Written | float | The total number of rows read and written |
| MySQL Table | Row Operations | Rows Updated | float | The number of rows updated |
| MySQL Table | Row Operations | Rows Written | float | The number of rows written |
| MySQL Table | Row Operations | Update Average Wait Time | integer | The average wait time of updates |
| MySQL Table | Row Operations | Update Max Wait Time | integer | The maximum wait time of updates |
| MySQL Table | Row Operations | Update Min Wait Time | integer | The minimum wait time of updates |
| MySQL Table | Row Operations | Update Total Wait Time | integer | The total wait time of updates |
| MySQL Table | Row Operations | Write Average Wait Time | integer | The average wait time of writes |
| MySQL Table | Row Operations | Write Max Wait Time | integer | The maximum wait time of writes |
| MySQL Table | Row Operations | Write Min Wait Time | integer | The minimum wait time of writes |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|

| MySQL MySQL Replication | | Primary User (Deprecated) | string | |
| MySQL MySQL Replication | | Primary Port (Deprecated) | integer | |
| MySQL MySQL Replication | | Connect Retry Time (Deprecated) | integer | |
| MySQL MySQL Replication | | Primary SSL Allowed (Deprecated) | string | |
| MySQL MySQL Replication | | Primary SSL Verify Server Cert (Deprecated) | string | |
| MySQL MySQL Replication | | Auto Position (Deprecated) | integer | |
| MySQL MySQL Replication | | Slave I/O State (Deprecated) | string | |
| MySQL MySQL Replication | | Slave I/O Running (Deprecated) | string | |
| MySQL MySQL Replication | | Slave SQL Running (Deprecated) | string | |
| MySQL MySQL Replication | | Last SQL Error Number (Deprecated) | integer | |
| MySQL MySQL Replication | | Last SQL Error (Deprecated) | string | |
| MySQL MySQL Replication | | Last I/O Error Number (Deprecated) | integer | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type | Attribute Description |
|---|---|---|---|---|
| MySQL MySQL Replication | | Last I/O Error (Deprecated) | string | |
| MySQL MySQL Replication | | SQL Delay (Deprecated) | string | |
| MySQL MySQL Replication | | Slave SQL Running State (Deprecated) | string | |
| MySQL MySQL Replication | | Primary Retry Count (Deprecated) | integer | |
| MySQL MySQL Replication | | Last I/O Error Time (Deprecated) | string | |
| MySQL MySQL Replication | | Last SQL Error Timestamp (Deprecated) | string | |

## Management Pack for Network Devices

The **Management Pack for Network Devices** is an embedded adapter for VMware Cloud Foundation Operations, collecting performance data from your Network systems and providing predictive analytics and real-time information about problems in your infrastructure—all within the VCF Operations user interface.

### Notable Features

The Management Pack harnesses powerful VCF Operations features such as:

- **Comprehensive monitoring dashboards**:
  - Networking Devices Overview
  - Networking Devices Investigation
  - Troubleshooting Networking Devices
  - Networking Devices Performance
  - Networking Devices Alerts
- **30+ number collected metrics** for Networking resources, including total throughput and out and in dropped packets
- **Detailed alerts and notifications**for several key events, including throughput total and in and out packet total
- **Key performance metrics** such as total throughput, and in and out dropped packets
- **External relationships** from the Host System to a Networking Device

### System Requirements Management Pack for Network Devices

Before installing and configuring the Management Pack, ensure your system meets the following requirements.

For compatibility between products, please refer to:

VMware Cloud Foundation Operations Interoperability for Network Devices

-OR-

Third Party Solution Interoperability for Network Devices

| | Network Devices Requirements |
|---|---|
| Connection | The default port used for this management pack is **161** |
| Credentials | The Management Pack requires one of the following credential types:<br>• **SNMP v2c read-only community string**<br>• **SNMP v3 User Name & Password** |

### Troubleshooting the Management Pack

Once you have finished Installing and Configuring the Management Pack , check the **Collection State** and **Collection Status** for the adapter instance on the **Solutions** page. If they show as **Not Collecting** or **No Data Receiving,** respectively, the following troubleshooting topics can help you diagnose and correct common problems with your adapter instance.

- Test Connection Errors
- Adapter and Collector Log Files

### Test Connection Errors

When Creating an Adapter Instance , click **Test Connection** after entering all of your configuration settings to ensure VCF Operations can connect to the specified host.

The following errors are possible:

**Unable to establish a valid connection to the target system**

**Error Message:** Unable to establish a valid connection to the target system. Could not connect to device(s): device1, device2.

**Description:** Check the following:

- The host and/or port are correct
- SNMP is enabled on the device
- The timeout allows sufficient time for data to be returned
- The community string or security parameters are correct
- A firewall isn't blocking UDP traffic on the specified port

**Unable to establish a valid connection to the target system**

**Error Message:** Unable to establish a valid connection to the target system. Could not resolve hostname for these device(s): device1

**Description:** Ensure that the hostname is correct.

### Adapter and Collector Log Files

You can review adapter errors in the adapter and collector log files, which can be viewed in the VCF Operations UI or in an external log viewer.

- **Adapter log files** are located in the $VCOPS_BASE/user/log/adapters/NetworkingDevicesAdapter/ folder.
- **Collector log files** are located in the $VCOPS_BASE/user/log/ folder.

To set the base log level for the collector in VCF Operations:

1. Navigate to **Administration > Logs**.
2. Expand the **PRIMARY** folder, then select the **COLLECTOR** folder.
3. Click the **Edit Properties**icon.
4. In the **Root logger level** drop-down menu, select the desired option.

- The default logging level is **warning.**
- To troubleshoot issues, set the logging level to **info.**
- To view detailed messages, including micro steps, queries, and returned results, set the logging level to debug.

  **CAUTION:**

  If you set the logging level to**debug**, log files can become large very quickly. Set the logging level to**debug**only for short periods of time.

For more information about viewing log files and modifying levels, refer to the VCF Operations online help.

### Using the Management Pack

The Management Pack for Network includes the following out-of-the-box features, harnessing the power of the VCF Operations user interface:

- Inventory Tree (Traversal Spec)
- Dashboards
- Views
- Reports
- Alerts
- Metrics

### Inventory Tree (Traversal Spec)

The Inventory Tree (Traversal Spec) feature in VCF Operations allows you to easily navigate your Network environment. The hierarchical structure implicitly shows relationships among resources and enables quick drill-downs to root-cause issues.

To access your Network Devices Inventory Tree, select **Environment** from the top navigation bar, then select **Networking Devices** from the left panel.

### Dashboards

Dashboards are the primary feature for monitoring and troubleshooting Network data problems from within VCF Operations.

The following dashboards are included in the Management Pack for Network Devices:

- **Networking Devices Overview** provides at-a-glance heatmaps depicting the overall health of your Networking devices.
- **Networking Devices Health Investigation** is the jumping-off point for examining the health of your networking environment. This dashboard displays at-a-glance health status for all resources in the Environment Overview widget. Selecting a resource from the widget will populate alerts and a health chart on the right.
- **Troubleshooting Network Devices** is the primary jumping-off point for troubleshooting specific network devices. Simply select a device from the Device widget to populate health and alert data about it.
- **Network Devices Performance**provides insight into the overall performance of your Networking Devices, including the top 10 devices by each of a variety of metrics.
- **Network Devices Alerts** shows all of the operational alerts specific to resources that have been discovered by the Adapter instances. Selecting an alert in the Alerts widget displays helpful information such as relationships and health data to allow you to more easily determine the origin and cause of the alert.

Additionally, the following dashboards are included for Cisco, Dell, HPE, and Lenovo:

- Device Summary
- Devices Traffic
- Networking Performance
- Networking Summary

### Views

The Management Pack for Network Devices creates views that allow the user to view statistics of metrics for various Network resources. The views help give a broad picture of the entire system, as opposed to a more in depth view.

The following views are available in the Management Pack:

| View | Type | Description |
|---|---|---|
| **Networking Devices Network Device Performance** | List | Displays performance of Network Devices |

To access the Management Pack views:

1. Navigate to **Environment > All Objects > Networking Devices**.
2. Double-click on the desired object (resource).
3. Select the **Details** tab, then **Views.**

The available views for that resource are listed and can be selected.

### Reports

The Management Pack for Network Devices contains out-of-the-box report(s) that you can export and easily share with key stakeholders in either .pdf or .csv formats.

The following reports are available in the Management Pack:

| Report | Description |
|---|---|
| **Networking Devices Network Device Performance** | Displays performance data for Network Devices |

To access Management Pack reports:

1. Navigate to **Environment > All Objects > Network Devices**.
2. Double-click on the desired object (resource).
3. Select the **Reports** tab, then **Report Templates.**

The available report(s) for the selected resource are listed and can be selected.

To run a selected report, click the **Run Template** icon.

### Alerts

The Management Pack pulls alerts and events from Network Devices and displays them in VCF Operations as alerts. See the table below for the list of alerts available in the Management Pack.

| Alert | Severity |
|---|---|
| Out Throughput Total | Immediate |
| Total Out Packets | Immediate |
| In Throughput Total | Immediate |
| Throughput Total | Immediate |
| Total In Packets | Immediate |

### Metrics

The Management Pack for Network Devices collects the metrics listed in the table below, according to Network Device resource kinds.

**CAUTION:**

The following list is generated with a standard MIB based on a large subset of devices; if any device is not using the standard MIB, some metrics may be unavailable.

| Vendors | Resource Type | Category | Metric | Description |
|---|---|---|---|---|
| All Vendors | entity | Details | Alias | The vendor-specific model name identifier string associated with this physical component. The preferred value is the customer-visible part number, which may be printed on the component itself. If the model name string associated with the physical component is unknown to the agent, then this object will contain a zero-length string. |

| | | | | |
|---|---|---|---|---|
| All Vendors | entity | Details | Asset ID | This object is a user-assigned asset tracking identifier for the physical entity as specified by a network manager, and provides non-volatile storage of this information. On the first instantiation of an physical entity, the value of entPhysicalAssetID associated with that entity is set to the zero-length string. Not every physical component will have a asset tracking identifier, or even need one. Physical entities for which the associated value of the entPhysicalIsFRU object is equal to 'false(2)' (e.g., the repeater ports within a repeater module), do not need their own unique asset tracking identifier. An agent does not have to provide write access for such entities, and may instead return a zero-length string. If write access is implemented for an instance of entPhysicalAssetID, and a value is written into the instance, the agent must retain the supplied value in the entPhysicalAssetID instance associated with the same physical entity for as long as that entity remains instantiated. This includes instantiations across all re- initializations/ reboots of the network management system, including those which result in a change of the physical entity's entPhysicalIndex value. If no asset tracking information is associated with the physical component, then this object will contain a zero-length string. |

| | | | | |
|---|---|---|---|---|
| All Vendors | entity | Details | Class | An indication of the general hardware type of the physical entity. An agent should set this object to the standard enumeration value which most accurately indicates the general class of the physical entity, or the primary class if there is more than one. If no appropriate standard registration identifier exists for this physical entity, then the value 'other(1)' is returned. If the value is unknown by this agent, then the value 'unknown(2)' is returned. |
| All Vendors | entity | Details | Contained In | The value of entPhysicalIndex for the physical entity which 'contains' this physical entity. A value of zero indicates this physical entity is not contained in any other physical entity. Note that the set of 'containment' relationships define a strict hierarchy; that is, recursion is not allowed. In the event a physical entity is contained by more than one physical entity (e.g., double-wide modules), this object should identify the containing entity with the lowest value of entPhysicalIndex. |
| All Vendors | entity | Details | Description | A textual description of physical entity. This object should contain a string which identifies the manufacturer's name for the physical entity, and should be set to a distinct value for each version or model of the physical entity. |

| | | | | |
|---|---|---|---|---|
| All Vendors | entity | Details | Firmware Revision | The vendor-specific firmware revision string for the physical entity. Note that if revision information is stored internally in a non-printable (e.g., binary) format, then the agent must convert such information to a printable format, in an implementation-specific manner. If no specific firmware programs are associated with the physical component, or this information is unknown to the agent, then this object will contain a zero-length string. |
| All Vendors | entity | Details | Hardware Revision | The vendor-specific hardware revision string for the physical entity. The preferred value is the hardware revision identifier actually printed on the component itself (if present). Note that if revision information is stored internally in a non-printable (e.g., binary) format, then the agent must convert such information to a printable format, in an implementation-specific manner. If no specific hardware revision string is associated with the physical component, or this information is unknown to the agent, then this object will contain a zero-length string. |
| All Vendors | entity | Details | Index | The index of the resource which uniquely identifies it on the SNMP tree. |

| | | | | |
|---|---|---|---|---|
| All Vendors | entity | Details | Is Field-Replaceable Unit | This object indicates whether or not this physical entity is considered a 'field replaceable unit' by the vendor. If this object contains the value 'true(1)' then this entPhysicalEntry identifies a field replaceable unit. For all entPhysicalEntries which represent components that are permanently contained within a field replaceable unit, the value 'false(2)' should be returned for this object. |
| All Vendors | entity | Details | Manufacturer Name | The name of the manufacturer of this physical component. The preferred value is the manufacturer name string actually printed on the component itself (if present). Note that comparisons between instances of the entPhysicalModelName, entPhysicalFirmwareRev, entPhysicalSoftwareRev, and the entPhysicalSerialNum objects, are only meaningful amongst entPhysicalEntries with the same value of entPhysicalMfgName. If the manufacturer name string associated with the physical component is unknown to the agent, then this object will contain a zero-length string. |
| All Vendors | entity | Details | Model Name | The vendor-specific model name identifier string associated with this physical component. The preferred value is the customer-visible part number, which may be printed on the component itself. If the model name string associated with the physical component is unknown to the agent, then this object will contain a zero-length string. |

| | | | | |
|---|---|---|---|---|
| All Vendors | entity | Details | Name | The textual name of the physical entity. The value of this object should be the name of the component as assigned by the local device and should be suitable for use in commands entered at the device's 'console'. This might be a text name, such as 'console' or a simple component number (e.g., port or module number), such as '1', depending on the physical component naming syntax of the device. If there is no local name, or this object is otherwise not applicable, then this object contains a zero-length string. Note that the value of entPhysicalName for two physical entities will be the same in the event that the console interface does not distinguish between them, e.g., slot-1 and the card in slot-1. |

| | | | | |
|---|---|---|---|---|
| All Vendors | entity | Details | Parent Relative Position | An indication of the relative position of this 'child' component among all its 'sibling' components. Sibling components are defined as entPhysicalEntries which share the same instance values of each of the entPhysicalContainedIn and entPhysicalClass objects. An NMS can use this object to identify the relative ordering for all sibling components of a particular parent (identified by the entPhysicalContainedIn instance in each sibling entry). This value should match any external labeling of the physical component if possible. For example, for a container (e.g., card slot) labeled as 'slot #3', entPhysicalParentRelPos should have the value '3'. Note that the entPhysicalEntry for the module plugged in slot 3 should have an entPhysicalParentRelPos value of '1'. If the physical position of this component does not match any external numbering or clearly visible ordering, then user documentation or other external reference material should be used to determine the parent-relative position. If this is not possible, then the the agent should assign a consistent (but possibly arbitrary) ordering to a given set of 'sibling' components, perhaps based on internal representation of the components. If the agent cannot determine the parent-relative position for some reason, or if the associated value of entPhysicalContainedIn is '0', then the value '-1' is returned. Otherwise a non-negative integer is returned, indicating the parent-relative position of this physical entity. Parent-relative ordering normally starts from '1' and continues to 'N', where 'N' represents the highest |

| | | | | |
|---|---|---|---|---|
| All Vendors | entity | Details | Serial Number | The vendor-specific serial number string for the physical entity. The preferred value is the serial number string actually printed on the component itself (if present). On the first instantiation of an physical entity, the value of entPhysicalSerialNum associated with that entity is set to the correct vendor-assigned serial number, if this information is available to the agent. If a serial number is unknown or non-existent, the entPhysicalSerialNum will be set to a zero-length string instead. Note that implementations which can correctly identify the serial numbers of all installed physical entities do not need to provide write access to the entPhysicalSerialNum object. Agents which cannot provide non-volatile storage for the entPhysicalSerialNum strings are not required to implement write access for this object. Not every physical component will have a serial number, or even need one. Physical entities for which the associated value of the entPhysicalIsFRU object is equal to 'false(2)' (e.g., the repeater ports within a repeater module), do not need their own unique serial number. An agent does not have to provide write access for such entities, and may return a zero-length string. If write access is implemented for an instance of entPhysicalSerialNum, and a value is written into the instance, the agent must retain the supplied value in the entPhysicalSerialNum instance associated with the same physical entity for as long as that entity remains instantiated. This includes instantiations across all re- initializations/ reboots of the network management system, including those which |

| | | | | |
|---|---|---|---|---|
| All Vendors | entity | Details | Software Revision | The vendor-specific software revision string for the physical entity. Note that if revision information is stored internally in a non-printable (e.g., binary) format, then the agent must convert such information to a printable format, in an implementation-specific manner. If no specific software programs are associated with the physical component, or this information is unknown to the agent, then this object will contain a zero-length string. |
| All Vendors | entity | Details | Vendor Type | An indication of the vendor-specific hardware type of the physical entity. Note that this is different from the definition of MIB-II's sysObjectID. An agent should set this object to a enterprise-specific registration identifier value indicating the specific equipment type in detail. The associated instance of entPhysicalClass is used to indicate the general type of hardware device. If no vendor-specific registration identifier exists for this physical entity, or the value is unknown by this agent, then the value { 0 0 } is returned. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | Details | Alias | This object is an 'alias' name for the interface as specified by a network manager, and provides a non-volatile 'handle' for the interface. On the first instantiation of an interface, the value of ifAlias associated with that interface is the zero-length string. As and when a value is written into an instance of ifAlias through a network management set operation, then the agent must retain the supplied value in the ifAlias instance associated with the same interface for as long as that interface remains instantiated, including across all re-initializations/reboots of the network management system, including those which result in a change of the interface's ifIndex value. An example of the value which a network manager might store in this object for a WAN interface is the (Telco's) circuit number/ identifier of the interface. Some agents may support write-access only for interfaces having particular values of ifType. An agent which supports write access to this object is required to keep the value in non-volatile storage, but it may limit the length of new values depending on how much storage is already occupied by the current values for other interfaces. |
| All Vendors | interface | Details | Connector Present | This object has the value 'true(1)' if the interface sublayer has a physical connector and the value 'false(2)' otherwise. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | Details | Description | A textual string containing information about the interface. This string should include the name of the manufacturer, the product name and the version of the interface hardware/software. |
| All Vendors | interface | Details | Index | A unique value, greater than zero, for each interface. It is recommended that values are assigned contiguously starting from 1. The value for each interface sub-layer must remain constant at least from one re-initialization of the entity's network management system to the next re- initialization. |
| All Vendors | interface | Details | Name | The textual name of the interface. The value of this object should be the name of the interface as assigned by the local device and should be suitable for use in commands entered at the device's 'console'. This might be a text name, such as 'le0' or a simple port number, such as '1', depending on the interface naming syntax of the device. If several entries in the ifTable together represent a single interface as named by the device, then each will have the same value of ifName. Note that for an agent which responds to SNMP queries concerning an interface on some other (proxied) device, then the value of ifName for such an interface is the proxied device's local name for it. If there is no local name, or this object is otherwise not applicable, then this object contains a zero-length string. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | Details | Physical Address | The interface's address at its protocol sub-layer. For example, for an 802.x interface, this object normally contains a MAC address. The interface's media-specific MIB must define the bit and byte ordering and the format of the value of this object. For interfaces which do not have such an address (e.g., a serial line), this object should contain an octet string of zero length. |
| All Vendors | interface | Details | Promiscuous Mode | This object has a value of false(2) if this interface only accepts packets/frames that are addressed to this station. This object has a value of true(1) when the station accepts all packets/ frames transmitted on the media. The value true(1) is only legal on certain types of media. If legal, setting this object to a value of true(1) may require the interface to be reset before becoming effective. The value of ifPromiscuousMode does not affect the reception of broadcast and multicast packets/frames by the interface. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | Details | Specific | A reference to MIB definitions specific to the particular media being used to realize the interface. It is recommended that this value point to an instance of a MIB object in the media-specific MIB, i.e., that this object have the semantics associated with the InstancePointer textual convention defined in RFC 2579. In fact, it is recommended that the media-specific MIB specify what value ifSpecific should/can take for values of ifType. If no MIB definitions specific to the particular media are available, the value should be set to the OBJECT IDENTIFIER { 0 0 }. |
| All Vendors | interface | Details | Type | The type of interface. Additional values for ifType are assigned by the Internet Assigned Numbers Authority (IANA), through updating the syntax of the IANAifType textual convention. |
| All Vendors | interface | Performance | Incoming Broadcast | The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | Performance | Incoming Discards | The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| All Vendors | interface | Performance | Incoming Errors | For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character- oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| All Vendors | interface | Performance | Incoming Multicast | The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | Performance | Incoming Non Unicast | The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. This object is deprecated in favour of ifInMulticastPkts and ifInBroadcastPkts. |
| All Vendors | interface | Performance | Incoming Data | The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| All Vendors | interface | Performance | Incoming Unicast | The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | Performance | Incoming Unknown Protocols | For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| All Vendors | interface | Performance | Outgoing Broadcast | The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| All Vendors | interface | Performance | Outgoing Discards | The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | Performance | Outgoing Errors | For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| All Vendors | interface | Performance | Outgoing Multicast | The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| All Vendors | interface | Performance | Outgoing Non Unicast | The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. This object is deprecated in favour of ifOutMulticastPkts and ifOutBroadcastPkts. |
| All Vendors | interface | Performance | Outgoing Queue Length | The length of the output packet queue. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | Performance | Outgoing Data | The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| All Vendors | interface | Performance | Outgoing Unicast | The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| All Vendors | interface | Performance | Speed | An estimate of the interface's current bandwidth in units of 1,000,000 bits per second. If this object reports a value of 'n' then the speed of the interface is somewhere in the range of 'n-500,000' to 'n+499,999'. For interfaces which do not vary in bandwidth or for those where no accurate estimation can be made, this object should contain the nominal bandwidth. For a sub-layer which has no concept of bandwidth, this object should be zero. |
| All Vendors | interface | Status | Admin Status | Raw admin status value. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | Status | Admin Status | The desired state of the interface. The testing(3) state indicates that no operational packets can be passed. When a managed system initializes, all interfaces start with ifAdminStatus in the down(2) state. As a result of either explicit management action or per configuration information retained by the managed system, ifAdminStatus is then changed to either the up(1) or testing(3) states (or remains in the down(2) state). |
| All Vendors | interface | Status | Last Change | The value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re-initialization of the local network management subsystem, then this object contains a zero value. |
| All Vendors | interface | Status | Operational Status | Raw operational status value. |
| All Vendors | interface | Status | Operational Status | The current operational state of the interface. The testing(3) state indicates that no operational packets can be passed. If ifAdminStatus is down(2) then ifOperStatus should be down(2). If ifAdminStatus is changed to up(1) then ifOperStatus should change to up(1) if the interface is ready to transmit and receive network traffic; it should change to dormant(5) if the interface is waiting for external actions (such as a serial line waiting for an incoming connection); it should remain in the down(2) state if and only if there is a fault that prevents it from going to the up(1) state; it should remain in the notPresent(6) state if the interface has missing (typically, hardware) components. |

| | | | | |
|---|---|---|---|---|
| All Vendors | interface | User Configuration | MTU | The size of the largest packet which can be sent/received on the interface, specified in octets. For interfaces that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the interface. |
| All Vendors | l3_interface | Network | IPv4 Broadcast Received Packets | The number of IP broadcast datagrams received. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Broadcast Sent Packets | The number of IP broadcast datagrams sent. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Forwards Received | The number of input datagrams for which this entity was not their final IP destination and for which this entity attempted to find a route to forward them to that final destination. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Forwards Sent | The number of datagrams for which this entity was not their final IP destination and for which it was successful in finding a path to their final destination. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Multicast Received Data | The total number of octets received in IP multicast datagram. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Multicast Received Packets | The number of IP multicast datagrams received. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Multicast Sent Data | The total number of octets transmitted in IP multicast datagram. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Multicast Sent Packets | The number of IP multicast datagrams transmitted. This metric applies to traffic over IPv4. |

| | | | | |
|---|---|---|---|---|
| All Vendors | l3_interface | Network | IPv4 Packets Reassembled Correctly | The number of IP datagrams successfully reassembled. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Packets Reassembly Failed | The number of failures detected by the IP re-assembly algorithm (for whatever reason:timed out, errors, etc.). This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Packets Requested for Reassembly | The number of IP fragments received that needed to be reassembled at this interface. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Received Data | The total number of octets received in input IP datagrams, including those received in error. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Received Packets | The total number of input IP datagrams received, including those received in error. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Sent Data | The total number of octets in IP datagrams delivered to the lower layers for transmission. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv4 Sent Packets | The total number of IP datagrams that this entity supplied to the lower layers for transmission. This metric applies to traffic over IPv4. |
| All Vendors | l3_interface | Network | IPv6 Broadcast Received Packets | The number of IP broadcast datagrams received. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Broadcast Sent Packets | The number of IP broadcast datagrams sent. This metric applies to traffic over IPv6. |

| | | | | |
|---|---|---|---|---|
| All Vendors | l3_interface | Network | IPv6 Forwards Received | The number of input datagrams for which this entity was not their final IP destination and for which this entity attempted to find a route to forward them to that final destination. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Forwards Sent | The number of datagrams for which this entity was not their final IP destination and for which it was successful in finding a path to their final destination. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Multicast Received Data | The total number of octets received in IP multicast datagram. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Multicast Received Packets | The number of IP multicast datagrams received. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Multicast Sent Data | The total number of octets transmitted in IP multicast datagram. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Multicast Sent Packets | The number of IP multicast datagrams transmitted. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Packets Reassembled Correctly | The number of IP datagrams successfully reassembled. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Packets Reassembly Failed | The number of failures detected by the IP re-assembly algorithm (for whatever reason:timed out, errors, etc.). This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Packets Requested for Reassembly | The number of IP fragments received that needed to be reassembled at this interface. This metric applies to traffic over IPv6. |

| | | | | |
|---|---|---|---|---|
| All Vendors | l3_interface | Network | IPv6 Received Data | The total number of octets received in input IP datagrams, including those received in error. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Received Packets | The total number of input IP datagrams received, including those received in error. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Sent Data | The total number of octets in IP datagrams delivered to the lower layers for transmission. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Network | IPv6 Sent Packets | The total number of IP datagrams that this entity supplied to the lower layers for transmission. This metric applies to traffic over IPv6. |
| All Vendors | l3_interface | Uncategorized | Index | The index of the resource which uniquely identifies it on the SNMP tree. |
| All Vendors | network_device | Details | Serial Number | The serial number as derived from the entity representing the module. |
| All Vendors | network_device | Details | System Contact | The textual identification of the contact person for this managed node, together with information on how to contact this person. If no contact information is known, the value is the zero-length string. |
| All Vendors | network_device | Details | System Description | A textual description of the entity. This value should include the full name and version identification of the system's hardware type, software operating-system, and networking software. |
| All Vendors | network_device | Details | System Location | The physical location of this node (e.g., 'telephone closet, 3rd floor'). If the location is unknown, the value is the zero-length string. |

| | | | | |
|---|---|---|---|---|
| All Vendors | network_device | Details | System Name | An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. |
| All Vendors | network_device | Details | System Object ID | The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.424242, it could assign the identifier 1.3.6.1.4.1.424242.1.1 to its 'Fred Router'. |
| All Vendors | network_device | Details | System Uptime | The time since the network management porition of the system was last re-initialized. |
| All Vendors | network_device | Fan | Total Fan Count | The total number of Fan on this device. |
| All Vendors | network_device | Interface | Total Interface Count | The total number of interfaces on this device. |
| All Vendors | network_device | Module | Total Module Count | The total number of Module on this device. |
| All Vendors | network_device | Power Supply | Total Power Supply Count | The total number of Power Supply on this device. |
| All Vendors | network_device | Sensor | Total Sensor Count | The total number of Sensor on this device. |
| Cisco | hsrp_group | Details | Active Router | IP Address of the currently active router for this group. |
| Cisco | hsrp_group | Details | Group Address | The primary virtual IP address used by this group. |
| Cisco | hsrp_group | Details | Group Number | The number identifying this group. |
| Cisco | hsrp_group | Details | MAC Address | The MAC address assigned to this group. |
| Cisco | hsrp_group | Details | Standby Router | IP Address of the currently standby router for this group. |

| | | | | |
|---|---|---|---|---|
| Cisco | hsrp_group_member | Details | Active Router | IP Address of the currently active router for this group. |
| Cisco | hsrp_group_member | Details | Group Address | This is the primary virtual IP address used by this group. If this address is configured (i.e a non zero ip address), this value is used. Otherwise, the agent will attempt to discover the virtual address through a discovery process (which scans the hello messages). |
| Cisco | hsrp_group_member | Details | Group MAC Address | The MAC Address of the group on which this HSRP Group Member resides. |
| Cisco | hsrp_group_member | Details | Hello Time | If the Hellotime is not configured on a router, it can be learned from the Hello messages from active router, provided the Hello message is authenticated. If the Hellotime is not learned from a Hello message from the active router and it is not manually configured, a default value of 3 seconds is recommended. |
| Cisco | hsrp_group_member | Details | Hold Time | If the Holdtime is not configured on a router, it can be learned from the Hello message from the active router. Holdtime should be learned only if the Hello message is authenticated. If the Holdtime is not learned and it is not manually configured, a default value of 10 seconds is recommended. |
| Cisco | hsrp_group_member | Details | Preemption Delay | This delay is the time difference between a router power up and the time it can actually start preempting the currently active router. |

| | | | | |
|---|---|---|---|---|
| Cisco | hsrp_group_member | Details | Priority | The priority helps to select the active and the standby routers. The router with the highest priority is selected as the active router. In the priority range of 0 to 255, 0 is the lowest priority and 255 is the highest priority. |
| Cisco | hsrp_group_member | Details | Standby Router | IP Address of the currently standby router for this group. |
| Cisco | hsrp_group_member | Status | State | The current HSRP state of this group on this interface. |
| Cisco | hsrp_group_member | Uncategorized | Group Number | The group to which this HSRP Group Member belongs. |
| Cisco | hsrp_group_member | Uncategorized | Index | The index of the resource which uniquely identifies it on the SNMP tree. |
| Cisco | interface | Details | Connected WWNN | The world wide name of the Remote Node the logged-in Nx_Port belongs to. |
| Cisco | interface | Details | Connected WWPN | The world wide name of the logged-in Nx_Port. |
| Cisco | interface | Details | VSAN | Index of the VSAN to which this interface is statically assigned. |
| Cisco | interface | Network | Attached CDP IP Addresses | The (first) network-layer address of the device as reported in the Address TLV of the most recently received CDP message. For example, if the corresponding instance of cacheAddressType had the value 'ip(1)', then this object would be an IPv4-address. If the neighbor device is SNMP-manageable, it is supposed to generate its CDP messages such that this address is one at which it will receive SNMP messages. Use cdpCtAddressTable to extract the remaining addresses from the Address TLV received most recently. |
| Cisco | network_device | Memory | Memory Utilization | The average utilization of memory on the active supervisor. |

| | | | | |
|---|---|---|---|---|
| Cisco | network_device | Module | Module Critical | The total number of Module on this device that are in the 'critical' state. |
| Cisco | network_device | Module | Module Down | The total number of Module on this device that are in the 'down' state. |
| Cisco | network_device | Module | Module Normal | The total number of Module on this device that are in the 'normal' state. |
| Cisco | network_device | Module | Module Not Functioning | The total number of Module on this device that are in the 'notFunctioning' state. |
| Cisco | network_device | Module | Module Not Present | The total number of Module on this device that are in the 'notPresent' state. |
| Cisco | network_device | Module | Module Shutdown | The total number of Module on this device that are in the 'shutdown' state. |
| Cisco | network_device | Module | Module Unknown | The total number of Module on this device that are in the 'unknown' state. |
| Cisco | network_device | Module | Module Up | The total number of Module on this device that are in the 'up' state. |
| Cisco | network_device | Module | Module Warning | The total number of Module on this device that are in the 'warning' state. |
| Cisco | network_device | Network | Attached CDP IP Addresses | CDP IP Addresses attached to interfaces on this device. |
| Cisco | vsan | Details | In Order Delivery | The InorderDelivery guarantee flag for the local switch on this VSAN. |
| Cisco | vsan | Details | Interoperability Mode | The interoperability mode of the local switch on this VSAN. This object indicates if this device can inter-operate with devices from other vendors on this VSAN. |
| Cisco | vsan | Details | Interoperability Value | This object is used for configuring the interoperability value of the VSAN, to inter-operate with different vendor devices. |
| Cisco | vsan | Details | Load Balancing Type | The type of load balancing used on this VSAN. |

| | | | | |
|---|---|---|---|---|
| Cisco | vsan | Details | Media Type | The network media type on which this VSAN is defined. |
| Cisco | vsan | Details | MTU | The MTU of the VSAN. Normally, this object is 2112 for all VSANs for which object vsanMediaType has the value 'fibreChannel'. |
| Cisco | vsan | Details | Name | The name of the VSAN. |
| Cisco | vsan | Performance | Network Drop Latency | Network latency of this switch on this VSAN. This is the time interval after which the frames are dropped if they are not delivered in the order they were transmitted. |
| Cisco | vsan | Status | Admin State | Represents the configurable state of this VSAN. |
| Cisco | vsan | Status | Operational State | The operational state of the VSAN. Indicates whether traffic can pass thru this VSAN. |
| Cisco | vsan | Status | Row Status | The status of this conceptual row. |
| Cisco | vsan | Uncategorized | Index | The index of the resource which uniquely identifies it on the SNMP tree. |
| Cisco, Dell | network_device | CPU | CPU Utilization | The average utilization of CPU on the active supervisor. |
| Cisco, Dell, Radlan | entity | Status | State | The operational state of the entity. |
| Cisco,Dell | network_device | Fan | Fan Critical | The total number of Fan on this device that are in the 'critical' state. |
| Cisco,Dell | network_device | Fan | Fan Critical Ratio | The ratio of Fan on this device that are in the 'critical' state. |
| Cisco,Dell | network_device | Fan | Fan Down | The total number of Fan on this device that are in the 'down' state. |
| Cisco,Dell | network_device | Fan | Fan Down Ratio | The ratio of Fan on this device that are in the 'down' state. |
| Cisco,Dell | network_device | Fan | Fan Normal | The total number of Fan on this device that are in the 'normal' state. |
| Cisco,Dell | network_device | Fan | Fan Normal Ratio | The ratio of Fan on this device that are in the 'normal' state. |
| Cisco,Dell | network_device | Fan | Fan Not Functioning | The total number of Fan on this device that are in the 'notFunctioning' state. |

| | | | | |
|---|---|---|---|---|
| Cisco,Dell | network_device | Fan | Fan Not Functioning Ratio | The ratio of Fan on this device that are in the 'notFunctioning' state. |
| Cisco,Dell | network_device | Fan | Fan Not Present | The total number of Fan on this device that are in the 'notPresent' state. |
| Cisco,Dell | network_device | Fan | Fan Not Present Ratio | The ratio of Fan on this device that are in the 'notPresent' state. |
| Cisco,Dell | network_device | Fan | Fan Shutdown | The total number of Fan on this device that are in the 'shutdown' state. |
| Cisco,Dell | network_device | Fan | Fan Shutdown Ratio | The ratio of Fan on this device that are in the 'shutdown' state. |
| Cisco,Dell | network_device | Fan | Fan Unknown | The total number of Fan on this device that are in the 'unknown' state. |
| Cisco,Dell | network_device | Fan | Fan Unknown Ratio | The ratio of Fan on this device that are in the 'unknown' state. |
| Cisco,Dell | network_device | Fan | Fan Up | The total number of Fan on this device that are in the 'up' state. |
| Cisco,Dell | network_device | Fan | Fan Up Ratio | The ratio of Fan on this device that are in the 'up' state. |
| Cisco,Dell | network_device | Fan | Fan Warning | The total number of Fan on this device that are in the 'warning' state. |
| Cisco,Dell | network_device | Fan | Fan Warning Ratio | The ratio of Fan on this device that are in the 'warning' state. |
| Cisco,Radlan | network_device | Sensor | Sensor Non-Operational | The total number of Sensor on this device that are in the 'nonoperational' state. |
| Cisco,Radlan | network_device | Sensor | Sensor Non-Operational Ratio | The ratio of Sensor on this device that are in the 'nonoperational' state. |
| Cisco,Radlan | network_device | Sensor | Sensor Ok | The total number of Sensor on this device that are in the 'ok' state. |
| Cisco,Radlan | network_device | Sensor | Sensor Ok Ratio | The ratio of Sensor on this device that are in the 'ok' state. |
| Cisco,Radlan | network_device | Sensor | Sensor Unavailable | The total number of Sensor on this device that are in the 'unavailable' state. |
| Cisco,Radlan | network_device | Sensor | Sensor Unavailable Ratio | The ratio of Sensor on this device that are in the 'unavailable' state. |
| Dell | chassis | Details | Asset Tag | The asset tag of the product. |

| | | | | |
|---|---|---|---|---|
| Dell | chassis | Details | Index | The index of the resource which uniquely identifies it on the SNMP tree. |
| Dell | chassis | Details | Serial Number | The serial number of the product. |
| Dell | chassis | Details | Service Tag | The service tag of the product. |
| Dell | network_device | Details | Product Description | A short description of this product such as 'Ethernet Router Switch'. |
| Dell | network_device | Details | Product Version | The version of the product. |
| Dell | network_device | Memory | Memory Free | The total memory free for utilization. |
| Dell | network_device | Memory | Total Memory Available | The total memory available. |
| Dell | network_device | Power Supply | Power Supply Critical | The total number of Power Supply on this device that are in the 'critical' state. |
| Dell | network_device | Power Supply | Power Supply Critical Ratio | The ratio of Power Supply on this device that are in the 'critical' state. |
| Dell | network_device | Power Supply | Power Supply Normal | The total number of Power Supply on this device that are in the 'normal' state. |
| Dell | network_device | Power Supply | Power Supply Normal Ratio | The ratio of Power Supply on this device that are in the 'normal' state. |
| Dell | network_device | Power Supply | Power Supply Not Functioning | The total number of Power Supply on this device that are in the 'notFunctioning' state. |
| Dell | network_device | Power Supply | Power Supply Not Functioning Ratio | The ratio of Power Supply on this device that are in the 'notFunctioning' state. |
| Dell | network_device | Power Supply | Power Supply Not Present | The total number of Power Supply on this device that are in the 'notPresent' state. |
| Dell | network_device | Power Supply | Power Supply Not Present Ratio | The ratio of Power Supply on this device that are in the 'notPresent' state. |
| Dell | network_device | Power Supply | Power Supply Shutdown | The total number of Power Supply on this device that are in the 'shutdown' state. |
| Dell | network_device | Power Supply | Power Supply Shutdown Ratio | The ratio of Power Supply on this device that are in the 'shutdown' state. |

| | | | | |
|---|---|---|---|---|
| Dell | network_device | Power Supply | Power Supply Warning | The total number of Power Supply on this device that are in the 'warning' state. |
| Dell | network_device | Power Supply | Power Supply Warning Ratio | The ratio of Power Supply on this device that are in the 'warning' state. |
| Dell | network_device | Status | Global Status | Current status of the product. This is a rollup for the entire product. The status is intended to give initiative to a snmp monitor to get further data when this status is abnormal. |
| N/A | chassis | Details | Internal Vendor | The vendor(s) that our product is assigned based on the MiBs it can collect. |
| N/A | chassis | Details | System Name | An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. |
| N/A | chassis | Details | System Object ID | The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.424242, it could assign the identifier 1.3.6.1.4.1.424242.1.1 to its 'Fred Router'. |
| N/A | entity | Details | Internal Vendor | The vendor(s) that our product is assigned based on the MiBs it can collect. |

| | | | | |
|---|---|---|---|---|
| N/A | entity | Details | System Name | An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. |
| N/A | entity | Details | System Object ID | The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.424242, it could assign the identifier 1.3.6.1.4.1.424242.1.1 to its 'Fred Router'. |
| N/A | hsrp_group | Details | Internal Vendor | The vendor(s) that our product is assigned based on the MiBs it can collect. |
| N/A | hsrp_group_member | Details | Internal Vendor | The vendor(s) that our product is assigned based on the MiBs it can collect. |
| N/A | hsrp_group_member | Details | System Name | An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. |

| | | | | |
|---|---|---|---|---|
| N/A | hsrp_group_member | Details | System Object ID | The vendor's authoritative identification of the network management subsystem contained in the entity. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.424242, it could assign the identifier 1.3.6.1.4.1.424242.1.1 to its 'Fred Router'. |
| N/A | interface | Details | Internal Vendor | The vendor(s) that our product is assigned based on the MiBs it can collect. |
| N/A | interface | Details | System Name | An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. |
| N/A | interface | Details | System Object ID | The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.424242, it could assign the identifier 1.3.6.1.4.1.424242.1.1 to its 'Fred Router'. |
| N/A | l3_interface | Details | Internal Vendor | The vendor(s) that our product is assigned based on the MiBs it can collect. |

| | | | | |
|---|---|---|---|---|
| N/A | l3_interface | Details | System Name | An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. |
| N/A | l3_interface | Details | System Object ID | The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.424242, it could assign the identifier 1.3.6.1.4.1.424242.1.1 to its 'Fred Router'. |
| N/A | network_device | Details | Internal Vendor | The vendor(s) that our product is assigned based on the MiBs it can collect. |
| N/A | network_device | Network | Connected IP Addresses | IP Addresses of devices connected. |
| N/A | network_device | Network | IP Address | IP Address of this device. |
| N/A | vsan | Details | Internal Vendor | The vendor(s) that our product is assigned based on the MiBs it can collect. |
| N/A | vsan | Details | System Name | An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. |

| | | | | |
|---|---|---|---|---|
| N/A | vsan | Details | System Object ID | The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.424242, it could assign the identifier 1.3.6.1.4.1.424242.1.1 to its 'Fred Router'. |
| Radlan | interface | Details | Admin Duplex Mode | This variable specifies whether this interface should operate in half duplex or full duplex mode. This specification will take effect only if swIfSpeedDuplexAutoNegotiation is disabled. A value of 'none' is returned if a value of the variable hasn't been set. |
| Radlan | interface | Details | Default VLAN Tag | This variable specifies the default VLAN tag which will be attached to outgoing frames if swIfTaggedMode for this interface is enabled. |
| Radlan | interface | Details | Duplex Mode | This variable indicates whether this interface operates in half duplex or full duplex mode. This variable can have the values hybrid or unknown only for a trunk. unknown - only if trunk operative status is not present. |

## Management Pack for Oracle Database

The **Management Pack for Oracle Database** is an embedded adapter for VMware Cloud Foundation Operations, collecting performance and capacity data from your Oracle Database environment and providing predictive analytics and real-time information about problems in your infrastructure—all within the VCF Operations user interface.

### Notable Features

The Management Pack for Oracle Database provides the following notable features:

- **Comprehensive monitoring dashboards**

- **Key performance metrics** such as I/O Throughput, Average I/O Time, Row Cache Hit Ratio, and Buffer Cache Hit Ratio
- **Out-of-the-box reports** for Oracle Database Health, Tablespace, Instance Session Capacity, and more
- **Relationship mapping** between Oracle Database and the virtual layer
- **Detailed alerts and recommendations** to help keep you on top of issues

**See also:**

System Requirements

### System Requirements for Management Pack for Oracle Database

Before installing and configuring the Management Pack, ensure your system meets the following requirements.

For compatibility between products, please refer to:

VMware Cloud Foundation Operations Interoperability for Oracle Database

-OR-

Third Party Solution Interoperability for Oracle Database

> **Restriction:**
>
> Oracle DB Management Pack does not support FIPS mode.

| | Oracle Database Requirements |
|---|---|
| Connection | **Oracle Database instance** hostname or IP address<br>**SID/Service Name** required to connect to the instance<br>**Default Ports**:<br>• **Non-SSL**: 1521 (TCP)<br>• **SSL:** 2484 (TCP) |
| Credentials | **Oracle Database User Name** and **Password**<br>**Note:**<br>For details on the minimum user privileges that must be granted for your monitoring user, see: Configuring a Least-Privileged User (LPU). |

Configuring a Least-Privileged User (LPU)

This topic contains the minimum Oracle Database user privileges required for creating a least-privileged user (LPU) for the management pack, as well as a script to help automate its creation.

#### Creating a Oracle Database Monitoring User

The following script can be used to help automate the creation of your least-privileged user. It includes the minimum Oracle Database user privileges required for the management pack.

To grant all necessary access to the LPU run the following queries.

> **Note:**
>
> For multitenant databases, a "common user" must be provisioned, which requires connection to the CDB root. The specified username must be prefixed with `C##`. The `CONTAINER_DATA` attribute must also be set after the user has been created, e.g.
>
> ```
> ALTER USER c##monitoring_user SET CONTAINER_DATA=ALL CONTAINER=CURRENT;
> ```

```
CREATE USER LPU IDENTIFIED BY LPU_PASSWORD;
GRANT CONNECT TO LPU;
GRANT CREATE SESSION TO LPU;
GRANT SELECT ON CDB_DATA_FILES TO LPU;
```

```
GRANT SELECT ON CDB_OUTSTANDING_ALERTS TO LPU;
GRANT SELECT ON CDB_TABLESPACES TO LPU;
GRANT SELECT ON CDB_TABLESPACE_USAGE_METRICS TO LPU;
GRANT SELECT ON DBA_DATA_FILES TO LPU;
GRANT SELECT ON DBA_FREE_SPACE TO LPU;
GRANT SELECT ON DBA_OUTSTANDING_ALERTS TO LPU;
GRANT SELECT ON DBA_TABLESPACES TO LPU;
GRANT SELECT ON DBA_TABLESPACE_USAGE_METRICS TO LPU;
GRANT SELECT ON DBA_TEMP_FILES TO LPU;
GRANT SELECT ON DBA_TEMP_FREE_SPACE TO LPU;
GRANT SELECT ON DBA_UNDO_EXTENTS TO LPU;
GRANT SELECT ON DUAL TO LPU;
GRANT SELECT ON GLOBAL_NAME TO LPU;
GRANT SELECT ON GV_$ARCHIVED_LOG TO LPU;
GRANT SELECT ON GV_$ARCHIVE_DEST TO LPU;
GRANT SELECT ON GV_$ASM_DISK_STAT TO LPU;
GRANT SELECT ON GV_$CON_SYSSTAT TO LPU ;
GRANT SELECT ON GV_$CON_SYSSTAT TO LPU;
GRANT SELECT ON GV_$FILESTAT TO LPU;
GRANT SELECT ON GV_$INSTANCE TO LPU;
GRANT SELECT ON GV_$PARAMETER TO LPU;
GRANT SELECT ON GV_$PDBS TO LPU;
GRANT SELECT ON GV_$RESOURCE_LIMIT TO LPU;
GRANT SELECT ON GV_$SERVICE_STATS TO LPU;
GRANT SELECT ON GV_$SESSION TO LPU;
GRANT SELECT ON GV_$SESSION_LONGOPS TO LPU;
GRANT SELECT ON GV_$SGAINFO TO LPU;
GRANT SELECT ON GV_$SQL TO LPU;
GRANT SELECT ON GV_$SYSMETRIC TO LPU;
GRANT SELECT ON GV_$SYSSTAT TO LPU;
GRANT SELECT ON GV_$SYSTEM_EVENT TO LPU;
GRANT SELECT ON GV_$SYSTEM_WAIT_CLASS TO LPU;
GRANT SELECT ON GV_$TEMPSTAT TO LPU;
GRANT SELECT ON V_$ARCHIVE_DEST TO LPU;
GRANT SELECT ON V_$CONTROLFILE TO LPU;
GRANT SELECT ON V_$DATABASE TO LPU;
GRANT SELECT ON V_$DATAFILE TO LPU;
GRANT SELECT ON V_$DB_CACHE_ADVICE TO LPU;
GRANT SELECT ON V_$FILESTAT TO LPU;
GRANT SELECT ON V_$INSTANCE TO LPU;
GRANT SELECT ON V_$LOG TO LPU;
GRANT SELECT ON V_$LOGFILE TO LPU;
GRANT SELECT ON V_$MEMORY_TARGET_ADVICE TO LPU;
GRANT SELECT ON V_$PARAMETER TO LPU;
GRANT SELECT ON V_$PGA_TARGET_ADVICE TO LPU;
GRANT SELECT ON V_$RECOVERY_AREA_USAGE TO LPU;
GRANT SELECT ON V_$RESOURCE_LIMIT TO LPU;
GRANT SELECT ON V_$RMAN_BACKUP_JOB_DETAILS TO LPU;
GRANT SELECT ON V_$SGA_TARGET_ADVICE TO LPU;
GRANT SELECT ON V_$SHARED_POOL_ADVICE TO LPU;
GRANT SELECT ON V_$TEMPFILE TO LPU;
GRANT SELECT ON V_$VERSION TO LPU;
```

### Troubleshooting the Management Pack

Once you have finished Installing and Configuring the Management Pack , check the **Collection State** and **Collection Status** for the adapter instance on the **Solutions** page. If they show as **Not Collecting** or **No Data Receiving**,

respectively, the following troubleshooting topics can help you diagnose and correct common problems with your adapter instance.

- Test Connection Errors
- Adapter and Collector Log Files

### Test Connection Errors

When Creating an Adapter Instance , click **Test Connection** after entering all of your configuration settings to ensure VMware Cloud Foundation Operations can connect to the specified host.

The following errors are possible:

User Authentication Error

**Error Message**: Unable to establish a valid connection to target system. User Authentication error.

**Description:** Ensure the correct Oracle Database User Name and Password were entered when Creating a Credential .

Host, port, or SSL settings are incorrect

**Error Message**: Host, port, or SSL settings are incorrect.

**Description:** Ensure the correct hostname, port number, and SSL settings for the Oracle Database instance were entered when adding your adapter instance. Ensure you are using the default port that corresponds to the applicable SSL settings (non-SSL = 1521; SSL = 2484).

SID/Service Name is invalid

**Error Message**: The given SID/Service Name is invalid.

**Description:** Check your Oracle Database database system and ensure your SID/Service name is the same as the one entered for your adapter instance.

Invalid character(s) found in SID/Service Name

**Error Message**: Invalid character(s) found in SID/Service Name.

**Description:** Make sure your SID/Service Name contains only alpha-numberic characters.

SSL RC4 Cipher Suites compromised

**Error Message**: SSL RC4 Cipher Suites are considered compromised (and disabled) with Java 1.8.0_60+.

**Description**: Configure the Oracle Database to not use SSL RC4 Cipher Suites. To configure valid SSL Cipher Suites for an Oracle database either use the netca utility installed with Oracle Database, or edit the sqlnet.ora file.

**Error Message**: ORA-00942 Table or view does not exist

**Description**: Database user may be missing privileges required for collecting data from this table. Please review the user privilages and compare them with the Least-Privileged User (LPU) recommendations.

### Adapter and Collector Log Files

You can review adapter errors in the adapter and collector log files, which can be viewed in the VMware Cloud Foundation Operations UI or in an external log viewer.

- **Adapter log files** are located in the $VCOPS_BASE/user/log/adapters/OracleDatabaseAdapter/ folder.
- **Collector log files** are located in the $VCOPS_BASE/user/log/ folder.

To set the base log level for the collector in VMware Cloud Foundation Operations:

1. Navigate to **Administration > Logs**.
2. Expand the **PRIMARY** folder, then select the **COLLECTOR** folder.
3. Click the **Edit Properties**icon.
4. In the **Root logger level** drop-down menu, select the desired option:
   – The default logging level is **warning.**

- To troubleshoot issues, set the logging level to **info.**
- To view detailed messages, including micro steps, queries, and returned results, set the logging level to **debug.**

  **Note:**

  If you set the logging level to **debug,** log files can become large very quickly. Set the logging level to **debug** only for short periods of time.

For more information about viewing log files and modifying levels, refer to the VMware Cloud Foundation Operations online help.

### Using the Management Pack

The Management Pack for Oracle Database includes the following out-of-the-box features, harnessing the power of the VCF Operations user interface:

- Resource Kinds and Relationships
- Inventory Tree (Traversal Spec)
- Dashboards
- Views
- Reports
- Analysis Badges and Capacity Definitions
- Alerts
- Metrics

#### Inventory Tree (Traversal Spec)

The Inventory Tree (Traversal Spec) feature in VCF Operations allows you to easily navigate your Oracle Database environment. The hierarchical structure implicitly shows relationships among resources and enables quick drill-downs to root-cause issues.

To access your Oracle Database Inventory Tree, select **Environment** from the top navigation bar, then select **Oracle Database** from the left panel. Click on a resource from the Inventory Tree to populate details about the resource on the right.

#### Resource Kinds and Relationships

The Management Pack for Oracle Database creates Resource Kinds and Relationships (associations) for critical resources in your Oracle Database environment.

**Resource Kinds**

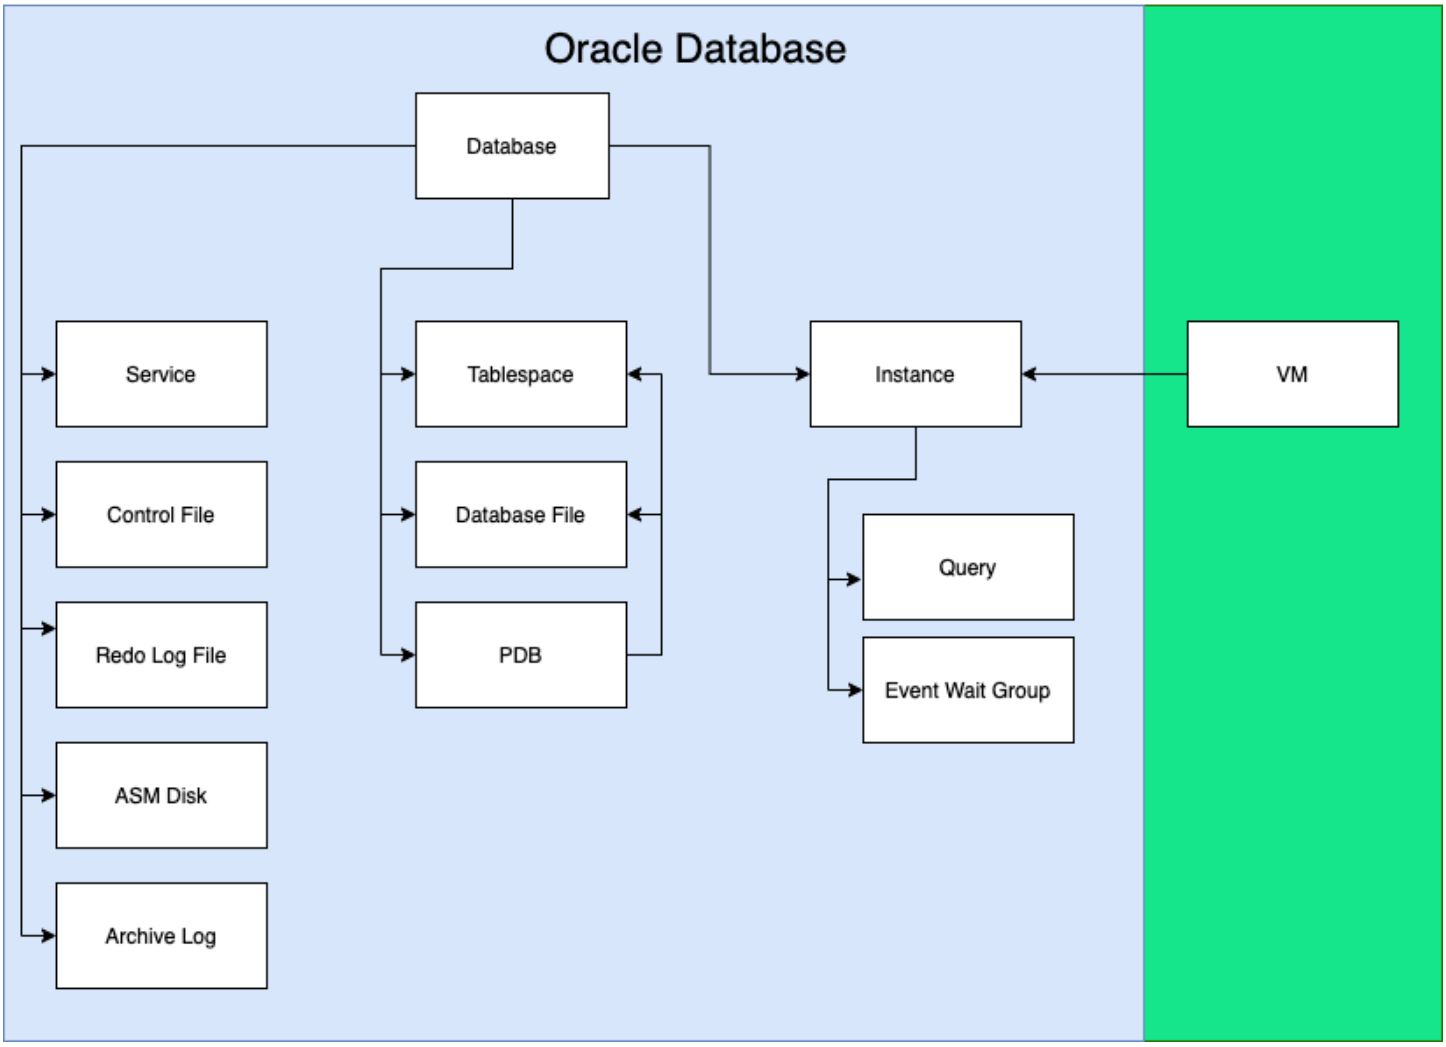
Performance, health, and availability data are collected for the following Oracle Database resource kinds:

1. Oracle Database Archive Log
2. Oracle Database ASM Disk
3. Oracle Database Control File
4. Oracle Database Database
5. Oracle Database Database File
6. Oracle Database Event Wait Group
7. Oracle Database Instance
8. Oracle Database PDB
9. Oracle Database Query
10. Oracle Database Redo Log File
11. Oracle Database Service
12. Oracle Database Tablespace

## Relationships

Relationships among discovered resources are also created by the Management Pack. The hierarchical structure of those relationships is depicted in the diagram below.

**Oracle Database Relationships Diagram**



## External Relationships

The Management Pack for Oracle Database also discovers the following external relationships:

- Oracle Database Instance > VMware Virtual Machine
- Oracle Database Instance > EP Ops

### Dashboards

Dashboards are the primary feature for monitoring and troubleshooting Oracle Database problems from within VCF Operations.

The following dashboards are included in the Management Pack for Oracle Database :

- **Oracle Database Database Drill Down**
- **Oracle Database Infrastructure Drill Down**

### Views

The Management Pack for Oracle Database creates views that allow the user to view statistics of metrics for Oracle Database resources. The views help give a broad picture of the entire system, as opposed to a more in depth view.

The following views are available in the Management Pack:

| View | Type | Description |
|---|---|---|
| **Oracle Database Configuration** | List | Shows Oracle Database Properties |
| **Oracle Database Overview** | List | Shows key metrics for Oracle Databases |
| **Oracle Health** | List | Shows health and availability for all Oracle objects |
| **Oracle Instance Overview** | List | Oracle Instance Overview |
| **Oracle Instance Waits** | List | Shows wait values for Oracle Instances |
| **Oracle Slow Queries** | List | Shows top slowest queries by Oracle Instance |
| **Oracle Tablespace** | List | Shows Tablespace metrics |
| **Oracle Instance Configuration** | List | Shows properties for Oracle Instances |

To access the Management Pack views:

1. Navigate to **Environment > All Objects > Oracle Database**.
2. Double-click on the desired object (resource).
3. Select the **Details** tab, then **Views.**

The available views for that resource are listed and can be selected.

### Reports

The Management Pack for Oracle Database contains out-of-the-box report(s)—which contain one or more Views—that you can export and easily share with key stakeholders in either .pdf or .csv formats.

The following reports are available in the Management Pack:

| Report | Description |
|---|---|
| **Oracle Database Overview** | Provides an overview of Oracle Database resources |
| **Oracle Health** | Provides health details about your Oracle Database resources |
| **Oracle Instance Overview** | Provides an overview specific to your Oracle Database instance |
| **Oracle KPIs** | Provides KPIs for your Oracle Database resources |
| **Oracle Tablespaces** | Provides details related to your Oracle Database Tablespaces |

To access Management Pack reports:

1. Navigate to **Environment > All Objects > Oracle Database**.
2. Double-click on the desired object (resource).
3. Select the **Reports** tab, then **Report Templates**.

The available report(s) for the selected resource are listed and can be selected.

To run a selected report, click the **Run Template** icon.

### Analysis Badges and Capacity Definitions

Using the predictive analytics capabilities of VCF Operations Analysis Badges through capacity definitions, the Management Pack for Oracle Database populates capacities as indicated in the table below.

### Capacity Definitions List

| Container | Use in Workload |
|---|---|
| **Oracle Database Instance** | |
| Calculated Session Capacity | yes |

Alerts

The VCF Operations Management Pack for Oracle Database pulls Oracle Database health indicators and displays them in VCF Operations as alerts. The critical levels of each alert are closely mapped from Oracle Database to VCF Operations. See the table below for the list of alerts available in the Management Pack.

### Alerts List

| Name | Description | Recommendation |
|---|---|---|
| ASM Disk Free Space is Low | ASM Disk Free Space is Low | ASM Disk Free Space Less Than 15%\|ASM Disk Free Space Less Than 10%\|ASM Disk Free Space Less Than 5% |
| ASM Status Not Normal | ASM Status Not Normal | Automatic Storage Management metadata indicates that the disk is known to be part of the Automatic Storage Management disk group, but no disk in the storage system was found with the indicated name\|Disk is present in the system, but is ignored by ASM |
| Archive Logging Disabled | Archive Logging Disabled | All databases should run in archive log mode. Enable archive logging |
| Average Datafile Read Duration Above Threshold | Average Datafile Read Duration Above Threshold | |
| Fast Recovery Area Not Configured | Fast Recovery Area Not Configured | Fast Recovery Area Should Be Configured |
| Database Flashback Disabled | Database Flashback Disabled | Database flashback is a useful facility for rapid recovery following a user error and should be enabled |
| Process Limit Above Threshold | Process Limit Above Threshold | Sessions will fail if the process limit is hit. Increase the limit for processes |
| Session Usage Above Threshold | Session Usage Above Threshold | Logins will begin to fail if the session limit is hit. Increase the limit for sessions |
| Datafile Not Available | Datafile Not Available | |
| High CPU Usage | High CPU Usage | |
| High Physical Read I/O Request | High Physical Read I/O Request | |
| High Volume Of User Calls | High Volume Of User Calls | |
| High Redo Logs Generated | High Redo Logs Generated | |
| High Average I/O Time | High Average I/O Time | |
| Long Read Time | Long Read Time | |
| Slow Write Time | Slow Write Time | |
| Database Not Active | Database Not Active | The database instance is not currently active. Connect to the instance and review the process status. |
| Low Buffer Cache Hit Ratio | Low Buffer Cache Hit Ratio | Review the buffer size configuration. |
| High Number of CR Blocks Created | High Number of CR Blocks Created | |
| Low Cursor Cache Hit Ratio | Low Cursor Cache Hit Ratio | |

| Name | Description | Recommendation |
|---|---|---|
| High Database CPU Time Usage | High Database CPU Time Usage | |
| High Database Wait Time | High Database Wait Time | |
| High Number of Enqueue Deadlocks | High Number of Enqueue Deadlocks | |
| Large Number of Executions | Large Number of Executions | |
| Number of Executions Per Second Exceeded Threshold | Number of Executions Per Second Exceeded Threshold | |
| High Volume of Executions Per Transaction | High Volume of Executions Per Transaction | |
| High I/O Throughput | High I/O Throughput | |
| Low Library Cache Hit Ratio | Low Library Cache Hit Ratio | |
| Slow Table Scans | Slow Table Scans | |
| Low PGA Cache Hit Percentage | Low PGA Cache Hit Percentage | |
| High Write Volume | High Write Volume | |
| Slow Response Time During Transactions | Slow Response Time During Transactions | |
| Low Cache Hit Ratio | Low Cache Hit Ratio | |
| Slow Service Response | Slow Service Response | |
| Large Number of Active Sessions | Large Number of Active Sessions | |
| Large Number of Applications | Large Number of Applications | |
| High Volume of Index Scans Per Transactions | High Volume of Index Scans Per Transactions | |
| Above Normal Query Time | Above Normal Query Time | |

Metrics

The Management Pack for Oracle Database collects the metrics listed in the table below, according to Oracle Database resource kinds.

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database Archive Log | Disk | Backup Count | Indicates the number of times this file has been backed up. Values range from 0-15. If the file has been backed up more than 15 times, the value remains 15 |
| Oracle Database Archive Log | Performance | Completion Time | Time when the archiving completed |
| Oracle Database Archive Log | General | Deleted | Indicates whether an RMAN DELETE command has physically deleted the archived log file from disk, as well as logically removing it from the control file of the target database and from the recovery catalog (YES) or not (NO) |
| Oracle Database Archive Log | General | Destination ID | Original destination from which the archive log was generated |
| Oracle Database Archive Log | General | Instance ID | |
| Oracle Database Archive Log | General | Name | Archived log file name |
| Oracle Database Archive Log | General | Record ID | Archived log record ID |
| Oracle Database Archive Log | Disk | Size | Size of the archive log |
| Oracle Database Archive Log | Status | Status | Status of the archived log |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database Archive Log | General | Thread Number | Redo Thread Number |
| Oracle Database ASM Disk | General | Compound Index | A 32-bit number consisting of a disk group number in the high-order 8 bits and a disk number in the low-order 24 bits |
| Oracle Database ASM Disk | General | Create Date | Date and time when the disk was added to the disk group |
| Oracle Database ASM Disk | Disk | Total Disk Capacity | Total capacity of the disk |
| Oracle Database ASM Disk | General | Disk Number | Number assigned to the disk withing its group |
| Oracle Database ASM Disk | General | Fail Group | Name of the failure group containing the disk |
| Oracle Database ASM Disk | Disk | Free Disk Space | Unused capacity of the disk |
| Oracle Database ASM Disk | Details | Group Number | Number of the disk group containing the disk |
| Oracle Database ASM Disk | Status | Header Status | Per-instance status of the disk as seen by discovery |
| Oracle Database ASM Disk | General | Instance ID | |
| Oracle Database ASM Disk | General | Discovery Label | Disk label portion of the name returned by discovery |
| Oracle Database ASM Disk | General | Library | Name of the library that discovered the disk |
| Oracle Database ASM Disk | Status | Mode Status | Global status about which kinds of I/O requests are allowed to the disk |
| Oracle Database ASM Disk | General | Mount Date | Date and time when the disk was was first mounted by the first instance |
| Oracle Database ASM Disk | Status | Mount Status | Per-instance status of the disk relative to group mounts |
| Oracle Database ASM Disk | General | Name | Name of the disk |
| Oracle Database ASM Disk | General | Path | Operating system pathname portion of the name returned by discovery |
| Oracle Database ASM Disk | General | Product | The name of the manufacturer and the name of the product |
| Oracle Database ASM Disk | Performance | Read | Total number of bytes read from the disk |
| Oracle Database ASM Disk | Performance | Read Errors | Total number of failed I/O read requests for the disk |
| Oracle Database ASM Disk | Performance | Read Time | Total I/O time for read requests for the disk |
| Oracle Database ASM Disk | Disk | Reads | Total number of I/O read requests for the disk |
| Oracle Database ASM Disk | General | Redundancy | External redundancy of the disk |
| Oracle Database ASM Disk | Status | State | Global state of the disk with respect to the disk group |
| Oracle Database ASM Disk | General | Universal Device ID | Universal Device ID portion of the name returned by discovery |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database ASM Disk | Performance | Bytes Written | Total number of bytes written to the disk |
| Oracle Database ASM Disk | Performance | Write Errors | Total number of failed I/O write requests for the disk |
| Oracle Database ASM Disk | Performance | Write Time | Total I/O time for write requests for the disk |
| Oracle Database ASM Disk | Disk | Writes | Total number of I/O write requests for the disk |
| Oracle Database ASM Disk | Disk | ASM Free Space | ASM free disk space percentage |
| Oracle Database Control File | General | Name | |
| Oracle Database Control File | General | Control File Size | |
| Oracle Database Database | Activity | Average Datafile Read Duration | |
| Oracle Database Database | General | Oracle Database Type | |
| Oracle Database Database | General | Cluster Database | |
| Oracle Database Database | General | Multiplexed Archive Log Files Count | |
| Oracle Database Database | General | Multiplexed Online Log Files Average Count | |
| Oracle Database Database | Activity | Connection Processes | |
| Oracle Database Database | General | Container ID | |
| Oracle Database Database | General | Controlfile Count | |
| Oracle Database Database | General | database_id | |
| Oracle Database Database | General | Database Type | Non-CDB, CDB, or PDB |
| Oracle Database Database | Undo | Expired Undo Extents Size | |
| Oracle Database Database | General | Fast Recovery Area | |
| Oracle Database Database | Activity | Fast Recovery Area Usage | |
| Oracle Database Database | General | Flashback Enabled | |
| Oracle Database Database | General | Global Name | |
| Oracle Database Database | General | Host List | |
| Oracle Database Database | General | Instances | |
| Oracle Database Database | Activity | Last RMAN Backup | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database Database | General | Archive Log Mode | |
| Oracle Database Database | Activity | Long Running Jobs | |
| Oracle Database Database | General | Oracle Managed Files | |
| Oracle Database Database | Activity | Processes Usage | |
| Oracle Database Database | Activity | Sessions Usage | |
| Oracle Database Database | Undo | Undo Tablespace Size | |
| Oracle Database Database | Undo | Unexpired Undo Extents Size | |
| Oracle Database Database File | General | Autoextensible | |
| Oracle Database Database File | Disk IO | Average I/O Time | |
| Oracle Database Database File | Disk IO | Average Read Time | |
| Oracle Database Database File | Disk IO | Average Write Time | |
| Oracle Database Database File | General | Container ID | |
| Oracle Database Database File | General | File Name | |
| Oracle Database Database File | Disk IO | Max Read Time | |
| Oracle Database Database File | General | Max Size | |
| Oracle Database Database File | Disk IO | Max Write Time | |
| Oracle Database Database File | Disk IO | Physical Blocks Read | |
| Oracle Database Database File | Disk IO | Physical Blocks Written | |
| Oracle Database Database File | Disk IO | Physical Reads | |
| Oracle Database Database File | Disk IO | Physical Writes | |
| Oracle Database Database File | Disk IO | Read Time | |
| Oracle Database Database File | Disk IO | Single Blocks Read | |
| Oracle Database Database File | General | Size | |
| Oracle Database Database File | Status | Status | |
| Oracle Database Database File | General | Tablespace Name | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database Database File | Disk IO | Write Time | |
| Oracle Database Event Wait Group | Activity | Foreground Time Waited | |
| Oracle Database Event Wait Group | Activity | Foreground Waits | |
| Oracle Database Event Wait Group | General | Instance ID | |
| Oracle Database Event Wait Group | Activity | Total Time Waited | |
| Oracle Database Event Wait Group | Activity | Total Waits | |
| Oracle Database Event Wait Group | General | Wait Class | |
| Oracle Database Instance | Performance | Active Parallel Sessions | |
| Oracle Database Instance | Performance | Active Serial Sessions | |
| Oracle Database Instance | General | Active State | |
| Oracle Database Instance | Session | Active User Sessions | |
| Oracle Database Instance | Session | Applications | |
| Oracle Database Instance | General | Archiver | |
| Oracle Database Instance | Performance | Average Active Sessions | |
| Oracle Database Instance | Disk IO | Average I/O Time | The average Input/Output time of the physical storage on the disk. |
| Oracle Database Instance | Disk IO | Average Read Time | Average read time to the physical storage on the disk. |
| Oracle Database Instance | Performance | Average Synchronous Single-Block Read Latency | |
| Oracle Database Instance | Disk IO | Average Write Time | Average write time to the physical storage on the disk. |
| Oracle Database Instance | Activity | Background Checkpoints | |
| Oracle Database Instance | Performance | Background Checkpoints | |
| Oracle Database Instance | Performance | Background CPU Usage | |
| Oracle Database Instance | Performance | Background Time | |
| Oracle Database Instance | Session | Background Types | |
| Oracle Database Instance | General | Blocked | |
| Oracle Database Instance | Session | Blocked by Unknown User Sessions | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database Instance | Session | Blocked User Sessions | |
| Oracle Database Instance | Activity | Branch Node Splits | |
| Oracle Database Instance | Performance | Branch Node Splits Per Transaction | |
| Oracle Database Instance | Performance | Branch Node Splits | |
| Oracle Database Instance | Performance | Buffer Cache Hit Ratio | |
| Oracle Database Instance | Shared Memory | Buffer Cache Size | |
| Oracle Database Instance | Session | Cached User Sessions | |
| Oracle Database Instance | Performance | Cell Physical I/O Interconnect | |
| Oracle Database Instance | Activity | Consistent Read Blocks Created | |
| Oracle Database Instance | Activity | Consistent Read Changes | |
| Oracle Database Instance | Performance | Consistent Read Changes Per Transaction | |
| Oracle Database Instance | Performance | Consistent Read Changes | |
| Oracle Database Instance | Activity | Consistent Read Gets | |
| Oracle Database Instance | Performance | Consistent Read Gets Per Transaction | |
| Oracle Database Instance | Performance | Consistent Read Gets | |
| Oracle Database Instance | Activity | Consistent Read Undo Records Applied | |
| Oracle Database Instance | Activity | CPU Usage | |
| Oracle Database Instance | Performance | CPU Usage Per Transaction | |
| Oracle Database Instance | Performance | CPU Usage | |
| Oracle Database Instance | Performance | Consistent Read Blocks Created | |
| Oracle Database Instance | Performance | Consistent Read Blocks Created Per Transaction | |
| Oracle Database Instance | Performance | Consistent Read Undo Records Applied | |
| Oracle Database Instance | Performance | Consistent Read Undo Records Applied Per Transaction | |
| Oracle Database Instance | Performance | Current Logons Count | |
| Oracle Database Instance | Performance | Current Open Cursors Count | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database Instance | Performance | Current OS Processes Load | |
| Oracle Database Instance | Performance | Cursor Cache Hit Ratio | |
| Oracle Database Instance | Activity | Data Definition Language Statements Parallelized | |
| Oracle Database Instance | Activity | Data Manipulation Language Statements Parallelized | |
| Oracle Database Instance | Shared Memory | Data Transfer Cache Size | |
| Oracle Database Instance | Activity | Database Block Changes | |
| Oracle Database Instance | Activity | Database Block Gets | |
| Oracle Database Instance | Performance | Database CPU Time Ratio | |
| Oracle Database Instance | General | Database Status | |
| Oracle Database Instance | Performance | Database Time | |
| Oracle Database Instance | Performance | Database Wait Time Ratio | |
| Oracle Database Instance | Activity | Database Writer Checkpoints | |
| Oracle Database Instance | Performance | Database Block Changes | |
| Oracle Database Instance | Performance | Database Block Changes Per Transaction | |
| Oracle Database Instance | Performance | Database Block Changes Per User Call | |
| Oracle Database Instance | Performance | Database Block Gets | |
| Oracle Database Instance | Performance | Database Block Gets Per Transaction | |
| Oracle Database Instance | Performance | Database Block Gets Per User Call | |
| Oracle Database Instance | Performance | Database Writer Checkpoints | |
| Oracle Database Instance | Performance | Data Definition Language Statements Parallelized | |
| Oracle Database Instance | Activity | Direct Read Full Index Scans | |
| Oracle Database Instance | Disk IO | Disk Sorts | |
| Oracle Database Instance | Performance | Disk Sort Per Transaction | |
| Oracle Database Instance | Performance | Disk Sort | |
| Oracle Database Instance | Performance | Data Manipulation Language Statements Parallelized | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database Instance | Activity | Enqueue Deadlocks | |
| Oracle Database Instance | Performance | Enqueue Deadlocks Per Transaction | |
| Oracle Database Instance | Performance | Enqueue Deadlocks | |
| Oracle Database Instance | General | Enqueue Locks Limit | |
| Oracle Database Instance | Activity | Enqueue Locks Utilization | |

| Oracle Database PDB | Activity | Parallel Execution downgraded to serial | |
| Oracle Database PDB | Activity | Parallel Execution Operations Not Downgraded | |
| Oracle Database PDB | Activity | Physical Application Data Written | Total size of all disk writes by application activity (and not other instance activity) only. |
| Oracle Database PDB | Disk | Physical Application Read I/O Requests | Number of read requests for application activity (mainly buffer cache and direct load operation) which read one or more database blocks per request. This is a subset of "Cumulative Physical Read IO Requests" statistic. |
| Oracle Database PDB | Disk | Physical Application Write I/O Requests | Number of write requests for application activity (mainly buffer cache and direct load operation) which write one or more database blocks per request. This is a subset of "Cumulative Physical Write IO Requests" statistic. |
| Oracle Database PDB | Disk IO | Physical Blocks Read | |
| Oracle Database PDB | Disk IO | Physical Blocks Written | |
| Oracle Database PDB | Disk | Physical Data Read | Total size of disk reads by all database instance activity including application reads, backup and recovery, and other utilities. The difference between this value and "Cumulative Physical Application Data Read" gives the total read size by non-application workload. |
| Oracle Database PDB | Disk | Physical Data Written | Total size of disk writes by all database instance activity including application writes, backup and recovery, and other utilities. The difference between this value and "Cumulative Physical Application Data Written" gives the total write size by non-application workload. |
| Oracle Database PDB | Disk | Physical Read I/O Requests | Number of read requests which read one or more database blocks for all instance activity including application, backup and recovery, and other utilities. |
| Oracle Database PDB | Disk IO | Physical Reads | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database PDB | Activity | Physical Reads Direct | |
| Oracle Database PDB | Disk | Physical Reads Direct Lobs | |
| Oracle Database PDB | Disk | Physical Write I/O Requests | Number of write requests which write one or more database blocks for all instance activity including application, backup and recovery, and other utilities. |
| Oracle Database PDB | Disk IO | Physical Writes | |
| Oracle Database PDB | Disk | Physical Writes Direct Lobs | |
| Oracle Database PDB | Activity | Queries Parallelized | |
| Oracle Database PDB | Disk IO | Read Time | |
| Oracle Database PDB | Status | Recovery Status | Shows whether recovery is enabled or disabled for the PDB. Possible values: ENABLED, DISABLED |
| Oracle Database PDB | Activity | Recursive Calls | |
| Oracle Database PDB | Activity | Redo Generated | |
| Oracle Database PDB | Activity | Redo Writes | |
| Oracle Database PDB | General | Restricted | Indicates whether only users possessing RESTRICTED SESSION privilege can connect to the PDB. |
| Oracle Database PDB | Activity | Row ID Ranges Full Index Scans | |
| Oracle Database PDB | Session | Sessions Count | |
| Oracle Database PDB | Activity | Short Table Scans | |
| Oracle Database PDB | Disk IO | Single Blocks Read | |
| Oracle Database PDB | General | Snapshot Parent Container ID | This column shows the container ID of the primary PDB that this PDB is a snapshot clone of. This column shows a non-zero value only if the PDB is a snapshot clone. For all other cases, it shows a value of 0. |
| Oracle Database PDB | Session | Sniped User Sessions | |
| Oracle Database PDB | Activity | Total Parse Count | |
| Oracle Database PDB | Session | Unblocked User Sessions | |
| Oracle Database PDB | Session | Unknown Wait Time User Sessions | |
| Oracle Database PDB | Disk | Used Space | Disk space used by the container, including both data and temp files. |

| Oracle Database Redo Log File | General | Member Name | |
| Oracle Database Redo Log File | General | Sequence Number | |
| Oracle Database Redo Log File | General | Size | |
| Oracle Database Redo Log File | Status | Status | |
| Oracle Database Redo Log File | General | Thread Number | |
| Oracle Database Service | Performance | Application Wait Time | The total wait time for waits that belong to the Application wait class |
| Oracle Database Service | Performance | Cluster Wait Time | The total wait time for waits that belong to the Cluster wait class |
| Oracle Database Service | Memory | Multipass Work Area Executions | Total number of times the work area size was too small |
| Oracle Database Service | Performance | Concurrency Wait Time | The total wait time for waits that belong to the Concurrency wait class |
| Oracle Database Service | Disk | Database Block Changes | Total number of changes that were part of an update or delete operation that were made to all blocks in the SGA. |
| Oracle Database Service | Performance | Executions | Total number of calls (user and recursive) that executed SQL statements |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database Service | Disk | Global Cache Consistent Real Blocks Received | Total number of blocks received |
| Oracle Database Service | Disk | Global Cache Consistent Real Block Receive Time | The total time required for consistent read requests to complete |
| Oracle Database Service | Disk | Global Cache Current Block Receive Time | Total time required for consistent read requests to complete |
| Oracle Database Service | Disk | Global Cache Current Blocks Received | Number of current blocks received from the holding instance over the hardware interconnect. |
| Oracle Database Service | Details | Logons | Total number of logons since the instance started |
| Oracle Database Service | Memory | One Pass Work Area Executions | Total number of times the work area size was oversize |
| Oracle Database Service | Memory | Optimal Work Area Executions | Total number of times the work area size was optimal |
| Oracle Database Service | Disk | Physical Reads | Total number of data blocks read from disk |
| Oracle Database Service | Disk | Physical Writes | Total number of data blocks written to disk |
| Oracle Database Service | Redo | Redo Size | Total amount of redo generated in bytes |
| Oracle Database Service | General | Name | |
| Oracle Database Service | Disk | Session Logical Reads | The sum of "db block gets" plus "consistent gets". This includes logical reads of database blocks from either the buffer cache or process private memory. |
| Oracle Database Service | Performance | SQL Execute Elapsed Time | The amount of elapsed time SQL statements are executing |
| Oracle Database Service | Performance | User Calls | Number of user calls such as login, parse, fetch, or execute |
| Oracle Database Service | Redo | User Commits | Number of user commits |
| Oracle Database Service | Performance | User IO Wait Time | The total wait time for waits that belong to the User I/O wait class |
| Oracle Database Service | Redo | User Rollbacks | Number of times users manually issue the ROLLBACK statement or an error occurs during a user's transactions |
| Oracle Database Tablespace | General | Allocated Capacity Utilization | The percentage of the allocated capacity that is currently used |
| Oracle Database Tablespace | General | Allocated Size | Current size of the file |
| Oracle Database Tablespace | General | Capacity Utilization | The percentage of the maximum capacity that is currently used |
| Oracle Database Tablespace | General | Container ID | |
| Oracle Database Tablespace | General | Contents | |
| Oracle Database Tablespace | General | Free Allocated Space | Amount of currently allocated space that is unused |
| Oracle Database Tablespace | General | Free Space | Unused space left for user data. This will include as-yet unallocated space. |
| Oracle Database Tablespace | Uncategorized | Global Name | |

| Resource Kind | Resource Group | Resource Attribute | Attribute Type |
|---|---|---|---|
| Oracle Database Tablespace | General | Maximum Space | Maximum size to which the file can grow |
| Oracle Database Tablespace | Status | Status | |
| Oracle Database Tablespace | General | Tablespace Name | |
| Oracle Database Tablespace | General | Used Space | Amount of space that is currently in use |

## Management Pack for PostgreSQL

The **Management Pack for PostgreSQL** is an embedded adapter for VMware Cloud Foundation Operations, collecting performance data from your PostgreSQL systems and providing predictive analytics and real-time information about problems in your infrastructure—all within the VCF Operations user interface.

### Notable Features

The Management Pack harnesses powerful VCF Operations features such as:

- **Comprehensive monitoring dashboards**
- **Key performance metrics** such as Memory, CPU, Disk, Waits, Sessions, Queries, and Tablespace
- **Out-of-the-box reports** for Database, Instance, Slow Query, and Throughput
- **Relationship mapping** between PostgreSQL and the VMware virtual layer
- **Detailed alerts and recommendations**

### System Requirements for Management Pack for PostgreSQL

Before installing and configuring the Management Pack, ensure your system meets the following requirements.

For compatibility between products, refer to:

VMware Cloud Foundation Operations Interoperability for PostgreSQL

-OR-

Third Party Solution Interoperability for PostgreSQL

| | PostgreSQL Requirements |
|---|---|
| Connection | IP address or hostname of **PostgreSQL instance**<br>**Default Port**: 5432 (TCP)<br>**Database name**<br>**Note:**<br>By default, the Management Pack will connect to 'pg_ database' and retrieve available databases through it. If another database is specified when adding an adapter instance, it will connect to that database only. |
| Credentials | PostgreSQL **User Name/Password**<br>The Management Pack requires a least-privileged user (LPU) account of read-only*. For details on creating an LPU, see: Configuring Database Permissions and the Least-Privileged User.<br>**Note:**<br>*NOTE: Tablespace and query data are not returned for PostgreSQL read-only users. Assigning the monitoring user/role a "super user" attribute will correct this limitation. Alternatively, using our defined LPU script will allow you to bypass assigning the "super user" attribute. See: Configuring Database Permissions and the Least-Privileged User. |

**Note:**

Prior to configuring an adapter instance for the Management Pack, ensure the required PostgreSQL views, tables, and functions are added for resources being monitored. See: Configuring Database Permissions and the Least-Privileged User for more information.

Configuring Database Permissions and the Least-Privileged User

The following topic outlines the required views, tables, and functions needed to properly monitor each PostgreSQL database resource.

- PostgreSQL Required Views, Tables, and Functions
- Creating a Least-Privileged User (LPU)

## PostgreSQL Required Views, Tables, and Functions

The table below lists PostgreSQL database resource kinds and their required views, tables, or functions needed to monitor each resource correctly. Prior to configuring an adapter instance for the Management Pack, ensure the following PostgreSQL function/query functionality is added for your PostgreSQL resources.

**Note:**

To help automate the assignment of the following permissions, you can run the script provided in Creating a Least-Privileged User (LPU).

| Resource Type | View/Table/Function Name | Required? | Version |
|---|---|---|---|
| Instance | pg_stat_bgwriter | Yes | 9.0+ |
| Database | pg_stat_database | Yes | 9.0+ |
| Database | pg_database | Yes | 9.0+ |
| Database | pg_stat_database_conflicts | Yes | 9.1+ |
| Database | pg_tablespace | Yes | 9.0+ |

| Resource Type | View/Table/Function Name | Required? | Version |
|---|---|---|---|
| Tablespace* | pg_user* | Yes | 9.0+ |
| Table | pg_stat_user_tables | No | 9.0+ |
| Table | pg_statio_user_tables | No | 9.0+ |
| Table | pg_tables | No | 9.0+ |
| Trigger | pg_trigger | No | 9.1+ |
| Index | pg_stat_user_indexes | No | 9.0+ |
| Index | pg_statio_user_indexes | No | 9.0+ |
| Function | pg_stat_user_functions | No | 9.0+ |
| Sequence | pg_statio_all_sequences | Yes | 9.0+ |
| Session | pg_stat_activity | Yes | 9.2+ |
| Query* | pg_stat_statements* | Yes | 9.0+ |

**Note:**

*NOTE: For security, an administrative-level monitoring user (i.e., “super user”) is required to view the SQL text or queryid of queries executed by other users. An “insufficient privileges” error will be returned in the Query text field if a read-only user is used. Tablespace data also requires an administrative-level monitoring user. However, using our defined LPU script will allow you to bypass assigning the "super user" attribute. See: Creating a Least-Privileged User (LPU).

**Function Tracking**: To track functions, `pg_stat_user_functions` requires the `log_statement_stats` field to be modified (in postgresql.conf) to allow for any function tracking to happen.

**Reference:** https://www.postgresql.org/docs/current/static/runtime-config-statistics.html

**Query Tracking**: To track queries, these settings need to be added to the `shared_preload_libraries` settings:

```
shared_preload_libraries = 'pg_stat_statements'
pg_stat_statements.max = 10000
pg_stat_statements.track = all
```

You also need to create the extension in the database. The extension is database bound and must be created for each database, even though it pulls data from each:

```
CREATE EXTENSION IF NOT EXISTS pg_stat_statements;
```

You can check if it is installed on the database by calling:

```
SELECT * FROM pg_available_extensions WHERE name = 'pg_stat_statements' AND installed_version IS NOT NULL;
```

## Creating a Least-Privileged User (LPU)

To help automate the creation of a least-privileged user (LPU) for your PostgreSQL instance, run the following script on the database you plan to monitor. If you're monitoring multiple databases, run the script on the **Postgres** database.

```
CREATE SCHEMA bluemedora;
CREATE EXTENSION IF NOT EXISTS pg_stat_statements;
CREATE OR REPLACE FUNCTION bluemedora.pg_stat_statements() RETURNS SETOF pg_stat_statements AS
$$
SELECT * FROM public.pg_stat_statements;
$$ LANGUAGE sql VOLATILE SECURITY DEFINER;

CREATE OR REPLACE FUNCTION public.explain_this (
      l_query text,
      out explain json
    )
RETURNS SETOF json AS
```

```
$$
BEGIN
  RETURN QUERY EXECUTE 'explain (format json) ' || l_query;
END;
$$
LANGUAGE 'plpgsql'
VOLATILE
RETURNS NULL ON NULL INPUT
SECURITY DEFINER
COST 100 ROWS 1000;

CREATE USER lpu WITH PASSWORD 'tmppassword';
GRANT SELECT ON pg_database TO lpu;
GRANT SELECT ON pg_stat_bgwriter TO lpu;
GRANT SELECT ON pg_stat_database TO lpu;
GRANT SELECT ON pg_stat_user_indexes TO lpu;
GRANT SELECT ON pg_stat_user_tables TO lpu;
GRANT SELECT ON pg_statio_all_sequences TO lpu;
GRANT SELECT ON pg_statio_user_indexes TO lpu;
GRANT SELECT ON pg_statio_user_tables TO lpu;
GRANT SELECT ON pg_tables TO lpu;
GRANT SELECT ON pg_tablespace TO lpu;
GRANT SELECT ON pg_user TO lpu;
GRANT SELECT ON pg_stat_replication TO lpu;
GRANT SELECT ON pg_stat_database_conflicts TO lpu;
GRANT SELECT ON pg_trigger TO lpu;
GRANT SELECT ON pg_stat_activity TO lpu;
GRANT SELECT ON pg_stat_statements TO lpu;
GRANT USAGE ON SCHEMA bluemedora TO lpu;
GRANT EXECUTE ON FUNCTION public.explain_this(l_query text, out explain text) TO lpu;
```

**Note:**

PostgreSQL databases previous to 9.2 may need to edit the script above.

Once complete, you can ensure the user has the EXPLAIN privilege by running:

```
SELECT exists( SELECT 1 FROM information_schema.role_routine_grants WHERE routine_name='explain_this' AND
 privilege_type='EXECUTE' AND grantee='explainer');
```

This query should return a single row with a single column of "exists" with a value of "true".

**Note:**

If the user has permissions to read from your tables and views, they do not require this special EXPLAIN permission.

### Troubleshooting the Management Pack

Once you have finished Installing and Configuring the Management Pack, check the **Collection State** and **Collection Status** for the adapter instance on the **Solutions** page. If they show as **Not Collecting** or **No Data Receiving**, respectively, the following troubleshooting topics can help you diagnose and correct common problems with your adapter instance.

- Test Connection Errors
- Adapter and Collector Log Files

#### Test Connection Errors

When Creating an Adapter Instance, click **Test Connection** after entering all of your configuration settings to ensure VMware Cloud Foundation Operations can connect to the specified host.

The following errors are possible:

Wrong Credentials

**Error:** Unable to establish a valid connection to target system. Connection authorization failure occurred. Reason: User ID or Password invalid.

**Action:** Ensure the correct PostgreSQL and VCF Operations User Name and Password was entered when Creating a Credential.

Wrong Host

**Error:** Unable to establish a valid connection to target system. Required property is unknown host.

**Action:** Ensure the correct hostname or IP address of the PostgreSQL instance was entered when Creating an Adapter Instance.

Wrong Port

**Error:** Unable to establish a valid connection to target system. Connection authorization failure occurred. Error opening socket server <name> on port with message: Connection refused.

**Action:** Check your PostgreSQL database system and ensure the connection port number matches the port number entered (if other than default of 5432) when Creating an Adapter Instance

Wrong Database

**Error:** Connection authorization failure occurred. The application server rejected establishment of the connection. An attempt was made to access a database, <name>, which was either not found or does not support transactions.

**Action:** Ensure the database name provided matches the PostgreSQL system. Multiple databases should be separated by commas in the **Manage Solution** window.

SSL Not Enabled

**Error**: SSL connection is not enabled.

**Action**: Under Advanced Settings, set SSL mode to be Enabled (required).

Server Does Not Support SSL

**Error**: The server does not support SSL connections.

**Action**: Under Advanced Settings, set SSL mode setting to Disabled.

### Adapter and Collector Log Files

You can review adapter errors in the adapter and collector log files, which can be viewed in the VCF OperationsUI or in an external log viewer.

- **Adapter log files** are located in the $VCOPS_BASE/user/log/adapters/PostgreSQLAdapter/ folder.
- **Collector log files** are located in the $VCOPS_BASE/user/log/ folder.

To set the base log level for the collector in vROps:

1. Navigate to **Administration > Logs**.
2. Expand the **PRIMARY** folder, then select the **COLLECTOR** folder.
3. Click the **Edit Properties** icon.
4. In the **Root logger level** drop-down menu, select the desired option.

- The default logging level is **warning.**
- To troubleshoot issues, set the logging level to **info.**
- To view detailed messages, including micro steps, queries, and returned results, set the logging level to **debug.**

> **Note:**
>
> If you set the logging level to **debug,** log files can become large very quickly. Set the logging level to **debug** only for short periods of time.

For more information about viewing log files and modifying levels, refer to the VCF Operations online help.

### Using the Management Pack

The Management Pack for PostgreSQL includes the following out-of-the-box features, harnessing the power of the VCF Operations user interface:

- Inventory Tree (Traversal Spec)
- Dashboards
- Views
- Reports
- Alerts
- Metrics

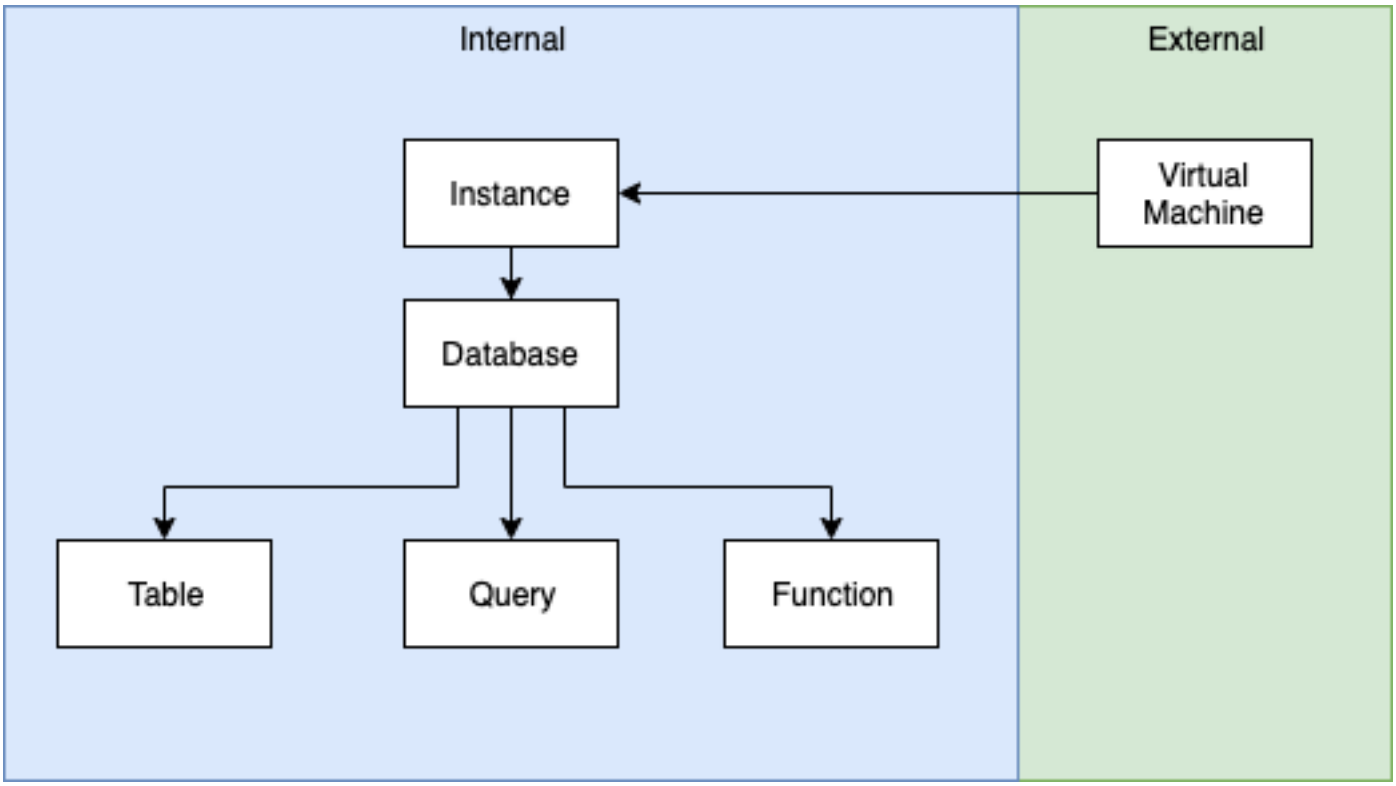
#### Inventory Tree (Traversal Spec), Resources and Relationships

The Inventory Tree (Traversal Spec) feature in VCF Operations allows you to easily navigate your PostgreSQL environment. The hierarchical structure implicitly shows relationships among resources and enables quick drill-downs to root-cause issues.

To access your PostgreSQL Inventory Tree, navigate to **Environment** > **Inventory Trees**.

**Resources and Relationships**

**Figure 485: PostgreSQL Relationships Diagram**



#### Dashboards

Dashboards are the primary feature for monitoring and troubleshooting PostgreSQL data problems from within VCF Operations.

The following dashboards are included in the Management Pack for PostgreSQL:

- **PostgreSQL Database Drill Down**

- **PostgreSQL Infrastructure Drill Down**

### Views

The Management Pack for PostgreSQL creates views that allow the user to view statistics of metrics for various PostgreSQL resources. The views help give a broad picture of the entire system, as opposed to a more in depth view.

The following views are available in the Management Pack:

| View | Type | Description |
|---|---|---|
| PostgreSQL Database Overview | List | Provides an overview of database performance metrics. |
| PostgreSQL Instance Overview | List | Provides an overview of instance performance metrics. |
| PostgreSQL Slowest Queries | List | Provides a list of slowest queries metrics. |
| PostgreSQL Throughput | List | Provides a list of throughput metrics. |

To access the Management Pack views:

1. Navigate to **Environment > All Objects > PostgreSQL**.
2. Double-click on the desired object (resource).
3. Select the **Details** tab, then **Views.**

The available views for that resource are listed and can be selected.

### Reports

The Management Pack for PostgreSQL contains four out-of-the-box reports that you can export and easily share with key stakeholders in either .pdf or .csv formats.

The following reports are available in the Management Pack:

| Report | Description |
|---|---|
| PostgreSQL Databases Report | Provides an overview of database performance metrics. |
| PostgreSQL Instance Report | Provides an overview of instance performance metrics. |
| PostgreSQL Slowest Queries Report | Provides a list of slowest queries metrics. |
| PostgreSQL Throughput Report | Provides a list of throughput metrics. |

To access Management Pack reports:

1. Navigate to **Environment > All Objects > PostgreSQL**.
2. Double-click on the desired object (resource).
3. Select the **Reports** tab, then **Report Templates**.

The available report for the selected resource is listed and can be selected.

To run a selected report, click the **Run Template** icon.

### Alerts

The Management Pack for PostgreSQL pulls PostgreSQL database health indicators and displays them in VCF Operations as alerts. See the table below for the list of alerts available in the Management Pack.

**Table 1668: Alerts List**

| Name | Description | Recommendation |
|---|---|---|
| Max Written Clean (Per Second) is Higher than Normal | The number of times the background writer has overwritten the maximum number of buffers (when a checkpoint is performed) is much higher than normal. | Consider increasing the value of “bgwriter_lru_maxpages” in postgresql.conf to increase performance. |
| Tablespace Size is Higher than Normal | The size of your Database is much higher than normal | Consider running a VACUUM to recover disk space. |
| Database Size is Higher than Normal | The size of your Database is much higher than normal | Consider running a VACUUM to recover disk space. |
| Table Size is Higher than Normal | The size of your Table is much higher than normal | Consider running a VACUUM to recover disk space. |
| Temp Files Created is Higher than Normal | The number of temporary files created is higher than normal. This can cause slower performance and I/O contention. | Consider increasing the “work_mem” in the postgresql.conf file. |
| Dead Rows is Higher than Normal | The dead rows for this table are higher than normal. | To clear the dead rows, consider running “VACUUM FULL” or “CLUSTER” during a maintenance window. |
| Queries Cancelled are Higher than Normal | The number of queries that are being canceled is higher than normal. | Consider enabling “hot_standby_feedback” in the postgresql.conf file to avoid canceled queries. Warning: This could create bloat in the primary database. |

Metrics

The Management Pack for PostgreSQL collects the metrics listed in the table below, according to PostgreSQL resource kinds.

| Resource Kind | Resource Group | Resource Attribute |
|---|---|---|
| PostgreSQL Instance | Tablespaces\|General | Tablespace Size |
| PostgreSQL Instance | Tablespaces\|Configuration | Tablespace Name |
| PostgreSQL Instance | Tablespaces\|Configuration | Tablespace Location |
| PostgreSQL Instance | Tablespaces\|Configuration | Tablespace Location |
| PostgreSQL Instance | Tablespaces\|Configuration | Tablespace Owner |
| PostgreSQL Instance | Tablespaces\|Configuration | Privileges |
| PostgreSQL Instance | Tablespaces\|Configuration | User Name |
| PostgreSQL Instance | Tablespaces\|Configuration | IP Address |
| PostgreSQL Instance | Tablespaces\|Configuration | Port |
| PostgreSQL Instance | Tablespaces\|Configuration | Instance Name |
| PostgreSQL Instance | Buffers | Buffers Allocated |
| PostgreSQL Instance | Buffers | Times Backend Executed Own fsync |
| PostgreSQL Instance | Buffers | Times Background Writer Stopped Due to too Many Buffers |
| PostgreSQL Instance | Buffers | Buffers Written by Backend |
| PostgreSQL Instance | Buffers | Buffers Written by Background Writer |
| PostgreSQL Instance | Buffers | Buffers Written During Checkpoint |
| PostgreSQL Instance | Configuration | Name |
| PostgreSQL Instance | Configuration | Server IP |
| PostgreSQL Instance | Configuration | Server Port |

| Resource Kind | Resource Group | Resource Attribute |
|---|---|---|
| PostgreSQL Instance | Configuration | Last Time Stats Reset |
| PostgreSQL Instance | Configuration | Version |
| PostgreSQL Instance | Checkpoints | Scheduled Checkpoints Performed |
| PostgreSQL Instance | Checkpoints | Time Synchronizing Checkpoint Files to Disk |
| PostgreSQL Instance | Checkpoints | Requested Checkpoints Performed |
| PostgreSQL Instance | Checkpoints | Time Writing Checkpoint Files to Disk |
| PostgreSQL Database | Sessions | Number of Active Connections |
| PostgreSQL Database | Sessions | Total Sessions |
| PostgreSQL Database | Sessions | Active Sessions |
| PostgreSQL Database | Sessions | Idle Sessions |
| PostgreSQL Database | Sessions | Idle Sessions in Transaction |
| PostgreSQL Database | Sessions | Idle Sessions in Transaction (Aborted) |
| PostgreSQL Database | Sessions | Sessions Executing Fastpath Function Call |
| PostgreSQL Database | Sessions | Sessions with Unknown State (Track Activities is Disabled) |
| PostgreSQL Database | General | Canceled Queries Due to Conflicts |
| PostgreSQL Database | General | Deadlock Count |
| PostgreSQL Database | General | Database Size |
| PostgreSQL Database | General | Last Timestamp Stats Reset |
| PostgreSQL Database | Activity | Rows Deleted |
| PostgreSQL Database | Activity | Rows Returned |
| PostgreSQL Database | Activity | Rows Updated |
| PostgreSQL Database | Activity | Rows Fetched |
| PostgreSQL Database | Activity | Rows Inserted |
| PostgreSQL Database | Configuration | Tablespace Name |
| PostgreSQL Database | Configuration | Database Name |
| PostgreSQL Database | Configuration | Database ID |
| PostgreSQL Database | Configuration | IP Address |
| PostgreSQL Database | Configuration | Port |
| PostgreSQL Database | Conflicts | Queries Canceled Due to Deadlocks |
| PostgreSQL Database | Conflicts | Queries Canceled Due to Old Snapshot |
| PostgreSQL Database | Conflicts | Queries Canceled Due to Lock Timeouts |
| PostgreSQL Database | Conflicts | Queries Canceled Due to Dropped Tablespaces |
| PostgreSQL Database | Conflicts | Queries Canceled Due to Pinned Buffers |
| PostgreSQL Database | Transactions | Transaction Rollbacks |
| PostgreSQL Database | Transactions | Transaction Commits |
| PostgreSQL Database | Disk IO | Temporary Bytes Written |
| PostgreSQL Database | Disk IO | Temporary Files Created |
| PostgreSQL Database | Disk IO | Buffer Hit Ratios |
| PostgreSQL Database | Disk IO | Block Reads/Buffer Misses |
| PostgreSQL Database | Disk IO | Time Spent Writing Data |
| PostgreSQL Database | Disk IO | Buffer Hits |

| Resource Kind | Resource Group | Resource Attribute |
|---|---|---|
| PostgreSQL Database | Disk IO | Time Spent Reading Data |
| PostgreSQL Database | Disk IO | Blocks Read by Sequences |
| PostgreSQL Database | Disk IO | Blocks Hit by Sequences |
| PostgreSQL Table | Triggers\|Configuration | Trigger Enabled Status |
| PostgreSQL Table | Triggers\|Configuration | Trigger ID |
| PostgreSQL Table | Triggers\|Configuration | Trigger Name |
| PostgreSQL Table | Triggers\|Configuration | Type of Trigger Fire |
| PostgreSQL Table | Triggers\|Configuration | Arguments Passed to Trigger |
| PostgreSQL Table | Triggers\|Configuration | Table ID |
| PostgreSQL Table | Triggers\|Configuration | Table Name |
| PostgreSQL Table | Triggers\|Configuration | Function Name |
| PostgreSQL Table | Triggers\|Configuration | Function ID |
| PostgreSQL Table | Triggers\|Configuration | IP Address |
| PostgreSQL Table | Triggers\|Configuration | Port |
| PostgreSQL Table | Indexes\|Activity | Number of Block Reads |
| PostgreSQL Table | Indexes\|Activity | Number of Table Rows Fetched by Scan |
| PostgreSQL Table | Indexes\|Activity | Number of Buffer Hits |
| PostgreSQL Table | Indexes\|Activity | Number of Index Entries Returned |
| PostgreSQL Table | Indexes\|Activity | Number of Scans |
| PostgreSQL Table | Indexes\|Configuration | Index ID |
| PostgreSQL Table | Indexes\|Configuration | Index Name |
| PostgreSQL Table | Indexes\|Configuration | Table Name |
| PostgreSQL Table | Indexes\|Configuration | Schema Name |
| PostgreSQL Table | Indexes\|Configuration | Table ID |
| PostgreSQL Table | Indexes\|Configuration | IP Address |
| PostgreSQL Table | Indexes\|Configuration | Port |
| PostgreSQL Table | General | Table Size |
| PostgreSQL Table | Activity | Number of Rows Updated |
| PostgreSQL Table | Activity | Number of Sequential Scans |
| PostgreSQL Table | Activity | Last Time Table Analyzed by Auto Daemon |
| PostgreSQL Table | Activity | Number of Dead Rows |
| PostgreSQL Table | Activity | Last Time Table Vacuumed by Auto Daemon |
| PostgreSQL Table | Activity | Number of Rows Deleted |
| PostgreSQL Table | Activity | Last Time Table Manually Analyzed |
| PostgreSQL Table | Activity | Number of Index Scans |
| PostgreSQL Table | Activity | Number of Rows Inserted |
| PostgreSQL Table | Activity | Number of Times Table Manually Vacuumed |
| PostgreSQL Table | Activity | Number of Times Table Vacuumed By Auto Daemon |
| PostgreSQL Table | Activity | Last Time Table Manually Vacuumed |
| PostgreSQL Table | Activity | Number of Rows Fetched by Index Scans |
| PostgreSQL Table | Activity | Number of Times Table Manually Analyzed |

| Resource Kind | Resource Group | Resource Attribute |
|---|---|---|
| PostgreSQL Table | Activity | Number of Rows Modified Since Last Analyzed |
| PostgreSQL Table | Activity | Number of Times Table Analyzed by Auto Daemon |
| PostgreSQL Table | Activity | Rows fetched by Sequential Scans |
| PostgreSQL Table | Activity | Number of Live Rows |
| PostgreSQL Table | Activity | Number of Rows Hot Updated (No separate index update requried) |
| PostgreSQL Table | Configuration | Table ID |
| PostgreSQL Table | Configuration | Tablespace Name |
| PostgreSQL Table | Configuration | Database Name |
| PostgreSQL Table | Configuration | Table Name |
| PostgreSQL Table | Configuration | Table Schema |
| PostgreSQL Table | Configuration | IP Address |
| PostgreSQL Table | Configuration | Port |
| PostgreSQL Table | Disk IO | Number of Block Reads from Indexes |
| PostgreSQL Table | Disk IO | Number of Block Reads |
| PostgreSQL Table | Disk IO | Number of Buffer Reads |
| PostgreSQL Table | Disk IO | Number of Block Reads from TOAST Table Indexes |
| PostgreSQL Table | Disk IO | Number of Buffer Hits from TOAST Table |
| PostgreSQL Table | Disk IO | Number of Buffer Hits from Indexes |
| PostgreSQL Table | Disk IO | Number of Buffer Hits from TOAST Table Indexes |
| PostgreSQL Table | Disk IO | Number of Block Reads from TOAST Table |
| PostgreSQL Function | Activity | Total Time Spent Calling This and All Called Functions |
| PostgreSQL Function | Activity | Average Total Call Time |
| PostgreSQL Function | Activity | Times Called |
| PostgreSQL Function | Activity | Time Spent on This Function Alone (not referenced functions) |
| PostgreSQL Function | Configuration | Schema Name |
| PostgreSQL Function | Configuration | Function Name |
| PostgreSQL Function | Configuration | Function ID |
| PostgreSQL Function | Configuration | IP Address |
| PostgreSQL Function | Configuration | Port |
| PostgreSQL Function | Configuration | Database Name |
| PostgreSQL Function | Configuration | Rank |
| PostgreSQL Query | Activity | Query Text |
| PostgreSQL Query | Activity | Total Time |
| PostgreSQL Query | Activity | Average Time Spent Per Call |
| PostgreSQL Query | Activity | Number of Calls |
| PostgreSQL Query | Activity | Rows Returned |
| PostgreSQL Query | Configuration | User Name |
| PostgreSQL Query | Configuration | Database Name |
| PostgreSQL Query | Configuration | IP Address |

| Resource Kind | Resource Group | Resource Attribute |
|---|---|---|
| PostgreSQL Query | Configuration | Port |
| PostgreSQL Query | Configuration | Rank |
| PostgreSQL Query | Disk IO | Local Block Cache Hits |
| PostgreSQL Query | Disk IO | Shared Block Reads |
| PostgreSQL Query | Disk IO | Shared Blocks Written |
| PostgreSQL Query | Disk IO | Total Time Spent Writing Blocks |
| PostgreSQL Query | Disk IO | Shared Blocks Dirty Read |
| PostgreSQL Query | Disk IO | Local Block Reads |
| PostgreSQL Query | Disk IO | Shared Block Cache Hits |
| PostgreSQL Query | Disk IO | Local Blocks Dirty Read |
| PostgreSQL Query | Disk IO | Total Time Spent Reading Blocks |
| PostgreSQL Query | Disk IO | Local Blocks Written |

## Management Pack for ServiceNow

The **Management Pack for ServiceNow** is an embedded adapter for VMware Cloud Foundation Operations, that contextualizes VCF Operations data by collecting ServiceNow CMDB configuration items (CIs) and mapping those VCF Operations objects based on a user-defined schema.

### Notable Features

The Management Pack for ServiceNow provides the following notable features:

- User-defined CMDB visibility in VCF Operations
- **Automatically generated dashboards** based on user-defined configuration

**See also:**

System Requirements

### System Requirements for Management Pack for ServiceNow

| | ServiceNow Requirements |
|---|---|
| Version(s) | All ServiceNow supported versions (Kingston+) |
| Connection | A ServiceNow host address<br>A configuration file<br>**Note:**<br>ServiceNow calls are made to the**Table API**and**CMDB Meta API**. |
| Credentials | A least privileged user with **itil** credentials is required (see: Creating a Least Privileged User |

Creating a Least Privileged User

A least privileged user account must have the following permissions:

All Configurations (required to validate the other ACLs)

- sys_user_has_role
- security_acl_detail
- sys_security_operation

Resource Grouping ACLs

- cmdb_metadata_hosting
- cmdb_metadata_reference
- cmdb_metadata_containment
- sys_dictionary
- sys_dictionary.*
- sys_glide_object
- svc_ci_assoc (only if you are using the association table in any of the group configurations)
- each table that is in the configuration json (`cmdb_ci_vmware_instance` for example)

Alerting ACLs:

- sys_choice
- sys_choice.*
- sys_dictionary
- sys_dictionary.*
- sys_glide_object
- each table that is in the configuration json if CI mapping is used (`cmdb_ci_vmware_instance` for example)
- One of the following depending on which option is specified in your configuration file:
  - incident (`read` and `write`)
  - em_alert (`read` and `write`)
  - em_event (`read` and `write`)

CMDB Sync ACLs

- sys_db_object
- cmdb_reconciliation_definition
- sys_choice
- sys_choice.*
- cmdb_rel_type
- each table in Synced Resources (`read` and `edit_ci_relations` are always required, `delete` is required if using a configuration which deletes CIs when they are removed from or are Not Existing in VCF Operations )

Role

- itil

> **Note:**
>
> This is a requirement for getting metadata about the tables, which we need in order to determine data types, allowable columns, etc.

### Adding an SSL Certificate to the VMware Cloud Foundation Operations Truststore

For added security, we recommend adding an SSL certificate to the VCF Operations truststore for your ServiceNow CMDB.

> **Note:**
>
> Different levels of security can be configured in the Management Pack for ServiceNow. The**least secure** configuration is to leave the default selection of**False**for the **ServiceNow SSL Configuration**Advanced Setting. In this configuration, the Management Pack will accept all SSL certificates.**For added security,**you can enable SSL by following the instructions below and selecting**True**for the**SSL Configuration**Advanced Setting when Creating an Adapter Instance.

1. Obtain the SSL certificate for your Unity host server from your Internet browser. Export the certificate as an **X.509 Certificate (PEM)**.
2. Copy the certificate to your VCF Operations machine.
3. Use ‘ssh’ to log in to the VCF Operations machine as the root user, then run the following command:

**Linux:**
$VCOPS_BASE/jre/bin/keytool -import -alias <product_alias> -file /tmp/<certfile> -keystore “$VCOPS_DATA_VCOPS/user/conf/ssl/tcserver.truststore” -storepass `grep ssltruststorePassword /storage/vcops/user/conf/ssl/storePass.properties | sed s/ssltruststorePassword=//` -trustcacerts
**Windows:**
%VCOPS_BASE%\jre\bin\keytool -import -alias <product_alias> C:\path\to\certfile -keystore “%VCOPS_DATA_VCOPS%\user\conf\ssl\tcserver.truststore” -storepass <truststore_password> -trustcacerts
**Parameter Descriptions:**
– -alias is a unique name for each key that you add (per host)
– certfile is the location where the cert file was saved

4. Run the reboot command to re-start the VCF Operations machine for the changes to take effect.

### Creating a Configuration File

By default, you must supply a configuration file in the work directory `$VCOPS_BASE/user/plugins/inbound/servicenow_adapter3/work`

The configuration file consists of an array of **resourceTypes**. Each element is explained below in detail.

```
{
  "cmdbSync": {},
  "resourceTypes": [
    {
      "vROps": {...},
      "serviceNow": {...},
      "identifierMapping": [],
      "groupTypes": [],
      "groupHierarchies": [[]]
    },
    ...
  ],
  "alertingConfigs": [
    {...},
    ...
  ]
}
```

### Examples of Configuration Files

Below are two examples of functional configuration files:

### Configuration File Example A

```
{
  "resourceTypes": [
    {
      "vROps": {
        "type": {
          "resourceKind": "VirtualMachine",
          "adapterKind": "VMWARE"
        },
        "id": {
          "type": "IDENTIFIER",
          "field": "VMEntityName"
        }
      },
      "serviceNow": {
        "type": {
          "cmdbCiClass": "cmdb_ci_vmware_instance"
```

```
        },
        "id": {
          "column": "name"
        }
      },
      "groupTypes": [
        {
          "serviceNowColumn": "u_application",
          "vROpsGroupType": "Application"
        },
        {
          "serviceNowColumn": "u_main_business_unit",
          "vROpsGroupType": "BusinessUnit",
          "booleanMapping":
            {
              "trueValue": "Main",
              "falseValue": "Other"
            }
        }
      ],
      "hierarchies": [
        [
          {
            "adapterKind": "Container",
            "resourceKind": "BusinessUnit"
          },
          {
            "adapterKind":"Container",
            "resourceKind": "Application"
          }
        ]
      ]
    }
  ]
}
```

## Configuration File Example B

```
{
  "resourceTypes": [
    {
      "vROps": {
        "type": {
          "resourceKind": "VirtualMachine",
          "adapterKind": "VMWARE"
        },
        "id": {
          "type": "PROPERTY",
          "field": "config|name"
        }
      },
      "serviceNow": {
        "type": {
          "cmdbCiClass": "cmdb_ci_vmware_instance"
        },
        "id": {
          "column": "name"
        }
```

```
      },
      "groupTypes": [
        {
          "serviceNowColumn": "u_application",
          "vROpsGroupType": "Application"
        },
        {
          "serviceNowColumn": "u_main_business_unit",
          "vROpsGroupType": "BusinessUnit",
          "booleanMapping":
          {
            "trueValue": "Main",
            "falseValue": "Other"
          }
        }
      ],
      "hierarchies": [
        [
          {
            "adapterKind": "Container",
            "resourceKind": "BusinessUnit"
          },
          {
            "adapterKind":"Container",
            "resourceKind": "Application"
          }
        ]
      ]
    }
  ]
}
```

### Configuration File Example C

```
{
 "resourceTypes": [
 {
 "vROps": {
 "type": {
 "resourceKind": "VirtualMachine",
 "adapterKind": "VMWARE"
 },
 "id": {
 "type": "IDENTIFIER",
 "field": "VMEntityName"
 }
 },
 "serviceNow": {
 "type": {
 "cmdbCiClass": "cmdb_ci_vmware_instance"
 },
 "id": {
 "column": "name"
 }
 },
 "groupTypes": [
 {
 "serviceNowColumn": "u_application",
```

```
  "vROpsGroupType": "Application"
  }
  ],
  "hierarchies": [ ]
  }
  ]
 }
```

### vROps

the `vROps` object in the resourceType defines the type of VCF Operations resource that will be assigned properties based on CMDB columns.

Example:

```
"vROps": { "type": {...}}
```

### Type

This object describes the resource and adapter kinds. Both are required.

```
"type": { "resourceKind": "VirtualMachine", "adapterKind": "VMWARE"}
```

### ServiceNow

The `serviceNow` object in the resourceType defines the type of ServiceNow CI that should be matched to the vROps resource.

```
"serviceNow": { "type": {...}}
```

### Type

This object describes the CI Class of the CI that will be matched to the defined vROps ResourceKind.

```
"type": { "cmdbCiClass": "cmdb_ci_vmware_instance"}
```

### Identifier Mapping

An array of mappings. Each mapping references one ServiceNow column which maps to a vROps Property, Identifier, Name, or vROps UUID. In most cases, using a unique identifier in combination with the vCenter UUID is preferred.

```
{ "identifierMapping": [ { "serviceNowId": { "column": "object_id" }, "vropsId":
{ "type": "IDENTIFIER", "field": "VMEntityObjectID" } }, { "serviceNowId": { "column":
"vcenter_uuid" }, "vropsId": { "type": "IDENTIFIER", "field": "VMEntityVCID" } } ]}
```

### ServiceNow ID

The column whose value will be matched to the id specified on the defined vROps ResourceKind.

```
"id": { "column": "vm_instance_uuid"}
```

### VROps ID

This field describes the identification mechanism used to match with a ServiceNow CI. There are 3 different ways this can be defined.

- Identifier: This method matches based on the value of the specified resource identifier on the resource. Set `type` to `IDENTIFIER` and `field` to the name of the identifier on the ResourceKind.

```
"id": { "type": "IDENTIFIER", "field": "VMEntityName"}
```

- PROPERTY: This method matches based on the latest value assigned to the specified property. Set `type` to `PROPERTY` and `field` to the name of the property on the ResourceKind.

```
"id": { "type": "PROPERTY", "field": "config|name"}
```

- Name: This method uses the name of the resource in vROps as the value matched by ServiceNow CI. Set `type` to `NAME` and do not specify a `field` in order to use this method.

```
"id": { "type": "NAME"}
```

- UUID: This method uses the unique ID generated by vROps as the value matched by ServiceNow CI. Set `type` to `UUID` and do not specify a `field` in order to use this method.

```
"id": { "type": "UUID"}
```

**Group Types**

The groupTypes array contains a list of mappings from serviceNow columns to vROps groups.

```
"groupTypes": [ {...}, {...}],
```

There are two ways to assign these mappings.

- Standard: This is used for string-based properties in which the literal string value of the `serviceNowColumn` will be used to create a group named the value specified by `vROpsGroupType`. All matched resources will be assigned to the group of type `vROpsGroupType` that matches the value of the column. In the example below, if a CI has `u_application` = `myApp` in the CMDB, the vROps resource will be assigned to a group of type `Application` named `myApp`.

```
{ "serviceNowColumn": "u_application", "vROpsGroupType": "Application"}
```

- Boolean: This is used for boolean properties only. The `serviceNowColumn` and `vROpsGroupType` work as explained above, but instead of assigning the literal value of the column, the adapter will translate it to the values assigned in the `booleanMapping`. In the example below, if a CI returns `u_main_business_unit` = `true`, the vROps resource will be assigned to a group of type `Business Unit` named `Main`.

```
{ "serviceNowColumn": "u_main_business_unit", "vROpsGroupType": "Business Unit",
"booleanMapping": { "trueValue": "Main", "falseValue": "Other" }}
```

Additionally, columns may be a reference to an object in another table. To do this, 'dot notation' is used.

```
{ "serviceNowColumn": "domain_manager.manager.name", "vROpsGroupType": "Domain Manager"}
```

Boolean mappings can be used (at the top level) as well. The value returned by the referenced table will use the boolean mapping in this case

```
{ "serviceNowColumn": "domain_manager.manager.active", "vROpsGroupType": "Domain Manager",
"booleanMapping": { "trueValue": "Active", "falseValue": "Inactive" }}
```

**Group Hierarchies**

Group hierarchies organize the groups. Objects at the top of the hierarchy are considered parents of objects lower on the hierarchy. The `resourceKind` is the `vROpsGroupType` from the `groupTypes` array.

```
"groupHierarchies": [ [ { "resourceKind": "Business Unit" }, { "resourceKind":
"Application" } ]]
```

It is possible to have multiple hierarchies that reference different `vROpsGroupType`s. It is also possible for them to share some of their group types.

```
"groupHierarchies": [ [ { "resourceKind": "Business Unit" }, { "resourceKind":
"Application" } ], [ { "resourceKind": "Business Unit" }, { "resourceKind": "Other
Group" } ]]
```

In the above scenario, `Application` and `Other Group` are both related to the `Business Unit`, but are not considered directly related to one another.

Constraints:

- Hierarchies must not be cyclic (`Business Unit` cannot both be a parent and a child of `Application`). This is for both individual resourceTypes and across all resourceTypes (`Business Unit` cannot be a parent of `Application` for a VM, but a child of `Application` for a Datastore). The hierarchy object can be assigned

```
"adapterKind":
        "Container"
```

  , but this can also be omitted since it is the only allowable adapterKind.
- All groups must be present in at least one hierarchy on the `resourceType` where it is defined.
- Similarly, groups in a hierarchy must be defined as a `vROpsGroupType` on the `resourceType` where it is defined.

**Alert Sync**

Alerting configurations for the alert-sync feature define what alerts will be synced between vROps and ServiceNow, and how they will be represented in ServiceNow. The three supported representations are INCIDENT (default), ALERT, and EVENT. Once the vROps alert is present in ServiceNow, the ServiceNow Management Pack performs the following additional features:

- If an alert is cancelled in vROps, the corresponding incident or alert in ServiceNow is closed.
- If an incident or alert is closed in ServiceNow, the corresponding alert in vROps is suspended. Alerts in vROps are generally triggered automatically by breaching thresholds. Because we cannot control this, if an incident or alert is closed in ServiceNow it should be due to the underlying issue being resolved. Thus, we suspend the Alert in vROps (for a configurable length of time) to allow the alert to resolve. If the threshold(s) is still breached when the alert suspend time has ended, the alert will re-trigger and reopen the ServiceNow incident or alert.
- If a synced vROps alert is on a vROps ResourceKind that is present in one of the `resourceTypes` sections above, the ServiceNow Management Pack will create a reference from the incident/alert/event `cmdb_ci` column to the CI representing the resource in ServiceNow. Note: A resourceType section can be created with empty `groupTypes` and `hierarchies` arrays for matching to a resource type, without creating any groupings and hierarchies.
- The ServiceNow Management Pack can be configured to watch a predefined set of incident/alert/event columns and display the current values in the corresponding vROps alert as a series of notes.

**Configuration**

If alert sync is not desired, `alertingConfigs` can be omitted entirely, or an empty list can be used:

```
"alertingConfigs": []
```

A typical incident config may look like this:

```
"alertingConfigs": [ { "callerId": "vROps Service User" "propagateAlertUpdates": true,
"retrieveIncidentUpdates": true, "incidentElementsToRetrieve": ["assigned_to.name",
"state", "cmdb_ci.sys_id"], "incidentReopenState": "In Progress", "incidentCloseState":
"Closed", "vropsSuspendMinutes": 30 }]
```

Each config contains a `callerId` which identifies which config the ServiceNow incident/alert/event comes from. The `callerId` does not need to be distinct between alerting configs, however there are some performance benefits if each `alertingConfig` has a unique `callerId`. Note that in the rare case where multiple vROps instances are monitoring the same vCenter and are pointing to the same ServiceNow instance, the `callerId`s should all be distinct between the vROps instances. Note that this list is ordered

```
"alertingConfigs": [ { "callerId": "VM Admin", ... }, { "callerId": "Storage
Admin", ... }]
```

In each alerting config, the following options are supported:

| Parameter | Type | Description |
|---|---|---|
| callerId | String | The `callerId` is the ServiceNow caller assigned in vROps ServiceNow plugin configuration. This is the only required field - defaults will be used for all other fields. All incidents in ServiceNow that have this caller id will be treated according to this configuration. Two incident configuration sections cannot have the same caller id. |
| serviceNowDestination | Enum | One of `INCIDENT`, `ALERT`, or `EVENT`. Specifies which type of Service now alerting record will be created for vROps alerts in this `alertingConfig`. |
| serviceNowOpenState | String | Specifies the ServiceNow state an alerting record will be in when it is opened. The default is `New`. The value must be present in the `sys_choice` table for the alerting record's state column. |
| serviceNowReopenState | String | Specifies the ServiceNow state an alerting record will be in when it is reopened. The default is `New` for Incidents and Events and `Reopen` for Alerts. The value must be present in the `sys_choice` table for the alerting record's state column. |
| serviceNowCloseState | String | Specifies the ServiceNow state an alerting record will be in when it is closed. The default is `Closed` for Incidents and Alerts and `Closing` for Events. The value must be present in the `sys_choice` table for the alerting record's state column. |
| category | String | Optional additional metadata for incidents/alerts/events that are opened in ServiceNow. |
| subcategory | String | Optional additional metadata for incidents/alerts/events that are opened in ServiceNow. |
| businessService | String | Optional additional metadata for incidents/alerts/events that are opened in ServiceNow. |
| contactType | String | Optional additional metadata for incidents/alerts/events that are opened in ServiceNow. |
| state | String | Optional additional metadata for incidents/alerts/events that are opened in ServiceNow. Defaults to the value of the corresponding vROps Alert, mapped using `ServiceNowOpenState`, `ServiceNowReopenState`, and `ServiceNowCloseState`. |
| resolutionCode | String | Optional additional metadata for incidents/alerts/events that are opened in ServiceNow. |
| resolutionNotes | String | Optional additional metadata for incidents/alerts/events that are opened in ServiceNow. |

| Parameter | Type | Description |
|---|---|---|
| onHoldReason | String | Optional additional metadata for incidents/alerts/events that are opened in ServiceNow. |
| impact | String | Optional additional metadata for incidents/alerts/events that are opened in ServiceNow. For Incident and Alert, defaults to the value of the vROps Alert's impact. |
| urgency | String | Optional additional metadata for incidents/alerts/events that are opened in ServiceNow. |
| filters | Object | Set of filters that determine which vROps Alerts will get processed in this `alertingConfig`. See detail below. |
| retrieveUpdates | Boolean | When set to true, vROps alerts will be suspended when an incident or alert is in a closed state. In addition, any elements specified in `incidentElementsToRetrieve` will be sent to the vROps alert as notes when they change. Defaults to `true`. |
| vropsSuspendMinutes | Int | Defines how long (in whole minutes) an alert should be suspended when the corresponding ServiceNow alerting record is marked as closed. |
| serviceNowElementsToRetrieve | Array | A list of strings corresponding to table columns that are surfaced in vROps alerts as notes. Columns with dot notation are allowed. The default list is `state`, `assigned_to.name`, `priority`, and `urgency` for Incidents; `state`, `assigned_to.name`, and `priority` for Alerts; and `state` and `resolution_state` for Events. |

## CMDB Sync

A cmdbSync configuration can be added to the configuration file in order to enable this adapter to populate the CMDB with resources. The configuration object can include the following, each of which will be described in greater detail.

```
"cmdbSync": {
   "cmdbSyncMethod": "IRE_API",
   "syncMode": "POPULATE_AND_DELETE_WHEN_NOT_EXISTING",
   "objectIdentifierSource": "MOID",
   "builtInTreeEnabled": true,
   "customTreesEnabled": false,
   "additionalColumns": {},
   "nameFilter": {}
}
```

Additionally, using CMDB sync requires the user to add a Data Source to the identification rule for each resource type, otherwise columns cannot be updated via IRE.

There are a few CI Class Identification Rules that must be addressed as well.

- cmdb_ci_vcenter_datacenter:
  - Add a rule that uses `object_id` and `vcenter_uuid` together to uniquely identify the datacenter
  - If you have ever used the Discovery plugin, it adds a dependent relationship to `cmdb_ci_cloud_service_account`. Remove this dependency and allow the Datacenter to be an Independent resource.

- cmdb_ci_vcenter_datastore
  - Add a dependent containment relationship to the Datacenter (`cmdb_ci_vcenter_datastoreContains::Contained` by `cmdb_ci_vcenter_datacenter`)
- cmdb_ci_esx_server
  - Add a rule that uses `object_id` and `vcenter_uuid` together to uniquely identify the datacenter
  - If Discovery is being used, you may also need to disable the `correlation_id` rule to avoid duplicate objects.
- cmdb_ci_vcenter
  - Add a rule that uses `instance_uuid` as the unique identifier

**Custom Trees**

By default, built-in trees are enabled and custom trees are disabled. If you need to change the identification of the built-in classes, or map these resources to different CIs, disable the built-in tree and create your own custom tree to represent vCenter resources.

> **Tip:**
>
> To add columns to a built-in tree, use `additionalColumns` rather than defining a custom tree. See Additional Columns below.

To use custom trees, you must enable custom trees in the CMDB Sync Configuration. You must define each custom tree in its own json file under 'work/custom_trees'. When you make the directory 'custom_trees', make sure your vROps user has permission to read from that directory.

Format:

```
{
    "treeName": "Sample Tree Name",
    "syncClasses": []
}
```

Tree Name

This is a unique identifier for the tree. It cannot match the name of any other custom trees, or the built-in tree if the built-in tree is enabled.

Sync Classes

Sync classes defined what should be synced to the CMDB. For a tree to be valid, the chosen sync classes must include all identifiers required by the CMDB. Test connection will inform you if there are any issues with any of the sync classes.

```
{
    "classIdentifier": "Sample Class ID",
    "vROps": {...},
    "serviceNow": {...},
    "identifierMapping: {...},
    "dataColumns": [],
    "relationships": [],
    "propertyFilter": {}
}
```

`Class Identifier` This is a unique identifier for the class. It cannot match the identifier of any other custom class, or the built-in class if the built-in tree is enabled.

`vROps Definition` This is the same object required for ResourceType vROps Definitions

`ServiceNow Definition` This is the same object required for ResourceType ServiceNow Definitions

`Identifier Definition` The identifier mapping is our way of linking our resources to ServiceNow's CIs. This is a combination of identifiers which uniquely identify the resource. For example, vROps resources should use the vCenter UUID in combination with the MOID (which is what is shown in the example in the link below).

These do not have to be identifiers on either the CMDB side or the vROps side, though they often will be.

This is the same object required for ResourceType Identifier Mapping

`Data Columns` Data columns represent the columns that we sync to the CMDB that are not used as part of the identification mapping. See vROps Types and Fields for available options for the vropsType and vropsField parameters.

```
{
  "cmdbColumn": "cpu_name",
  "vropsType": "PROPERTY",
  "vropsField": "cpu|cpuModel"
}
```

`Relationships` Defines all relationships to children. The `childClassIdentifier` is the unique Class Identifier assigned to the child class. The child class must be a part of this tree. The `relationshipType` is not required if the CI Class Definition defines only one possible relationship type between the two CI Classes, but is required if there are multiple options.

```
"relationships": [
    {
      "childClassIdentifier": "CustomDatastore",
      "relationshipType": "Contains::Contained By"
    }
]
```

`Property Filter` This is used to filter resources based on properties. An example use-case would be if you wanted to map VMWARE VirtualMachine resources to `cmdb_ci_vmware_instance` CIs only when the property `summary|config|isTemplate` is set to false. You could make a second Custom Class which maps to `cmdb_ci_vmware_template` when `summary|config|isTemplate` is set to true from the same vROps ResourceType.

If this is not needed for your class, omit the block.

This sample filters only resources that are not templates.

```
"propertyFilter": {
    "conditions": [
      {
        "vropsField": "summary|config|isTemplate",
        "value": "false",
        "filterOperation": "EQUALS",
        "default": false
      }
    ],
    "joiner": "AND or OR"
}
```

`Property Filter Value` Set this to the value to search for in the string returned from the vropsField. If your field is a boolean or an integer, set it to the string representation of that boolean or integer (such as "15" or "true")

`Property Filter Operation` This specifies how we determine whether the filter condition is met.

Available options:

| Option | Behavior |
|---|---|
| EQUALS | The condition is true if the property value returned by vROps exactly matches the provided value |
| DOES_NOT_EQUAL | The condition is true if the property value returned by vROps does not match the provided value |
| CONTAINS | The condition is true if the value returned from vROps contains the provided value |
| DOES_NOT_CONTAIN | The condition is true if the value returned from vROps does not contain the provided value |

`Property Filter Default`This specifies how we should evaluate the condition if we cannot retrieve the property in vROps. Since the most common reason this could occur is for vROps to discover a new resource but not complete a collection and thus assign properties yet, we recommend defaulting to false. Using false as default will cause the filter to exclude all resources that do not have this property assigned from the sync.

`Property Filter Joiner` This specifies whether we should include the resource if all of the conditions are met (AND) or if at least one of the conditions are met (OR)

Available options:

| Option | Behavior |
|---|---|
| AND | All property filters must resolve to true in order to include the resource |
| OR | At least one of the property filters must resolve to true in order to include the resource |

**Tip:**

To map a custom tree representing another technology that vROps can monitor, such as AWS, whilst simultaneously using the built-in tree, enable custom trees and leave the built-in tree also enabled.

Custom Tree Example

```
{
  "instructions": "Copy this file to work/custom_trees before you begin to modify it. Remove all
 'instructions' objects from this json before attempting to collect using the this custom tree.",
  "treeName": "Replace this with a unique string which describes what this tree represents (such as
 'vCenter')",
  "syncClasses": [
    {
      "classIdentifier": "Replace this with a unique string which describes what this class represents (such
 as 'Virtual Machine')",
      "vROps": {
        "type": {
          "resourceKind": "Replace this with the vROps Resource Kind (such as 'Datastore')",
          "adapterKind": "Replace this with the vROps Adapter Kind (such as 'VMWARE')"
        }
      },
      "serviceNow": {
        "type": {
          "cmdbCiClass": "Replace this with the CI class in the ServiceNow CMDB (such as
 'cmdb_ci_vcenter_datastore')"
        }
      },
      "instructions": "identifierMapping can include any number of identifiers which, when taken together,
 uniquely identify the resource. If you are syncing vCenter resources, a combination of VMEntityObjectID and
 VMEntityVCID is generally recommended. These are for this adapter to map back and forth between ServiceNow
 and vROps. The columns and vROps fields referenced do not have to be identifiers for their platform, though
 they often are.",
      "identifierMapping": [
        {
          "serviceNowId": {
            "column": "The CMDB column (such as 'object_id')"
          },
          "vropsId": {
            "instructions": "See documentation for a full description of possible types and how to specify
 fields for them.",
            "type": "IDENTIFIER",
            "field": "VMEntityObjectID"
          }
```

```
        }
      ],
      "instructions": "dataColumns includes all other fields that you which to sync to the CMDB that are not
  used for our identification.",
      "dataColumns": [
        {
          "instructions": "See documentation for a full description of possible types and how to specify
  fields for them.",
          "cmdbColumn": "sample_column",
          "vropsType": "METRIC",
          "vropsField": "sample|metric|key"
        }
      ],
      "instructions": "Use the relationships array to define children of the the class. You can only reference
  classes that are also members of this tree.",
      "relationships": [
        {
          "childClassIdentifier": "Reference To Another Class In This Tree",
          "relationshipType": "This is only required if there are multiple possible relationship types between
  two CI Classes - if it is not defined, the adapter will read the relationship type from the CMDB. The format
  for this string is 'Contains::Contained by'"
        }
      ],
      "propertyFilter": {
        "instructions": "This is optional. Remove the propertyFilter object if you don't need it for your
  resource. If you do need the filter, you can define any number of conditions and whether we should join them
  all together with AND or OR. Conditions can only be made from vROps properties. Metrics, Identifiers, etc
  will not work.",
        "conditions": [
          {
            "vropsField": "The property that we will used from the vROps resource to determine if the
  condition is met (formatted|like|this)",
            "value": "The expected value for the condition. Use a string representation even if this is an int
  or boolean property",
            "filterOperation": "Whether a resource's property should equal, not equal, contain, or not contain
  the value in order to be included for this class (acceptable values: EQUALS, DOES_NOT_EQUAL, CONTAINS,
  DOES_NOT_CONTAIN)",
            "default": "If the property is not present on the resource, the boolean default determines whether
  or not to include this resource. Our recommendation and the default for this field is false since it is safer
  to assume the property has not yet initialized for the resource and we should wait until it is before making
  the determination."
          }
        ],
        "joiner": "AND or OR"
      }
    },
    {
      "instructions": "Define a sync class for every class you want to define and add it to this array."
    }
  ]
}
```

## Additional Columns

To add properties to the CMDB that are not defined by the built-in tree definition, use the 'additionalColumns' parameter.

This is a mapping from class identifier (See table in Name Filter) to a list of additional columns. An additional column has the following fields:

- cmdbColumn: The key of the column that the vROps field will be send to on the CMDB CI Class
- vropsType: Where to get this data from in vROps. See the type table below for a list of options
- vropsField: Represents the field to sync. See the type table below for a list of options

This example syncs the vROps property 'cpu|cpuModel' to the CMDB column 'cpu_name' on all Host System resources:

```
"additionalColumns": {
  "builtInHostSystem": [
    {
      "cmdbColumn": "cpu_name",
      "vropsType": "PROPERTY",
      "vropsField": "cpu|cpuModel"
    }
  ]
}
```

## vROps Types and Fields

When defining a column, this describes available 'vropsType' enums and what should be provided as the 'vropsField' when that type is selected

| Type | Applicable Field |
|---|---|
| PROPERTY | The key of the vROps property to sync such as 'cpu\|cpuModel' |
| IDENTIFIER | The key of the vROps Identifier to sync sync as 'VMEntityVCID' |
| METRIC | The key of the vROps property to sync such as 'cpu\|demand\|stress' |
| NAME | This should be left empty. The name of the resource will be used. |
| UUID | This should be left empty. The UUID assigned by vROps for the resource will be used. This is unique to each vROps instances so if the same resource is monitored by multiple vROps instances, this is not an ideal metric to use |
| STATIC_STRING | The value you want assigned to the column. For instance, you could set 'Synced From vROps' to a description column and the column would be set to that value for all resources of the CI Class that we sync. |

## Data Source

In order to sync data, the following must be done on ServiceNow:

- Add data_source `VMwareTVS` to the

  `Choice List`

  (you can search `sys_choice.list` in the UI or query `sys_choice` in the REST API) with the `Element` (`element` in REST) attribute set to `discovery_source` and the `Value` (`value`) and `Label` (`label`) attributes set to `VMwareTVS`. The `Table` (`table`) must be set to `cmdb_ci`.
- Add a Reconciliation Rule for your new `data_source` (`VMwareTVS`) on each of the CI classes in >Synced Resources

If this is not done, IRE will not be able to update the resource, but the API still returns a successful response so we are not able to alert/fail collection due to this.

## Synced Resources

The following resources from the VMWARE adapter will be synced to the CMDB if CMDB Sync is enabled:

| vROps Type | CI Class |
|---|---|
| Datastore | cmdb_ci_vcenter_datastore |
| Datacenter | cmdb_ci_vcenter_datacenter |
| HostSystem | cmdb_ci_esx_server |

| vROps Type | CI Class |
|---|---|
| ClusterComputeResource | cmdb_ci_vcenter_cluster |
| VMwareAdapter Instance | cmdb_ci_vcenter |
| VirtualMachine | cmdb_ci_vmware_instance |

Additional information about what properties and relationships we sync can be found in CMDB Synced Metrics.

### CMDB Sync Method

Currently, the only supported sync method is the IRE API (IRE_API). This is the default value and specifying it is not required. IRE_API uses ServiceNow's Identification and Reconciliation Engine to resolve vROps resources to the appropriate ServiceNow resources. For this to work properly, the identification rules for the ci classes this adapter populates should not be altered from what ServiceNow includes by default. If rules are edited or removed, we cannot guarantee how the IRE will resolve resources that this adapter sends it.

CMDB Sync using the IRE is not compatible with ServiceNow's Discovery plugin.

Note: The TableAPI is also used for methods the IRE API cannot accomplish such as adding/deleting relationships that have changed which would affect identification and deleting resources if the sync mode is set to allow deletion.

### Sync Mode

This specifies how we should sync CIs to the CMDB.

There are 3 options for syncMode:

- POPULATE_ONLY: Populates the CMDB, but does not remove CIs. If a resource is Not Existing, it sets the operational status to '6' (retire).
- POPULATE_AND_DELETE_WHEN_NOT_EXISTING: Populates the CMDB and removes CIs that have been marked as `Not Existing` in vROps
- POPULATE_AND_DELETE_WHEN_REMOVED: Populates the CMDB and removes CIs that have been removed from vROps. If a resource is Not Existing, it sets the operational status to '6' (retire).

### Object Identifier Source

This is used to select which identifier should be used for objects which have both a UUID and a MOID. Currently, this only applies to Virtual Machine resources. If you are populating your CMDB for the first time, we recommend using MOID. If you are using this adapter to add data to a CMDB that has already been populated, check the format of the identifier in the `object_id` column for a `cmdb_ci_vmware_instance` object and choose the option below that matches it.

There are 2 options for Object Identifier Source:

- MOID (default): Also called MoRef ID, this is a required identifier in vROps and looks like `vm-111`. It includes a prefix and a number which is generated by a counter.
- UUID: This is an optional identifier in vROps and looks like a standard UUID. In most cases, this should be present, but there is a chance that it will not be. We have a few VMs in our test environment which are in bad states that don't have UUIDs, but they do have MOIDs.

For further info about identifiers in vCenter, see

- Identification Overview Part 1
- Identification Overview Part 2

### Name Filter

A map from ServiceNow CI Class to a regex filter. Every resource with a name that matches this regex will not be synced to the CMDB. This can be omitted if you intend to include all resources. It will look like this if you wish to ignore all VMs that end in the `dev`:

```
{ "cmdb_ci_vmware_instance": "^.*dev$"}
```

Note: VM templates are automatically filtered out so there is no need to add a name filter for VM templates.

### Configuration Samples

Some sample configuration files are provided for you. They are pre-installed with the Management Pack and located at `/usr/lib/vmware-vcops/user/plugins/inbound/servicenow_adapter3/conf/config_samples`. You can use these out-of-the-box, or you can modify the json as described in the (Configuration File)[#Configuration File] section. If you do modify any of the files, it is recommended that you move the modified file to the `work` directory. Otherwise, the modified file will be overwritten if you update the Management Pack.

If you wish to use an un-modified configuration file, you will need to specify the path starting with the directory inside `config_samples` in the Adapter Configuration.

For example, if you wish to use `moid_alerts.json`, you can specify `alert/moid_alerts.json`. If you copy it to the work directory so that you can modify it, you only need to specify the name of the file.

Since group configurations are custom to specific customer deployments, we do not include any out-of-the-box samples with group configurations

The following sample configurations are available:

#### Alerts No Mapping

Location in `config_samples`: `alert/alerts_no_mapping.json`

This is a basic configuration that will send all vROps alerts to ServiceNow as ServiceNow alerts. It does not apply any filters.

#### Alerts No Mapping

Location in `config_samples`: `alert/events_no_mapping.json`

This is a basic configuration that will send all vROps alerts to ServiceNow as ServiceNow events. It does not apply any filters.

#### Alerts No Mapping

Location in `config_samples`: `alert/incidents_no_mapping.json`

This is a basic configuration that will send all vROps alerts to ServiceNow as ServiceNow incidents. It does not apply any filters.

#### MOID Alerts

Location in `config_samples`: `alert/moid_alerts.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow alerts for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds except VirtualMachine, which uses MOID and vCenter UUID.

#### MOID Events

Location in `config_samples`: `alert/moid_events.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow events for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds except VirtualMachine, which uses MOID and vCenter UUID.

#### MOID Incidents

Location in `config_samples`: `alert/moid_incidents.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow incidents for these vROps alerts and associates them with

their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds except VirtualMachine, which uses MOID and vCenter UUID.

#### UUID Alerts

Location in `config_samples`: `alert/uuid_alerts.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow alerts for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

#### UUID Events

Location in `config_samples`: `alert/uuid_events.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow events for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

#### UUID Incidents

Location in `config_samples`: `alert/uuid_incidents.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow incidents for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

#### CMDB Sync MOID Populate Only

Location in `config_samples`: `cmdb_sync/moid_populate_only.json`

This configuration syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, but it does not delete resources from the CMDB.

#### CMDB Sync MOID Populate and Delete When Not Existing

Location in `config_samples`: `cmdb_sync/moid_populate_and_delete_when_not_existing.json`

This configuration syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when vROps marks them as `Not Existing`

#### CMDB Sync MOID Populate and Delete When Removed

Location in `config_samples`: `cmdb_sync/moid_populate_and_delete_when_removed.json`

This configuration syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

#### CMDB Sync UUID Populate Only

Location in `config_samples`: `cmdb_sync/uuid_populate_only.json`

This configuration syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, but it does not delete resources from the CMDB.

### CMDB Sync UUID Populate and Delete When Not Existing

Location in `config_samples`: `cmdb_sync/uuid_populate_and_delete_when_not_existing.json`

This configuration syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, and deletes resources from the CMDB when vROps marks them as

```
Not
        Existing
```

### CMDB Sync UUID Populate and Delete When Removed

Location in `config_samples`: `cmdb_sync/uuid_populate_and_delete_when_removed.json`

This configuration syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

### Combined: MOID Alerts and Populate Only

Location in `config_samples`: `combined/moid_alerts_and_populate_only.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow alerts for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

### Combined: MOID Alerts and Populate Delete When Not Existing

Location in `config_samples`: `combined/moid_alerts_and_populate_when_not_existing.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow alerts for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when vROps marks them as `Not Existing`

### Combined: MOID Alerts and Populate When Removed

Location in `config_samples`: `combined/moid_alerts_and_populate_when_removed.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow alerts for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

### Combined: MOID Events and Populate Only

Location in `config_samples`: `combined/moid_events_and_populate_only.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow events for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

**Combined: MOID Events and Populate Delete When Not Existing**

Location in `config_samples`: `combined/moid_events_and_populate_when_not_existing.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow events for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when vROps marks them as `Not Existing`

**Combined: MOID Events and Populate When Removed**

Location in `config_samples`: `combined/moid_events_and_populate_when_removed.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow events for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

**Combined: MOID Incidents and Populate Only**

Location in `config_samples`: `combined/moid_incidents_and_populate_only.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow incidents for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

**Combined: MOID Incidents and Populate Delete When Not Existing**

Location in `config_samples`: `combined/moid_incidents_and_populate_when_not_existing.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow incidents for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when vROps marks them as `Not Existing`

**Combined: MOID Incidents and Populate When Removed**

Location in `config_samples`: `combined/moid_incidents_and_populate_when_removed.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow incidents for these vROps alerts and associates them with

their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the `object_id` for `cmdb_ci_vmware_instance` (Virtual Machine) CIs and the UUID is used as the `object_id` for all other CI Classes. This configuration populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

**Combined: UUID Alerts and Populate Only**

Location in `config_samples`: `combined/uuid_alerts_and_populate_only.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow alerts for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, but it does not delete resources from the CMDB.

**Combined: UUID Alerts and Populate and Delete When Not Existing**

Location in `config_samples`: `combined/uuid_alerts_and_populate_when_not_existing.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow alerts for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, and deletes resources from the CMDB when vROps marks them as

```
Not
        Existing
```

**Combined: UUID Alerts and Populate When Removed**

Location in `config_samples`: `combined/uuid_alerts_and_populate_when_removed.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow alerts for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

**Combined: UUID Events and Populate Only**

Location in `config_samples`: `combined/uuid_events_and_populate_only.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow events for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, but it does not delete resources from the CMDB.

**Combined: UUID Events and Populate and Delete When Not Existing**

Location in `config_samples`: `combined/uuid_events_and_populate_when_not_existing.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow events for these vROps alerts and associates them with

their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, and deletes resources from the CMDB when vROps marks them as

```
Not
        Existing
```

**Combined: UUID Events and Populate When Removed**

Location in `config_samples`: `combined/uuid_events_and_populate_when_removed.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow events for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

**Combined: UUID Incidents and Populate Only**

Location in `config_samples`: `combined/uuid_incidents_and_populate_only.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow incidents for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, but it does not delete resources from the CMDB.

**Combined: UUID Incidents and Populate and Delete When Not Existing**

Location in `config_samples`: `combined/uuid_incidents_and_populate_when_not_existing.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow incidents for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, and deletes resources from the CMDB when vROps marks them as

```
Not
        Existing
```

**Combined: UUID Incidents and Populate When Removed**

Location in `config_samples`: `combined/uuid_incidents_and_populate_when_removed.json`

This configuration filters vROps alerts to the following ResourceKinds: VirtualMachine, ClusterComputeResource, Datacenter, Datastore, HostSystem. It creates ServiceNow incidents for these vROps alerts and associates them with their CI if it is present in the CMDB. The mapping uses a combination of UUID and vCenter UUID as identifiers for all ResourceKinds.

Also, it syncs vROps resources to the CMDB. The MOID is used as the UUID is used as the `object_id` for all CI Classes. It populates the CMDB, and deletes resources from the CMDB when they are deleted from vROps.

### Using the Management Pack

The Management Pack for ServiceNow includes the following out-of-the-box features, harnessing the power of the VCF Operations user interface:

- Dashboards
- Views
- Metrics and Statistics
- Alert Sync

## Dashboards

Dashboards are the primary feature for monitoring and troubleshooting ServiceNow problems from within VCF Operations.

The following dashboards are included in the Management Pack for ServiceNow:

**ServiceNow Statistics** provides a breakdown of all the relevant and important statistics from your monitored ServiceNow CMDB.

**ServiceNow Group Overview** provides an overview of different SNOW resources. Simply select a resource from the Environment Overview widget to populate the Alert List and KPI widgets with the relevant information for that resource.

**ServiceNow Details** provides status, relationships, health, alerts, and KPIs.

**ServiceNow Cost Analysis** provides monthly cost data for operating virtual machines, host systems, or datastores. ServiceNow Cost Analysis requires the user to set a currency. To do this, go to Administration/Management/Global Settings; find the Currency setting and set it to the appropriate value. Caution: Currency cannot be changed after it has been set.

> **Note:**
>
> Additional Details dashboards are generated based on your configuration file and will be installed automatically if you set the **Upload Dashboards** setting to true in the adapter configuration.

## Views

The Management Pack for ServiceNow creates views that allow the user to view statistics of metrics for ServiceNow resources. The views help give a broad picture of the entire system, as opposed to a more in depth view.

The following views are available in the Management Pack:

| View | Type | Description |
|---|---|---|
| Alerts that are currently active | List | Show alerts for the selected object and its descendants that are currently active |
| Environment Top Critical Alerts Summary | List | |
| Symptoms | List | This view provides a list of active symptoms for the selected object. It is useful for a dashboard that is focused on diagnosing problems that do not have an alert. |
| Datastore Cost Analysis | Summary | The total and average values of monthly cost metrics for Datastores related to the selected group. |
| Host System Cost Analysis | Summary | The total and average values of monthly cost metrics for Host Systems related to the selected group. |
| Virtual Machine Monthly Cost Analysis | Summary | The total and average values of monthly cost metrics for Virtual Machines related to the selected group. |

To access the Management Pack views:

1. Navigate to **Environment > All Objects > ServiceNow**.
2. Double-click on the desired object (resource).
3. Select the **Details** tab, then **Views.**

The available views for that resource are listed and can be selected.

CMDB Synced Metrics

**CMDB Sync Properties**

The following cmdb columns will be populated for the given CI Classes.

- ServiceNow Column: This is the column that will be populated in ServiceNow
- VCF Operations Type: This is indicates where the column value is taken from in VCF Operations.

The following options are available:

- IDENTIFIER: an identifier on the VCF Operations resource
- PROPERTY: a property on the VCF Operations resource
- METRIC: a metric on the VCF Operations resource
- STATIC_STRING: a static string that will always return the same value (that value is shown in the VCF Operations key column of the table)
- VCF Operations Key: The key for the attribute found in VCF Operations
- Conversion: A description of the conversion used on the VCF Operations attribute before sending it to ServiceNow
- Native Attribute: Returns true if this is an attribute that is present out-of-the-box on the ServiceNow CI Class. If this is false, it is added by the Discovery plugin. If you are not using the discovery plugin, but want to use the attribute, add the column to the CI Class definition cmdb_ci_vcenter_datastore (VMWARE::Datastore)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| name | IDENTIFIER | VMEntityName | None | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| morid | IDENTIFIER | VMEntityObjectID | None | true |
| accessible | PROPERTY | summary\|accessible | None | true |
| vcenter_ref | PROPERTY | summary\|parentVcenter | None | true |
| type | PROPERTY | summary\|type | None | true |
| capacity | PROPERTY | summary\|diskCapacity | None | true |
| freespace | METRIC | diskspace\|freespace | None | true |
| url | PROPERTY | summary\|path | None | true |
| object_id | IDENTIFIER | VMEntityObjectID | None | true |
| vcenter_uuid | IDENTIFIER | VMEntityVCID | None | true |

cmdb_ci_vmware_instance (VMWARE::VirtualMachine)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| vm_instance_uuid | IDENTIFIER | VMEntityInstanceUUID | None | true |
| template | PROPERTY | summary\|config\|isTemplate | None | true |
| name | IDENTIFIER | VMEntityName | None | true |
| cpus | PROPERTY | config\|hardware\|numCpu | None | true |
| disks | PROPERTY | config\|numVMDKs | None | true |
| disks_size | PROPERTY | config\|hardware\|diskSpace | None | true |
| memory | PROPERTY | config\|hardware\|memoryKB | Convert KB to MB | true |
| nics | PROPERTY | summary\|config\|numEthernetCards | None | true |

| | | | | |
|---|---|---|---|---|
| state | PROPERTY | summary\|runtime\|powerState | None | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| object_id | IDENTIFIER | VMEntityObjectID or VMEntityInstanceUUID | None | true |
| vcenter_uuid | IDENTIFIER | VMEntityVCID | None | true |

cmdb_ci_esx_server (VMWARE::HostSystem)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| name | IDENTIFIER | VMEntityName | None | true |
| asset | PROPERTY | hardware\|vendorModel | None | true |
| connection_state | PROPERTY | runtime\|connectionState | None | false |
| connection_id | PROPERTY | summary\|hostuuid | None | false |
| cpu_core_count | PROPERTY | hardware\|cpuInfo\|numCpuCores | None | true |
| cpu_count | PROPERTY | hardware\|cpuInfo\|numCpuPackages | None | true |
| cpu_speed | PROPERTY | hardware\|cpuInfo\|hz | None | true |
| cpu_type | PROPERTY | cpu\|cpuModel | None | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| disk_space | METRIC | diskspace\|total_capacity | None | true |
| hyper_threading | PROPERTY | config\|hyperThread\|available | None | false |
| ip_address | PROPERTY | net\|mgmt_address | None | true |
| manufacturer | PROPERTY | hardware\|vendor | None | true |
| model_id | PROPERTY | hardware\|vendorModel | None | true |
| os_version | PROPERTY | summary\|version | None | true |
| power_state | PROPERTY | runtime\|powerState | None | false |
| ram | PROPERTY | hardware\|memorySize | Convert KB to MB | true |
| serial_number | PROPERTY | hardware\|serialNumber | None | true |
| vcenter_ref | PROPERTY | summary\|parentVcenter | None | true |
| object_id | IDENTIFIER | VMEntityObjectID | None | true |
| vcenter_uuid | IDENTIFIER | VMEntityVCID | None | true |

cmdb_ci_vcenter_datacenter (VMWARE::Datacenter)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| name | IDENTIFIER | VMEntityName | None | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| morid | IDENTIFIER | VMEntityObjectID | None | true |
| vcenter_ref | PROPERTY | summary\|parentVcenter | None | true |
| object_id | IDENTIFIER | VMEntityObjectID | None | true |
| vcenter_uuid | IDENTIFIER | VMEntityVCID | None | true |

cmdb_ci_vcenter_cluster (VMWARE::ClusterComputeResource)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| name | IDENTIFIER | VMEntityName | None | true |

| | | | | |
|---|---|---|---|---|
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| morid | IDENTIFIER | VMEntityObjectID | None | true |
| effectivehosts | METRIC | summary\|number_running_hosts | None | true |
| vcenter_ref | PROPERTY | summary\|parentVcenter | None | true |
| numhosts | METRIC | summary\|total_number_hosts | None | true |
| totalcpu | METRIC | cpu\|haTotalCapacity_average | None | true |
| totalmemory | METRIC | mem\|totalCapacity_average | None | true |
| numcpucores | METRIC | cpu\|corecount_provisioned | None | true |
| drs_behavior | PROPERTY | configuration\|drsConfig\|defaultVmBehavior | None | true |
| drs_enabled | PROPERTY | configuration\|drsconfig\|enabled | None | true |
| drs_vmotion_rate | PROPERTY | configuration\|drsConfig\|vmotionRate | None | true |
| object_id | IDENTIFIER | VMEntityObjectID | None | true |
| vcenter_uuid | IDENTIFIER | VMEntityVCID | None | true |

cmdb_ci_vcenter (VMWARE::VMwareAdapter Instance)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| name | IDENTIFIER | VCURL | None | true |
| cmdb_ci_vcenter | STATIC_STRING | sys_class_name | None | true |
| fullName | PROPERTY | summary\|vcfullname | None | true |
| url | IDENTIFIER | VCURL | Builds SDK URL from hostname | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| instance_uuid | IDENTIFIER | VMEntityVCID | None | true |

The following cmdb columns may be populated for the given Discovery CI Classes. Discovery classes can be either optional or required. Optional discovery classes are not required and if discovery has not been set up in the environment, they will not be included. If discovery is required, then then CI Class structure must include the required relation to the Cloud Service Account that discovery creates (even if you are not actively using discover).

Optional Discovery Class cmdb_ci_cloud_service_account (VMWARE::VMwareAdapter Instance)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion |
|---|---|---|---|
| account_id | IDENTIFIER | account_id | None |
| object_id | IDENTIFIER | object_id | None |
| datacenter_url | IDENTIFIER | VCURL | Convert hostname or IP to URL |
| datacenter_type | STATIC_STRING | cmdb_ci_vcenter_datacenter | None |

CMDB Sync Relationships

The following relationships are made between CMDB CI sync classes. Relationships are displayed from the perspective of the parent object.

cmdb_ci_vcenter_datastore (VMWARE::Datastore)

| Child CI Class | CI Relationship Type |
|---|---|
| cmdb_ci_esx_server | Used by::Uses |
| cmdb_ci_vmware_instance | Provides storage for::Stored on |

cmdb_ci_vmware_instance (VMWARE::VirtualMachine)

| Child CI Class | CI Relationship Type |
|---|---|
| cmdb_ci_vcenter_datacenter | Registered on::Has registered |
| cmdb_ci_vcenter_datacenter | Hosted on::Hosts |

cmdb_ci_vcenter_datacenter (VMWARE::Datacenter)

| Child CI Class | CI Relationship Type |
|---|---|
| cmdb_ci_vcenter_cluster | Contains::Contained by |
| cmdb_ci_vcenter_datastore | Contains::Contained by |
| cmdb_ci_vmware_instance | Contains::Contained by |
| cmdb_ci_esx_server | Contains::Contained by |

cmdb_ci_vcenter_cluster (VMWARE::ClusterComputeResource)

| Child CI Class | CI Relationship Type |
|---|---|
| cmdb_ci_esx_server | Members::Member of |

cmdb_ci_vcenter (VMWARE::VMwareAdapter Instance)

| cmdb_ci_vcenter_datacenter | Contains::Contained by |
| cmdb_ci_esx_server | Runs on::Runs |

Discovery Resource cmdb_ci_cloud_service_account (VMWARE::VMwareAdapter Instance)

| Parent CI Class | CI Relationship Type |
|---|---|
| cmdb_ci_vcenter_datacenter | Hosted on::Hosts |

### Alert Sync

Incident configurations are used for the alert-sync feature and define what types of alerts will be synced between VCF Operations and ServiceNow. This feature only works on VCF Operations using the built in ServiceNow plugin. It depends on this plugin filter to send initial alerts from VCF Operations to ServiceNow. Once the VCF Operations alert is present in ServiceNow, the ServiceNow Management Pack performs the following additional features:

- If an alert is cancelled in VCF Operations, the corresponding incident in ServiceNow is closed.
- If an incident is closed in ServiceNow, the corresponding alert in VCF Operations is suspended. Alerts in VCF Operations are generally triggered automatically by breaching thresholds. Because we cannot control this, if an incident is closed in ServiceNow it should be due to the underlying issue being resolved. Thus, we suspend the Alert in VCF Operations (for a configurable length of time) to allow the alert to resolve. If the threshold(s) is still breached when the alert suspend time has ended, the alert will re-trigger and reopen the ServiceNow Incident.
- If a VCF Operations alert is triggered on a VCF Operations ResourceKind that is present in one of the `resourceTypes` sections above, the ServiceNow Management Pack will create a reference from the incident's `cmdb_ci` column to the CI representing the resource in ServiceNow the alert was triggered on. A resourceType section can be created with empty `groupTypes` and `hierarchies` arrays for matching to a resource type, without creating any groupings and hierarchies.

- The ServiceNow Management Pack can be configured to watch a predefined set of incident columns and display the current values in the corresponding VCF Operations alert as a series of notes.

  **Important:**

  VCF Operations alerts cannot be closed based on incidents, only suspended.

For more information, see Creating a Configuration File.

CMDB Synced Metrics

**CMDB Sync Properties**

The following cmdb columns will be populated for the given CI Classes.

- ServiceNow Column: This is the column that will be populated in ServiceNow
- VCF Operations Type: This is indicates where the column value is taken from in VCF Operations.

The following options are available:

- IDENTIFIER: an identifier on the VCF Operations resource
- PROPERTY: a property on the VCF Operations resource
- METRIC: a metric on the VCF Operations resource
- STATIC_STRING: a static string that will always return the same value (that value is shown in the VCF Operations key column of the table)
- VCF Operations Key: The key for the attribute found in VCF Operations
- Conversion: A description of the conversion used on the VCF Operations attribute before sending it to ServiceNow
- Native Attribute: Returns true if this is an attribute that is present out-of-the-box on the ServiceNow CI Class. If this is false, it is added by the Discovery plugin. If you are not using the discovery plugin, but want to use the attribute, add the column to the CI Class definition cmdb_ci_vcenter_datastore (VMWARE::Datastore)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| name | IDENTIFIER | VMEntityName | None | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| morid | IDENTIFIER | VMEntityObjectID | None | true |
| accessible | PROPERTY | summary\|accessible | None | true |
| vcenter_ref | PROPERTY | summary\|parentVcenter | None | true |
| type | PROPERTY | summary\|type | None | true |
| capacity | PROPERTY | summary\|diskCapacity | None | true |
| freespace | METRIC | diskspace\|freespace | None | true |
| url | PROPERTY | summary\|path | None | true |
| object_id | IDENTIFIER | VMEntityObjectID | None | true |
| vcenter_uuid | IDENTIFIER | VMEntityVCID | None | true |

cmdb_ci_vmware_instance (VMWARE::VirtualMachine)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| vm_instance_uuid | IDENTIFIER | VMEntityInstanceUUID | None | true |
| template | PROPERTY | summary\|config\|isTemplate | None | true |
| name | IDENTIFIER | VMEntityName | None | true |
| cpus | PROPERTY | config\|hardware\|numCpu | None | true |
| disks | PROPERTY | config\|numVMDKs | None | true |
| disks_size | PROPERTY | config\|hardware\|diskSpace | None | true |

| | | | | |
|---|---|---|---|---|
| memory | PROPERTY | config\|hardware\|memory KB | Convert KB to MB | true |
| nics | PROPERTY | summary\|config\|numEthernetCards | None | true |
| state | PROPERTY | summary\|runtime\|powerState | None | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| object_id | IDENTIFIER | VMEntityObjectID or VMEntityInstanceUUID | None | true |
| vcenter_uuid | IDENTIFIER | VMEntityVCID | None | true |

cmdb_ci_esx_server (VMWARE::HostSystem)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| name | IDENTIFIER | VMEntityName | None | true |
| asset | PROPERTY | hardware\|vendorModel | None | true |
| connection_state | PROPERTY | runtime\|connectionState | None | false |
| connection_id | PROPERTY | summary\|hostuuid | None | false |
| cpu_core_count | PROPERTY | hardware\|cpuInfo\|numCpuCores | None | true |
| cpu_count | PROPERTY | hardware\|cpuInfo\|numCpuPackages | None | true |
| cpu_speed | PROPERTY | hardware\|cpuInfo\|hz | None | true |
| cpu_type | PROPERTY | cpu\|cpuModel | None | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| disk_space | METRIC | diskspace\|total_capacity | None | true |
| hyper_threading | PROPERTY | config\|hyperThread\|available | None | false |
| ip_address | PROPERTY | net\|mgmt_address | None | true |
| manufacturer | PROPERTY | hardware\|vendor | None | true |
| model_id | PROPERTY | hardware\|vendorModel | None | true |
| os_version | PROPERTY | summary\|version | None | true |
| power_state | PROPERTY | runtime\|powerState | None | false |
| ram | PROPERTY | hardware\|memorySize | Convert KB to MB | true |
| serial_number | PROPERTY | hardware\|serialNumber | None | true |
| vcenter_ref | PROPERTY | summary\|parentVcenter | None | true |
| object_id | IDENTIFIER | VMEntityObjectID | None | true |
| vcenter_uuid | IDENTIFIER | VMEntityVCID | None | true |

cmdb_ci_vcenter_datacenter (VMWARE::Datacenter)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| name | IDENTIFIER | VMEntityName | None | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| morid | IDENTIFIER | VMEntityObjectID | None | true |
| vcenter_ref | PROPERTY | summary\|parentVcenter | None | true |
| object_id | IDENTIFIER | VMEntityObjectID | None | true |
| vcenter_uuid | IDENTIFIER | VMEntityVCID | None | true |

cmdb_ci_vcenter_cluster (VMWARE::ClusterComputeResource)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| name | IDENTIFIER | VMEntityName | None | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| morid | IDENTIFIER | VMEntityObjectID | None | true |
| effectivehosts | METRIC | summary\|number_running_hosts | None | true |
| vcenter_ref | PROPERTY | summary\|parentVcenter | None | true |
| numhosts | METRIC | summary\|total_number_hosts | None | true |
| totalcpu | METRIC | cpu\|haTotalCapacity_average | None | true |
| totalmemory | METRIC | mem\|totalCapacity_average | None | true |
| numcpucores | METRIC | cpu\|corecount_provisioned | None | true |
| drs_behavior | PROPERTY | configuration\|drsConfig\|defaultVmBehavior | None | true |
| drs_enabled | PROPERTY | configuration\|drsconfig\|enabled | None | true |
| drs_vmotion_rate | PROPERTY | configuration\|drsConfig\|vmotionRate | None | true |
| object_id | IDENTIFIER | VMEntityObjectID | None | true |
| vcenter_uuid | IDENTIFIER | VMEntityVCID | None | true |

cmdb_ci_vcenter (VMWARE::VMwareAdapter Instance)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion | Native Attribute |
|---|---|---|---|---|
| name | IDENTIFIER | VCURL | None | true |
| cmdb_ci_vcenter | STATIC_STRING | sys_class_name | None | true |
| fullName | PROPERTY | summary\|vcfullname | None | true |
| url | IDENTIFIER | VCURL | Builds SDK URL from hostname | true |
| discovery_source | STATIC_STRING | VMwareTVS | None | true |
| instance_uuid | IDENTIFIER | VMEntityVCID | None | true |

The following cmdb columns may be populated for the given Discovery CI Classes. Discovery classes can be either optional or required. Optional discovery classes are not required and if discovery has not been set up in the environment, they will not be included. If discovery is required, then then CI Class structure must include the required relation to the Cloud Service Account that discovery creates (even if you are not actively using discover).

Optional Discovery Class cmdb_ci_cloud_service_account (VMWARE::VMwareAdapter Instance)

| ServiceNow Column | VCF Operations Type | VCF Operations Key | Conversion |
|---|---|---|---|
| account_id | IDENTIFIER | account_id | None |
| object_id | IDENTIFIER | object_id | None |
| datacenter_url | IDENTIFIER | VCURL | Convert hostname or IP to URL |
| datacenter_type | STATIC_STRING | cmdb_ci_vcenter_datacenter | None |

CMDB Sync Relationships

The following relationships are made between CMDB CI sync classes. Relationships are displayed from the perspective of the parent object.

cmdb_ci_vcenter_datastore (VMWARE::Datastore)

| Child CI Class | CI Relationship Type |
|---|---|
| cmdb_ci_esx_server | Used by::Uses |
| cmdb_ci_vmware_instance | Provides storage for::Stored on |

## Management Pack for VMware Avi Load Balancer

This management pack provides a single pane view of all the Avi Load Balancer objects, their metrics, and properties. You can monitor and troubleshoot resource objects deployed across multiple Avi Load Balancer instances.

### Intended Audience

The information in this guide is intended for IT operations and security personnel who set up and support the VCF Operations infrastructure.

### Introduction

The VCF Operations Management Pack for Avi Load Balancer provides end-to-end visibility of the infrastructure and effective monitoring of the supported objects. While the Avi Load Balancer application uses next generation architecture, delivering application services beyond load balancing, such as application analytics, predictive autoscaling,

micro-segmentation, and self-service for app owners in both on-premises or cloud environments, the VCF Operations Management Pack for Avi Load Balancer allows you to intelligently monitor and troubleshoot Avi Load Balancer instances and its entities for smooth operations management.

Here are some notable features of this management pack:

- End-to-end visibility of load balanced resources across geographies, spread across both on-premises or cloud environments.
- Single pane view of the Avi Load Balancer objects such as, controllers, tenants, clouds, virtual services, pools, servers, service engines, service engine groups, and network, and their metrics, and properties.
- Continuous monitoring of the resource objects deployed in the Avi Load Balancer. This leads to effective and prompt troubleshooting.
- One-stop view of the availability and health of the supported objects from dashboards and alerts.
- Visualization of object relationships helps to troubleshoot issues by leveraging hierarchical insights using metrics, properties, and health score analytics.
- Unified alert reporting across multiple instances of the Avi Load Balancer.

**Object Types and Object Hierarchy**

The VCF Operations Management Pack for Avi Load Balancer collects metrics and properties for several object types.

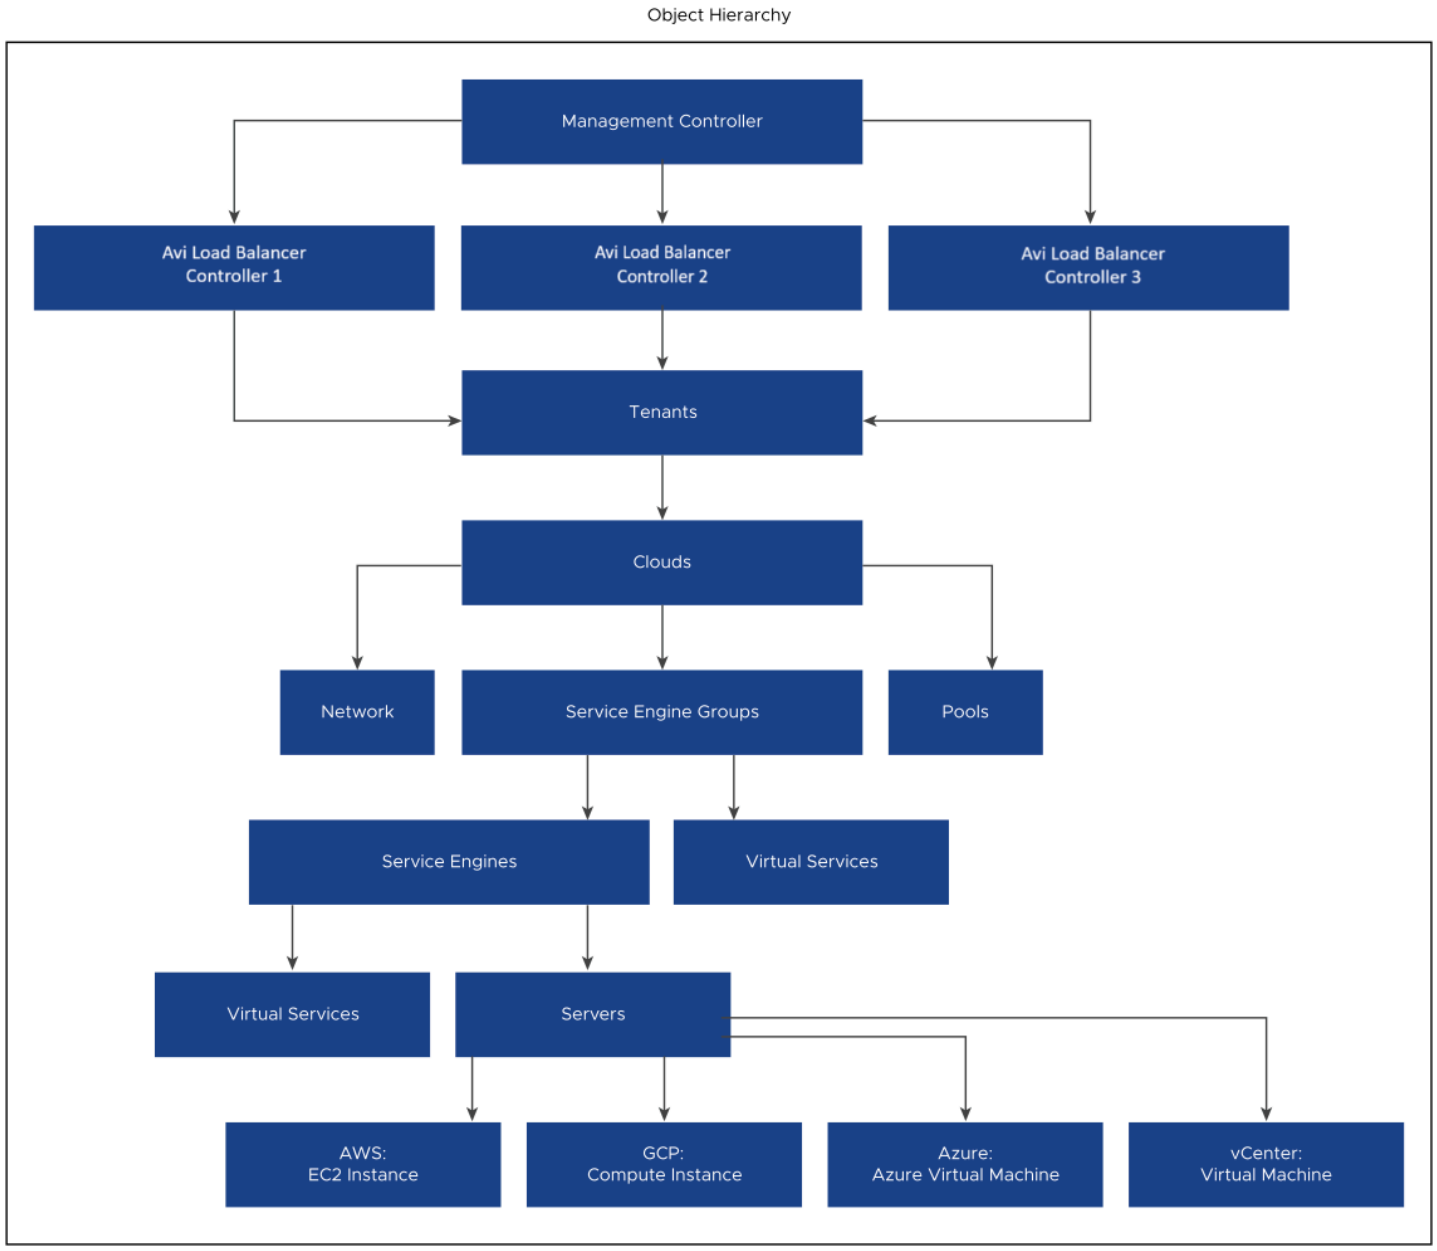
**Table 1669: List of Object Types**

| Object Types | Description |
|---|---|
| Controllers | Single point of management and control that serves as the brain of the entire system. For high availability, the controller is typically deployed as a three-node cluster. The controller implements the control plane. |
| Tenants | Isolated instances of the Avi Load Balancer that are associated with a user account that defines the resources that a user has access to. |
| Clouds | Containers for the environment that the Avi Load Balancer is installed in or operating within. |
| Virtual Services | Objects that advertise an IP address and ports to the external world and listen for client traffic. When the virtual service receives traffic, it can be configured for different reasons. |
| Pools | Objects that maintain the list of servers assigned to them and performs health monitoring, load balancing, persistence, and functions that involve Avi Load Balancer-to-server interaction. |
| Servers | The service engine machine. This can either be an EC2 instance/ Azure Virtual Machine/Compute Instance/vCenter Virtual Machine.<br>**Note:**<br>A prerequisite to view this object type is to add the cloud account, which is, vCenter/AWS/Azure/GCP, in VCF Operations where the service engine is deployed. This helps to monitor the actual service engine machine. |
| Service Engines | Machines that host the virtual services and require either direct or routable access to the client and server network. |
| Service Engine Groups | Objects that contain the definition of how the service engines should be sized, placed, and made highly available. |
| Network | Network resources used by service engines to communicate with the controller. This may be the same network as one of the data networks used for load balancing. |

For more details about object types, see the Avi Documentation.

## Object Hierarchy

The flow chart depicts the hierarchy of the supported objects types.



**Note:**
When a virtual service is initially created, it is associated with the service engine group. However, when it is hosted in the service engine, it is associated with all the service engines that are hosting the virtual service.

### Tenant Information

Each tenant that is supported in the instance of the Avi Load Balancer, is represented as an object in the object hierarchy. VCF Operations has the capability of representing the various tenants created in each of the Avi Load Balancer instances and represents them as part of the object hierarchy.

### Clouds

The VCF Operations Management Pack for Avi Load Balancer collects and monitors load balancer resources. This version of the management pack is certified for vCenter, NSX, AWS, Azure and GCP deployment options. The VCF Operations Management Pack for Avi Load Balancer collects metrics and properties for each of the public clouds. Although other deployment options supported in the Avi Load Balancer are not certified, that should not impact the

collection of inventory in terms of object metrics and associated alerts and dashboards. Deployments in native VMware environments such as NSX, vSphere, and vSAN are also supported.

**Getting Started**

Install and configure the VCF Operations Management Pack for Avi Load Balancer to collect metrics, properties, view dashboards, and troubleshoot alerts for the configured Avi Load Balancer instance.

### Install the VCF Operations Management Pack for Avi Load Balancer

The management pack consists of a PAK file that contains default dashboards for the objects that the management pack identifies. After installation, configure the management pack. For install information, see Installing and Configuring Integrations in VMware Cloud Foundation Operations.

### Configure the VCF Operations Management Pack for Avi Load Balancer

After you install the management pack, add and configure the Avi Load Balancer instance.

- As a non-admin user, to monitor the Avi Load Balancer objects in VCF Operations, the configured user must have at least read only access to the following objects to view the objects and their hierarchy.
  - Controller
  - Tenant
  - Cloud
  - Service Engine
  - Service Engine Group
  - Network
  - Pool
  - Virtual Service
  - Alert
  - Controller Site
  - System setting
  - Security admin role at admin tenant
- Ensure that the tenant access to the provider service engine is enabled for the tenants on the Avi Load Balancer instance: **Administration** > **Accounts** > **Tenants** > **Edit** > **Tenant Access to Provider Service Engine**.

1. From the left the menu, select **Data Sources** > **Integrations** and then select the **Accounts** tab from the left pane.
2. From the **Accounts** tab, click **Add Account**.
3. From the **Accounts Types** page, click **Avi Load Balancer**.
4. Enter a display name and description for the cloud account.
   a) Enter the **Name** for the management pack instance as you want it to appear in VCF Operations.
   b) Enter the **Description** for the management packs with any additional information that helps you manage your instances.
5. Enter the **Controller URL** which can be the IP address of an individual Avi Load Balancer controller, or the controller cluster IP, or the DNS name of the controller. Add the controller URL as *`https://<Controller_IP>`*.
6. Select the **Credential** you want to use to sign on to the environment from the drop-down menu. To add new credentials to access the management pack, click the plus sign and create a new credential.
   a) In the **Manage Credential** dialog box, enter the user name and password of the Avi Load Balancer controller instance.
   b) In the **Manage Credential** dialog box, to configure a proxy, enter the proxy details such as the IP, port, user name, and password.
   c) Click **OK**.
7. Click **VALIDATE CONNECTION**.
8. Enter **Collector/Group** to manage the management pack on VCF Operations. If you have only one account, select Default collector group.
9. Click **ADD**.

Verify that the adapter is configured and collecting data.

**Dashboards**
Use the dashboards to understand the availability and health of virtual services and to ensure consistency in the configuration of the virtual services.

Avi Load Balancer Availability & Health Dashboard
Use the **Avi Load Balancer Availability & Health** dashboard to understand the availability of a virtual service and associated service engines and the current availability status and health score as reported in the recent collection cycle.

**How to Use the Dashboard**

- Select an Avi Load Balancer instance from the **Avi LB Instances** widget.
- You see the availability and health of the virtual services for the selected instance in the **Virtual Service Availability Heatmap** and **Virtual Service Health Heatmap** widgets.
- Similarly, you see the availability and health of the service engines for the selected instance in the **Service Engine Availability Heatmap** and **Service Engine Health Heatmap** widgets.

By default, the heatmap widgets have three color codes. Green indicates that the health score of the virtual service or service engine is between 90–100. Yellow/orange means that the health score of the virtual service or service engine is between 70–89 and there are issues that should be identified and fixed. Red indicates that the health score of the virtual service or service engine is less than 70, has deteriorated, and needs immediate attention.

> **Note:**
> The **Virtual Services Health Overview** dashboard complements the **Avi Load Balancer Availability & Health** dashboard. For more information, see the Virtual Services Health Overview Dashboard.

Virtual Services Health Overview Dashboard
Use the **Virtual Services Health Overview** dashboard to get an overview of the health of the virtual services across all of your Avi Load Balancer instances.

**How To Use the Dashboard**

- Select an Avi Load Balancer instance from the **Avi LB Instances** widget.
- You see a list of corresponding virtual services for the selected Avi Load Balancer instance in the **Virtual Services** widget. Select a virtual service from the list. The **Virtual Services** widget also provides details of all the virtual services in the selected instance. It can be used to quickly check the status and view high level information and important metrics of the virtual service.
- Use the **Health Score Details** widget to understand details on specific aspects, such as performance, resource penalty, anomaly penalty, and security penalty that are the factors that determine the health score of a virtual service. This provides you with a starting point to troubleshoot the virtual service and eventually the application itself.
- Use the **Virtual Service End to End timing** widget to view the time taken for the application to respond at the server level, application level, and data transfer level. You can also view the average total time taken for the application to respond to client requests.
- Use the **Health Score Distribution Chart** widget to view the distribution of virtual services based on their current health score. For example, you might want to prioritise troubleshooting virtual services with the lowest health score.
- Use the **DNS Type Virtual Service Details** widget to view the DNS type virtual services and the related DNS queries, DNS query type, the DNS percentage errors, and other details.
- Use the **Virtual Service Metrics** widget to view the selected virtual service and related metrics.

Virtual Services Configuration Overview Dashboard

Use the **Virtual Services Configuration Overview** dashboard to ensure configuration consistency across all groups of virtual services.

**How to Use the Dashboard**

- Select an Avi Load Balancer instance from the **Avi LB Instances** widget.
- You see a list of corresponding virtual services for the selected Avi Load Balancer instance in the **Virtual Services** widget. Select a virtual service from the list.
- Use the **Profiles** widget to view the list of objects and other details.
- Use the **Service Ports** widget to view the ports that are open to service the client requests.
- Use the **Analytics** widget to view settings related to analytics across each virtual service.
- Use the **Advanced Settings** widget to view other configuration details for the virtual service selected.

Avi Load Balancer License Overview Dashboard

**Avi Load Balancer License Overview** dashboard provides an overview of licenses across different licensing models.

**How to Use the Dashboard**

- Select an Avi Load Balancer instance from the **Avi LB Instances** widget.
- In the **Current License Tier** widget, you can view the license tier option (Basic/Enterprise/Enterprise with Cloud Services/Essentials) selected in Avi LB instance:
  - Current Tier: Selected license type.
  - Message: License related information.
  - Service Core Usage (%): Total consumed service core capacity percentage.
  - Service Core Usage: Total service core consumed out of the total core capacity.
  - Reserved Service Licenses: Minimum service units that always remain reserved on the controller.
  - Max Service Licenses: Maximum service units limit for the controller.
  - Cloud Services Available Licenses: Available service units in the org.
- Similarly, you can see the capacity and consumption information for the other available license types in the **Available License Tiers** widget.

**Alerts**

Alerts occur in two ways, based on the health score and the alert forwarding mechanism from the Avi Load Balancer.

- **Based on the health score**

Alerts are triggered for virtual services and service engines based on the health score, using the same color code used in the Avi Load Balancer. The default Wait/Cancel cycle is set to 1. Alerts are grouped as following:

- Critical, when the total health score is less than 70.
- Warning, when the health score is between 70 and 89.

- **Alert forwarding from the Avi Load Balancer**

  The management pack has an alert forwarding mechanism that mirrors the alerts and sends them from the Avi Load Balancer to VCF Operations.

  Any new alert generated in the Avi Load Balancer instance, after the previous collection cycle, is forwarded to the corresponding object in VCF Operations as a "Notification Event". If the same alert does not recur in the next collection cycle, then it is assumed that the alert has been canceled. Alerts are grouped into Critical, Warning, and Info, corresponding to the alert levels from the Avi Load Balancer which are "ALERT_HIGH", "ALERT_MEDIUM", "ALERT_LOW.

  These alerts are currently not supported on the Management Controller and Controller objects because of an ambiguity while mapping alerts to these two objects.

**Metrics and Properties**

The management pack collects metrics and properties for the supported objects.

Metrics

VCF Operations connects to an instance of the Avi Load Balancer and collects metrics for the management controller, controller, tenant, cloud, virtual service, pool, service engine, service engine groups, and network object types.

Management Controller Metrics

Metrics are collected for the management controller object type.

Here is the list of management controller metrics:

- Controller Count
- Average CPU Usage (%)
- Average Disk Usage (%)
- Average Memory Usage (%)
- Number Of Metrics Collected
- Number Of Objects Collected
- Number Of Down Objects
- Number Of Tenants
- Number Of Clouds

Controller Metrics

Metrics are collected for the controller object type.

**Controller Metrics**

| Metric Name | Category | Description |
|---|---|---|
| CPU Usage | Controller Statistics | The host's view of the CPU usage as the amount of actively used virtual CPU, as a percentage of the total available CPU. |
| Disk Usage | Controller Statistics | Average disk usage. |
| Memory Usage | Controller Statistics | Memory usage as percentage of the total configured or available memory. |

Cloud Metrics

Metrics are collected for the vCenter, AWS, GCP, and Azure object types.

**vCenter, AWS, Azure, and GCP Metrics**

- Num of Virtual Services
- Num of Service Engines
- Num of Pools
- Number Of Down Objects

Pool Metrics

Metrics are collected for the pool object type.

**Pool Metrics**

| Metric Name | Category | Description |
|---|---|---|
| Open Connections | Pool | Average per server open connections in the pool. |
| Throughput | Pool | Average transmit and receive network bandwidth between client and virtual service. |
| Server RTT | Pool | Averaged RTT across all connections closed. |
| Request Errors | Pool | Rate of HTTP error responses sent per second. It does not include errors excluded in the analytics profile. |
| RPS | Pool | Average rate of HTTP requests received by a pool's server per second. |
| Request Errors % | Pool | Percent of HTTP 4xx and 5xx responses. |
| Total Score | Health Score | Total health score of the pool. |
| Security Threat Level | Health Score | Security penalty score of the pool. |
| Anomaly Score | Health Score | Anomaly penalty score of the pool. |
| Resource Score | Health Score | Resource penalty score of the pool. |
| Performance Score | Health Score | Performance score of the pool. |

Service Engine Metrics

Metrics are collected for the service engine object type.

**Service Engine Metrics**

| Metric Name | Category | Description |
|---|---|---|
| Connections | Service Engine | Average number of connections including the dropped connections and ones due to policy drops. This would be the same as the number of SYNS seen by service engines on any virtual service. |
| Dropped Connections % | Service Engine | Total number of connections dropped excluding the dropped connections and ones due to policy drops. This would be same as number of SYNS seen by the service engine on any virtual service. It include both connections that failed to establish. |
| Throughput | Service Engine | Average transmit and receive network bandwidth for an interface. |

| Metric Name | Category | Description |
|---|---|---|
| CPU Usage | Service Engine | The host's view of the CPU usage. The amount of actively used virtual CPU, as a percentage of total available CPU. |
| Memory Usage | Service Engine | Memory usage as percentage of total configured or available memory. |
| Disk1 Usage | Service Engine | Service engine disk 1 capacity usage. |
| RX Packets | Service Engine | Average rate of received packets per second. |
| RX Bytes | Service Engine | Average rate of received bytes on an interface. |
| RX packets Drop | Service Engine | Average number of received packets dropped per sec. It includes packets across all virtual services and non-virtual services. |
| TX Bytes | Service Engine | Average rate of transmitted bytes on an interface. |
| TX Packets | Service Engine | Average rate of transmit packets per second. |
| Interface Throughput | Service Engine | Average transmit and receive network bandwidth for an interface. |
| Connection Memory Usage | Service Engine | Connection memory usage as percentage of total allowed for connections. |
| Dynamic Memory Usage | Service Engine | Percentage of service engine's dynamic memory usage. |
| SSL Cache Usage | Service Engine | SSL session cache usage in percent. |
| Buffer Usage | Service Engine | Packet Buffer usage as percentage of total configured packet buffers. |
| Persistent Table Usage | Service Engine | Session persistent table entries usage percent. |
| Syn Cache Usage | Service Engine | Percentage of SYN cache usage. Higher usage indicates too many connection attempts and open at service engine. |
| Total Score | Health Score | Total health score of the service engine. |
| Anomaly Score | Health Score | Anomaly penalty of the service engine. |
| Performance Score | Health Score | Performance score of the service engine. |
| Resources Score | Health Score | Resource penalty of the service engine. |
| Security Threat Level | Health Score | Security penalty score of the service engine. |

### Tenant Metrics

Metrics are collected for the tenant object type.

Here is the list of tenant metrics:

- Num of Virtual Services
- Num of Service Engines
- Num of Pools
- Number Of Down Objects

Virtual Service Metrics
Metrics are collected for the virtual service object type.

**Virtual Service Metrics**

| Metric Name | Category | Description |
|---|---|---|
| Average Bandwidth | L4 statistics | Average transmit and receive network bandwidth between client and virtual service. |
| Average New Established Connections | L4 statistics | Averaged rate of new client connections per second. |
| Percent Connections DOS Attacks | L4 statistics | Fraction of L4 connections owing to DoS. |
| Average New SSL Handshakes | L7 statistics | Average new successful SSL sessions. |
| Max SSL Open Connections | L7 statistics | Maximum number of open SSL sessions. |
| RPS | Virtual Service Metrics | Average rate of client HTTP requests received by the virtual service per second. |
| CPS | Virtual Service Metrics | Rate of total connections per second. |
| Open Connections | Virtual Service Metrics | Max number of open connections. |
| Client RTT | Virtual Service Metrics | Average network round trip time between client and virtual service. |
| Server RTT | Virtual Service Metrics | Averaged RTT across all connections closed. |
| App response | Virtual Service Metrics | Average latency measured for pool server. |
| Data transfer time | Virtual Service Metrics | Average client data transfer time that represents latency of sending response to the client excluding the RTT time. Higher client data transfer time signifies lower bandwidth between client and the service engine. |
| End to end timing | Virtual Service Metrics | Average network round trip time between the client and virtual service. |
| Request packets | Virtual Service Metrics | Average rate of packets received per second. |
| Tx packets | Virtual Service Metrics | Average rate of packets transmitted per second. |
| Requests | Virtual Service Metrics | Average rate of client HTTP requests received by the virtual service per second. |
| Request Errors % | Virtual Service Metrics | Percent of 4xx and 5xx responses. |
| Rx Packets | Virtual Service Metrics | Average rate of packets received per second. |
| Tx Packets | Virtual Service Metrics | Average rate of packets transmitted per second. |
| DoS attacks | Virtual Service Metrics | Number DDOS attacks occurring. |
| Throughput | Virtual Service Metrics | Average transmit and receive network bandwidth between client and virtual service. |

| Metric Name | Category | Description |
|---|---|---|
| HTTP / HTTP2 Request | Virtual Service Metrics | Rate of HTTP responses sent per second and average number of client HTTP2 requests received by the Virtual Service per second. |
| DNS Query Types | Virtual Service Metrics | Rate of DNS Responses of type A per second, rate of DNS Requests of type AAAA per second, rate of DNS Requests of type NS per second, rate of DNS requests of type SRV per second, rate of DNS requests of type MX per second, and rate of DNS requests of type OTHER per second. |
| DNS Queries, % errors | Virtual Service Metrics | Rate of DNS responses per second, including errors and Percentage of DNS responses with errors. |
| TCP vs UDP | Virtual Service Metrics | Rate of TCP queries per second and rate of UDP queries per second. |
| Total Score | Health Score | Total health score of the virtual service. The final health score for the virtual service equals the performance score minus the various penalty scores. |
| Security Threat Level | Health Score | Security penalty score of the virtual service. The security penalty shows risks due to configuration settings that leave a site vulnerable, as well as vulnerability to attacks such as DDoS. |
| Anomaly Score | Health Score | Anomaly penalty score of the virtual service. Anomaly is defined as traffic that is outside the statistical norm for the time period. |
| Resource Score | Health Score | Resource penalty score of the virtual service. Any penalty assessed because of resource availability issues is assigned a score, which is then subtracted from the performance score. |
| Performance Score | Health Score | Performance score of the virtual service. Performance is comprised of end user's experience and server response. The performance score is a positive number from 0 (down) to 100 (ideal). |

### Properties

VCF Operations connects to an instance of the Avi Load Balancer and collects metrics for the controller, management controller, tenant, cloud, virtual service, pool, service engine, service engine groups, and network object types.

Some properties are listed in VCF Operations only if the corresponding properties are configured in the Avi Load Balancer.

### Management Controller Properties

Properties are collected for the management controller object type.

Here is the list of management controller properties:

- Controller Version

- Count of Regions
- Total Service Core Usage
- Total Service Core Usage (%)
  - Basic
    - Current Tier
    - Message
    - Service Core Usage
    - Service Core Usage (%)
  - Enterprise
    - Current Tier
    - Message
    - Service Core Usage
    - Service Core Usage (%)
  - Enterprise with Cloud Services
    - Current Tier
    - Message
    - Service Core Usage
    - Service Core Usage (%)
    - Cloud Services Available Licenses
    - Max Service Licenses
    - Reserved Service Licenses
  - Essentials
    - Current Tier
    - Message
    - Service Core Usage
    - Service Core Usage (%)

### Controller Properties

Properties are collected for the controller object type.

**Controller Properties**

| Property Name | Category | Description |
|---|---|---|
| Name | Summary | Name of the controller. |
| URL | Summary | URL of the controller. |
| Port | Summary | Port of the controller. |
| IP Address | Summary | IP address of the controller. |
| Public IP | Summary | Value of controller tag 'public_ip_or_name'. |
| UUID | Summary | UUID of the controller. |
| Version | Summary | Controller version. |
| Role | Summary | Controller role: whether leader or follower. |
| Status | Summary | Current status of the controller. |
| Current Tier | Basic | Selected Licence tier option. |
| Message | Basic | License related information. |
| Service Core Usage | Basic | No of consumed core out of the total core capacity. |
| Service Core Usage (%) | Basic | Total core consumption percentage. |
| Current Tier | Enterprise | Selected Licence tier option. |

| Property Name | Category | Description |
|---|---|---|
| Message | Enterprise | License related information. |
| Service Core Usage | Enterprise | No of consumed core out of the total core capacity. |
| Service Core Usage (%) | Enterprise | Total core consumption percentage. |
| Current Tier | Enterprise with Cloud Services | Selected Licence tier option. |
| Message | Enterprise with Cloud Services | License related information. |
| Service Core Usage | Enterprise with Cloud Services | No of consumed core out of the total core capacity. |
| Service Core Usage (%) | Enterprise with Cloud Services | Total core consumption percentage. |
| Cloud Services Available Licenses | Enterprise with Cloud Services | Available service units in the org. |
| Max Service Licenses | Enterprise with Cloud Services | Maximum service units limit for the controller. |
| Reserved Service Licenses | Enterprise with Cloud Services | Minimum service units that always remain reserved on the controller. |
| Current Tier | Essentials | Selected Licence tier option. |
| Message | Essentials | License related information. |
| Service Core Usage | Essentials | No of consumed core out of the total core capacity. |
| Service Core Usage (%) | Essentials | Total core consumption percentage. |

Cloud Properties

Cloud properties are collected for the vCenter, AWS, GCP, and Azure object types.

**vCenter Properties**

| Property Name | Category | Description |
|---|---|---|
| Name | Summary | Name of the object. |
| Cloud Type | Summary | Type of cloud. |
| Status | | Current status of the cloud. |
| vCenter Hostname Address | Summary | vCenter hostname or IP address . |
| UUID | Summary | UUID of the object to fetch. |
| DHCP Enabled | Summary | The IP address management scheme. |
| Management Network | Summary | Management network to use for the service engines. Reference to an object of type VIMgrNWRuntime. |
| Access Permission | Summary | Access mode to vCenterwhich is either Read, which allows the Avi Load Balancer to discover networks and servers, or Write, which also allows the Avi Load Balancer to create service engines and configure their network properties. |
| Tenant | Summary | Reference to an object of type Tenant. |
| License Type | Infrastructure | If no license type is specified then default license enforcement for the cloud type is chosen. |

| Property Name | Category | Description |
|---|---|---|
| IPAM Profile | IPAM/DNS | IPAM Profile for the cloud. Reference to an object of type IpamDnsProviderProfile |
| DNS Profile | IPAM/DNS | DNS Profile for the cloud. Reference to an object of type IpamDnsProviderProfile |
| State Based DNS Registration | IPAM/DNS | DNS records for VIPs are added/deleted based on the operational state of the VIPs. |
| Data Center | Data Center Properties | Datacenter for virtual infrastructure discovery. |
| IPv6 Auto Configuration | Data Center Properties | Enable IPv6 auto configuration. |
| Prefer Static Routes vs Directly Connected Network | Data Center Properties | Prefer static routes over interface routes during VirtualService placement. |
| Use Static Routes for Network Resolution of VIP | Data Center Properties | Use static routes for VIP side network resolution during VirtualService placement. |
| Template Service Engine Group | Service Engine | The service engine group to use as template. Reference to an object of type ServiceEngineGroup. |
| IP Subnet | Service Engine | Management subnet to use for service Engines |

## AWS Properties

| Property Name | Category | Description |
|---|---|---|
| Name | Summary | Name of the object type. |
| Cloud Type | Summary | Type of cloud. |
| Region | Summary | AWS region. |
| Route53 Integration | Summary | If enabled, create/update DNS entries in Amazon Route 53 zones. |
| VPC | Summary | VPC name. |
| VPC Id | Summary | VPC ID. |
| UUID | Summary | UUID of the object to fetch. |
| Availability Zone | AWS Zone Config | Availability zone. |
| Management Network Name | AWS Zone Config | Name or CIDR of the network in the Availability Zone that will be used as management network. |
| Management Network Id | AWS Zone Config | UUID of the network in the Availability Zone that will be used as management network. |
| License Type | Infrastructure | If no license type is specified then default license enforcement for the cloud type is chosen. |
| DNS registration for VS Names | DNS | DNS Profile for the cloud. It is a reference to an object of type IpamDnsProviderProfile. |
| State Based DNS Registration | DNS | DNS records for VIPs are added/deleted based on the operational state of the VIPs. |
| SQS for Autoscale Groups Monitoring | AWS VPC and Availability Zones | Use SNS/SQS based notifications for monitoring Auto Scaling Groups. |
| Template Service Engine Group | AWS VPC and Availability Zones | The service engine group to use as template. Reference to an object of type ServiceEngineGroup. |

| Property Name | Category | Description |
|---|---|---|
| Encryption for SE S3 Bucket | AWS VPC and Availability Zones | S3 encryption mode and the master key to be used for encrypting S3 buckets during SE AMI upload. Only SSE-KMS mode is supported. |
| Encryption for SE AMI/EBS volumes | AWS VPC and Availability Zones | EBS encryption mode and the master key to be used for encrypting SE AMI, Volumes, and Snapshots. |
| ASG Polling Interval | AWS VPC and Availability Zones | Time interval between periodic polling of all Auto Scaling Groups. |

## Azure Properties

| Property Name | Category | Description |
|---|---|---|
| Cloud Type | Summary | Type of cloud. |
| Name | Summary | Name of the object type. |
| Autoscale Polling Interval | Summary | CloudConnector polling interval in seconds for external autoscale groups, minimum 60 seconds. |
| Azure Subscription ID | Summary | Subscription ID for the Azure subscriptions. |
| UUID | Summary | UUID of the object to fetch. |
| License Type | Infrastructure | If no license type is specified then default license enforcement for the cloud type is chosen. |
| DNS registration | DNS | Whether Azure is the DNS provider. |
| DNS Provider | DNS | DNS Profile for the cloud. Reference to an object of type IpamDnsProviderProfile. |
| State Based DNS Registration | DNS | DNS records for VIPs are added/deleted based on the operational state of the VIPs. |
| Location | Location Or Network | Azure location where this cloud is located.. |
| Resource Group | Location Or Network | Azure resource group dedicated for the controller. The controller create all its resources in this resource group. |
| VNet | Location Or Network | Virtual network where virtual IPs belong. |
| Service Engine Network | Location Or Network | ID of the Azure subnet where the controller creates the service engines. |
| Use Dedicated Management Interface | Location Or Network | ID of the Azure subnet used as management network for the service engines. If set, service engines have a dedicated management NIC. Otherwise, they operate in inband mode. |
| Template Service Engine Group | Service Engine | The service engine group association for the service engine. If None, then the Default-Group, which is SEGroup, is associated with the service engine. Reference to an object of type ServiceEngineGroup. |
| Disk Encryption Set | Disk | Disks Encryption Set resource ID (des_id) to encrypt service engine images and managed disks using customer-managed-keys. |

## GCP Properties

| Property Name | Category | Description |
|---|---|---|
| Cloud Type | Summary | Type of cloud. |
| Name | Summary | Name of the object. |
| UUID | Summary | UUID of the object to fetch. |
| Service Account Email | GCP Account | Email of the GCP Service Account to be associated to the service engines. |
| GCS Bucket Name | GCP Account | Google Cloud Storage Bucket name where the service engine image is uploaded. This image will be deleted once the image is created in Google compute images. By default, a bucket will be created if this field is not specified. |
| SE Project Id | GCP Account | Google Cloud Platform Project ID where service engines will be spawned. |
| VPC Network Name | GCP Account | Google Cloud Platform VPC network configuration for the service engines. |
| GCS Project Id | GCP Account | Google Cloud Storage Project ID where the service engine image is uploaded. This image is deleted once the image is created in Google compute images. By default, the service engine Project ID is used. |
| Name | Zones | Google Cloud Platform region name where service engines will be spawned. |
| Regions | Zones | Google Cloud Platform zones where service engines will be distributed for HA. |

Network Properties

Properties are collected for the network object type.

## Network Properties

| Property Name | Category | Description |
|---|---|---|
| Name | Summary | Name of the object. |
| UUID | Summary | UUID of the object to fetch. |
| Discovered Subnets | Summary | A list of one or more IP networks that are auto-discovered via the virtualization orchestrator. |
| VRF Context | Summary | Reference to an object of type VrfContext. |
| DHCP Enabled | Summary | The IP address management scheme for this network. |
| IPv6 Auto Configuration | Summary | Enable IPv6 auto configuration. |

Pool Properties

Properties are collected for the pool object type.

## Pool Properties

| Property Name | Category | Description |
|---|---|---|
| Name | Summary | Name of the object. |
| UUID | Summary | UUID of the object to fetch. |
| Status | Summary | Enable or disable the pool. Disabling will terminate all open connections and pause health monitors. |
| Active Monitors | Summary | Verifies server health by applying one or more health monitors. Active monitors generate synthetic traffic from each service engine and mark a server up or down based on the response. The passive monitor listens only to client to server communication. It raises or lowers the ratio of traffic destined to a server based on successful responses. Reference to an object of type HealthMonitor. |
| Server Name | Summary | DNS resolvable name of the server. May be used in place of the IP address. |
| IP Address | Summary | IP address of the server. Required if there is no resolvable host name. |
| Port | Summary | Optionally specify the servers port number. This will override the pool's default server port attribute. |
| Row | Summary | Ratio of selecting eligible servers in the pool. Allowed values are 1-20. |
| Cloud | Summary | Reference to an object of type Cloud. |
| Tenant | Summary | Reference to an object of type Tenant. |
| Virtual Services Count | Summary | Count of virtual services using this pool. |
| Virtual Services | Summary | Name of the virtual services using this pool. |
| Servers (Up/Total) | Summary | Ratio of the total number of servers in the pool that are up, to the total number of servers configured in the pool. |
| VRF Context | Summary | Virtual Routing Context that the pool is bound to. Used to provide isolation of the set of networks the pool is attached to. Reference to an object of type VrfContext |
| Active Health Monitors | Summary | Verifies server health by applying one or more health monitors. Reference to an object of type HealthMonitor. |
| Server Name | Summary | DNS resolvable name of the server. May be used in place of the IP address. |
| Status | Summary | Enable, disable, or graceful disable determine if new or existing connections to the server are allowed. |
| IP Address | Summary | IP Address of the server. |
| Port | Summary | Port number of the server. Overrides the pool's default server port attribute. |
| Ratio | Summary | Ratio of selecting eligible servers in the pool. Allowed values are 1-20. |
| Default Server Port | Configuration | Traffic sent to servers will use this destination server port unless overridden by the server's specific port attribute. |

| Property Name | Category | Description |
|---|---|---|
| Graceful Disable Timeout | Configuration | Virtual service waits for the specified time before terminating the existing connections to the servers that are disabled. |
| Load Balance Algorithm | Configuration | The load balancing algorithm will pick a server within the pool's list of available servers. |
| Passive Health Monitor | Configuration | The Passive monitor will monitor client to server connections and requests and adjust traffic load to servers based on successful responses. |
| Min. Health Monitors to consider server 'up' | Configuration | Minimum number of health monitors in UP state to mark server UP. |
| AutoScale Policy | Configuration | Reference to Server Autoscale Policy. Reference to an object of type ServerAutoScalePolicy. |
| AutoScale Launch Config | Configuration | If configured, then the Avi Load Balancer will trigger an orchestration of pool server creation and deletion. Reference to an object of type AutoScaleLaunchConfig. |
| Persistence | Configuration | Persistence ensures that a user sticks to the same server for a desired duration of time. Reference to an object of type ApplicationPersistenceProfile. |
| Analytics Profile | Configuration | Specifies settings related to analytics. Reference to an object of type AnalyticsProfile. |
| Append Port | Configuration | The option to append port to hostname in the host header while sending a request to the server. By default, port is appended for non-default ports. |
| Lookup Server by Name | Configuration | Server lookup by name. |
| Rewrite Host Header to Server Name | Configuration | Rewrite incoming Host Header to server name of the server to which the request is proxied. |
| Enable real time metrics | Configuration | Enable real time metrics for server and pool metrics. |
| SSL | SSL to backend servers | When enabled, the Avi Load Balancer re-encrypts traffic to the backend servers. The specific SSL profile defines which ciphers and SSL versions will be supported. Reference to an object of type SSLProfile. |
| Server Disable Type | SSL to backend servers | Server graceful disable timeout behavior. |
| Request Queuing | Pool Full Settings | Enable request queue when pool is full. |
| Queue Length | Pool Full Settings | Minimum number of requests to be queued when pool is full. |
| Fail Action | Pool Full Settings | Enables a response to the client when the pool experiences a failure. By default TCP connection is closed. |
| Placement Settings/Server Network | Pool Full Settings | Manually select the networks and subnets used to provide reachability to the pool's servers. |
| Connection Idle Timeout | Connection Pool Settings | Connection idle timeout. |
| Connection Life Timeout | Connection Pool Settings | Connection life timeout. |

| Property Name | Category | Description |
|---|---|---|
| Connection Max Used Times | Connection Pool Settings | Maximum number of times a connection can be reused. |
| Max Cache Connections Per Server | Connection Pool Settings | Maximum number of connections a server can cache. |
| Disable Port Translation | Other Settings | Does not translate the client's destination port when sending the connection to the server. |
| Default Server Timeout | Other Settings | Server timeout value specifies the time within which a server connection needs to be established and a request-response exchange completes between the Avi Load Balancer and the server. |
| Connection Ramp | Other Settings | Duration for which new connections will be gradually ramped up to a server recently brought online. |
| Max Connections per Server | Other Settings | The maximum number of concurrent connections allowed to each server within the pool. |
| Routing Pool | Other Settings | Routing is enabled when this pool is selected to send traffic. |
| HTTP Server Reselect | Other Settings | Server reselect configuration for HTTP requests. |

Service Engine Properties

Properties collected for the service engine object type.

**Service Engine Properties**

| Property Name | Category | Description |
|---|---|---|
| Name | Summary | Name of the object. |
| UUID | Summary | UUID of the object to fetch. |
| Status | Summary | Boolean value to indicate if the service engine is up. |
| Cloud | Summary | Reference to an object of type Cloud. |
| Tenant | Summary | Reference to an object of type Tenant. |
| Virtual Services Count | Summary | Count of virtual services in the service engine. |
| Virtual Services | Summary | Virtual services present within the service engine. |
| Enable State | Summary | Set this field to disable the service engine. |
| SE Group | Summary | Reference to an object of type ServiceEngineGroup. |
| Management IP | Summary | Management IP address. |
| Availability Zone | Summary | The availability_zone of the service engine. |
| Host | Summary | Reference to an object of type VIMgrHostRuntime. |
| **Management Network** (Network used by the service engine to communicate with the controller) | | |
| Interface | Summary | Interface name of the management network. |

| Property Name | Category | Description |
|---|---|---|
| Network Name | Summary | Network name of the management network. |
| MAC Address | Summary | MAC address of the management network. |
| DHCP | Summary | DHCP of the management network. |
| IP Address[Mode on IP] | Summary | IP address of the management network. |
| VRF | Summary | Reference to an object of type VrfContext. |
| **Data Networks** (Network used for load balancing) | | |
| Interface | Summary | Interface name of the data network. |
| Network Name | Summary | Network name of the data network. |
| MAC Address | Summary | MAC address of the data network. |
| DHCP | Summary | DHCP of the data network. |
| IP Address | Summary | IP address of the data network. |
| VRF | Summary | Reference to an object of type VrfContext. |

Service Engine Group Properties

Properties are collected for the service engine group object type.

**Service Engine Group Properties**

| Property Name | Category | Description |
|---|---|---|
| Name | Summary | Name of the object. |
| UUID | Summary | UUID of the object to fetch. |
| Tenant | Summary | Reference to an object of type Tenant. |
| Cloud | Summary | Reference to an object of type Cloud. |
| Version | Summary | Version and build of the service engine group created. |
| Num of Service Engines | Summary | Number of service engines belonging to a particular service engine group. |
| Max Num of Service Engines | Summary | Maximum number of services engines in the group. |
| Num of Virtual Service | Summary | Total number of virtual services hosted in the service engine that belongs to a particular service engine group. |
| Max Num of Virtual Services per Service Engine | Summary | Maximum number of virtual services that can be placed on a single service engine. |
| RealTime Metrics | Summary | Enable or deactivate real time service engine metrics. |
| HA Mode | High Availability & Placement Settings | High Availability mode for all the virtual services using the service engine group. |
| SE Self-Election | High Availability & Placement Settings | Enables service engines to elect a primary amongst themselves in the absence of connectivity to a controller. |
| VS Placement across Ses | High Availability & Placement Settings | If placement mode is 'Auto',virtual services are automatically placed on service engines. |

| Property Name | Category | Description |
|---|---|---|
| Max Number of Service Engine | Service Engine Capacity and Limit Settings | Maximum number of services engines in the group. |
| Memory per Service Engine | Service Engine Capacity and Limit Settings | Amount of memory for each of the service engine virtual machines. |
| Memory Reserve | Service Engine Capacity and Limit Settings | Description of the property mem_reserve of the object type ServiceEngineGroup. |
| vCPU per Service Engine | Service Engine Capacity and Limit Settings | Number of vCPUs for each of the service engine virtual machines. |
| CPU Reserve | Service Engine Capacity and Limit Settings | Description of property cpu_reserve of the object type ServiceEngineGroup. |
| Disk per Service Engine | Service Engine Capacity and Limit Settings | Amount of disk space for each of the service engine virtual machines. |
| Host Geolocation Profile | Memory Allocation | Extra configuration memory to support large Geo DB configurations. |
| Memory for Caching | Memory Allocation | A percent value of total service engine memory reserved for application caching. |
| Available Memory for Connections and Buffers | Memory Allocation | Percentage of memory for the connection state. |
| Connections Memory Distribution | Memory Allocation | Percentage of memory for connection state. |
| Buffers Memory Distribution | Memory Allocation | Percentage of memory for buffers state. |
| License Type | License | If no license type is specified, then the default license enforcement for the cloud type is chosen. |
| Enable Per-app SE Mode | License | Per-app service engine mode is designed for deploying dedicated load balancers per app (virtual service). |
| SE Bandwidth Type | License | The bandwidth of the service engine for the bandwidth license. |
| Number of SE Data Paths | License | Configures the maximum number of se_dp processes that handles traffic. |
| Hyperthreading | License | Controls the distribution of service engine data path processes on CPUs which support hyper-threading. |
| Cluster Included | Host & Data Store Scope | List of clusters where service engines will be deployed. |
| Cluster Excluded | Host & Data Store Scope | List of clusters where service engines are not deployed. |
| Data Store Scope for Service Engine Virtual Machine | Host & Data Store Scope | Enum options - VCENTER_DATASTORE_ANY, VCENTER_DATASTORE_LOCAL, VCENTER_DATASTORE_SHARED |
| Buffer Service Engines | Advanced HA & Placement | Excess service engine capacity provisioned for HA failover. |
| Scale per Virtual Service (Min) | Advanced HA & Placement | Minimum number of active service engines for the virtual service. |
| Scale per Virtual Service (max) | Advanced HA & Placement | Maximum number of active service engines for the virtual service. |

| Property Name | Category | Description |
|---|---|---|
| CPU socket Affinity | Advanced HA & Placement | Allocate all the CPU cores for the service engine VMs on the same CPU socket. |
| Dedicated dispatcher CPU | Advanced HA & Placement | Dedicate the core that handles packet receive/transmit from the network to just the dispatching function. Not used for TCP/IP and SSL functions. |
| Override Management Network | Advanced HA & Placement | Management network to use for service engines. Reference to an object of type Network. |
| Significant Log Throttle | Log Collection and Streaming Settings | The setting limits the number of significant logs generated per second per core on this service engine. |
| UDF Log Throttle | Log Collection and Streaming Settings | The setting limits the number of UDF logs generated per second per core on this service engine. |
| Non-significant Log Throttle | Log Collection and Streaming Settings | The setting limits the number of non-significant logs generated per second per core on this service engine. |
| Number of Streaming Threads | Log Collection and Streaming Settings | Number of threads to use for log streaming. |
| Instance Flavor | AWS and Azure | Instance/Flavor name for the service engine instance. |
| Service Engine Name Prefix | AWS and Azure | Prefix to use for the virtual machine name of service engines. |
| Delete Unused Service Engines After | AWS and Azure | Duration to preserve unused service engine virtual machines before deleting them. If traffic to a virtual service were to spike up abruptly, this service engine would be available to be utilized again rather than creating a new service engine. |
| Avi Managed Security Group | AWS and Azure | By default, security groups are created and managed along with the custom security group provided by the user. Set this to True to disallow the creation and management of new security groups. Only custom security groups provided by user are used. |
| Management vNIC Custom Security Groups | AWS and Azure | Custom security groups to be associated with management vNics for service engine instances. |
| Data vNIC Custom Security Groups | AWS and Azure | Custom security groups to be associated with data vNICs for service engine instances. |
| Auto Rebalance | AWS and Azure | If set, virtual services are automatically migrated when load on a service engine is less than minimum or more than maximum thresholds. Only alerts are generated when the auto_rebalance is not set. |

Tenant Properties

Properties are collected for the tenant object type.

**Tenant Properties**

| Property Name | Category | Description |
|---|---|---|
| Name | Tenant | Name of the object. |
| Description | Tenant | User defined description for the object. |
| URL | Tenant | URL of the object. |
| UUID | Tenant | Unique object identifier of the object. |
| Tenant Access to Provider Service Engine | Tenant | Description of the property `tenant_access_to_provider_se` in the TenantConfiguration field. |
| Tenant VRF | Tenant | When 'Per Tenant IP Domain' is selected, each tenant gets its own routing domain that is not shared with any other tenant. When 'Share IP Domain across all tenants' is selected, all tenants share the same routing domain. |

Virtual Service Properties

Properties are collected for the virtual service object type.

**Virtual Service Properties**

| Property Name | Category | Description |
|---|---|---|
| Name | Summary | Name of the object. |
| UUID | Summary | UUID of the object to be fetched. |
| Status | Summary | Enable or disable the Virtual Service. |
| Traffic Enabled | Summary | Knob to enable the Virtual Service traffic on its assigned service engines. |
| VIP Address | Summary | Virtual IP address. |
| IPv4 Address | Summary | IPv4 address of the virtual IP. |
| IPv6 Address | Summary | IPv6 address of the virtual IP. |
| Application Domain Name | Summary | Fully qualified domain name. |
| VS VIP | Summary | Indicates the vip_id that needs placement retrial. |
| Cloud | Summary | Reference to an object of type Cloud. |
| Status | Summary | Boolean value suggesting whether the virtual service is up or not. |
| Pools | Summary | Pools to which the virtual service has to load balance to. |
| Virtual Hosting | Summary | Specifies the virtual service acting as virtual hosting (SNI) parent. Reference to an object of type VirtualService. |
| VRF Context | Summary | Virtual Routing Context that the virtual service is bound to. This is used to provide the isolation of the set of networks the application is attached to. Reference to an object of type VrfContext. |
| Service Port 1 | Service Port | The Virtual Service's port number. |

| Property Name | Category | Description |
|---|---|---|
| Service Port 2 | Service Port | The Virtual Service's port number. |
| Service Port N | Service Port | The Virtual Service's port number. |
| TCP/UDP Profile | Profiles | Determines network settings such as protocol, TCP or UDP, and related options for the protocol. Reference to an object of type NetworkProfile. |
| Application Profile | Profiles | Enables application layer specific features for the Virtual Service. Reference to an object of type ApplicationProfile. |
| Error Page Profile | Profiles | This profile is used to send the custom error page to the client generated by the proxy. Reference to an object of type ErrorPageProfile. |
| Name | Pool Type | An object that contains destination servers and related attributes such as load-balancing and persistence. Reference to an object of type Pool. |
| Pool Group | Pool Type | Reference to an object of type Pool. |
| Analytics Profile | Analytics | Specifies settings related to analytics. Reference to an object of type AnalyticsProfile. |
| Metrics Update Frequency | Analytics | Settings to set duration for real time updates. |
| Real Time Metrics | Analytics | Settings to turn on real time metrics. |
| Significant Log Throttle | Client Log Settings | This setting limits the number of significant logs generated per second for the virtual service on each service engine. |
| User defined filters Log Throttle | Client Log Settings | This setting limits the total number of UDF logs generated per second for the virtual service on each service engine. UDF logs are generated because of the configured client log filters or the rules with logging enabled. |
| Non Significant Logs | Client Log Settings | Captures all client logs including connections and requests. |
| Non-significant log throttle | Client Log Settings | Limits the number of non-significant logs generated per second for this virtual service on each service engine. Default is 10 logs per second. |
| Non-significant log duration | Client Log Settings | Amount of time the system captures all the logs, measured in minutes. |
| Name 1 | Client Log Filter | Description of `property client_log_filters` of object type AnalyticsPolicy. |
| Name 2 | Client Log Filter | Description of `property client_log_filters` of object type AnalyticsPolicy. |

| Property Name | Category | Description |
|---|---|---|
| Name 3 | Client Log Filter | Description of `property client_log_filters` of object type AnalyticsPolicy. |
| Weight | Quality of Service | The Quality of Service weight to assign to traffic transmitted from the virtual service. A higher weight will prioritize traffic versus other virtual services sharing the same service engines. |
| Fairness | Quality of Service | Determines how multiple virtual services sharing the same service engines will prioritize traffic over a congested network. |
| Auto Gateway | Other Settings | Response traffic to clients will be sent back to the source MAC address of the connection, rather than statically sent to a default gateway. |
| Use VIP as SNAT | Other Settings | Uses the virtual IP as the SNAT IP for health monitoring and sends traffic to the backend servers instead of the service engine interface IP. |
| Advertise VIP via BGP | Other Settings | Advertises a virtual service via BGP even if it is marked down by the health monitor. |
| Advertise SNAT via BGP | Other Settings | Enables Route Health Injection for Source NAT'ted floating IP Address using the BGP Config in the vrf context |
| SE Group | Other Settings | The service engine group to use for this virtual service. Reference to an object of type ServiceEngineGroup. |
| SNAT IP Address | Other Settings | Natted floating source IP Address(es) for upstream connection to servers. |
| Traffic Clone Profile | Other Settings | Server network or list of servers for cloning traffic. Reference to an object of type TrafficCloneProfile. |
| Remove Listening Port when VS down | Other Settings | Removes listening port if the virtual service is down. |
| Scale Out ECMP | Other Settings | Disable re-distribution of flows across service engines for a virtual service. Enable if the network itself performs flow hashing with ECMP in environments such as GCP. |
| Service Ports | ServicePort | Port number. |
| Protocol | ServicePort | Type of protocol. |

**Known Issues**

This section provides details of the known issues.

**Hierarchy mismatch in case of multi-tenancy**

The VCF Operations Management Pack for Avi Load Balancer collects all the resources of a tenant. However, if the same cloud is used across tenants, the relationship hierarchy lists all the child objects of the cloud collected across all tenants. This affects the count of virtual services displayed when the service engine group is shared across tenants.

**Workaround:** None

#### Certain objects are not collected

Upgrade of the Avi Load Balancer or the addition or removal of a tenant by the user, leads to collection cycles that do not work as expected.

**Workaround:** Reconfigure the VCF Operations Management Pack for Avi Load Balancer.

#### Some metrics/properties may return incorrect results

In some versions of the Avi Load Balancer, because of a bug in the API exposed by the Avi Load Balancer, the following metrics/properties may return incorrect results:

- VS VIP, Virtual Hosting, Application Domain Name
- App Response and Server RTT for Virtual Service
- Pool metrics in some cases

In some cases, intermittent API failures from the Avi Load Balancer occur, because of which metrics may not be collected for that particular collection cycle.

**Workaround:** None

#### The service engine object type may be associated with the wrong machine

In rare scenarios, when a service engine such as an EC2 Instance/virtual machine/Azure VM/Compute Instance in VCF Operations is created with the same name and within the same cloud, the service engine object type may be associated with the wrong machine.

**Workaround:** Use different name prefixes if multiple cloud accounts of the same type are used.

## Management Pack for SNMP

The Management Pack for SNMP guide provides information about installing and configuring the SNMP.

#### Introduction to SNMP

The Simple Network Management Protocol (SNMP) is a standard Internet protocol for managing devices on IP networks. The SNMP adapter is an embedded adapter for VCF Operations that collects metrics from devices that support SNMP. These devices typically include routers, switches, servers, workstations, and printers.

SNMP displays management data on SNMP managed devices as variables, which are organized in hierarchies. Management Information Base (MIB) files describe these hierarchies and contain object identifiers (OIDs) that identify each variable.

The SNMP adapter uses MIB files to identify the metrics that have to be collected from a particular device. When you install the SNMP adapter, the installation utility places a set of standard MIB files in the `conf/mib` folder. You can import additional MIB files after you install the SNMP adapter. The MIB files that are added will appear in the MIB list drop-down menu.

The SNMP adapter supports devices that are configured with SNMP v2C and V3. The SNMP adapter supports auto-discovery of devices when you add a range or pool of IP addresses while configuring the adapter. The SNMP adapter does not support the device with V3 Auth Only, the v3 device must have both Authentication and Privacy Protocols enabled.

The SNMP adapter ships a range of MIB files, and metrics are created for all the OIDs that have the data type that the Management Pack supports. By default, all metrics are created but none are enabled. You can enable metrics by using Policies to monitor network devices and its components.

#### Intended Audience

The information in this guide is intended for anyone who wants to install and configure the SNMP.

### Installing SNMP

Install the Management Pack for SNMP from the VCF Operations interface.

- Download the PAK file from VCF Solutions Catalog.
- Save the PAK file to a temporary folder on your local system.

1. Log in to the VCF Operations user interface with administrator privileges.
2. In the menu, select **Administration** and in the left pane select **Solutions** > **Repository**.
3. On the **Repository** tab, click **Add/Upgrade**.
4. Browse to locate the temporary folder and select the PAK file.
5. Click **Upload**. The upload might take several minutes.
6. Read and accept the EULA, and click **Next**.
   Installation details appear in the window during the process.
7. When the installation is complete, click **Finish**.

Configure an adapter instance for the management pack.

### Configuring SNMP

After you install the Management Pack, configure an instance for SNMP.

To monitor any network device, ensure that the SNMP adapter is enabled and is running.

1. In the menu, click **Administration** and then in the left pane, click **Other Accounts**.
2. Click **Add Account** and then click **SNMP Adapter**.
3. Configure the adapter instance.

| Option | Description |
|---|---|
| **Name** | Enter a name for the adapter instance. |
| **Description** | Enter a description for the adapter instance. |
| **Start IP** | Enter a start IP address.<br><br>**Note:**<br><br>The test connection fails if the Start IP does not belong to the defined Credential. The Start IP provided should match the defined credentials. |
| **End IP** | Enter an end IP address. The discovery process finds all the devices that have IP addresses within this range.<br><br>**Note:**<br><br>In a range of IPs, only those IPs that belong to the defined Credential are monitored. The IPs that you define should match with credentials that you have selected. The IPs that do not match the credentials are skipped. |
| **Port** | The default port for SNMP is 161. |
| **MIB File** | Select the MIB file specific to the component you want to monitor.<br><br>The SNMP adapter supports only specific data types with OIDs that it collects from the attached MIB file.You can attach any MIB file but the SNMP adapter can not create metrics for all OIDs even when the data for a component exists with that OID. The SNMP adapter supports the following datatypes for the MIBs.<br><br>• integer |

| Option | Description |
|---|---|
| | • integer32<br>• counter<br>• counter32<br>• gauge<br>• gauge32<br>• timeticks<br>• counter64<br><br>For details of MIB files that are supported and validated, see List of MIBs in SNMP Adapter.<br><br>For details on adding custom MIBs in VCF Operations for SNMP adapter, see Loading Custom MIBs to vRealize Operations Manager for SNMP. |
| **Credential** | Select the credential from the drop-down menu or click the plus icon to add new credentials. For details, see Adding a Credential.<br><br>**Note:**<br><br>With SNMP V3, the Authentication Protocols supported are MD5 and SHA and the Privacy Protocols supported are AES and DES. |
| **Collector / Group** | Select the collector on which you want to run the adapter instance. A collector gathers objects into its inventory for monitoring. The collector specified by default is selected for optimal data collecting.<br><br>**Note:**<br><br>Ensure that the network latency between the collector and the device is as per the VCF Operations guidelines. |

4. Click **Validate Connection**.

   The validation starts with the defined Start IP. The connection fails if the Start IP is invalid or if it does not match with the selected credential. For all the devices that the credentials match with, objects for each device will be created under **Inventory** > **SNMP Adapter Instance** .

Adding a Credential

You must add a credential for an SNMP adapter instance. The credential can be of SNMP v2C or V3.

You can add the credential before you create the adapter instance and select the correct credential while configuring the adapter instance. You can also add the credential while configuring the adapter instance.

1. In the menu, click **Administration** and then in the left pane, click **Other Accounts**.
2. Click **Add Account** and then, click **SNMP Adapter**.
3. To add new credentials, click the plus icon next to the **Credential** drop-down menu.
4. Enter the credential details.

| Option | Description |
|---|---|
| **Credential Kind** | Select **SNMPv2c** or **SNMPv3** from the drop-down menu. |
| **Credential Name** | Enter a name for the credential. |
| **Community** | Enter the community string for the v2c credential kind. |

   The following options are available only when you select **SNMPv3** as **Credential Kind**.

| Option | Description |
|---|---|
| **Username** | Enter the username for the credential. |
| **Authentication Protocol** | Select the authentication protocol from the list.<br>• MD5<br>• SHA<br>• SHA224<br>• SHA256<br>• SHA384<br>• SHA512 |
| **Authentication Password** | Enter the authentication password |
| **Privacy Protocol** | Select the privacy protocol from the list.<br>• AES<br>• AES192<br>• AES256<br>• DES<br>• TRIPLE_DES |
| **Privacy Password** | Enter a password for the credential. |

5. Click **Ok** to save the credential.

### Loading Custom MIBs to VCF Operations for SNMP

You can load your custom MIB if a device requires MIB files that are not shipped with SNMP Management Pack.

Copy the MIB files and all itsdependent MIB files under `conf/mibs`. The default installation location of SNMP is `$ALIVE_BASE/user/plugins/inbound/snmp_adapter3/conf/mibs` folder.

1. For a multinode environment, enable SSH to all VCF Operations nodes.
2. Provide executive permission to update the `Mibs.sh` file and run the MIB file update script to import the MIB files. The MIB update script is available in the `$ALIVE_BASE/user/plugins/inbound/snmp_adapter3/conf` folder.
3. Check the mib-import.log file for any errors. The script generates the mib-import.log file in the `conf` folder. Errors commonly occur when the dependent MIB files are not present in the `conf/mibs` folder.
4. Open the conf/describe.xml file in a text editor and increase the version number. For example, if the version is '7', then change it to '8'.
5. Repeat the procedure from Step 1 through Step 4 in all VCF Operations nodes.
6. Log in to VCF Operations as an administrator.
7. In the **Administration** page, click **Control Panel** and then, click **REDESCRIBE**.

   The custom MIB files are added to the SNMP Management Pack. You can select the custom MIB from the **MIB File** drop-down menu while configuring the adapter instance.

   **Note:**

   Only those MIB files which have levels with numeric data will appear in drop-down menu.

### List of MIBs in SNMP Adapter

The SNMP adapter uses MIB files to determine the metrics to collect from a particular device. When you install the SNMP adapter, the installation utility places a set of standard MIB files in the `conf/mib` folder. You can import additional MIB files after you install the SNMP adapter.

**List of MIBs Supported and Validated**

- RFC1158-MIB.mib
- RFC1213-MIB.mib
- RFC1229-MIB.mib
- RFC1231-MIB.mib
- RFC1243-MIB.mib
- RFC1253-MIB.mib
- RFC1269-MIB.mib
- RFC1271-MIB.mib
- RFC1285-MIB.mib
- RFC1315-MIB.mib
- RFC1316-MIB.mib
- RFC1381-MIB.mib
- RFC1382-MIB.mib
- RFC1398-MIB.mib
- RFC1406-MIB.mib
- RFC1407-MIB.mib
- RFC1414-MIB.mib
- RFC1493-MIB.mib
- CISCO-ENVMON-MIB.mib
- CISCO-COMMON-MGMT-MIB.mib
- CISCO-PROCESS-MIB.mib
- CISCO-MEMORY-POOL-MIB.mib
- CISCO-ENTITY-FRU-CONTROL-MIB.mib
- ENTITY-MIB.mib IF-MIB.mib

**List of MIBs Supported But Not Validated**

- VMWARE-TUNNEL-SERVER-MIB.mib
- UDP-MIB.mib SNMPv2-CONF.mib
- RFC1229-MIB.mib
- RFC-1155.mib
- dcs3rmt.mib
- CISCO-COMMON-MGMT-MIB.mib
- VMWARE-VROPS-AGENTCAP-MIB.mib
- VMWARE-VRNI-MIB.mib
- VMWARE-TC-MIB.mib
- VMWARE-SRM-EVENT-MIB.mib
- VMWARE-HEARTBEAT-MIB.mib
- VMWARE-ESX-AGENTCAP-MIB.mib
- SNMP-USER-BASED-SM-MIB.mib
- SNMP-COMMUNITY-MIB.mib
- RFC1382-MIB.mib
- qlaspCfg.mib
- LLDP-V2-MIB.mib
- IP-MIB.mib
- INET-ADDRESS-MIB.mib
- IEEE8021-TC-MIB.mib
- CISCO-VTP-MIB.mib
- CISCO-ENVMON-MIB.mib
- 10892.mib
- RFC1406-MIB.mib
- DELL-RAC-MIB_NPS_6.1.mib
- baspStat.mib
- VMWARE-VA-AGENTCAP-MIB.mib
- VMWARE-RESOURCES-MIB.mib
- VMWARE-NSX-MANAGER-MIB.mib

**Monitoring Network Devices Selectively**

With SNMP adapter, metrics are created using MIB as the base object. Metrics are created only for the OIDs that Management Pack supports. These metrics are then monitored for all the devices that are attached with MIB file while configuring the adapter instance.

While creating a symptom, the SNMP adapter does not allow you to choose a specific device, you can only choose a specific component at a specific index from the existing inventory. For example, if you have to monitor all three Cisco fan modules for 'shutdown' status, you can create three symptoms for each fan module at each index(1,2 and 3), but you cannot choose a specific device. The symptoms will be generated for all devices that has fan modules at index (1,2 and 3).

If there are three Cisco switches (10.107.119.1, 10.107.119.2 and 10.107.119.3) in the environment, then each device has three fan modules at index 1, 2 and 3. When you create an alert using the symptoms, these alerts will be generated for all three Cisco switches. The following scenario explains how to selectively monitor a specific device using VCF Operations 'Custom Groups' and 'Policies'.

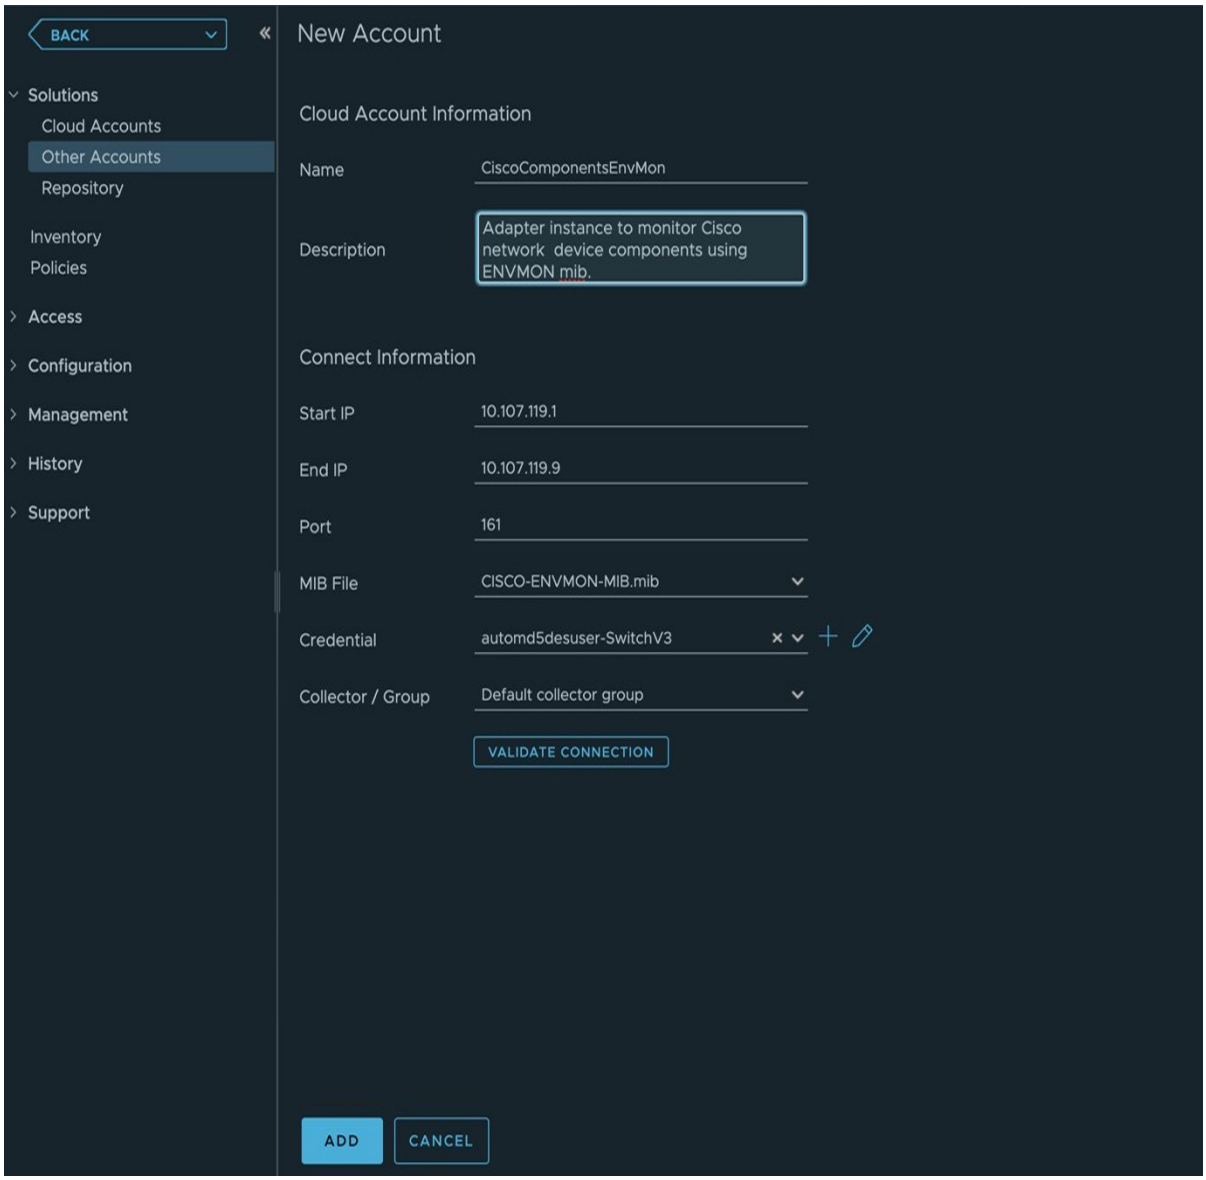
Example: Monitoring Fan State for a Cisco Switch

Let us consider the scenario of monitoring fan state for a Cisco Switch alone using VCF Operations 'Custom Groups' and 'Policies'.

In this example:

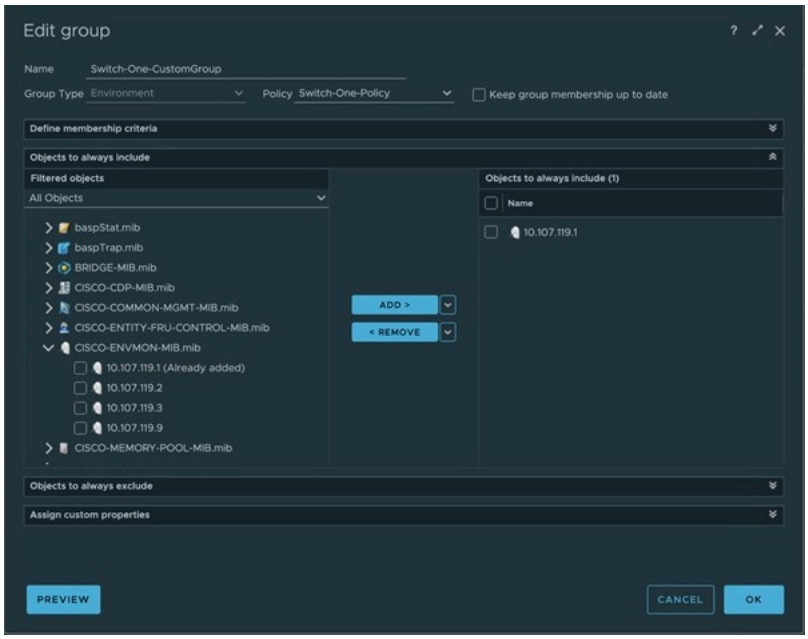
- CISCO-ENVMON-MIB gives the current state of the fan present at OID 1.3.6.1.4.1.9.9.13.1.4.1.3 (ciscoEnvMonFanState)
- For Cisco Switch with IP 10.107.119.1, there are three Fan components and you want to monitor Fan state for Cisco Switch 10.107.119.1 for any/all Fan modules
- The possible states of a Fan module are normal, warning, critical, shutdown, not present, and not functioning

1. Create an adapter instance for the range of devices that you want to monitor for Fan State. While creating the adapter instance, attach **CISCO-ENVMON-MIB** to adapter instance as shown in the following figure.

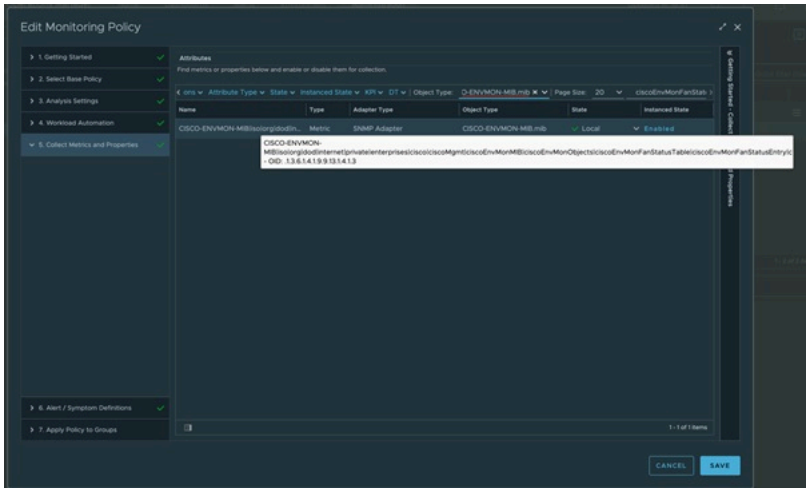


You have added a range of devices. For the credentials that match, the objects for each device are created under the adapter instance.

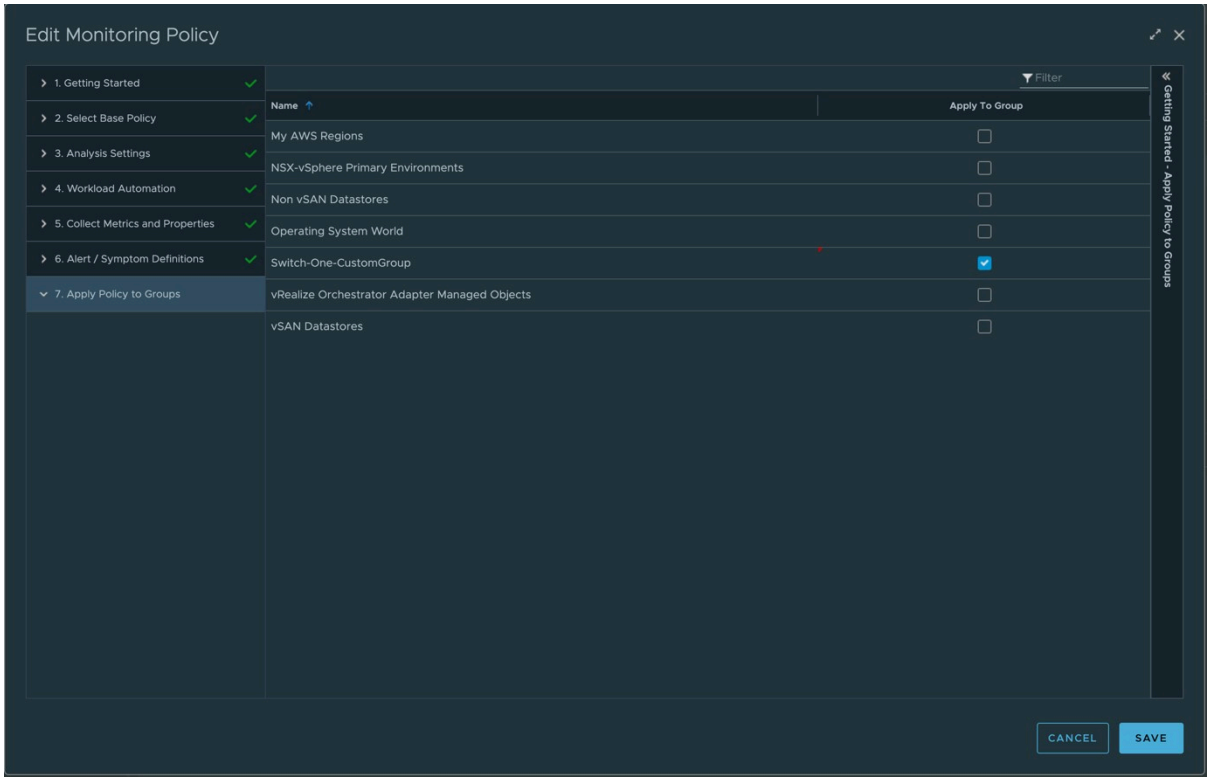
2. Create a new custom group in **Environment** > **Custom Groups** . While creating a custom group, select the policy and add only the device(s) that have to be monitored. In this example, add **10.107.119.1**.



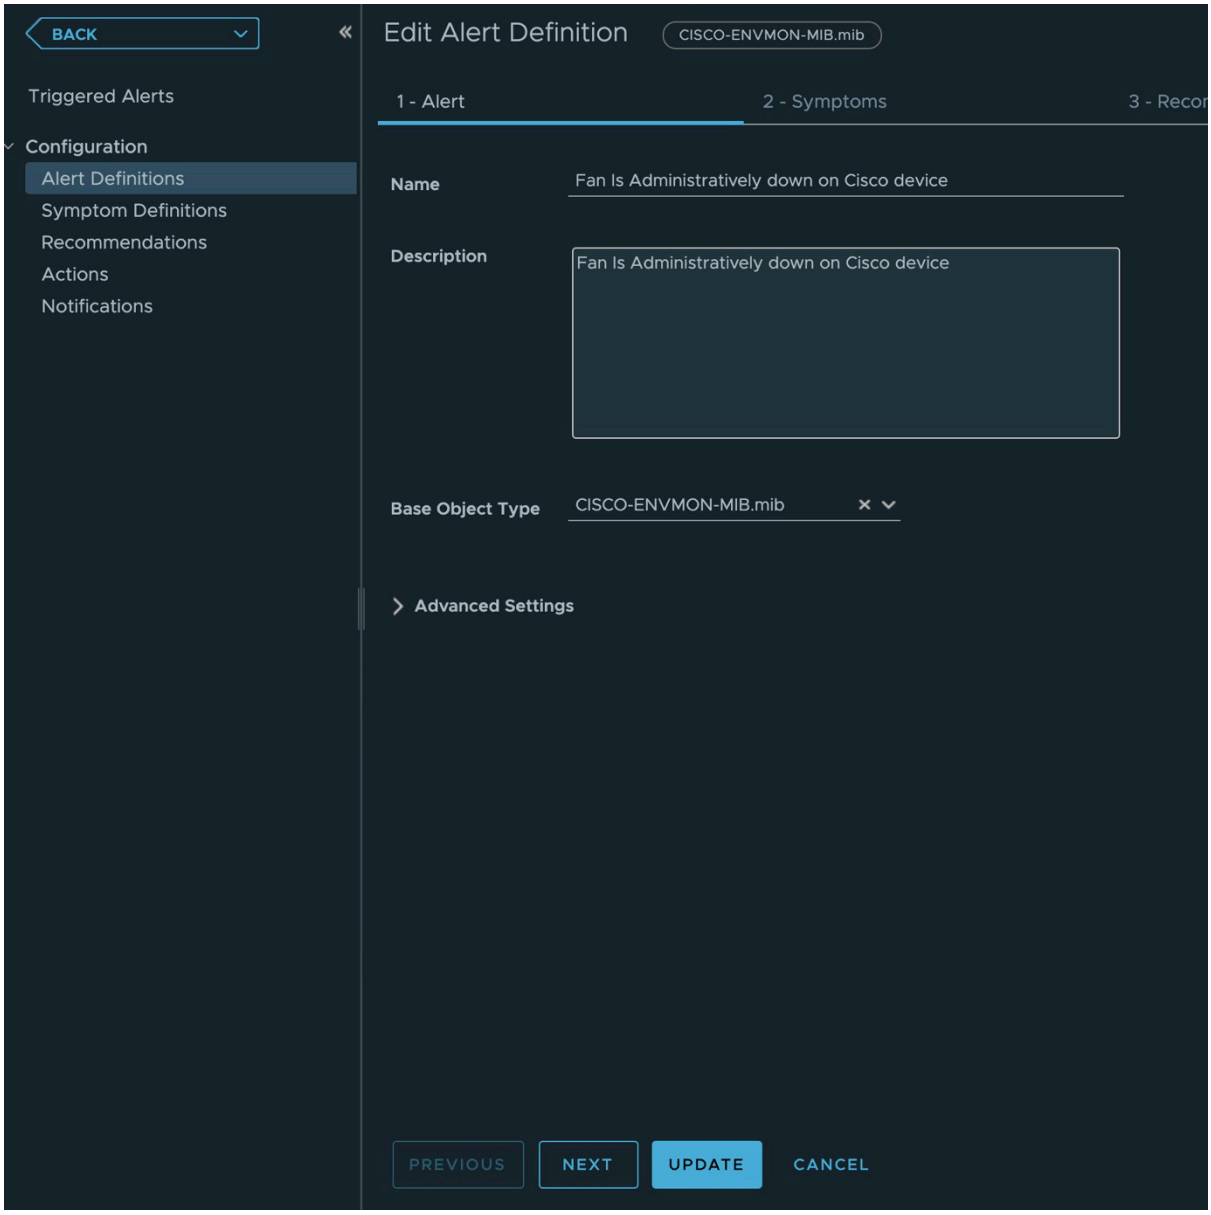
3. Go to **Administration** > **Policies** and click **Collect Metrics and Policies**. Search for `1.3.6.1.4.1.9.9.13.1.4.1.3` or `ciscoEnvMonFanState` and then set the state to `Local` for the OID as shown in the following figure.



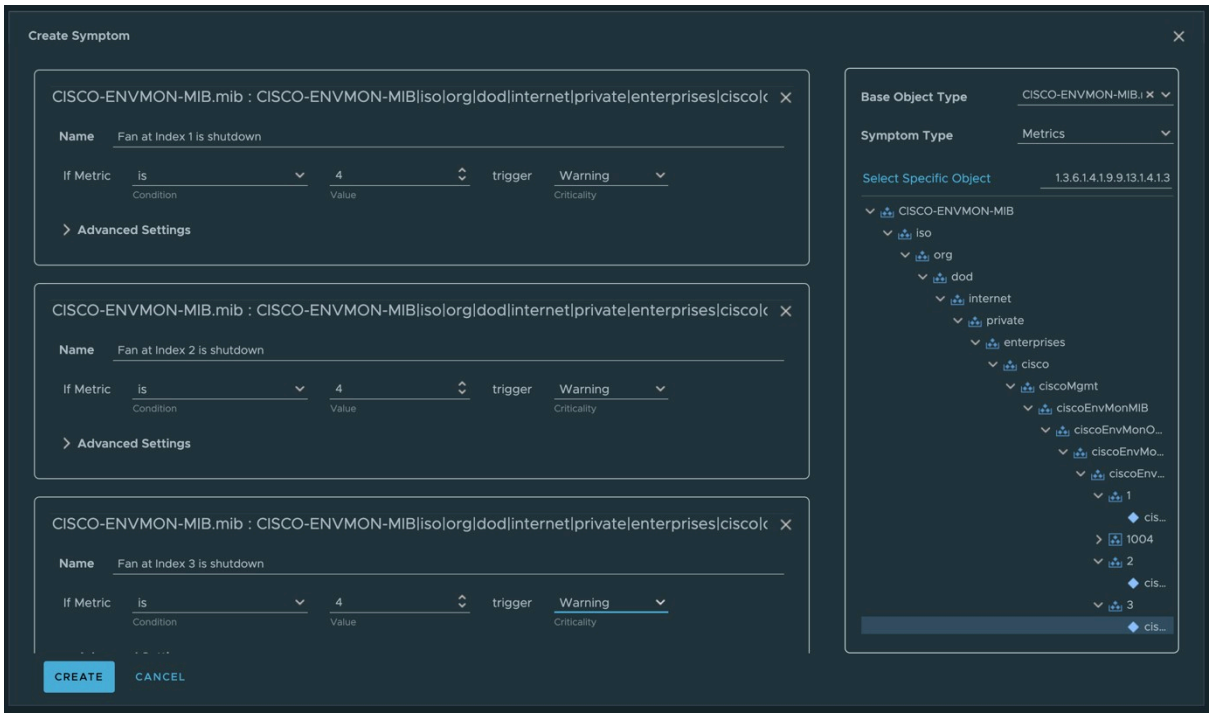
4. In the **Apply Policy to Groups** tab, select **Switch-One-CustomGroup**.



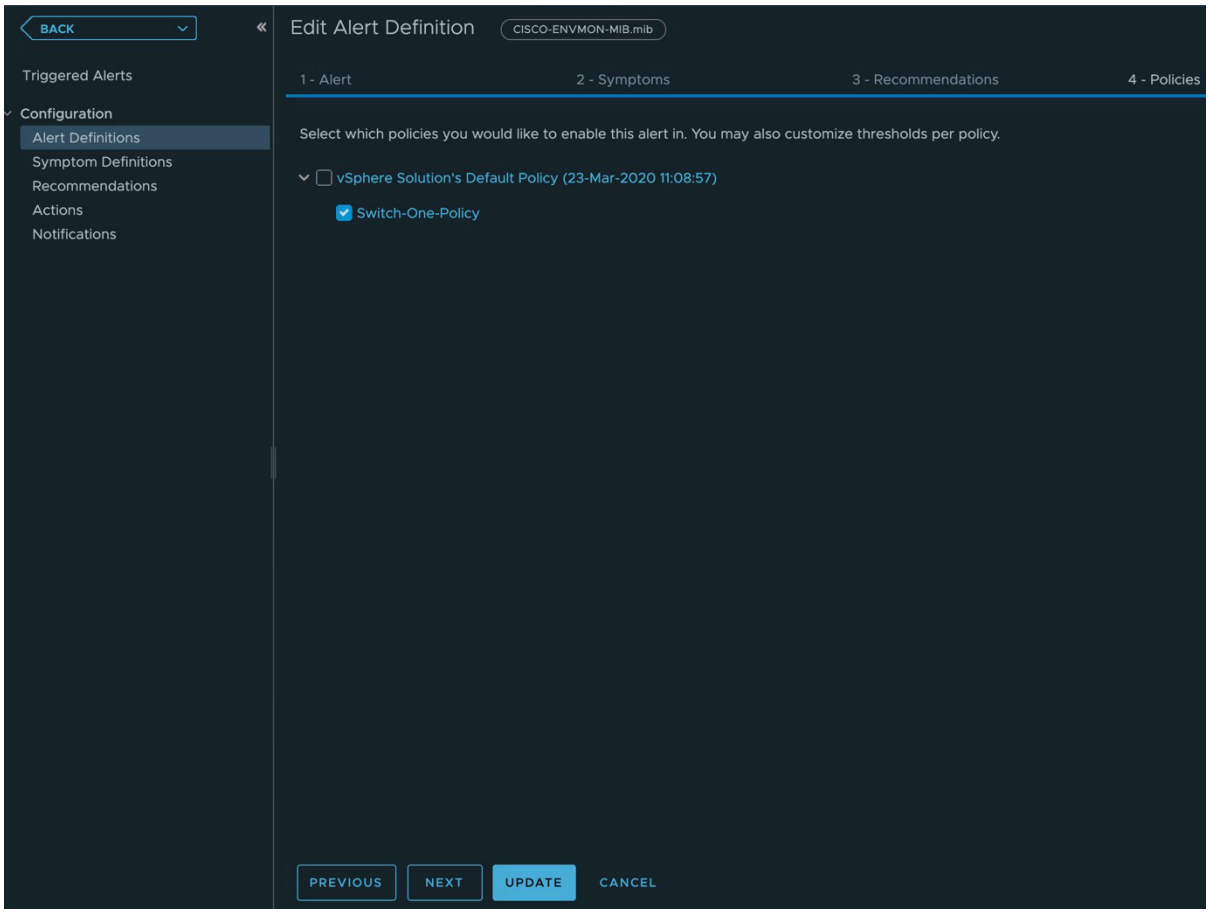
5. In the **Alerts** page, click **Configuration** > **Alert Definition**.
6. Create a new alert definition with the name 'Fan Is Administratively down on Cisco device' and select the **Base Object Type** as 'CISCO-ENVMON-MIB.mib'.



7. Create Symptoms for each fan module at index 1, 2 and 3 for status 'shutdown' at OID 1.3.6.1.4.1.9.9.13.1.4.1.3. Attach these symptoms to alert definition.

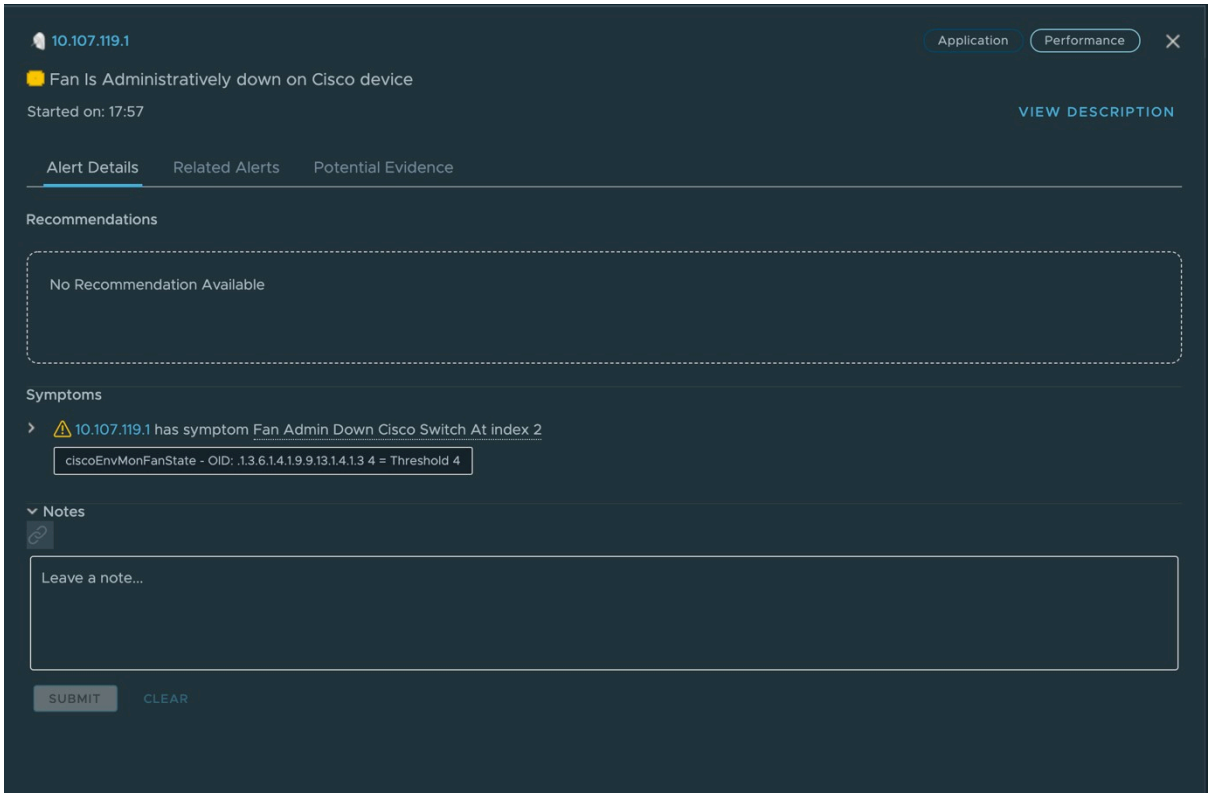


8. Restrict the alert to the policy 'Switch-One-Policy' so that this alert will be generated only for the Cisco Switch with IP 10.107.119.1.



9. Click **Update**.

   After a few collection cycles, alert is generated only for Cisco Switch with IP 10.107.119.1 as shown in the following figure.



**Metrics in SNMP Adapter**
The SNMP Adapter collects metrics for objects within its plug-in.

**Table 1670: SNMP Metrics**

| Resource | Metric Key | Metric Value |
|---|---|---|
| Predefined MIB Statistics (Interface Level) | Input Bandwidth Utilization | Double |
| Predefined MIB Statistics (Interface Level) | Output Bandwidth Utilization | Double |
| Predefined MIB Statistics (Interface Level) | Nominal Bandwidth | Double |

## Management Pack for Telco Cloud Automation Platform

Configuration Guide for this Management Pack is available at Management Pack for VMware Telco Cloud Automation Platform Guide.

## Management Pack for vSphere Replication

Configuration Guide for this Management Pack is available at Management Pack for vSphere Replication.

## Getting Started with Amazon Web Services

Amazon Web Services (AWS) is an embedded adapter with diagnostic dashboards for VCF Operations. The adapter collects metrics from AWS.

### Supported AWS Services

AWS supports the following services in VCF Operations.

| Service | Object | Description |
|---|---|---|
| Amazon MQ* | Amazon MQ Broker<br>Amazon MQ Node<br>Amazon MQ Topic<br>Amazon MQ Queue<br>Amazon MQ Virtual Host | Provides fully managed service for open source message brokers |
| Amazon Simple Queue Service (SQS) | SQS Queue | Provides fully managed message queues for microservices, distributed systems, and serverless applications |
| Amazon EC2 | EC2 Instance<br>EC2 Instance Type | Provides a secure and resizable compute capacity to support virtually any workload |
| Amazon EC2 Auto Scaling | EC2 Auto Scaling Group | Allows you to add or remove compute capacity to meet changes in demand |
| AWS Lambda | Lambda Function | Provides a serverless compute service that lets you run code without provisioning or managing servers, creating workload-aware cluster scaling logic, maintaining event integrations, or managing runtimes |
| AWS Elastic Beanstalk | Elastic Beanstalk Application<br>Elastic Beanstalk Environment | Provides an easy-to-use service for deploying and scaling web applications and services developed with Java, .NET, PHP, Node.js, Python, Ruby, Go, and Docker on familiar servers such as Apache, Nginx, Passenger, and IIS |
| Amazon Elastic Container Registry (ECR) | ECR Container Repository<br>ECR Container Image | Allows you to share and deploy container software, publicly or privately |
| Amazon Elastic Container Service (ECS) | ECS Cluster<br>ECS Service | Provides a highly secure, reliable, and scalable way to run containers |
| Amazon Elastic Kubernetes Service (EKS) | EKS Cluster<br>EKS Cluster ARN | Provides the flexibility to start, run, and scale Kubernetes applications in the AWS cloud or on-premises |
| Amazon Relational Database Service (RDS) | RDS DB Instance<br>RDS Instance Type | Allows you to set up, operate, and scale a relational database in the cloud |
| Amazon DynamoDB | DynamoDB<br>DynamoDB Accelerator Cluster<br>DynamoDB Accelerator Node | Provides fast and flexible NoSQL database service for any scale |
| Amazon ElastiCache | ElastiCache Cluster<br>ElastiCache Node | Provides fully managed in-memory data store, compatible with Redis or Memcached |
| Amazon WorkSpaces | Workspace | Provides a managed, secure Desktop-as-a-Service (DaaS) solution |
| AWS CloudFormation | CloudFormation Stack | Allows you to speed up cloud provisioning with infrastructure as code |
| Amazon Virtual Private Cloud (Amazon VPC) | VPC<br>VPC NAT Gateway<br>VPC VPN Connection | Allows you to build on a logically isolated virtual network in the AWS cloud |

| Service | Object | Description |
|---|---|---|
| Amazon CloudFront | CloudFront Distribution | Provides a fast, highly secure, and programmable content delivery network (CDN) |
| Amazon Route 53 | Route53 Hosted Zone | A highly available and scalable cloud Domain Name System (DNS) web service |
| AWS Direct Connect | AWS Direct Connect | A cloud service solution that makes it easy to establish a dedicated network connection from your premises to AWS |
| Elastic Load Balancing | Elastic Load Balancing | Allows you to distribute network traffic to improve the scalability of your applications |
| Amazon Simple Storage Service (S3) | S3 Bucket | Provides object storage built to store and retrieve any amount of data from anywhere |
| Amazon Fargate/ECS | ECS Cluster<br>ECS Service | Provides serverless compute for containers |
| Amazon Elastic Block Store (EBS) | EBS | An easy-to-use, high-performance, block-storage service designed for use with Amazon Elastic Compute Cloud (EC2) for both throughput and transaction-intensive workloads at any scale |
| Amazon Redshift | Redshift<br>Redshift Cluster<br>Redshift Node | Allows you to analyze all of your data with the fastest and most widely used cloud data warehouse |
| Amazon EMR | EMR Job Flow | Provides easily run and scale Apache Spark, Hive, Presto, and other big data frameworks |
| Amazon Elastic File System (EFS) | EFS | A simple, scalable, fully managed elastic NFS file system for use with AWS Cloud services and on-premises resources |
| Amazon Athena | Amazon Athena WorkGroup | An interactive query service that makes it easy to analyze data in Amazon S3 using standard SQL |
| Amazon CloudSearch | Amazon CloudSearch Domain | A managed service in the AWS Cloud that makes it simple and cost-effective to set up, manage, and scale a search solution for your website or application |
| Amazon OpenSearch | Amazon ElasticSearch Domain<br>Amazon ElasticSearch Node | Provides a managed service to easily deploy, operate, and scale OpenSearch clusters in the AWS Cloud |
| Amazon Elasticsearch Service* | Amazon ElasticSearch Domain<br>Amazon ElasticSearch Node | Provides fully managed, scalable, and secure Elasticsearch service |
| Amazon Kinesis Data Firehose | Amazon Kinesis Firehose | Allows you to prepare and load real-time data streams into data stores and analytics services |
| Amazon Kinesis Data Analytics | Amazon Kinesis Analytics | Provides actionable insights from streaming data with serverless Apache Flink |
| Amazon Kinesis Data Streams | Amazon Kinesis Stream | Allows you to easily collect, process, and analyze video and data streams in real-time |
| Amazon Kinesis Video Streams | Amazon Kinesis Video Stream | Provides a fully managed AWS service that can be used to stream live video from other devices to AWS Cloud or build applications for real-time video processing or batch-oriented video analytics. |
| Amazon Managed Streaming for Apache Kafka | Amazon MSK Cluster | Provides fully managed, highly available, and secure Apache Kafka service |

| Service | Object | Description |
|---|---|---|
| AWS Step Functions* | Amazon Step Functions State Machine | Allows you to assemble functions into business-critical applications |
| Amazon EventBridge* | Amazon EventBridge Rule | Provides serverless event bus that connects application data from your apps, SaaS, and AWS services |
| Amazon Simple Notification Service (SNS)* | Amazon SNS Topic | Provides fully managed pub/sub messaging, SMS, email, and mobile push notifications |
| Amazon Simple Workflow Service (SWF)* | Amazon SWF Workflow Type<br>Amazon SWF Activity Type<br>Amazon SWF Task List | Allows developers to build, run, and scale background jobs that have parallel or sequential steps |
| Amazon WorkMail* | Amazon WorkMail Organization | A secure, managed business email and calendar service with support for existing desktop and mobile email client applications |
| Amazon Connect* | Amazon Connect Instance | An easy-to-use omnichannel cloud contact center |
| Amazon Pinpoint* | Amazon Pinpoint Application | A multichannel marketing communication service |
| Amazon Neptune | Amazon Neptune DB Instance<br>Amazon Neptune DB Cluster<br>Amazon Neptune DB Engine | Provides fast, reliable graph database built for the cloud |
| Amazon Quantum Ledger Database (QLDB) | Amazon QLDB Ledger<br>Amazon QLDB Stream | Provides a fully managed ledger database that provides a transparent, immutable, and cryptographically verifiable transaction log |
| Amazon DocumentDB | Amazon DocDB DB Instance<br>Amazon DocDB DB Cluster<br>Amazon DocDB DB Engine | Provides a fast, scalable, and highly available MongoDB-compatible database service |
| Amazon Keyspaces* | Amazon keyspace | A scalable, highly available, and managed Apache Cassandra–compatible database service |
| Amazon Timestream | Amazon Timestream Database | Provides fast, scalable, serverless time series database |
| AWS CodeBuild* | Amazon CodeBuild Project | Allows you to build and test code with continuous scaling. Pay only for the build time you use |
| Amazon AppStream 2.0* | Amazon AppStream Fleet | A fully managed non-persistent application and desktop streaming service |
| Amazon GameLift* | Amazon GameLift Fleet<br>Amazon GameLift Queue | Allows you to enhance multiplayer experiences with dedicated cloud servers |
| AWS IoT* | Amazon IoT Protocol | Provides easily and securely connect devices to the cloud |
| AWS IoT Analytics* | Amazon IoTAnalytics Data Set | Provides analytics for IoT devices |
| Amazon Kendra* | Amazon Kendra Index<br>Amazon Kendra DataSource | Provides highly accurate intelligent search service powered by machine learning |
| Amazon Lex* | Amazon Lex Bot | A conversational AI for Chatbots |
| AWS AppSync* | AWS AppSync GraphQL API | Allows you to accelerate application development with scalable GraphQL APIs |
| Amazon Cognito* | Amazon Cognito User Pool | A simple and secure user sign-up, sign-in, and access control |

| Service | Object | Description |
|---|---|---|
| AWS WAF - Web Application Firewall* | AWS WAF WebACL | A web application firewall that helps protect your web applications or APIs against common web exploits that may affect availability, compromise security, or consume excessive resources |
| AWS Storage Gateway* | Amazon Storage Gateway | A hybrid cloud storage service that gives you on-premises access to virtually unlimited cloud storage |
| Amazon Glue | Amazon Glue | A simple, scalable, and serverless data integration |
| Amazon Aurora | Amazon Aurora DB Cluster<br>Amazon Aurora DB Instance | A MySQL and PostgreSQL-compatible relational database built for the cloud |
| Amazon SageMaker | Amazon SageMaker Endpoint<br>Amazon SageMaker Batch Transform Jobs<br>Amazon SageMaker Training Jobs<br>Amazon SageMaker Ground Truth Labeling Jobs<br>Amazon SageMaker Ground Truth Work Team | Helps data scientists and developers to prepare, build, train, and deploy high-quality machine learning (ML) models quickly by bringing together a broad set of capabilities purpose-built for ML |
| Amazon Personalize | Amazon Personalize DataSet Import Jobs<br>Amazon Personalize Solutions<br>Amazon Personalize Campaigns<br>Amazon Personalize Event Tracker | Allows you to create real-time personalized user experiences faster at scale |
| Amazon Elastic Inference | Amazon Elastic Inference | Allows you to attach low-cost GPU-powered acceleration to Amazon EC2 and Sagemaker instances or Amazon ECS tasks, to reduce the cost of running deep learning inference |
| Amazon API Gateway | Amazon API Gateway | Allows you to create, maintain, and secure APIs at any scale |
| Amazon Global Accelerator | Amazon Global Accelerator | Allows you to improve global application availability and performance using the AWS global network |
| Amazon FSx for Lustre | Amazon FSx for Lustre | Provides fast and scalable shared storage to power your compute workloads |
| Amazon FSx for Windows File Server | Amazon FSx for Windows File Server | Provides fully managed file storage built on Windows Server |
| AWS App Mesh (App Mesh Metrics for EKS & ECS) | **Note:**<br>These services appear under App Mesh Metrics for EKS & ECS. | A service mesh that provides application-level networking to make it easy for your services to communicate with each other across multiple types of compute infrastructure |
| Amazon S3 Glacier (Scale object of S3) | **Note:**<br>These services appear under Scale object of S3. | A secure, durable, and extremely low-cost Amazon S3 cloud storage classes for data archiving and long-term backup |
| Amazon Kinesis (Data Analytics, Data Firehose, and Data Stream) | **Note:**<br>These services appear under Data Analytics, Data Firehose, and Data Stream. | Allows you to easily collect, process, and analyze video and data streams in real-time |
| AWS Auto Scaling (EC2 Auto Scaling) | **Note:**<br>These services appear under EC2 Auto Scaling. | Allows you to add or remove compute capacity to meet changes in demand |

**Note:**
Services marked with * indicate that the objects have relationships only with regions.

**Note:**
All services are created with the following Service Descriptors:

- Account ID
- Region
- Service Type

For more information about Amazon Web Services, go to the Amazon Web Services site at https://aws.amazon.com/products.

### Charges for AWS Metrics

Amazon charges you for the metrics you collect. You can reduce costs by selecting only the metrics that are most helpful and filtering out those that are of less interest.

By default, the Management Pack for AWS requests data every five minutes. Every collection cycle makes one CloudWatch call per metric, for an object.

For information about metric costs, see Amazon CloudWatch Pricing.

Based on the costs associated with running the adapter, you can take advantage of some of the features that limit the amount of data you collect from AWS.

- Turn off auto discovery and use manual discovery.
- Go to **Advanced Settings** and select only those services that are critical to your system.
- Subscribe only to specific critical regions.
- Use acceptlist and blocklist filtering to select object import by name.
- Use acceptlist or blocklist to selectively import specific service instances using instance names. Using regex, you can filter services by providing the partial name of the instance.

### Configuring AWS

Configure the AWS in VCF Operations and optionally change its properties to customize the management pack's operation.

An Amazon Web Services account has multiple types of credentials associated with the account. Sign-in credentials are used to access the Amazon Web Services Web-based console, key pairs are used to access EC2 instances, and access keys are used in the REST API that Amazon Web Services exposes.

Because the AWS adapter is based on the REST API, you must use access keys when you set up the adapter. You generate access keys from the Amazon Web Services console. You can create credentials on a per user basis. Access keys are not a username-password pair, but a generated sequence of characters.

**Note:**
While it is not required, it is recommended that you create a guest type account, which has a read-only access to Amazon Web Services, and use the access keys associated with this account. When you create a guest group with default permissions, they do not include read access to the Elastic Map Reduce (EMR) service. You must use the IAM console to add the following permission:

```
elasticmapreduce:DescribeJobFlows
```

#### Generate Required Access Keys

To configure AWS, you must acquire an access key and secret key from the Amazon server. You can acquire these keys as an Amazon Web Services Admin user or as an Amazon Identity and Access Management (IAM) user. For the latest instructions,

- Ensure that you are using Amazon Web Services.
- Ensure that you have the valid permissions and roles in Amazon Web Services.

1. Log in to Amazon Web Services.
2. To generate access keys, see the online documentation on the https://docs.aws.amazon.com/ site.
   Complete the following tasks:
   - Generate access keys as an Amazon Web Services Administrator.
   - Generate access keys as Amazon Web Services Identity and Access Management User.

### Configuring IAM Permissions

When you set up IAM users and groups, you can stipulate which permissions the account has for API calls. The keys you use when you set up the adapter instance must have certain permissions activated.

For each supported AWS Service, the `ReadOnlyAccess` permission is enough to collect metrics. Use the permission to create a IAM Policy for all supported services and their related services.

To use resource groups tagging API operations, see Resource Groups Tagging API Reference and Services that support the Resource Groups Tagging API.

Log in to the AWS console and create a json similar to the following to get the list of privileges for the service:

```
{
    "Version": "2012-10-17",
    "Statement": [
       {
         "Action": [
          "autoscaling:Describe*",
          "cloudwatch:Describe*",
          "cloudwatch:Get*",
          "cloudwatch:List*",
          "logs:Get*",
          "logs:List*",
          "logs:Describe*",
          "logs:TestMetricFilter",
          "logs:FilterLogEvents",
          "sns:Get*",
          "sns:List*"
        ],

Update Configuration Settings in the Properties File

The `amazonaws.properties` file provides configuration options. You can optionally change the following configuration properties if required.

**Table 1672: Amazon Web Services Property Settings**

| Property | Description |
|---|---|
| firstcollecthistoryhours | Determines how far in the past to collect data when the adapter starts. The default is 0, meaning no historical collection. |
| maxquerywindowminutes | The maximum query window for collections, in minutes. The default is 60. The adapter asks AWS for metrics for a maximum of this many minutes. |
| maxhoursback | The maximum number of hours back from the current time that the adapter attempts to collect. The default value is 336, or two weeks, because Cloudwatch keeps only two weeks worth of metrics. |
| includetransient | False by default. Set to true to allow the adapter to import known transient objects. Transient objects currently include any EMR job that is set to terminate on completion and all of the supporting cluster EC2 instances that belong to that job. |
| threadcount | Default is 4. Controls how many threads are active while making calls to cloudwatch to get metrics. This threadcount is per region. The total number of threads is this value times the number of regions. |
| collecttimeout | Controls how long the adapter waits for all metric collection calls to return from AWS during a collection cycle. The value is measured in seconds. The default value is 240 seconds, which is in line with the default 5 minute collection cycle. |

Installing and Configuring a VCF Operations Management Pack for AWS

You can add a AWS cloud account instance to your VCF Operations implementation. VCF Operations collects data from Amazon Web Services (AWS) and supports both commercial and AWS GovCloud accounts. It covers multiple services and regions. You can also add application metrics and other custom metrics from your AWS services and use them in dashboards, alerts and reports.

- You must install the Management Pack for AWS before you can configure it. Download the PAK file from the VCF Solutions Catalog to a temporary folder on your local system. For more information, see Installing and Configuring Integrations in VMware Cloud Foundation Operations.
- For key-based authentication, obtain the Access Key and Secret Key values. See Generate Required Access Keys. These values are not the same as your log in credentials for the Amazon Web Services site.
- Determine the services for which you collect metrics. See Supported AWS Services. The default value * includes all services in your subscription. If you do not want to subscribe to all services, you can specify region identifiers in the Regions text box.
- Determine the regions to which you subscribe. Amazon Web Services are divided into different regions. The default value * includes all regions in your subscription. If you do not want to subscribe to all regions, you can specify region identifiers in the Regions text box.

**Table 1673: Amazon Web Services Regions for AWS Standard Account**

| Region-Friendly Name | Region Identifier |
|---|---|
| US East (N. Virginia) | us-east-1 |
| US East (Ohio) | us-east-2 |
| US West (N. California) | us-west-1 |
| US West (Oregon) | us-west-2 |
| Asia Pacific (Hong Kong) | ap-east-1 |
| Asia Pacific (Tokyo) | ap-northeast-1 |
| Asia Pacific (Seoul) | ap-northeast-2 |

| Region-Friendly Name | Region Identifier |
|---|---|
| Asia Pacific (Osaka-Local) | ap-northeast-3 |
| Asia Pacific (Mumbai) | ap-south-1 |
| Asia Pacific (Singapore) | ap-southeast-1 |
| Asia Pacific (Sydney) | ap-southeast-2 |
| Asia Pacific (Jakarta) | ap-southeast-3 |
| Canada (Central) | ca-central-1 |
| China (Beijing) | cn-north-1 |
| China (Ningxia) | cn-northwest-1 |
| Europe (Frankfurt) | eu-central-1 |
| Europe (Zurich) | eu-central-2 |
| Europe (Ireland) | eu-west-1 |
| Europe (London) | eu-west-2 |
| Europe (Paris) | eu-west-3 |
| Europe (Stockholm) | eu-north-1 |
| Europe (Milan) | eu-south-1 |
| Europe (Spain) | eu-south-2 |
| South America (São Paulo) | sa-east-1 |
| Africa (Cape Town) | af-south-1 |
| Middle East (Bahrain) | me-south-1 |
| Middle East (UAE) | me-central-1 |

**Table 1674: Amazon Web Services Regions for AWS GovCloud (US) Account**

| Region-Friendly Name | Region Identifier |
|---|---|
| AWS GovCloud (US-East) | us-gov-east-1 |
| AWS GovCloud (US) | us-gov-west-1 |

- Determine any blocked list or allowed list filters. These filters use regular expressions to filter in or out specific objects by name. For example, an allowed list filter of `.*indows.*` allows only objects with a name including "indows". A blocked list filter of `.*indows.*` filters out all objects with that string in their name.
- To publish custom metrics to CloudWatch, see Publishing Custom Metrics.
- To collect additional metrics for EC2 through CloudWatch agent, set up the agent. For details, see Installing CloudWatch Agent.

1. In the left menu, click **Administration** > **Integrations**.
2. On the Accounts tab, click **ADD**.
3. On the Account Types page, click **AWS**.
4. Configure the instance settings.

| Option | Action |
|---|---|
| **Name** | Enter a name for the adapter instance. |
| **Description** | Enter a description. |
| **Account Type** | Select the AWS account type.<br>Select **AWS Standard Account** to set up a commercial AWS account. |

| Option | Action |
|---|---|
| | Select **AWS GovCloud (US) Account** to set up a AWS GovCloud (US) account to monitor GovCloud services and regions. |
| **Services/ GovCloud Services** | Select the services from which you want to capture metrics. If you want to collect metrics for specific services, then click the drop-down icon and select one or more services. For example, `Amazon CloudFormation, Amazon EC2`. If you do not select any of the services, the metrics for all the services get collected.<br><br>The services marked with an asterix* for example, `AWS AppSync*` are grouped together under AWS Other Services. These services display the relationship with the regions only. For more information on supported AWS services, see Supported AWS Services.<br><br>**Note:**<br>If you select **AWS GovCloud (US) Account** as the account type, you can only select the services applicable for AWS GovCloud (US). |
| **Regions/ GovCloud Regions** | Select the regions you want to subscribe to. If you want to subscribe to specific regions, then click the drop-down icon and select one or more regions. For example, `US East (N. Virginia),US East (Ohio)`. If you want to subscribe to all the regions, do not select any of the regions.<br><br>**Note:**<br>If you select **AWS GovCloud (US) Account** as the account type, you can only select the regions applicable for AWS GovCloud (US). The regions for AWS GovCloud (US) are AWS GovCloud (US-East) and AWS GovCloud (US). |
| **Credential** | Add the credentials used to access the AWS environment by clicking the plus sign and select the **Credential Kind**.<br><br>**Note:**<br>For each credential kind, you must enter a **Credential name**. This name is not the name of the adapter instance, but a friendly name to identify the credential with ease.<br><br>• **Key-based authentication**: Use the AWS key-based authentication an application (running in an AWS Account) using access key and secret key.<br><br>**Note:**<br>If you are configuring an AWS GovCloud (US) Account, then the access key and secret key values must be specific to AWS GovCloud.<br>Enter the **Credential name** and the **Access Key** and **Secret Key** values.<br>Optionally, enter any required local proxy information for your network.<br><br>**Note:**<br>This proxy information activates VCF Operations that is deployed on a local network to have a public network access for AWS to collect statistics for its accounts. |
| **Collector / Group** | Select the collector upon which you want to run the adapter instance. A collector gathers objects into its inventory for |

| Option | Action |
|---|---|
| | monitoring. The collector specified by default has been selected for optimal data collecting. |

5. Click **Test Connection** to validate the connection.
6. Click the arrow to the left of the **Advanced Settings** to configure advanced settings.

| Option | Action |
|---|---|
| **Collect Custom Metrics** | Set this option to true if you want to import all the custom metrics from your AWS account.<br>To publish custom metrics in VCF Operations, the metrics dimension names should match the following service mappings: |

| Service Name | Dimension Name |
|---|---|
| dax_cluster | ClusterId |
| dax_node | NodeId |
| dynamodb | TableName |
| efs | FileSystemId |
| eks | ClusterName |
| elasticbeanstalk_env | EnvironmentName |
| redshift_node | NodeID |
| redshift_cluster | ClusterIdentifier |
| s3_bucket | BucketName |
| vpc_nat_gateway | NatGatewayId |
| vpc_vpn | VpnId |
| workspace | WorkspaceId |
| ec2_auto_scale_group | AutoScalingGroupName |
| cloudfront_distribution | DistributionId |
| direct_connect | ConnectionId |
| ec2_instance | InstanceId |
| ec2_volume | VolumeId |
| transit_gateway | TransitGateway |
| ecs_cluster | ClusterName |
| ecs_service | ServiceName |
| elasticache_cachecluster | CacheClusterId |
| elasticache_cachenode | CacheNodeId |
| ec2_load_balancer | LoadBalancerName |
| application_load_balancer | LoadBalancer |
| network_load_balancer | LoadBalancer |
| emr_job_flow | JobFlowId |
| lambda_function | FunctionName |
| rds_dbinstance | DBInstanceIdentifier |
| hosted_zone | HostedZoneId |
| health_check | HealthCheckId |
| sqs_queue | QueueName |
| amazon_neptune_db_instance | DBInstanceIdentifier |
| amazon_neptune_db_cluster | DBClusterIdentifier |

| Option | Action |
|---|---|
| | <table><tr><th>Service Name</th><th>Dimension Name</th></tr><tr><td>amazon_personalize_data_import</td><td>DatasetimportjobArn</td></tr><tr><td>amazon_personalize_event_tracker</td><td>EventTrackerArn</td></tr><tr><td>amazon_personalize_solution</td><td>SolutionArn</td></tr><tr><td>amazon_personalize_campaign</td><td>CampaignArn</td></tr><tr><td>amazon_sagemaker_endpoint</td><td>EndpointName</td></tr><tr><td>amazon_sagemaker_batch_transform_job</td><td>Host</td></tr><tr><td>amazon_sagemaker_ground_truth_labeling_job</td><td>LabelingJobName</td></tr><tr><td>amazon_sagemaker_ground_truth_work_team</td><td>Workteam</td></tr><tr><td>amazon_global_accelerator</td><td>Accelerator</td></tr><tr><td>amazon_api_gw</td><td>ApiName</td></tr><tr><td>amazon_elastic_inference</td><td>ElasticInferenceAcceleratorId</td></tr><tr><td>amazon_glue_job</td><td>JobName</td></tr><tr><td>amazon_qldb_ledger</td><td>LedgerName</td></tr><tr><td>amazon_qldb_stream</td><td>StreamId</td></tr></table> |
| **Support Auto Discovery** | Set this option to true for automatic discovery of AWS services. If you set this value to false, when you create an adapter instance you must perform a manual discovery of services. |
| **Allowed List Regex** | Add regular expressions to allow only objects with names that fit the criteria you specify. |
| **Blocked List Regex** | Add regular expressions to filter out objects by name. |
| **Actions Activated** | Activate this option to run actions specific to the AWS virtual machine using VCF Operations. By default, this option is set to **true**.<br>For details on running actions, see Power On, Power Off, and Reboot Actions. |
| **Account ID** | The AWS account ID is auto populated. Each AWS account uses a unique account ID to run actions. The account ID is the same one used to log in Amazon Web Services site. |

7. Click **Save Settings**.

Make sure that VCF Operations is collecting data.

| Where to View the Information | Information to View |
|---|---|
| Collection Status and Collection State columns in the MP for AWS Solution Details pane on the **Accounts** tab on the **Integrations** page. | The collection status appears approximately 10 minutes after you have configured the adapter. |
| Environment Overview | The objects related to AWS are added to the inventory trees. |
| Dashboards | AWS dashboards are added to VCF Operations. |

Tagging Groups

AWS uses tagging groups. The tagging groups appear under the AWS Entity Status in the Inventory page.

**Table 1675: Tagging Groups**

| Group Name | Description |
|---|---|
| PoweredOn | Objects with this tag are in the running state. |
| PoweredOff | Objects with this tag are in the stopped state. |
| Transient | Objects with this tag are not expected to persist for long periods of time. |
| NotExisting | Objects with this tag do not exist in the Amazon Web Services system. You can use this tag to take advantage of the periodic purge feature of VCF Operations, that the `controller.properties` file on the Analytics server controls. |

**View AWS Objects**

You can use the inventory tree to browse and select objects. The inventory tree shows a hierarchical arrangement of the AWS objects by region.

1. In the left pane of VCF Operations, click the **Environment** icon.
   - Click **Accounts** to list the AWS adapter instances.
   - Click **Regions** to to list the AWS regions.
2. To view the child objects, expand the regions and then expand the regions per account.

   **Note:**
   All the account-specific objects related to a region are grouped under the region per account section.
3. To display information about the object, select an object in the inventory tree.

## AWS Dashboards

Dashboards provide the user interface you use to monitor and troubleshoot Amazon Web Services problems in VCF Operations.

You can access the dashboards by selecting **Dashboards**, and then selecting **AWS**.

**Table 1676: AWS Dashboards**

| Dashboard Name | Purpose |
|---|---|
| AWS Alerts | The Alerts dashboard reports system-generated performance information for Amazon Web Services. In VCF Operations 5.8 and later, the dashboard also displays alerts received from Amazon Web Services Cloudwatch. |
| AWS ASG Utilization | Use the Auto Scaling Group (ASG) dashboard to identify which ASG groups have a high utilization across the metrics CPU, Disk IO, Network Transmissions, Received/Sent, and Number of Instances in the ASG. Use that information to determine whether any action is needed to adjust the ASG parameters. For example, you might need to raise or lower the scaling threshold for the CPU metric.<br>ASG metrics are not collected by default. You must activate them when creating the group. This applies only to the metrics belonging directly to the auto scale group, for example GroupDesiredCapacity. It does not apply to the aggregate instance metrics for the ASG, for example Instance Aggregate CPU Utilization. |

| Dashboard Name | Purpose |
|---|---|
| AWS Disk Space | Use the Disk Space dashboard to monitor EBS volumes to see whether they are running out of disk space and take appropriate action to anticipate future storage needs. Amazon Web Services does not report disk space by default.<br>For more information on accessing additional metrics, including disk space, and corresponding pricing, go to the Amazon Web Services documentation page at http://docs.aws.amazon.com/AmazonCloudWatch/latest/DeveloperGuide/mon-scripts.html |
| AWS Instance Heatmap | Use the Instance Heatmap to monitor CPU/Disk/Network metric elements and identify instances that perform poorly. |
| AWS Instance Utilization | Use to identify which EC2 instances have high use across the metrics for CPU, Disk IO, Network Transmissions, Received/Sent, and Memory. Use that information to determine whether you can optimize the system by making adjustments to EC2 instances. |
| AWS Troubleshooting | This dashboard is most helpful when someone calls in with a problem and you know which device they are using. You can search for that type of device or the specific device, if you know the name.<br>When you select the device, the relationship tree displays the item, its parents, and children. You can observe the Health, Workload, Anomalies, and Faults to get an overview of how the system is functioning in those areas. You can use information in the Interesting Metrics widget to help identify the root cause of issues. The Health, Anomalies, and Events Mash-up widget allows you to compare changes in the system to see how they might affect one another. |
| AWS Volume Performance | Use the Volume Performance dashboard to identify Elastic Block Store (EBS) volumes that are experiencing high disk read time, high disk write time, a high volume of disk read operations, or a high volume of disk write operations. |
| AWS Availability | Use this dashboard to view the availability of each AWS service. |
| AWS Inventory | Use this dashboard to view the count of each AWS service instance in each region. |
| AWS Optimization | Use this dashboard to view if you are effectively using AWS services. |

**Table 1677: AWS - All Other Dashboards**

| Dashboard Name | Purpose |
|---|---|
| AWS Services<br>• CloudFormation Stacks<br>• Compute: EC2<br>• Compute: Elastic Containers<br>• Compute: Lambda Functions<br>• Database: Dynamo<br>• Database: Elasticache<br>• Database: RDS<br>• Database: Redshift<br>• Desktop: Workspaces<br>• Network: Load Balancers<br>• Network: VPS<br>• Simple Queue Services<br>• Storage | Select **AWS Services** and then select a dashboard to view a specific service-related information. |

**AWS Instance Utilization Dashboard**
Use the AWS Instance Utilization dashboard to identify which EC2 instances have a high usage across the metrics for CPU, Disk IO, Network Transmissions, Received/Sent, and Memory. Use that information to determine whether you can optimize the system by adjusting the EC2 instances.

For example, you might determine that you need to resize the EC2 instance to make it larger or smaller.

You most often use this dashboard to troubleshoot issues with the listed metrics based on a support request from a user.

You can also identify which EC2 instances have been running for the longest and shortest amount of time. Then, you can use that information to determine whether EC2 instances can be decommissioned, or discover instances that have been added and need to be tracked in inventory.

Memory metrics require that you implement an add-on for each EC2 instance. These add-ons cost extra, and are not included by default.

**AWS Auto Scaling Group Dashboard**
Use the AWS Auto Scaling Group (ASG) dashboard to identify which ASG groups have a high utilization across the metrics CPU, Disk IO, Network Transmissions, Received/Sent, and Number of Instances in the ASG. Use that information to determine whether any action is needed to adjust the ASG parameters. For example, you might need to raise or lower the scaling threshold for the CPU metric.

**AWS Troubleshooting Dashboard**
When a user calls in with a problem and you know the name of the device they are using, can search for that type of device or the specific device and use the AWS Troubleshooting dashboard to get an overview of the system functionality.

When you select the device, the relationship tree displays the item, its parents, and children. You can observe the Health, Workload, Anomalies, and Faults to get an overview of how the system is functioning in those areas.

Use information in the Interesting Metrics widget to help identify the root cause of issues. The Health, Anomalies, and Events Mash-up widget allows you to compare changes in the system to see how they might affect one another.

There is a suggested flow to using the widgets in this dashboard.

1. Start with only the AWS Object widget open, and find the item you want to inspect.
2. Select the item, then expand the AWS Relationship widget to view the item's status.
3. Select one or all the related objects, then view the Ordered Symptoms, Interesting Metrics, and Mash-up.
4. Optionally, drag widgets into a new configuration if it makes it easier for you to compare information that is meaningful to you.
5. Examine the list of ordered symptoms and determine which of these events, in the given order might cause the problem to occur.

**AWS Instance Heatmap Dashboard**
Use the AWS Instance Heatmap dashboard to monitor CPU/Disk/Network metric elements and identify instances that perform poorly.

You can use the Troubleshooting dashboard to find more detail, and research the root cause of issues. Then you can view the specific object instance to identify faulty processes and take a corrective action.

**AWS Volume Performance Dashboard**
Use the AWS Volume Performance dashboard to identify Elastic Block Store (EBS) volumes that are experiencing high disk read time, high disk write time, a high volume of disk read operations, or a high volume of disk write operations. When you identify the EC2 instance that generates the load, use the Troubleshooting dashboard to investigate further.

**AWS Disk Space Dashboard**
Use the AWS Disk Space dashboard to monitor EBS volumes to see whether they are running out of disk space and take appropriate action to anticipate future storage needs. Amazon Web Services does not report disk space by default.

For more information on accessing additional metrics, including disk space, and corresponding pricing, go to the Amazon Web Services documentation page at http://docs.aws.amazon.com/AmazonCloudWatch/latest/DeveloperGuide/mon-scripts.html.

**AWS Alerts Dashboard**
The AWS Alerts dashboard reports system-generated performance information for Amazon Web Services. In VCF Operations 6.6 and later, the dashboard also displays alerts received from Amazon Web Services Cloud watch.

**AWS Inventory Dashboard**
Using the **AWS Inventory** dashboard you can navigate through the AWS inventory and view service details for each AWS account.

The **AWS Inventory** dashboard is built to provide an overview of your AWS inventory. By default, the total number of accounts and services displayed is at the AWS World level. You can view the number and types of services and also the growth or decline of a service within a specific period for individual accounts. You can also drill down and view the service summary per region for a specific account. Using this information you can understand growth trends, and manage and utilize your inventory cost-effectively.

The Inventory dashboard helps you answer several key questions:

- How many accounts are being monitored?
- How many services are running?
- What services are being used?
- What is the growth trend of the services?

**How to Use the Dashboard**

The **AWS Inventory** dashboard displays the total number of accounts, the account names, available regions, and the total number of services running at the AWS World level.

- **Total Number of Accounts Being Monitored** widget: Displays the total number of AWS accounts being monitored at the AWS World level.
- **Accounts** widget: Select an account from the table to refresh the service count and view the services specific to that account.
- **Regions** widget: Select a region to filter the service count and view service information per region.
- **Services** widget: Services are arranged in the alphabetical order, double click a service to view the growth trend and details regarding the service.

**Compute EC2 Dashboard**
Using the **Compute EC2** dashboard you can cater to the network, memory, and CPU utilization of your EC2 instances at the AWS World level.

You can use the **Compute EC2** dashboard to monitor the health of all your EC2 instances in the AWS inventory and filter them based on accounts and regions. The dashboard displays the total number of EC2 instances and the number of active instances. You can also view the size of the instances and their CPU, network, and memory utilization and distribution at the AWS World level.

The **Compute EC2** dashboard displays the top 10 EC2 instances with the highest and the lowest CPU, network, and memory utilization and distribution at the AWS World level. You can filter this information and view it based on accounts and regions per account.

The **Compute EC2** dashboard helps you answer several key questions:

- How many EC2 instances are there?
- How many EC2 instances are running or shut down?
- What alerts are generated for the EC2 instances?
- What are the key metrics for specific VMs in an EC2 instance?

**How to Use the Dashboard?**

The **Compute EC2** dashboard displays the account names, available regions, EC2 instances by size, and the total number of EC2 instances at the AWS World level. It also displays the top ten EC2 instances with the highest and lowest CPU utilization and CPU distribution, the top ten EC2 instances with the highest and lowest network bandwidth and network distribution, and the top ten EC2 instances with the highest and lowest memory usage and distribution. To view memory-related data for any EC2 instances, the AWS CloudWatch agent must be installed on the EC2 instances.

You can also view the EC2 instances according to their power state and running time and view the alerts for the EC2 instances. You can also view the list of EC2 instances with their key metrics at the AWS world level.

- **Accounts** widget: Displays the total number of AWS accounts being monitored at the AWS World level. Select an account from the table to refresh the dashboard and view the EC2 instance information for the specific account.
- **Regions** widget: Select a region to filter the displayed information and view the data for EC2 instances per region.
- **EC2 Instances with Key Metrics** widget: Displays the list of EC2 instances with key metrics at the AWS World level. The list of EC2 instances gets updated according to the account and region you select. Select an EC2 instance to view its key metrics, CPU utilization, network bandwidth, and memory usage for a particular EC2 instance.

**AWS Network Services Overview Dashboard**

The **AWS Network Services Overview** dashboard is built to provide an overview of your AWS VPCs and key network services linked to it.

You can view the number of VPCs, Subnets, NAT Gateways, and VPN connections.

The **AWS Network Services Overview** dashboard helps you answer several key questions.

- What is the network service count for a specific account or region?
- How many VPCs are used for a specific account or region?
- What are the NAT gateways for a specific VPC?
- How many VPNs and Subnets are connected to a specific VPC?

**How to Use the Dashboard?**

In the **AWS Network Services Overview** dashboard, the numbers of VPCs, Subnets, NAT Gateways, and VPN connections are displayed at the AWS World level by default. You can filter them by account and by region. You can also drill down to a specific VPC and check the NAT Gateways and VPN Connections linked to the selected VPC.

- **Accounts** widget: Lists the AWS accounts. Select an account from the table to refresh the dashboard and view the VPC information for the specific account.
- **Regions** widget: Lists the AWS regions. Select a region to filter the displayed information and view the data for VPCs per region.
- **Network Service Count** widget: Displays the total number of VPCs, number of VPC NAT Gateways, and the number of VPN connections.
- **VPC List**: Displays the names and regions of the VPCs deployed. The first VPC in the list is selected by default. The list of VPCs gets updated according to the account and region you select. Select a VPC instance to view the associated VPC NAT gateways, VPN connection, and connected services.
- **VPC NAT Gateways**: Displays the VPC NAT Gateway information for the first VPC in the VPC list by default. The VPC NAT gateways list gets updated according to the VPC you select.
- **VPN Connection**: Displays the number of VPN connections for the first VPC in the VPC list by default. The VPN connections information gets updated according to the VPC you select.
- **Connected Services**: Displays the number of connected services for the first VPC in the VPC list by default. It displays the number of VPNs and the number of subnets connected to the VPC. The information gets updated according to the VPC you select.

**AWS Storage Services Overview Dashboard**

Using the **AWS Storage Services Overview** dashboard you view the total storage service count (EBS volumes and S3 buckets).

The **AWS Storage Services Overview** dashboard provides an overview of your EBS volumes and S3 buckets. You can view the number of EBS and S3 buckets used in your environment.

The **AWS Storage Services Overview** dashboard helps you answer several key questions.

- What is the usage of EBS volumes?
- Which are the top read and top written EBS volumes?
- Which S3 buckets have maximum usage?

**How to Use the Dashboard?**

The **AWS Storage Services Overview** dashboard is divided into two sections based on the two storage types, **EBS Volumes** and **S3 Buckets**. By default, the numbers are displayed at the AWS World level and you can filter the information by account and by region. You can check the usage of the EBS volumes and drill down to individual volumes. For S3 buckets, you can view the buckets with maximum usage and errors. You can also select an individual bucket to check the traffic and errors associated with it.

- **Accounts**: Lists the AWS accounts. Select an account from the table to refresh the storage information and view the EBS volumes and S3 buckets specific to that account.
- **Regions**: Lists the AWS regions. Select a region to filter the storage information and view the EBS volumes and S3 buckets specific to that region.
- **EBS Volumes**: The EBS volumes section displays the top read EBS volumes, top written EBS volumes, EBs volumes with maximum idle time, and the EBS volumes list based on the load that they have. The lists get updated according to the account or region you select.

  The **EBS Volumes List** displays the name, region, capacity, maximum queue, and maximum write time of the EBS Volumes storage. The first EBS volume in the list is selected by default. The list of EBS volumes gets updated according to the account and region you select. Select an EBS volume to view the associated read time and write time.
- **S3 Buckets**: The S3 buckets section displays the S3 buckets with maximum total latency, S3 buckets with maximum first byte latency, S3 buckets with most 4xx errors, S3 buckets with most 5xx errors, and the S3 bucket lists. The lists get updated according to the account or region you select.

  The **S3 Buckets List** displays the name, region, object, and size of the S3 buckets storage. The first S3 bucket in the list is selected by default. The list of S3 buckets gets updated according to the account and region you select. Select a S3 bucket to view the associated requests and the 4xx and 5xx errors related to it.

## Summary Tab for Management Pack for AWS

The summary tab of Management Pack for AWS provide subscription details, overall public cloud inventory of the subscription including key components, aggregated metrics, and so on.

**World Summary Tab**
The World Summary tab of Management Pack for AWS provides a summary and information about the overall performance of all the multi-regional objects that you monitor.

Where To View the World Summary Tab

From the left menu, click **Administration** > **Integrations**. Click the vertical ellipses against the AWS and then click **Go to Details**

**Table 1678: World Summary Options**

| Option | Description |
|---|---|
| World | This widget displays details such as object type, number of accounts, and the number of regions that have objects for an adapter instance. |
| Instances | Displays the regions where services are provided and gives an inventory of the top 10 services sorted by the number of accounts in descending order. Click any region on the map to view details of the selected region. |
| Active Alerts | This widget provides a visual indicator of the alert status for the following alert types.<br>• Health alerts that usually require immediate attention.<br>• Risk alerts indicating that you must look into any problems shortly.<br>• Efficiency alerts indicating that you can reclaim resources.<br>To see the alerts for the object, click the labels of the alert. |
| Relationship | Displays the object relationship of the selected object. |

### Region Summary Tab

The Region Summary tab of Management Pack for AWS provides a summary and overall performance of the object where services are configured and allows you to troubleshoot performance issues, if any.

Where To View the Region Summary Tab

From the left menu, click **Administration** > **Integrations**. Click the vertical ellipses against the AWS Cloud Account, and then click **Go to Details**.

**Table 1679: Region Summary Options**

| Option | Description |
|---|---|
| Region | This widget displays details such as the name of the region, number of projects in the region, and region the availability zone belongs to. |
| Instances | Displays the total number of instances and gives an inventory of the top 10 services sorted by the number of accounts in descending order. Click any region on the map to view details of the selected region. |
| Active Alerts | This widget provides a visual indicator of the alert status for the following alert types.<br>• Health alerts that usually require immediate attention.<br>• Risk alerts indicating that you must look into any problems shortly.<br>• Efficiency alerts indicating that you can reclaim resources.<br>To see the alerts for the object, click the labels of the alert. |
| Relationship | Displays the object relationship of the selected object. |

### Service Summary Tab

The Service Summary tab of Management Pack for AWS, provide the summary of the selected object and allows you to troubleshoot the performance issues.

Where To View the Service Summary Tab

From the left menu, click **Data Sources** > **Integrations**. Click the vertical ellipses against the AWS, and then click **Go to Details**.

**Table 1680: Service Summary Options**

| Option | Description |
|---|---|
| Instance | Displays the object name, type, subscription, region, availability zone, VPC, subnet, and autoscaling group of the adapter instance. |
| Active Alerts | This widget provides a visual indicator of the alert status for the following alert types.<br>• Health alerts that usually require immediate attention.<br>• Risk alerts indicating that you must look into any problems shortly.<br>• Efficiency alerts indicating that you can reclaim resources.<br>To see the alerts for the object, click the labels of the alert. |
| Metrics | Displays the metrics available for the adapter instance. |
| Tags/Labels | Displays the tags or labels available for the object. |
| Relationship | Displays the object relationship of the selected object. |
| The following widgets are available for AWS Management Pack. | |

| Option | Description |
|---|---|
| Time Remaining | This widget displays the number of days remaining till the projected resource utilization crosses the threshold for the usable capacity. |
| Capacity Remaining | This widget displays the unused capacity of your virtual environment to accommodate new virtual machines. |

# Management Pack Builder

The Management Pack Builder enables the creation of custom management packs for use in VCF Operations. This is a no-code solution for bringing in data from an external API and either creating new resources or extending VCF Operations and third party objects with new data, relationships, and events.

### Backwards Compatibility

In VCF Operations, there is no separate installation required. Previously, you needed to deploy a separate OVA virtual appliance, which involved extra setup steps. Now, it is pre-integrated into the VCF Operations platform, reducing the initial installation time and eliminating compatibility issues.

The Management Pack Builder retains backward compatibility. Existing designs can be imported directly, preserving previous work while leveraging new efficiencies and improved performance. This ensures a smooth transition for teams who previously relied on the standalone Management Pack Builder.

### Where you find the Management Pack Builder

In the VCF Operations navigation bar at the top, click **Operate** and in the left navigation pane, click **Developer Center** > **Management Pack Builder**.

### What Can You Do in the Management Pack Builder page

You can use the **Management Pack Builder** page to design a new management pack, import or export a design, edit an existing design, or delete an existing design. After you design a management pack, you can install it.

**Table 1681: Accounts Page Options**

| Option | Description |
|---|---|
| Create New | To create a new management pack, you must perform the following steps:<br>• Connect: Connect to a data source to collect data.<br>• Transform: Use the data from the connected source to define the VCF Operations objects.<br>• Verify: Review and validate the management pack design.<br>• Install: Install the management pack.<br>To create a new management pack, click **Create New**, enter the **Name** and **Description**, and select the **Type**. You cannot change the management pack type after you create it.<br>**HTTP API**: Use the HTTP API type to create a management pack that collects data from an HTTP API to create objects, relationships, and events in VCF Operations. To design a management pack using HTTP, see Designing a Management Pack using HTTP.<br>**Prometheus**: Use the Prometheus type to create a management pack that collects data from Prometheus which includes objects and relationships. To design a management pack using Prometheus, see Designing a Management Pack using Prometheus. |
| Import Design | If you do not have any designs, you can import a JSON design file in VCF Operations. For more information, see Importing or Exporting a Design. |

After you create or import a design, you can view, export, edit, or delete it in the **Management Pack Builder** page.

**Table 1682: Designs Grid Options**

| Option | Description |
|---|---|
| Design | Displays the name of the design. |
| Type | Displays the design type: HTTP API or Prometheus. |
| Design Status | Indicates the status of the design.<br>• Valid: The design contains all components required to create a management pack. It has not been tested using the "Verify" step.<br>• Invalid: The design has an issue that needs to be resolved before it can be tested and installed.<br>• Verified: The design contains all components required to create a management pack and the "Verify" step has run successfully.<br>• Incomplete: The design does not contain all the components needed to create a management pack. |
| Install Status | Indicates installation status of the design.<br>• Installed<br>• Uninstalled<br>• Draft<br>• Out of date |
| Last Edited | Indicates when the design was last modified. |
| Edit | Click a design to edit it. |
| Export | Export a design as a JSON file. For more information, see Importing or Exporting a Design. |
| Delete | Delete the design. |

## Before you Start your Design

Before starting, you should make sure you have access to the reference environment including hostname, user information, and API documentation. It is important to think about what you want to include in it. The main items to understand are objects, requests, and relationships.

### Things to Consider for designing a Management Pack using HTTP

- Objects: Objects are the core item that we will be adding or updating in VCF Operations . You should think of them as the nouns of your technology. An example is a network switch. Your nouns for a switch could be the switch, ports, CPUs, and fans. These would all become objects in your design. For every object, you will provide the metrics and properties by adding one or more requests. VCF Operations manages metrics by the objects and has limits based on number of objects and metrics. Please review the sizing guide for the appropriate sizing of VCF Operations when designing your objects.
  You can also extend existing objects in your VCF Operations environment such as VMs, Host Systems, or third-party resources. By extending those objects, you can add metrics or properties to the existing object allowing custom information to be used as if it was part of the original resource.

  **Note:**

  VCF Operations manages metrics by objects and imposes limits based on the number of objects.
- Requests: These are the API requests used to add metrics and properties. To understand what is available on these requests, reference the API documentation. In our switch example, the requests to create port objects could include an interface endpoint that lists all the ports and a stats endpoint that show the performance of the port.
- Relationships: Relationships associate objects to each other in a parent to child relationship. This creates a topology for your objects allowing VCF Operations to understand the connectivity between your objects. In our switch example, the switch would be the parent to the ports, CPUs, and fans. You can also add relationships to VCF Operations objects like hosts, VMs, or third-party resources like data arrays.
- Events: Events represent a message reported by your endpoint pertaining to a VCF Operations object with an associated severity. Events can be used to impact the health of an object using symptoms. These symptoms also can be used to create alerts.

**Things to Consider for designing a Management Pack using Prometheus**

- Objects: Objects are the core item that we will be adding or updating in VCF Operations. You should think of them as the nouns of your technology. In a Prometheus design, objects are associated with a specific Prometheus job. For every object type, you will select the Prometheus metrics you would like to include and the labels on those metrics which will be mapped to identifiers and properties on the object. VCF Operations manages metrics by the objects and has limits based on number of objects and metrics. Please review the sizing guide for the appropriate sizing of VCF Operations when designing your objects.

  You can also extend existing objects in your environment such as VMs, Host Systems, or third-party resources. By extending those objects, you can add metrics and properties to the existing object, allowing custom information to be used as if it was part of the original resource.

  **Note:**

  VCF Operations manages metrics by objects and imposes limits based on the number of objects.
- Relationships: Relationships associate objects to each other in a parent to child relationship. This creates a topology for your objects allowing VCF Operations to understand the connectivity between your objects. You can also add relationships to objects like hosts, VMs, or third-party resources.

### Creating A Regular Expression

A regular expression is a sequence of characters that define a search pattern, mainly for use in string matching. Management Pack Builder supports Java-style regular expressions. When using a **Regular Expression** in Management Pack Builder you can enter in the expression in the **Regex** field. When the test button is pressed the **Sample Value** will be run through the expression and the result will be displayed in the **Sample Output**.

Regular expressions can be used in the following contexts:

- When defining fields that should match between objects when creating a relationship.
- When defining fields that should match between an event and the object it could be assigned to when creating an event.

### Variables

Custom authentication allows the user to add custom variables to be used in the advanced section of the source creation. This is generally used with permanent session tokens, or any variable sent with every request.

## Designing a Management Pack using HTTP

VCF Operations offers a wizard that makes it easy for you to design a management pack based on an HTTP API.

Building a new HTTP API-based management pack consists of the following steps. Once you start your design, you can save your work and pick up from where you left off. You can edit an existing design at any step.

- Define a Data Source: In this initial step, you define the data source from which the management pack will collect information. This involves specifying the external API or system that the management pack will integrate with, setting up the necessary connection parameters, and ensuring that the data source is accessible for data retrieval.
- Set up API Requests: Here, you configure the specific API requests or queries that will be used to fetch data from the defined source. This includes detailing the endpoints, request methods, parameters, and any necessary authentication details to ensure successful data extraction.
- Define Objects: In this step, you define the objects that represent the data entities retrieved from the source. This involves mapping the data to meaningful resource types within VCF Operations, specifying their properties, and determining how they will be represented in the monitoring environment.
- Specify Relationships (Optional): This step focuses on establishing relationships between the defined objects. By specifying how these objects interrelate, you can create a structured representation of the data, which aids in understanding dependencies and interactions within the monitored environment.

- Define Events (Optional): Here, you create an event from an API by defining the message, severity, and assoicated objects. You can configure symptoms and alerts for significant events in VCF Operations after designing the management pack.
- Verify your Design: In this step, you validate the configurations made in the previous steps. This involves testing the data collection, ensuring that objects and relationships are correctly defined, and confirming that events trigger as expected. It’s a crucial step to ensure the management pack functions as intended before deployment.
- Install: This is the final step. After you have reviewed and verified the design, you can install the management pack.

## Define a Source

Start by identifying the source system or API from which you intend to pull data. This step includes specifying host name, connection settings, and authentication protocols.

**Sub-sections in Define Source**

- Data Source Connections
- Get Session (visible if you turn on session authentication)
- Global Settings
- Release Session (visible if you turn on session authentication)
- Test Connection

**Data Source Connections**

- Collector: The collector node or cloud proxy from which the Management Pack Builder adapter instance will make API requests during the design process.
- Host Name:The target you're pulling data from.
- Port:The port to use.
- TLS Configuration: Select from one of the following options:
  - Verify: Use TLS and verify the target's certificate
  - No Verify: Use TLS but don't verify the target's certificate
  - No TLS: Do not use TLS at all
- Base Path: Path to be added to all API calls defined in this design. You can leave it blank and use the full path for all requests if there is no shared prefix.
- Preview API Path: A preview of your full path.

**Authentication Details**

Configure the authentication details for your API requests.

Choose between basic authentication, custom authentication, and no authentication. The configuration here is used for every subsequent call, so you only need to configure authentication once. If you need to create a session token, before making connection requests, turn on **Use Session Authentication**.

The Management Pack Builder can use three different authentication source types:

- Basic: Specify a username and password. The header is automatically created.
  - Username: The user on reference system that is authorized to query the intended API endpoint.
  - Password: User’s password for authentication.
- Custom**:** Add authentication fields and headers.
  - Use custom authentication when you need to add custom variables to be used in the advanced section of the source creation.
  - This is generally used with permanent session tokens or any variable sent with every request if session authentication is not used.
  - It is generally used for login credentials that will be used in POST a post body to get the session token when using session authenication.
- No Authentication**:** Use for public and non-secured APIs.

You can next choose to turn on **Session Authentication**. Session authentication is a method in which a session is created on login and stores information from the response body and/or headers as defined by the user. Common fields include a token or a session ID. When running a collection, the session fields are retrieved once, then used on all subsequent requests. If a release session request is defined, the session is released at the end of the collection.

Once you are done, click **NEXT**.

**Get Session**

Define the **HTTP Method** and **API Path** when using session authentication.

- HTTP Method: Based on the API requirements this will be either a GET, POST, PUT, PATCH.
- API Path: This is the path to the session creation resource as defined by the API documentation.

Next, set up additional request settings, such as headers, query parameters, and body

- HTTP Headers: This is used to assign headers to the request that is used to retrieve the session. This only needs to be used if the API requires custom values in the header. If using basic credentials, the Authorization header is automatically added and thus does not need further configuration.
- Query Parameters: This section allows the user to add custom query prompts to the end of the URL request. This is optional and only necessary if the API documentation calls for it.
- Body: This allows you to create a body to be sent to the session creation request. Some APIs require the body to contain information like user and password. This is optional and only needs to be used if the API documentation indicates it.

Click **Test** to see the test response. VCF Operations displays the **Body**, **Headers** and **Log**.

Once you are done, click **NEXT**.

**Global Settings**

Define the headers which are used to pass data with every call in the request header. Session data should be put here so that every call includes the session ID or token information.

Once you are done, click **NEXT**.

**Release Session**

Defining a **Release Session Request** is recommended when using session authentication. This request will log out the session, reduce session leaks, and improve security.

- HTTP Method: Based on the API requirements this will be either a GET, POST, PUT, PATCH, DELETE.
- API Path: This is the path to the API endpoint you want to use to release the session.

Once you are done, click **NEXT**.

**Test Session**

In this step, you to define the **HTTP Method** being used (GET, POST, PUT, PATCH), the API path, and see a preview of the fully qualified path. Then, you click **TEST CONNECTION**.

- HTTP Method: Based on the API requirements this will be either a GET, POST, PUT, PATCH.
- API Path: This is the path to test that your defined authentication works for your API.

The test connection confirms that all the source data is set up correctly. If using basic authentication, this will send one request including the basic authentication header. If using the session, this will make up to three requests to create the session, make a call to the test endpoint, then make a call to delete the session.

The response section will show the response to the test connection endpoint. You can see the body and headers of the response as well as the logs generated by the request. You can download the test response as a JSON file.

Once you are done, click **SAVE SOURCE**.

## Add Requests

This is the second step of the wizard. You can add all the API calls used by the design to provide data to the objects and events. You will need to reference your API documentation to determine the endpoint and settings necessary for this section.

### Add API Request and API Pagination

In the **Add API Request** section, define the endpoint to be used for the request. Note: the source hostname, port, and base path will be prepended to this path for the request URL.

- HTTP Method: This is the method used for the request. It will be either a GET, PUT, PATCH, or POST.
- API Path: Endpoint that needs to be call to retrieve the data.
- Name: Name for this request used in future settings in the design.

Advanced (optional)

In this section you can add specific data to the requests body, headers, and query parameters, as defined by the API documentation.

Once you are done, click **SAVE REQUEST**.

You can also add paging to your API call in the **Add API Pagination** section. You must make the request prior to configuring paging. Management Pack Builder supports two main methods of pagination: offset and pages. Reference your API documentation to determine whether paging is necessary and, if so, which method to use.

- Paging Parameter: This is the parameter name to use to indicate which page we are requesting.
- Starting Offset: This is the number that represents the beginning of the API's results. Often, "Pages" start at 1 and "Offset" starts at 0. Confirm the starting number in the API documentation.
- Limit Parameter: This is the parameter name for the number of records per page.
- Limit Value: The number of records returned per page.
- Data List Returned from Paged Request: List of data being returned. When the count of this is less than the limit value, it means that the end of the data has been reached and no more paged requests will be made.

### Chain From Other API Calls

To add a chained request, return to the wizard, go to the **Requests** step, and select the parent request from requests list, then select **Add Chained**.

- In the **Add Chaining** section, select a list from the parent request's response which contains the attribute(s) to be used in the child request.
- System Attributes: For each attribute that you would like to use in the child request, select **Add Field**. Select the **Attribute**. If desired, update the **Parameter**. The **Parameter** will be used to define the usage key, so make sure that it is meaningful in the context of the design. If the parent request had a value for the selected attribute, it will populate by default. Regardless, you can manually set the value here. This is the value that will be substituted for the usage key later when testing the child request, so make sure that it is a valid value which will cause the child request to succeed.
- In the **Add API Request** section, define the child request like any other request, but now you can use the attribute(s) defined in the previous step. You can insert the usage key in the path, headers, query parameters, and/or body of the child request. To insert the attribute usage key, click the clipboard icon on the right side of the field, then select the attribute you want to insert. It will be inserted where the cursor is currently located in the field. When the request is run via **MAKE REQUEST**, all usage keys will be replaced with the sample values defined in the previous step.

Once you are done, click **SAVE REQUEST**.

## Add Objects

In the third step, you define the objects that will be part of your custom management pack. You can define new objects or extend existing objects from VCF Operations with new metrics and properties.

### Sub-Sections in Add New and Add Existing Objects

- Object Type
- Attributes from API
- Properties and Metrics
- Name and Identifiers (Section appears only when adding new objects.)
- Object Bindings (Section appears when there is an existing object or when the attribue selections require it)

### Object Type

- Add New Object Type: The object type is the user-facing label that will be displayed for this type of object in VCF Operations when this management pack is installed. Example object types are Switch, Port, etc. You can also choose the icon that will be used in VCF Operations. Once you are done, click **NEXT**.
- Add Existing Object: To extend an existing object, choose a resource type to extend from the list of resource types on your VCF Operations instance. You can filter by the resource type or page through the list of available options.

### Attributes from API

From the list of **Requests**, you select one or more requests to pull into this object. You will then select all the data entries you want to add to your object from the list. You can search the list of attributes for a specific attribute or scroll through the list.

Once you are done, click **NEXT**.

### Properties and Metrics

Here you will see the metric and property definitions you have attached to the object.

- Label: The name of the metric or property visible in VCF Operations.
- Datatype: Defines how the data is rendered. If you select decimal or one of the counter options and the data cannot be converted to a number, the data will be discarded.
  - String: Returns the value of the attribute as a string. This datatype is allowed only on properties, and not metrics.
  - Decimal: Returns the value of the attribute as a number.
  - Counter Delta: Calculates the change in the value between collections.
  - Counter Rate: Calculates the change in value between collections over time.
- Unit: If applicable, this is where you can define the unit for the data point. This will allow auto-scaling in dashboards and reports.
- Property: This drop-down list indicates whether the data is a property.
- KPI: This toggle indicates whether the data will be treated as a KPI. KPIs are key metrics that are used in dashboards and resource detail pages. They should be metrics that are important to the status, performance, and health of the object.
- Expanded row view:
  - Request: Shows the call and data path from which this metric is pulled.
  - List: List in the request response from which the data is pulled.
  - Attribute: Name of the attribute in the response being pulled.
  - Example: Shows the value of the first returned data point from the request.

  Once you are done, click **NEXT**.

### Name and Identifiers

Define the identity of the object in this step.

- Object Instance Name: This is the property from the list above that is used as the object's name in VCF Operations.
- Object Identifiers: Define the properties using the smallest set of properties that will accurately and uniquely identify each object.

Once you are done, click **SAVE OBJECT**. If you see Attribute Bindings, proceed to the next step.

#### Attribute Bindings

When combining data from multiple JSON or XML arrays into a single new object, it's necessary to establish a base array and select a corresponding attribute from each of the other arrays for mapping. You will only see this section if it is required.

When extending an existing object, all arrays must link to a property or identifier on the existing object in VCF Operations.

- API Attribute: The data from the selected JSON or XML list in the API response that you match to an existing property or identifier.
- Object Property: A matching property or identifier on the object. For a new object, it is selected from the base list. For an extended object, it is selected from the identifiers and properties of the existing object.

## Best Practices For Metrics and Properties

Follow these best practices when you create objects from new metrics and properties.

#### Best Practices

- Objects created from new metrics and properties should be represent stable objects, not transient objects.
- Metrics should represent measurable performance characteristics. Example: CPU Utilization %, Network Throughput, etc. Properties should represent relatively stable configuration values. Example: version, power status, etc.
- Properties should have a small number of possible values.
- Property values should not change frequently from collection to collection.
- Opt for defining metrics using reasonable unit sizes and prefix multipliers to avoid publishing excessively large values.
- The depth of the relationships of the objects should not be too deep (for example 100).
- Avoid defining artificial relationships that do not exist in the end-point.

## Define Object Relationships

Relationships are a parent to child connection that is used in VCF Operations to define the interaction between interconnected resources. Parent to child relationships are the only supported type of relationships with the Management Pack Builder.

#### Parent and Child object

Define the objects used to create the relationships. Parent objects are higher in the topology.

#### Matching Properties

Relationships in Management Pack Builder are created by matching all resources with matching properties. For example, a Switch has a **switch ID** property and the Port has a **parent switch ID** property. The parent object properties and the properties of any relevant child object(s) will always match, e.g. **switch ID** with **parent switch ID**. With multiple matching sets, all sets of properties must match for the relationship to be created. This can be either case-sensitive or insensitive and use basic or advanced matching.

Once you are done, click **SAVE RELATIONSHIP**.

## Add New Events

Map events from the target system into the VCF Operations event model. This includes defining event triggers and mapping severity levels, and linking them to VCF Operations objects.

#### Sub-sections in this step

- Add Events from API

- Severity
- Related Objects

**Add Events from API**

- Event Name: The user-friendly name of the event. This will be prefixed on the event message in VCF Operations.
- API Request: This is the request endpoint setup in the **Requests** section to use to create events.
- Event List: The location of events in the API response.
- Event Message: This is the event message that will show in VCF Operations. Often in APIs this would be the event description. You can create the message using one or more fields from the response and type any static information as well. You can also edit the value of the fields using regular expressions. See the section on regular expressions for further help on this.

  Once you are done, click **NEXT**.

**Severity**

Events in VCF Operations are ranked with a severity from Info to Immediate. Please reference your API documentation for a list of valid severities they support.

- Event Severity: Define API response fields and static text which form the event severity definition. You can also adjust the value of the fields using regular expression.
- Map Severities: Add mappings from the VCF event severity (Event Severity) to the corresponding value expected from the API (API Response Severity). For example, if the API returns "critical," you would map to the VCF "Critical" severity. Sometimes an API will have a severity that does not directly correspond to a VCF severity. In that case, the mapping is up to your discretion. For example, if any API returns an event severity of Severe, you must map that to the VCF severity "Critical," or "Immediate."
- Set all unmatched API response Severities to: Specify a default severity. If an event severity is returned from the API that does not match one of the mappings you created, the associated event will be set to the default severity specified here.

Once you are done, click **NEXT**.

**Related Objects**

Relate events to objects by matching. Select "All" if you want to related events to more than one object in the case that multiple related objects match. Select "First" if you only want the first related object to match.

The order defined in this section is the order in which the management pack will evaluate matches.

Add related object: For each related object, first select the object type (**Select object**) to relate to. By default, you can choose any object types included in the current design. If you select "All objects", you can also choose from existing object types in VCF Operations. Next, create a mapping from the object properties to the API response. You can use any combination of object properties, API response fields, static text, and regular expressions to make the mapping work. In the top-right, you can choose whether the matching logic should be case-sensitive. If you define multiple related objects and selected "Relate events to objects by matching: First", you can use the arrows on the left to change the order in which the mappings will be evaluated.

Once you are done, click **SAVE EVENT**.

## Verify your Design

Before final deployment, you can test your design to ensure that the management pack collects the correct data and accurately represents the target system within VCF Operations.

**Perform Collection**

Click **PERFORM COLLECTION** to verify your design.

VCF Operations runs the collection and displays the following information:

- Summary: Displays the **Collection Status**, **Collection Time**, **Objects Collected**, **Metrics Collected**, **Properties Collected**, **Relationships Found**, and **Events Collected**.
- Log: Displays the last 1000 lines. You can download the log to view all the lines. You can change the logging level to see more detailed logs.
- Objects: Displays the details for the objects.
- Events: Displays the events for the objects.

Once you are done, go to the final step, **INSTALL**.

### Install

Once testing is complete, click **REVIEW CONFIGURATION** or directly click **INSTALL**. VCF Operations installs the management pack, making it available for live monitoring.

## Designing a Management Pack using Prometheus

VCF Operations offers a wizard that makes it easy for you to design a management pack from Prometheus data.

Building a Prometheus-based management pack consists of the following steps. Once you start your design, you can save your work and pick up from where you left off. You can edit an existing design at any step.

- Define a Data Source: In this initial step, you define the Prometheus data source from which the management pack will collect information. You must specify the Prometheus instance that the management pack will integrate with, setting up the authentication, and ensuring that Prometheus is accessible for data retrieval. For more information, see Define a Source.
- Define Objects: In this step, you map metrics that are retrieved from Prometheus to meaningful objects and metrics within VCF Operations. For more information, see Add Objects.
- Specify Relationships: This step focuses on establishing relationships between the defined objects. By specifying how these objects interrelate, you can create a structured representation of the data, which aids in understanding dependencies and interactions within the monitored environment. For more information, see Define Object Relationships.
- Verify your Design: In this step, you validate the configurations that were made in the previous steps. It also involves testing the data collection and ensuring that objects and relationships are correctly defined. It’s a crucial step to ensure the management pack functions as intended before deployment. For more information, see Define Object Relationships.
- Install: As the final step, after you have reviewed and verified the design, you can install the management pack. For more information, see Install.

### Define a Source

Start by identifying the Prometheus instance from which you intend to pull data. This step includes specifying the IP address or FQDN, API port, TLS configuration, and authentication settings.

#### Data Source Connections

- Collector: The collector node or cloud proxy from which the Management Pack Builder adapter instance will make requests to Prometheus during the design process.
- Prometheus Host: the IP address, hostname, or FQDN for the Prometheus instance that will be used during the design process.
- Port: The port hosting the Prometheus APIs. The default is 9090.
- TLS Configuration: Select from one of the following options:
  - Verify: Use TLS and verify the target's certificate
  - No Verify: Use TLS but do not verify the target's certificate
  - No TLS: Do not use TLS at all
- Authentication Type: Select from one of the following options:

- Basic: Specify a username and password
- No Authentication: No credentials are required

Once the form is complete, click **Test Connection**. The test connection confirms that the Prometheus instance is accessible with the provided configuration information and the API is returning the expected data.

The **Test Response** section shows you the list of jobs available on the Prometheus instance. In Prometheus, each type of monitored technology typically corresponds to one job. For example, all Clickhouse-related metrics are defined with the “clickhouse” job. By default, Prometheus defines its own self-monitoring metrics under the “prometheus” job.

The **Test Response** section also shows a **Log** tab, where you can review the test connection logs. If you are seeing a failed test connection, review the logs to determine the root cause of the failure.

Once you are done, click **Save Source**.

## Add Objects

Next, select Prometheus metrics that you want to convert into VCF Operations metrics and objects. Prometheus metrics have labels which can be used to uniquely identify objects. Prometheus metrics can be filtered and processed during their conversion to VCF Operations metrics.

### Add New Object Type

1. Object Type:
   - Object Type: The type which will be assigned and visible in VCF Operations.
   - Prometheus Job: In Prometheus, each type of monitored technology typically corresponds to one job. Select which type of technology will be associated with this object type.
   - Object Icon: Select an icon to represent this object type. By default, all icons are shown. Select a category to filter the icons shown. After a management pack is installed, custom icons can optionally be uploaded in **Administration** > **Control Panel** > **Icons**.
2. Prometheus Data: Prometheus metrics related to the job selected previously are shown. Select the metrics that should comprise the new VCF Operations object type. Use the search bar to filter on metric name and label.

   **Note:**

   When defining object identifiers, you will only be able to select labels that are shared across all the selected metrics. All Prometheus metrics have the “instance” label by default.
3. Identifiers and Name: Select one or more labels to uniquely identify the objects in VCF Operations. You can optionally update the text that will be shown in the VCF Operations UI.

   After the identifying labels are defined, select one of them to be used as the object name.
4. Metrics Mapping: Each Prometheus metric selected previously is shown. A Prometheus metric can be mapped to one or more VCF Operations metrics on the new object type.
   - Metric Label: Optionally update the metric label to be shown in VCF Operations UI.
   - Function: The selection for function varies depending on the type of Prometheus metric:
     - Gauge metrics always use the **Current Total** function. This means the VCF Operations metric will report the sum of the latest values returned.
     - Counter and summary metrics can use a **Delta** or **Rate** function.
       - Delta: The VCF Operations metric will report the difference between the current value and previous value of the Prometheus metric.
       - Rate: The VCF Operations metric will report the difference between the current value and previous value of the Prometheus metric, divided by the time elapsed between collections.
   - Units: Specify the unit for this metric.
   - Filters: Optionally define one or more filters to include only a subset of the Prometheus metric’s time series in the VCF Operations metric calculation. For example, you may want to split an HTTP Response metric into multiple VCF Operations metrics by filtering on response codes (2xx -> Successes, 4xx -> Failures, etc.).
     - =: Include time series where the specified label matches the provided text exactly.

- !=: Include time series where the specified label does not match the provided text exactly.
- =~: Include time series where the specified label matches the provided regex. Supports the same RE2 regex syntax that Prometheus supports.
- !~: Include time series where the specified label does not match the provided regex. Supports the same RE2 regex syntax that Prometheus supports.

5. KPI: Indicates whether the data will be treated as a key performance indicator. KPIs are key metrics that are used in dashboards and resource detail pages. They should be metrics that are important to the status, performance, and health of the object.

**Extend Existing Object Type**

To extend an object type that is defined by another management pack already installed in VCF Operations with Prometheus data, select **Extend Existing**.

1. Object Type:
   – Select Existing Object Type: Select the type of object that will be extended with additional metrics. Use the search bar in the top-right to filter on **Object Type** and **Adapter**.
   – Prometheus Job: In Prometheus, each type of monitored technology typically corresponds to one job. Select which type of technology will be associated with this object type.
2. Prometheus Data: Prometheus metrics related to the job selected previously are shown. Select the metrics that should be added to the existing VCF Operations object type. Use the search bar to filter on metric name and label.

   **Note:**

   When defining object identifiers, you will only be able to select labels that are shared across all the selected metrics. All Prometheus metrics have the “instance” label by default.
3. Binding Labels: Select one or more binding labels from the selected Prometheus metrics to link to the existing objects in VCF Operations.
4. Object Binding: Use a combination of one or more binding labels and static text to define a matching pattern between the Prometheus metric labels and the existing object type’s properties and identifiers. You may optionally apply a regex to any label, property, or identifier to modify the text that will be used for matching.
5. Metrics Mapping: Each Prometheus metric selected previously is shown. A Prometheus metric can be mapped to one or more VCF Operations metrics on the new object type.
   – Metric Label: Optionally update the metric label to be shown in VCF Operations UI.
   – Function: The selection for function varies depending on the type of Prometheus metric:
     - Gauge metrics always use the **Current Total** function. This means the VCF Operations metric will report the sum of the latest values returned.
     - Counter and summary metrics can use a **Delta** or **Rate** function.
       - Delta: The VCF Operations metric will report the difference between the current value and previous value of the Prometheus metric.
       - Rate: The VCF Operations metric will report the difference between the current value and previous value of the Prometheus metric, divided by the time elapsed between collections.
   – Units: Specify the unit for this metric.
   – Filters: Optionally define one or more filters to include only a subset of the Prometheus metric’s time series in the VCF Operations metric calculation. For example, you may want to split an HTTP Response metric into multiple VCF Operations metrics by filtering on response codes (2xx -> Successes, 4xx -> Failures, etc.).
     - =: Include time series where the specified label matches the provided text exactly.
     - !=: Include time series where the specified label does not match the provided text exactly.
     - =~: Include time series where the specified label matches the provided regex. Supports the same RE2 regex syntax that Prometheus supports.
     - !~: Include time series where the specified label does not match the provided regex. Supports the same RE2 regex syntax that Prometheus supports.
6. KPI: Indicates whether the data will be treated as a key performance indicator. KPIs are key metrics that are used in dashboards and resource detail pages. They should be metrics that are important to the status, performance, and health of the object.

### What To Do Next

- Define Object Relationships: For more information, see Define Object Relationships.
- Verify your Design: For more information, see Verify your Design.
- Install: For more information, see Install.

## Importing or Exporting a Design

A JSON file is created when exporting a design. A JSON file can be imported into VCF Operations. The file is verified as a valid design file and the author and description is shown. Only valid designs can be exported.

### Importing a Design

To import a design, click the **Import** button in the Management Pack Builder page. Browse to the location of the JSON file in your system. Only one design can be imported at a time.

VCF Operations verifies the validity and displays the name and description of the design. Ensure that another design of the same name does not exist. The design that you are importing must have a unique name.

After you import the design, it is displayed in the Management Pack Builder page. Verify the information in the **Design Status** column. You must provide the reference environment to test the design against. Click the imported design, and in the **Source** step of the wizard, specify the required fields.

### Exporting a Design

Before you export a design, ensure that it does not contain private information, such as IP addresses, credentials, or IDs, outside of end-user configurable fields. Before sharing or storing your exported design in an unsecured location, review the export file to ensure it does not include any private information.

A zip file containing the JSON file is exported. You must extract the JSON file from the zip file before you can import it.

## Troubleshooting a Design

1. Request Log: Every time you make a test request or perform a test collection in Management Pack Builder, there are tabs which show the body, headers, and logs. In the case of an error response code, review the logs and headers for information regarding the cause of the error.
2. Third-party API documentation: ensure that the request you defined complies with the requirements described in the third-party API documentation.
3. Management Pack Builder Adapter logs: located under `$VCOPS_BASE/user/log/adapters/MPBAdapter` on the node or cloud proxy selected under **Source**. Review these logs for any additional errors or warnings.
4. If you suspect an error with the Management Pack Builder tool itself, you can open a support case, or review the server logs at `/usr/lib/vmware-vcops/user/log/integration-designer-controller.log`. You can also review the Suite API logs at `/usr/lib/vmware-vcops/user/log/suite-api for additional errors`.

   **Note:**

   VMware Support is limited to the functionality and performance of the Management Pack Builder application. Support does not include troubleshooting or designing customer-specific management packs or custom API integrations. For questions about specific management pack designs, please post in the Management Pack Builder Community Page.
